Contents

PART 1:	Setup and Troubleshooting	124
Chapter 1:	CLI Navigation Commands	125
	Introduction	125
	configure terminal	126
	disable (Privileged Exec mode)	127
	do	128
	enable (Privileged Exec mode)	129
	end	131
	exit	132
	help	133
	logout	134
	show history	135
Chapter 2:	Device GUI and Vista Manager EX Commands	136
	Introduction	136
	atmf topology-gui enable	137
	http log webapi-requests	138
	http port	139
	http secure-port	140
	log event-host	141
	service http	142
	show http	143
Chapter 3:	File and Configuration Management Commands	144
	Introduction	144
	autoboot enable	148
	boot config-file	149
	boot config-file backup	151
	boot system	152
	boot system backup	154
	cd	155
	copy (filename)	156

copy debug	158
copy running-config	159
copy startup-config	160
copy zmodem	161
create autoboot	162
crypto verify	163
delete	165
delete debug	166
delete stack-wide force	167
dir	168
dir stack-wide	170
edit	172
edit (filename)	173
erase factory-default	174
erase startup-config	175
ip tftp source-interface	176
ipv6 tftp source-interface	177
mkdir	178
move	179
move debug	180
pwd	181
rmdir	182
show autoboot	183
show boot	184
show file	186
show file systems	187
show running-config	189
show running-config interface	192
show startup-config	195
show version	196
unmount	197
write file	198
write memory	199
write terminal	200

Chapter 4:	User Access Commands	201
	Introduction	201
	aaa authentication enable default local	203
	aaa local authentication attempts lockout-time	204
	aaa local authentication attempts max-fail	205
	aaa login fail-delay	206
	clear aaa local user lockout	207
	clear line console	208
	clear line vty	209
	enable password	210
	enable secret (deprecated)	213
	exec-timeout	214
	flowcontrol hardware (asyn/console)	216
	length (asyn)	218
	line	219
	privilege level	221
	security-password history	222
	security-password forced-change	223

	security-password lifetime	224
	security-password min-lifetime-enforce	225
	security-password minimum-categories	226
	security-password minimum-length	227
	security-password reject-expired-pwd	228
	security-password warning	229
	service advanced-vty	230
	service password-encryption	231
	service telnet	232
	service terminal-length (deleted)	233
	show aaa local user locked	234
	show privilege	235
	show security-password configuration	236
	show security-password user	237
	show telnet	238
	show users	239
	telnet	240
	telnet server	241
	terminal length	242
	terminal resize	243
	username	244
Chapter 5:	Feature Licensing Commands	246
	Introduction	246
	license	247
	show license	249
	show license brief	251
	show license brief member	253
	show license member	255
Chapter 6:	Subscription Licensing Commands	257
	Introduction	257
	license redistribute	258
	license update file	259
	license update online	260
	show license external	262
Chapter 7:	System Configuration and Monitoring Commands	265
	Introduction	265
	banner exec	267
	banner login (system)	269
	banner motd	271
	clock set	273
	clock summer-time date	274
	clock summer-time recurring	276
	clock timezone	278
	continuous-reboot-prevention	279
	crypto secure-mode	281
	debug core-file	282
	ecofriendly led	283
	ecofriendly lpi	284
	findme	286

findme trigger	288
hostname	289
max-fib-routes	291
max-static-routes	293
no debug all	294
reboot	296
reload	297
show clock	298
show continuous-reboot-prevention	300
show cpu	301
show cpu history	304
show debugging	307
show ecofriendly	308
show interface memory	310
show memory	312
show memory allocations	314
show memory history	316
show memory pools	318
show memory shared	319
show process	320
show reboot history	323
show router-id	325
show secure-mode	326
show system	327
show system environment	328
show system environment counters	330
show system interrupts	332
show system mac	333
show system pci device	334
show system pci tree	335
show system serialnumber	336
show tech-support	337
speed (asyn)	339
terminal monitor	341
undebg all	342

Chapter 8: Pluggables and Cabling Commands 343

Introduction	343
clear fiber-monitoring interface	344
clear test cable-diagnostics tdr	345
debug fiber-monitoring	346
fiber-monitoring action	348
fiber-monitoring baseline	350
fiber-monitoring enable	352
fiber-monitoring interval	353
fiber-monitoring sensitivity	354
show system fiber-monitoring	356
show system pluggable	359
show system pluggable detail	361
show system pluggable diagnostics	364
show test cable-diagnostics tdr	366
test cable-diagnostics tdr interface	367

Chapter 9:	Connectivity Fault Management Commands	368
	Introduction	368
	cc interval	370
	cc multicast	372
	cc unicast	373
	clear (MEP Attribute)	374
	clear ethernet cfm errorlog	375
	clear mep counter	376
	ethernet cfm domain-name	377
	ethernet cfm mep	380
	mep (FNG attributes)	382
	mep active	384
	mep ccm-ltm-priority	386
	mep crosscheck	388
	service ma-name	390
	show ethernet cfm details	393
	show ethernet cfm domain	398
	show ethernet cfm errorlog	401
	show ethernet cfm maintenance-points local mep	403
	show ethernet cfm maintenance-points remote mep	409
	show ethernet cfm service	412
	show mep-alarm status	415
 Chapter 10:	 Logging Commands	 416
	Introduction	416
	clear exception log	418
	clear log	419
	clear log buffered	420
	clear log external	421
	clear log permanent	422
	copy buffered-log	423
	copy permanent-log	424
	default log buffered	425
	default log console	426
	default log email	427
	default log external	428
	default log host	429
	default log monitor	430
	default log permanent	431
	log buffered	432
	log buffered (filter)	433
	log buffered exclude	436
	log buffered size	439
	log console	440
	log console (filter)	441
	log console exclude	444
	log email	447
	log email (filter)	448
	log email exclude	451
	log email time	454
	log external	456
	log external (filter)	458

	log external exclude	461
	log external rotate	464
	log external size	466
	log facility	467
	log host	469
	log host (filter)	471
	log host exclude	474
	log host source	477
	log host startup-delay	478
	log host time	480
	log monitor (filter)	482
	log monitor exclude	485
	log permanent	488
	log permanent (filter)	489
	log permanent exclude	492
	log permanent size	495
	log-rate-limit nsm	496
	log trustpoint	497
	show counter log	498
	show exception log	499
	show log	500
	show log config	502
	show log external	504
	show log permanent	505
	show running-config log	507
	unmount	508
Chapter 11:	Scripting Commands	509
	Introduction	509
	activate	510
	echo	512
	wait	513
Chapter 12:	Interface Commands	514
	Introduction	514
	description (interface)	515
	interface (to configure)	516
	platform jumboframe	518
	mtu	519
	service statistics interfaces counter	520
	show interface	521
	show interface brief	524
	show interface memory	525
	show interface status	527
	shutdown	529
Chapter 13:	Port Mirroring and Remote Mirroring Commands	530
	Introduction	530
	mirror interface	531
	remote-mirror interface	533
	show mirror	535
	show mirror interface	536

	show remote-mirror	537
	switchport remote-mirror-egress	539
	vlan mode remote-mirror-vlan	540
PART 2:	Interfaces and Layer 2	542
Chapter 14:	Switching Commands	543
	Introduction	543
	backpressure	546
	clear loop-protection action	548
	clear loop-protection counters	549
	clear mac address-table dynamic	550
	clear mac address-table static	552
	clear port counter	553
	clear port counter stackports	554
	clear port-security intrusion	555
	cut-through	558
	debug loopprot	559
	debug platform packet	560
	duplex	562
	flowcontrol (switch port)	563
	linkflap action	565
	loop-protection loop-detect	566
	loop-protection action	567
	loop-protection action-delay-time	568
	loop-protection timeout	569
	mac address-table acquire	570
	mac address-table ageing-time	571
	mac address-table logging	572
	mac address-table static	573
	mac address-table thrash-limit	574
	platform acs-to-vlanclassifiers	575
	platform control-plane-prioritization rate	577
	platform jumboframe	579
	platform l2mc-table mode	580
	platform l2mc-overlap	582
	platform load-balancing	583
	platform multicast-address-mismatch-action	585
	platform multicast-ratelimit	587
	platform routingratio	588
	platform sdn-route-ratio	590
	platform vlan-stacking-tpid	591
	polarity	592
	show debugging loopprot	593
	show debugging platform packet	594
	show flowcontrol interface	595
	show interface err-disabled	596
	show interface switchport	597
	show loop-protection	598
	show mac address-table	600
	show mac address-table thrash-limit	602
	show platform	603

show platform classifier statistics utilization brief	606
show platform port	609
show port-security interface	611
show port-security intrusion	612
show storm-control	613
speed	614
storm-control level	616
switchport port-security	617
switchport port-security aging	618
switchport port-security maximum	619
switchport port-security violation	620
thrash-limiting	621
undebg loopprot	623
undebg platform packet	624

Chapter 15:

VLAN Commands	625
Introduction	625
clear vlan statistics	627
debug private-vlan ufo	628
platform acs-to-vlanclassifiers	629
platform vlan-stacking-tpid	631
port-vlan-forwarding-priority	632
private-vlan	635
private-vlan association	637
private-vlan ufo trap	638
show debugging private-vlan	639
show interface switchport vlan translation	640
show port-vlan-forwarding-priority	642
show vlan	643
show vlan access-map	644
show vlan classifier group	645
show vlan classifier group interface	646
show vlan classifier interface group	647
show vlan classifier rule	648
show vlan filter	649
show vlan private-vlan	650
show vlan private-vlan ufo	651
show vlan statistics	652
switchport access vlan	653
switchport enable vlan	654
switchport mode access	655
switchport mode private-vlan	656
switchport mode private-vlan trunk promiscuous	657
switchport mode private-vlan trunk secondary	659
switchport mode private-vlan ufo	661
switchport mode trunk	663
switchport private-vlan host-association	664
switchport private-vlan mapping	665
switchport trunk allowed vlan	666
switchport trunk native vlan	669
switchport vlan translation	670
switchport vlan translation default drop	672
switchport vlan-stacking (double-tagging)	673

switchport voice dscp	674
switchport voice vlan	675
switchport voice vlan priority	678
vlan	679
vlan access-map	681
vlan classifier activate	682
vlan classifier group	683
vlan classifier rule ipv4	684
vlan classifier rule proto	685
vlan database	688
vlan filter	689
vlan mode stack-local-vlan	690
vlan statistics	692

Chapter 16:

Spanning Tree Commands	694
Introduction	694
clear spanning-tree statistics	696
clear spanning-tree detected protocols (RSTP and MSTP)	697
debug mstp (RSTP and STP)	698
instance priority (MSTP)	702
instance vlan (MSTP)	704
region (MSTP)	706
revision (MSTP)	707
show debugging mstp	708
show spanning-tree	709
show spanning-tree brief	712
show spanning-tree mst	713
show spanning-tree mst config	714
show spanning-tree mst detail	715
show spanning-tree mst detail interface	717
show spanning-tree mst instance	719
show spanning-tree mst instance interface	720
show spanning-tree mst interface	721
show spanning-tree statistics	722
show spanning-tree statistics instance	724
show spanning-tree statistics instance interface	725
show spanning-tree statistics interface	727
show spanning-tree vlan range-index	729
spanning-tree autoedge (RSTP and MSTP)	730
spanning-tree bpdu	731
spanning-tree cisco-interoperability (MSTP)	733
spanning-tree edgeport (RSTP and MSTP)	734
spanning-tree enable	735
spanning-tree errdisable-timeout enable	737
spanning-tree errdisable-timeout interval	738
spanning-tree force-version	739
spanning-tree forward-time	740
spanning-tree guard root	741
spanning-tree hello-time	742
spanning-tree link-type	743
spanning-tree max-age	744
spanning-tree max-hops (MSTP)	745
spanning-tree mode	746

spanning-tree mst configuration	747
spanning-tree mst instance	748
spanning-tree mst instance path-cost	749
spanning-tree mst instance priority	751
spanning-tree mst instance restricted-role	752
spanning-tree mst instance restricted-tcn	754
spanning-tree path-cost	755
spanning-tree portfast (STP)	756
spanning-tree portfast bpdu-filter	758
spanning-tree portfast bpdu-guard	760
spanning-tree priority (bridge priority)	762
spanning-tree priority (port priority)	763
spanning-tree restricted-role	764
spanning-tree restricted-tcn	765
spanning-tree transmit-holdcount	766
undebg mstp	767

Chapter 17: Unidirectional Link Detection (UDLD) Commands 768

Introduction	768
debug udld	769
show debugging udld	770
show udld	771
show udld neighbors	772
show udld port	773
udld aggressive-mode	774
udld enable	775
udld port	776
udld port aggressive-mode	777
udld port disable	778
udld reset	779
udld time disable-period	780
udld time message-interval	781
undebg udld	782

Chapter 18: Link Aggregation Commands 783

Introduction	783
channel-group	785
clear lacp counters	787
debug lacp	788
lacp global-passive-mode enable	789
lacp port-priority	790
lacp system-priority	791
lacp timeout	792
platform load-balancing	794
show debugging lacp	796
show diagnostic channel-group	797
show etherchannel	799
show etherchannel detail	800
show etherchannel summary	801
show lacp sys-id	802
show lacp-counter	803
show port etherchannel	804

	show static-channel-group	805
	static-channel-group	806
	undebbug lacp	808
Chapter 19:	Power over Ethernet Commands	809
	Introduction	809
	clear power-inline counters interface	811
	debug power-inline	812
	power-inline allow-legacy	814
	power-inline description	815
	power-inline enable	817
	power-inline hanp	818
	power-inline max	819
	power-inline priority	821
	power-inline usage-threshold	823
	service power-inline	824
	show debugging power-inline	825
	show power-inline	826
	show power-inline counters	829
	show power-inline interface	831
	show power-inline interface detail	834
PART 3:	Layer 3 Switching	837
Chapter 20:	IP Addressing and Protocol Commands	838
	Introduction	838
	arp-aging-timeout	840
	arp-mac-disparity	841
	arp	844
	arp log	846
	arp opportunistic-nd	849
	arp-reply-bc-dmac	851
	clear arp-cache	852
	debug ip packet interface	854
	debug ip irdp	856
	ip address (IP Addressing and Protocol)	857
	ip directed-broadcast	859
	ip forwarding	861
	ip forward-protocol udp	862
	ip gratuitous-arp-link	864
	ip helper-address	866
	ip irdp	868
	ip icmp error-interval	869
	ip irdp address preference	870
	ip irdp broadcast	871
	ip irdp holdtime	872
	ip irdp lifetime	873
	ip irdp maxadvertinterval	874
	ip irdp minadvertinterval	876
	ip irdp multicast	878
	ip irdp preference	879
	ip limited-local-proxy-arp	880

ip local-proxy-arp	881
ip proxy-arp	882
ip redirects	883
ip tcp synack-retries	884
ip unreachable	885
local-proxy-arp	887
optimistic-nd	888
ping	889
platform multicast-address-mismatch-action	891
router ip irdp	893
show arp	894
show debugging ip packet	896
show ip flooding-nexthops	897
show ip forwarding	898
show ip interface	899
show ip irdp	900
show ip irdp interface	901
show ip sockets	903
show ip traffic	906
tcpdump	908
traceroute	909
undebug ip packet interface	910
undebug ip irdp	911

Chapter 21: Domain Name Service (DNS) Commands 912

Introduction	912
clear ip dns forwarding cache	914
debug ip dns forwarding	915
ip dns forwarding	916
ip dns forwarding cache	917
ip dns forwarding dead-time	919
ip dns forwarding retry	920
ip dns forwarding source-interface	921
ip dns forwarding timeout	922
ip domain-list	923
ip domain-lookup	924
ip domain-name	926
ip name-server	927
ip name-server preferred-order	929
show debugging ip dns forwarding	930
show hosts	931
show ip dns forwarding	932
show ip dns forwarding cache	933
show ip dns forwarding server	935
show ip domain-list	937
show ip domain-name	938
show ip name-server	939

Chapter 22: IPv6 Commands 940

Introduction	940
clear ipv6 neighbors	942
ipv6 address	943

	ipv6 address autoconfig	945
	ipv6 address suffix	947
	ipv6 enable	948
	ipv6 eui64-linklocal	950
	ipv6 forwarding	951
	ipv6 icmp error-interval	952
	ipv6 multicast forward-slow-path-packet	953
	ipv6 nd accept-ra-default-routes	954
	ipv6 nd accept-ra-pinfo	955
	ipv6 nd current-hoplimit	956
	ipv6 nd managed-config-flag	957
	ipv6 nd minimum-ra-interval	958
	ipv6 nd other-config-flag	959
	ipv6 nd prefix	960
	ipv6 nd ra-interval	962
	ipv6 nd ra-lifetime	963
	ipv6 nd rguard	964
	ipv6 nd reachable-time	966
	ipv6 nd retransmission-time	967
	ipv6 nd suppress-ra	968
	ipv6 neighbor	969
	ipv6 opportunistic-nd	970
	ipv6 route	971
	ipv6 unreachable	972
	optimistic-nd	973
	ping ipv6	974
	show ipv6 forwarding	976
	show ipv6 interface	977
	show ipv6 neighbors	978
	show ipv6 route	979
	show ipv6 route summary	981
	traceroute ipv6	982
Chapter 23:	IPv6 over IPv4 Tunneling Commands	983
	Introduction	983
	interface tunnel (ipv6ip)	984
	show platform mem tunnel	985
	tunnel destination (ipv6ip)	986
	tunnel mode (ipv6ip)	988
	tunnel source (ipv6ip)	989
Chapter 24:	Routing Commands	991
	Introduction	991
	ip route	992
	ipv6 route	995
	max-fib-routes	996
	max-static-routes	998
	maximum-paths	999
	show ip route	1000
	show ip route database	1003
	show ip route summary	1006
	show ipv6 route	1008

	show ipv6 route summary	1010
Chapter 25:	RIP Commands	1011
	Introduction	1011
	accept-lifetime	1013
	alliedware-behavior	1015
	cisco-metric-behavior (RIP)	1017
	clear ip rip route	1018
	debug rip	1020
	default-information originate (RIP)	1021
	default-metric (RIP)	1022
	distance (RIP)	1023

Part 1: Setup and Troubleshooting

1

CLI Navigation Commands

Introduction

Overview This chapter provides an alphabetical reference for the commands used to navigate between different modes. This chapter also provides a reference for the help and show commands used to help navigate within the CLI.

- Command List**
- “[configure terminal](#)” on page 126
 - “[disable \(Privileged Exec mode\)](#)” on page 127
 - “[do](#)” on page 128
 - “[enable \(Privileged Exec mode\)](#)” on page 129
 - “[end](#)” on page 131
 - “[exit](#)” on page 132
 - “[help](#)” on page 133
 - “[logout](#)” on page 134
 - “[show history](#)” on page 135

configure terminal

Overview This command enters the Global Configuration command mode.

Syntax `configure terminal`

Mode Privileged Exec

Example To enter the Global Configuration command mode (note the change in the command prompt), enter the command:

```
awplus# configure terminal  
awplus(config)#
```

disable (Privileged Exec mode)

Overview This command exits the Privileged Exec mode, returning the prompt to the User Exec mode. To end a session, use the [exit](#) command.

Syntax `disable`

Mode Privileged Exec

Example To exit the Privileged Exec mode, enter the command:

```
awplus# disable
awplus>
```

Related commands

- [enable \(Privileged Exec mode\)](#)
- [end](#)
- [exit](#)

do

Overview This command lets you to run User Exec and Privileged Exec mode commands when you are in any configuration mode.

Syntax do <command>

Parameter	Description
<command>	Specify the command and its parameters.

Mode Any configuration mode

Example awplus# configure terminal
awplus(config)# do ping 192.0.2.23

enable (Privileged Exec mode)

Overview This command enters the Privileged Exec mode and optionally changes the privilege level for a session. If a privilege level is not specified then the maximum privilege level (15) is applied to the session. If the optional privilege level is omitted then only users with the maximum privilege level can access Privileged Exec mode without providing the password as specified by the [enable password](#) or [enable secret \(deprecated\)](#) commands. If no password is specified then only users with the maximum privilege level set with the [username](#) command can access Privileged Exec mode.

Syntax `enable [<privilege-level>]`

Parameter	Description
<code><privilege-level></code>	Specify the privilege level for a CLI session in the range <1 - 15>, where 15 is the maximum privilege level, 7 is the intermediate privilege level and 1 is the minimum privilege level. The privilege level for a user must match or exceed the privilege level set for the CLI session for the user to access Privileged Exec mode. Privilege level for a user is configured by username .

Mode User Exec

Usage notes Many commands are available from the Privileged Exec mode that configure operating parameters for the device, so you should apply password protection to the Privileged Exec mode to prevent unauthorized use. Passwords can be encrypted but then cannot be recovered. Note that non-encrypted passwords are shown in plain text in configurations.

The [username](#) command sets the privilege level for the user. After login, users are given access to privilege level 1. Users access higher privilege levels with the [enable \(Privileged Exec mode\)](#) command. If the privilege level specified is higher than the users configured privilege level specified by the [username](#) command, then the user is prompted for the password for that level.

Note that a separate password can be configured for each privilege level using the [enable password](#) and the [enable secret \(deprecated\)](#) commands from the Global Configuration mode. The [service password-encryption](#) command encrypts passwords configured by the [enable password](#) and the [enable secret \(deprecated\)](#) commands, so passwords are not shown in plain text in configurations.

Example The following example shows the use of the **enable** command to enter the Privileged Exec mode (note the change in the command prompt).

```
awplus> enable
awplus#
```

The following example shows the **enable** command enabling access the Privileged Exec mode for users with a privilege level of 7 or greater. Users with a privilege level of 7 or greater do not need to enter a password to access Privileged

Exec mode. Users with a privilege level 6 or less need to enter a password to access Privilege Exec mode. Use the [enable password](#) command or the [enable secret \(deprecated\)](#) commands to set the password to enable access to Privileged Exec mode.

```
awplus> enable 7
```

```
awplus#
```

**Related
commands**

[disable \(Privileged Exec mode\)](#)

[enable password](#)

[enable secret \(deprecated\)](#)

[exit](#)

[service password-encryption](#)

[username](#)

end

Overview This command returns the prompt to the Privileged Exec command mode, from any advanced command mode.

Syntax end

Mode All advanced command modes, including Global Configuration and Interface Configuration modes.

Example The following example shows how to use the **end** command to return to the Privileged Exec mode directly from Interface Configuration mode.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# end
awplus#
```

Related commands

- disable (Privileged Exec mode)
- enable (Privileged Exec mode)
- exit

exit

Overview This command exits the current mode, and returns the prompt to the mode at the previous level. When used in User Exec mode, the **exit** command terminates the session.

Syntax exit

Mode All command modes, including Interface Configuration and Global Configuration modes.

Example The following example shows the use of the **exit** command to exit Interface Configuration mode and return to Global Configuration mode.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# exit
awplus(config)#
```

Related commands [disable \(Privileged Exec mode\)](#)
[enable \(Privileged Exec mode\)](#)
[end](#)

help

Overview This command displays a description of the AlliedWare Plus™ OS help system.

Syntax `help`

Mode All command modes

Example To display a description on how to use the system help, use the command:

```
awplus# help
```

Output Figure 1-1: Example output from the **help** command

```
When you need help at the command line, press '?'.

If nothing matches, the help list will be empty. Delete
characters until entering a '?' shows the available options.

Enter '?' after a complete parameter to show remaining valid
command parameters (e.g. 'show ?').

Enter '?' after part of a parameter to show parameters that
complete the typed letters (e.g. 'show ip?').
```

logout

Overview This command exits the User Exec or Privileged Exec modes and ends the session.

Syntax logout

Mode User Exec and Privileged Exec

Example To exit the User Exec mode, use the command:

```
awplus# logout
```

show history

Overview This command lists the commands entered in the current session. The history buffer is cleared automatically upon reboot.

The output lists all command line entries, including commands that returned an error.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax show history

Mode User Exec and Privileged Exec

Example To display the commands entered during the current session, use the command:

```
awplus# show history
```

Output Figure 1-2: Example output from the **show history** command

```
1 en
2 show ru
3 conf t
4 route-map er deny 3
5 exit
6 ex
7 di
```

2

Device GUI and Vista Manager EX Commands

Introduction

Overview This chapter provides an alphabetical reference of commands used to configure the Device GUI. They also allow your device to be monitored and managed by Vista Manager EX™.

For more information, see [Getting Started with the Device GUI on Switches](#).

- Command List**
- [“atmf topology-gui enable”](#) on page 137
 - [“http log webapi-requests”](#) on page 138
 - [“http port”](#) on page 139
 - [“http secure-port”](#) on page 140
 - [“log event-host”](#) on page 141
 - [“service http”](#) on page 142
 - [“show http”](#) on page 143

atmf topology-gui enable

Overview Use this command to enable the operation of Vista Manager EX on the Master device.

Vista Manager EX delivers state-of-the-art monitoring and management for your Autonomous Management Framework™ (AMF) network, by automatically creating a complete topology map of switches, firewalls and wireless access points (APs). An expanded view includes third-party devices such as security cameras.

Use the **no** variant of this command to disable operation of Vista Manager EX.

Syntax atmf topology-gui enable
no atmf topology-gui enable

Default Disabled by default on AMF Master and member nodes. Enabled by default on Controllers.

Mode Global Configuration mode

Usage notes To use Vista Manager EX, you must also enable the HTTP service on all AMF nodes, including all AMF masters and controllers. The HTTP service is enabled by default on AlliedWare Plus switches and disabled by default on AR-Series firewalls. To enable it, use the commands:

```
Node1# configure terminal
Node1(config)# service http
```

On one master in each AMF area in your network, you also need to configure the master to send event notifications to Vista Manager EX. To do this, use the commands:

```
Node1# configure terminal
Node1(config)# log event-host <ip-address> atmf-topology-event
```

Examples To enable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# atmf topology-gui enable
```

To disable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# no atmf topology-gui enable
```

Related commands [atmf enable](#)
[log event-host](#)
[service http](#)

http log webapi-requests

Overview Use this command to log authenticated web API requests. These logs allow you to monitor and debug Vista Manager EX or Device GUI interactions with your device.

See the [Logging Feature Overview and Configuration Guide](#) for more information about the different types of logging and how to filter log messages.

Use the **no** variant of this command to disable authenticated web API request logging.

Syntax `http log webapi-requests {configuration|all}`
`no http log webapi-requests`

Parameter	Description
configuration	Log PUT, POST, and DELETE requests.
all	Log PUT, POST, DELETE, and GET requests.

Default Web API request logging is disabled.

Mode Global Configuration

Example To enable logging of all authenticated web API requests, use the following commands:

```
awplus# configure terminal
awplus(config)# http log webapi-requests all
```

To disable logging of authenticated web API requests, use the following commands:

```
awplus# configure terminal
awplus(config)# no http log webapi-requests
```

Related commands [http port](#)
[service http](#)
[show log](#)

Command changes Version 5.4.8-1.1: command added

http port

Overview Use this command to change the HTTP port used to access the web-based device GUI, or to disable HTTP management.

Use the **no** variant of this command to return to using the default port, which is 80.

Syntax `http port {<1-65535>|none}`
`no http port`

Parameter	Description
<1-65535>	The HTTP port number
none	Disable HTTP management. You may want to do this if you need to use port 80 for a different service or you do not need to use HTTP at all.

Default The default port for accessing the GUI is port 80.

Mode Global Configuration

Usage notes Do not configure the HTTP port to be the same as the HTTPS port.
Note that the device will redirect from HTTP to HTTPS unless you have disabled HTTPS access, which we do not recommend doing.

Example To set the port to 8080, use the commands:

```
awplus# configure terminal
awplus(config)# http port 8080
```

To return to using the default port of 80, use the commands:

```
awplus# configure terminal
awplus(config)# no http port
```

To stop users from accessing the GUI via HTTP, use the commands:

```
awplus# configure terminal
awplus(config)# http port none
```

Related commands [http secure-port](#)
[service http](#)
[show http](#)

Command changes Version 5.4.7-2.4: command added on AR-Series devices
Version 5.4.8-0.2: command added on AlliedWare Plus switches

http secure-port

Overview Use this command to change the HTTPS port used to access the web-based device GUI, or to disable HTTPS management.

Use the **no** variant of this command to return to using the default port, which is 443.

Syntax http secure-port {<1-65535>|none}
no http secure-port

Parameter	Description
<1-65535>	The HTTPS port number
none	Disable HTTPS management. Do not do this if you want to use Vista Manager EX or the GUI.

Default The default port for accessing the GUI is port 443.

Mode Global Configuration

Usage notes Do not configure the HTTPS port to be the same as the HTTP port.
Note that if you are using Vista Manager EX and need to change the HTTPS port, you must use certificate-based authorization in Vista Manager EX. See the [Vista Manager EX Installation Guide](#) for instructions.

Example To set the port to 8443, use the commands:
awplus# configure terminal
awplus(config)# http secure-port 8443
To return to using the default port of 443, use the commands:
awplus# configure terminal
awplus(config)# no http secure-port
To stop users from accessing the GUI via HTTPS, use the commands:
awplus# configure terminal
awplus(config)# http secure-port none

Related commands [http port](#)
[service http](#)
[show http](#)

Command changes Version 5.4.7-1.1: command added on AR-Series devices
Version 5.4.7-2.4: **none** parameter added
Version 5.4.8-0.2: command added on AlliedWare Plus switches

log event-host

Overview Use this command to set up an external host to log AMF topology events through Vista Manager. This command is run on the Master device.

Use the **no** variant of this command to disable log events through Vista Manager.

Syntax `log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event`
`no log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event`

Parameter	Description
<ipv4-addr>	ipv4 address of the event host
<ipv6-addr>	ipv6 address of the event host

Default Log events are disabled by default.

Mode Global Configuration

Usage notes Event hosts are set so syslog sends the messages out as they come.
Note that there is a difference between log event and log host messages:

- Log event messages are sent out as they come by syslog
- Log host messages are set to wait for a number of messages (20) to send them out together for traffic optimization.

Example To enable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
```

```
Node1(config)# log event-host 192.0.2.31 atmf-topology-event
```

To disable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
```

```
Node1(config)# no log event-host 192.0.2.31 atmf-topology-event
```

Related commands [atmf topology-gui enable](#)

service http

Overview Use this command to enable the HTTP (Hypertext Transfer Protocol) service. This service is required to support Vista Manager EX™ and the Device GUI. Use the **no** variant of this command to disable the HTTP feature.

Syntax service http
no service http

Default Enabled

Mode Global Configuration

Example To enable the HTTP service, use the following commands:

```
awplus# configure terminal  
awplus(config)# service http
```

To disable the HTTP service, use the following commands:

```
awplus# configure terminal  
awplus(config)# no service http
```

Related commands [http port](#)
[http secure-port](#)
[show http](#)

show http

Overview This command shows the HTTP server settings.

Syntax show http

Mode User Exec and Privileged Exec

Example To show the HTTP server settings, use the command:

```
awplus# show http
```

Output Figure 2-1: Example output from the **show http** command

```
awplus#show http
HTTP Server Configuration
-----
HTTP server          : Enabled
Port                 : 80
```

Related commands [clear line vty](#)
[service http](#)

3

File and Configuration Management Commands

Introduction

Overview This chapter provides an alphabetical reference of AlliedWare Plus™ OS file and configuration management commands.

Filename Syntax and Keyword Usage Many of the commands in this chapter use the placeholder 'filename' to represent the name and location of the file that you want to act on. The following table explains the syntax of the filename for each different type of file location.

When you copy a file...	Use this syntax:	Example:
Copying in local flash memory	<code>flash: [/] [<directory> /] <filename></code>	To specify a file in the configs directory in flash: <code>flash:configs/example.cfg</code>
Copying to or from a USB storage device	<code>usb: [/] [<directory> /] <filename></code>	To specify a file in the top-level directory of the USB stick: <code>usb:example.cfg</code>
Copying with HTTP	<code>http://[[<username> :<password>] @ {<hostname> <host-ip> } [/<filepath>] /<filename></code>	To specify a file in the configs directory on the server: <code>http://www.company.com/configs/example.cfg</code>
Copying with TFTP	<code>tftp://[[<location>] /<directory>] /<filename></code>	To specify a file in the top-level directory of the server: <code>tftp://172.1.1.1/example.cfg</code>
Copying with SCP	<code>scp://<username> @<location> [/<directory>] [/<filename>]</code>	To specify a file in the configs directory on the server, logging on as user 'bob': e.g. <code>scp://bob@10.10.0.12/configs/example.cfg</code>

When you copy a file...	Use this syntax:	Example:
Copying with SFTP	<code>sftp://[<location>]/<directory>] /<filename></code>	To specify a file in the top-level directory of the server: <code>sftp://10.0.0.5/example.cfg</code>
Copying to or from stack member flash	<code><hostname>-<stack_ID>/flash:[/][<directory>/ <stack_member_filename></code>	To specify a file in the configs directory on member 2 of a stack named vcstack: <code>vcstack-2/flash:/configs/example.cfg</code>

Valid characters The filename and path can include characters from up to four categories. The categories are:

- 1) uppercase letters: A to Z
- 2) lowercase letters: a to z
- 3) digits: 0 to 9
- 4) special symbols: most printable ASCII characters not included in the previous three categories, including the following characters:

- -
- /
- .
- _
- @
- "
- '
- *
- :
- ~
- ?

Do not use spaces, parentheses or the + symbol within filenames. Use hyphens or underscores instead.

Syntax for directory listings

A leading slash (/) indicates the root of the current file system location.

In commands where you need to specify the local file system's flash base directory, you may use **flash** or **flash:** or **flash:/**. For example, these commands are all the same:

- `dir flash`
- `dir flash:`
- `dir flash:/`

Similarly, you can specify the USB storage device base directory with **usb** or **usb:** or **usb:/**

You cannot name a directory or subdirectory **flash**, **nvs**, **usb**, **card**, **tftp**, **scp**, **sftp** or **http**. These keywords are reserved for tab completion when using various file commands.

In a stacked environment you can only access flash and nvs using the stack member filepath (e.g. **dir awplus-2/flash:/**). To access a USB storage device on a backup stack member, use the [remote-login](#) command.

autoboot enable

Overview This command enables the device to restore a release file and/or a configuration file from a USB storage device.

When the Autoboot feature is enabled, the device looks for a special file called `autoboot.txt` on the external media. If this file exists, the device will check the key and values in the file and recover the device with a new release file and/or configuration file from the external media. An example of a valid `autoboot.txt` file is shown in the following figure.

Figure 3-1: Example `autoboot.txt` file

```
[AlliedWare Plus]
Copy_from_external_media_enabled=yes
Boot_Release=x530-5.5.0-2.1.rel
Boot_Config=network1.cfg
```

Use the **no** variant of this command to disable the Autoboot feature.

NOTE: *This command is not supported in a stacked configuration.*

Syntax `autoboot enable`
`no autoboot enable`

Default The Autoboot feature operates the first time the device is powered up in the field, after which the feature is disabled by default.

Mode Global Configuration

Example To enable the Autoboot feature, use the command:

```
awplus# configure terminal
awplus(config)# autoboot enable
```

Related commands [create autoboot](#)
[show autoboot](#)
[show boot](#)

boot config-file

Overview Use this command to set the configuration file to use during the next boot cycle.
Use the **no** variant of this command to remove the configuration file.

Syntax boot config-file <filepath-filename>
no boot config-file

Parameter	Description
<filepath-filename>	Filepath and name of a configuration file. The specified configuration file must exist in the specified filesystem. Valid configuration files must have a .cfg extension.

Mode Global Configuration

Usage notes You can only specify that the configuration file is on a USB storage device if there is a backup configuration file already specified in flash. If you attempt to set the configuration file on a USB storage device and a backup configuration file is not specified in flash, the following error message is displayed:

```
% Backup configuration files must be stored in the flash  
filesystem
```

For an explanation of the configuration fallback order, see the [File Management Feature Overview and Configuration Guide](#).

Examples To run the configuration file "branch.cfg" the next time the device boots up, when "branch.cfg" is stored on the device's flash filesystem, use the commands:

```
awplus# configure terminal  
awplus(config)# boot config-file flash:/branch.cfg
```

To stop running the configuration file "branch.cfg" when the device boots up, when "branch.cfg" is stored on the device's flash filesystem, use the commands:

```
awplus# configure terminal  
awplus(config)# no boot config-file flash:/branch.cfg
```

To run the configuration file "branch.cfg" the next time the device boots up, when "branch.cfg" is stored on a USB storage device, use the commands:

```
awplus# configure terminal  
awplus(config)# boot config-file usb:/branch.cfg
```

To stop running the configuration file “branch.cfg” when the device boots up, when “branch.cfg” is stored on a USB storage device, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no boot config-file usb:/branch.cfg
```

**Related
commands**

[boot config-file backup](#)

[boot system](#)

[boot system backup](#)

[show boot](#)

boot config-file backup

Overview Use this command to set a backup configuration file to use if the main configuration file cannot be accessed.

Use the **no** variant of this command to remove the backup configuration file.

Syntax boot config-file backup <filepath-filename>
no boot config-file backup

Parameter	Description
<filepath-filename>	Filepath and name of a backup configuration file. Backup configuration files must be in the flash filesystem. Valid backup configuration files must have a .cfg extension.
backup	The specified file is a backup configuration file.

Mode Global Configuration

Usage notes For an explanation of the configuration fallback order, see the [File Management Feature Overview and Configuration Guide](#).

Examples To set the configuration file backup.cfg as the backup to the main configuration file, use the commands:

```
awplus# configure terminal
awplus(config)# boot config-file backup flash:/backup.cfg
```

To remove the configuration file backup.cfg as the backup to the main configuration file, use the commands:

```
awplus# configure terminal
awplus(config)# no boot config-file backup flash:/backup.cfg
```

Related commands [boot config-file](#)
[boot system](#)
[boot system backup](#)
[show boot](#)

boot system

Overview Use this command to set the release file to load during the next boot cycle.

Use the **no** variant of this command to stop specifying a primary release file to boot from. If the device boots up with no release file set, it will use autoboot or the backup release file if either of those are configured, or you can use the boot menu to select a release file source. To access the boot menu, type Ctrl-B at bootup.

Syntax boot system <filepath-filename>
no boot system

Parameter	Description
<filepath-filename>	Filepath and name of a release file. The specified release file must exist and must be stored in the root directory of the specified filesystem. Valid release files must have a .rel extension.

Mode Global Configuration

Usage notes You can only specify that the release file is on a USB storage device if there is a backup release file already specified in flash. If you attempt to set the release file on a USB storage device and a backup release file is not specified in flash, the following error message is displayed:

```
% A backup boot image must be set before setting a current boot image on USB storage device
```

In a VCStack configuration, the stack only accepts a release file on a USB storage device if a USB storage device is inserted in all stack members and all stack members have a bootloader version that supports booting from it. If a stack member has a USB storage device removed an error message is displayed. For example, if stack member 2 does not have a USB storage device inserted the following message is displayed:

```
% Stack member 2 has no USB storage device inserted
```

Examples To boot up with the release file x530-5.5.0-2.1.rel the next time the device boots up, when the release file is stored on the device's flash filesystem, use the commands:

```
awplus# configure terminal
awplus(config)# boot system flash:/x530-5.5.0-2.1.rel
```

To run the release file x530-5.5.0-2.1.rel the next time the device boots up, when the release file is stored on a USB storage device, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# boot system usb:/x530-5.5.0-2.1.rel
```

In a VCStack configuration, if there is not enough space to synchronize the new release across the stack, the boot system command has an interactive mode that prompts you to delete old releases.

```
awplus# configure terminal
```

```
awplus(config)# boot system x530-5.5.0-2.1.rel
```

```
Insufficient flash available on stack member-2 (11370496)
to synchronize file x530-5.5.0-2.1.rel (14821895).
```

```
List of release files on stack member-2
      x530-5.5.0-1.1.rel (14822400)
```

```
Select files to free up space,
Delete awplus-2/flash:/x530-5.5.0-1.1.rel? (y/n)[n]:y
```

Answering “y” at the prompt will cause the system to delete the specified file:

```
awplus(config)# y
```

```
Deleting selected files, please wait.....
Successful operation
VCS synchronizing file across the stack, please wait.....
File synchronization with stack member-2 successfully completed
[DONE]
```

**Related
commands**

[boot config-file](#)

[boot config-file backup](#)

[boot system backup](#)

[show boot](#)

boot system backup

Overview Use this command to set a backup release file to load if the main release file cannot be loaded.

Use the **no** variant of this command to stop specifying a backup release file.

Syntax boot system backup *<filepath-filename>*
no boot system backup

Parameter	Description
<i><filepath-filename></i>	Filepath and name of a backup release file. Backup release files must be in the Flash filesystem. Valid release files must have a .rel extension.
backup	The specified file is a backup release file.

Mode Global Configuration

Examples To specify the file x530-5.5.0-1.1.rel as the backup to the main release file, use the commands:

```
awplus# configure terminal
awplus(config)# boot system backup flash:/x530-5.5.0-1.1.rel
```

To stop specifying a backup to the main release file, use the commands:

```
awplus# configure terminal
awplus(config)# no boot system backup
```

Related commands [boot config-file](#)
[boot config-file backup](#)
[boot system](#)
[show boot](#)

cd

Overview This command changes the current working directory.

Syntax `cd <directory-name>`

Parameter	Description
<code><directory-name></code>	Name and path of the directory.

Mode Privileged Exec

Example To change to the directory called `images`, use the command:

```
awplus# cd images
```

Related commands

- `dir`
- `pwd`
- `show file systems`

copy (filename)

- Overview** This command copies a file. This allows you to:
- copy files from your device to a remote device
 - copy files from a remote device to your device
 - copy files stored on Flash memory to or from a different memory type, such as a USB storage device
 - create two copies of the same file on your device

Syntax copy [force] <source-name> <destination-name>

Parameter	Description
force	This parameter forces the copy command to overwrite the destination file, if it already exists, without prompting the user for confirmation.
<source-name>	The filename and path of the source file. See Introduction on page 144 for valid syntax.
<destination-name>	The filename and path for the destination file. See Introduction on page 144 for valid syntax.

Mode Privileged Exec

Examples To use TFTP to copy the file "bob.key" into the current directory from the remote server at 10.0.0.1, use the command:

```
awplus# copy tftp://10.0.0.1/bob.key bob.key
```

To use SFTP to copy the file "new.cfg" into the current directory from a remote server at 10.0.1.2, use the command:

```
awplus# copy sftp://10.0.1.2/new.cfg bob.key
```

To use SCP with the username "beth" to copy the file old.cfg into the directory config_files on a remote server that is listening on TCP port 2000, use the command:

```
awplus# copy scp://beth@serv:2000/config_files/old.cfg old.cfg
```

To copy the file "newconfig.cfg" onto your device's Flash from a USB storage device, use the command:

```
awplus# copy usb:/newconfig.cfg flash:/newconfig.cfg
```

To copy the file "newconfig.cfg" to a USB storage device from your device's Flash, use the command:

```
awplus# copy flash:/newconfig.cfg usb:/newconfig.cfg
```

To copy the file "config.cfg" into the current directory from a USB storage device, and rename it to "configtest.cfg", use the command:

```
awplus# copy usb:/config.cfg configtest.cfg
```

To copy the file "config.cfg" into the current directory from a remote file server, and rename it to "configtest.cfg", use the command:

```
awplus# copy fserver:/config.cfg configtest.cfg
```

To copy the file "test.txt" from the top level of Flash on stack member 2 to the current directory in the stack master, use the command:

```
awplus# copy awplus-2/flash:/test.txt test.txt
```

Note that you must specify either the NVS or Flash filesystem on the (backup) stack member (**flash:** in this example).

On an AMF network, to copy the device GUI file from the AMF master to the Flash memory of 'node_1', use the command:

```
master# copy awplus-gui_549_13.gui node_1.atmf/flash:
```

**Related
commands**

[copy zmodem](#)

[copy buffered-log](#)

copy debug

Overview This command copies a specified debug file to a destination file.

Syntax `copy debug {<destination-name>|debug|flash|nvs|scp|tftp|usb}
{<source-name>|debug|flash|nvs|scp|tftp|usb}`

Parameter	Description
<code><destination-name></code>	The filename and path where you would like the debug output saved. See Introduction on page 144 for valid syntax.
<code><source-name></code>	The filename and path where the debug output originates. See the Introduction to this chapter for valid syntax.

Mode Privileged Exec

Example To copy debug output to a file on flash called “my-debug”, use the following command:

```
awplus# copy debug flash:my-debug
```

To copy debug output to a USB storage device with a filename “my-debug”, use the following command:

```
awplus# copy debug usb:my-debug
```

Output Figure 3-2: CLI prompt after entering the **copy debug** command

```
Enter source file name []:
```

Related commands [delete debug](#)
[move debug](#)

copy running-config

Overview This command copies the running-config to a destination file, or copies a source file into the running-config. Commands entered in the running-config do not survive a device reboot unless they are saved in a configuration file.

Syntax `copy <source-name> running-config`
`copy running-config [<destination-name>]`
`copy running-config startup-config`

Parameter	Description
<code><source-name></code>	The filename and path of a configuration file. This must be a valid configuration file with a .cfg filename extension. Specify this when you want the script in the file to become the new running-config. See Introduction on page 144 for valid syntax.
<code><destination-name></code>	The filename and path where you would like the current running-config saved. This command creates a file if no file exists with the specified filename. If a file already exists, then the CLI prompts you before overwriting the file. See Introduction on page 144 for valid syntax. If you do not specify a file name, the device saves the running-config to a file called default.cfg.
<code>startup-config</code>	Copies the running-config into the file set as the current startup-config file.

Mode Privileged Exec

Examples To copy the running-config into the startup-config, use the command:

```
awplus# copy running-config startup-config
```

To copy the file 'layer3.cfg' into the running-config, use the command:

```
awplus# copy layer3.cfg running-config
```

To use SCP to copy the running-config as 'current.cfg' to the remote server listening on TCP port 2000, use the command:

```
awplus# copy running-config  
scp://user@server:2000/config_files/current.cfg
```

Related commands [copy startup-config](#)
[write file](#)
[write memory](#)

copy startup-config

Overview This command copies the startup-config script into a destination file, or alternatively copies a configuration script from a source file into the startup-config file. Specify whether the destination is Flash or USB when loading from the local filesystem.

Syntax `copy <source-name> startup-config`
`copy startup-config <destination-name>`

Parameter	Description
<code><source-name></code>	The filename and path of a configuration file. This must be a valid configuration file with a .cfg filename extension. Specify this to copy the script in the file into the startup-config file. Note that this does not make the copied file the new startup file, so any further changes made in the configuration file are not added to the startup-config file unless you reuse this command. See Introduction on page 144 for valid syntax.
<code><destination-name></code>	The destination and filename that you are saving the startup-config as. This command creates a file if no file exists with the specified filename. If a file already exists, then the CLI prompts you before overwriting the file. See Introduction on page 144 for valid syntax.

Mode Privileged Exec

Examples To copy the file 'Layer3.cfg' to the startup-config, use the command:

```
awplus# copy Layer3.cfg startup-config
```

To copy the startup-config as the file 'oldconfig.cfg' in the current directory, use the command:

```
awplus# copy startup-config oldconfig.cfg
```

Related commands [copy running-config](#)

copy zmodem

Overview This command allows you to copy files using ZMODEM using Minicom. ZMODEM works over a serial connection and does not need any interfaces configured to do a file transfer.

Syntax `copy <source-name> zmodem`
`copy zmodem`

Parameter	Description
<code><source-name></code>	The filename and path of the source file. See Introduction on page 144 for valid syntax.

Mode Privileged Exec

Example To copy the local file 'asuka.key' using ZMODEM, use the command:
`awplus# copy asuka.key zmodem`

Related commands [copy \(filename\)](#)
[show file systems](#)

create autoboot

Overview Use this command to create an autoboot.txt file on an external storage device. This command will automatically ensure that the keys and values that are expected in this file are correct. After the file is created the **create autoboot** command will copy the current release and configuration files across to the external storage device. The external storage device is then available to restore a release file and/or a configuration file to the device.

Syntax create autoboot usb

Mode Privileged Exec

Example To create an autoboot.txt file on a USB storage device, use the command:

```
awplus# create autoboot usb
```

Related commands [autoboot enable](#)
[show autoboot](#)
[show boot](#)

crypto verify

Overview Use this command to compare the SHA256 checksum of the release file or bootloader with the correct checksum for the file. This ensures that the release file or bootloader has not been corrupted or interfered with during download.

Use the **no** variant of this command to remove a verified filename/hash combination from the running configuration.

Syntax `crypto verify <filename> <hash-value>`
`crypto verify signed <filename> <hash-value>`
`crypto verify bootrom <hash-value>`
`no crypto verify <filename>`

Parameter	Description
<filename>	The AlliedWare Plus release file that you want to verify
<hash-value>	The known correct checksum of the file. The correct checksum is listed in the release sha256sum file, which is available from the Allied Telesis Download Center.
signed	The hash used is from a <release>.sig file and calculated as a keyed HMAC-SHA. Only use this parameter in accordance with the Allied Telesis FIPS Security Policy.
bootrom	This tells the device that the signature provided is for the bootrom. It stores that hash permanently, preventing boot if the bootloader is modified.

Default No default

Mode Global Configuration

Usage notes If the verification fails, the following error message will be generated:

% Verification Failed

If the verification fails, please delete the release file and contact Allied Telesis support.

All models of a particular series run the same release file and therefore have the same checksum. For example, all x930 Series switches have the same checksum.

Once the device has successfully verified the release file, it adds the **crypto verify** command to the running configuration.

If the device is in secure mode, it will verify the release file every time it boots up. To do this, it runs the **crypto verify** command while booting. Therefore, you need to copy the **crypto verify** command to the startup configuration, by using the command **copy running-config startup-config**. If the **crypto verify** command is not in the startup configuration, the device will report a verification error at bootup.

If there is a verification error at bootup, the device produces an error message and finishes booting up. If this happens, run the **crypto verify** command after bootup finishes, to verify the running release file. If verification of the running release file fails, delete the release file and contact Allied Telesis support.

Caution:

When using signature verification, if:

- the release verified is the boot release
- and the device is running in secure mode
- and signed verification succeeds

then the signed hash is also stored into the device and enforced on all subsequent boots.

This means that if you change the software version, the switch will not boot up. You can only change the software version if you reset the switch to the factory defaults **before** changing the software version, by using the command [erase factory-default](#).

Example To verify the release file for 5.4.8-1.2 on an x930 Series switch, use the commands:

```
awplus# configure terminal
awplus(config)# crypto verify x930-5.4.8-1.2.rel
50fae963b460ba02eb0bd609289c0491de404ba5b0d7e5fa79e64f56082ecf
ee
```

Related commands [crypto secure-mode](#)
[show secure-mode](#)

delete

Overview This command deletes files or directories.

Syntax delete [force] [recursive] <filename>

Parameter	Description
force	Ignore nonexistent filenames and never prompt before deletion.
recursive	Remove the contents of directories recursively.
<filename>	The filename and path of the file to delete. See Introduction on page 144 for valid syntax.

Mode Privileged Exec

Examples To delete the file temp.cfg from the current directory, use the command:

```
awplus# delete temp.cfg
```

To delete the read-only file one.cfg from the current directory, use the command:

```
awplus# delete force one.cfg
```

To delete the directory old_configs, which is not empty, use the command:

```
awplus# delete recursive old_configs
```

To delete the directory new_configs, which is not empty, without prompting if any read-only files are being deleted, use the command:

```
awplus# delete force recursive new_configs
```

Related commands [erase startup-config](#)
[rmdir](#)

delete debug

Overview Use this command to delete a specified debug output file.

Syntax delete debug <source-name>

Parameter	Description
<source-name>	The filename and path where the debug output originates. See Introduction on page 144 for valid URL syntax.

Mode Privileged Exec

Example To delete debug output, use the following command:

```
awplus# delete debug
```

Output Figure 3-3: CLI prompt after entering the **delete debug** command

```
Enter source file name []:
```

Related commands [copy debug](#)
[move debug](#)

delete stack-wide force

Overview Use this command to delete files from all members of a stack.

Syntax delete stack-wide force [recursive] <name>

Parameter	Description
recursive	Delete directories that match the name, including their contents.
<name>	The name of the files or directories to delete. The filename can include the wildcard *. Use the wildcard with caution, because this command does not ask for confirmation before deleting files.

Mode Privileged Exec.

Usage notes This is a non-interactive command, so if the specified file or files exist, they are deleted without question or warning. This is indicated by the mandatory **force** parameter.

You can use this command within an AMF working set.

Examples To delete a file "test.scp" that is located in flash memory on all stack members, use the following command:

```
awplus# delete stack-wide force test.scp
```

To remove directories "output1" and "output2" from an external USB memory device on all stack members, use the following command:

```
awplus# delete stack-wide force recursive usb:output*
```

Related commands [cd](#)
[dir stack-wide](#)

Command changes Version 5.4.7-0.1: command added.

dir

Overview This command lists the files on a filesystem. If you don't specify a directory or file, then this command lists the files in the current directory.

Syntax `dir [all] [recursive] [sort [reverse] [name|size|time]]
[<filename>|debug|flash|nvs|usb]`

Parameter	Description
all	List all files.
recursive	List the contents of directories recursively.
sort	Sort directory listing.
reverse	Sort using reverse order.
name	Sort by name.
size	Sort by size.
time	Sort by modification time (default).
<filename>	The name of the directory or file. If you don't specify a directory or file, then this command lists the files in the current directory.
debug	Debug root directory
flash	Flash memory root directory
nvs	NVS memory root directory
usb	USB storage device root directory

Mode Privileged Exec

Usage notes In a stacked environment you can use the CLI on a stack master to access filesystems that are located on another stack member. The syntax is:

```
<hostname>-<stack_ID>/flash:[/][<directory>/  
<stack_member_filename>
```

For example, to specify a file in the "configs" directory on member 2 of a stack, enter:

```
awplus-2/flash:/configs/example.cfg
```

Alternatively, you can use the command **dir stack-wide** to display files on all stack members.

Examples To list the files in the current working directory, use the command:

```
awplus# dir
```

To list the non-hidden files in the root of the Flash filesystem, use the command:

```
awplus# dir flash
```

To list all the files in the root of the Flash filesystem, use the command:

```
awplus# dir all flash:
```

To list recursively the files in the Flash filesystem, use the command:

```
awplus# dir recursive flash:
```

To list the files in alphabetical order, use the command:

```
awplus# dir sort name
```

To list the files by size, smallest to largest, use the command:

```
awplus# dir sort reverse size
```

To sort the files by modification time, oldest to newest, use the command:

```
awplus# dir sort reverse time
```

To list the files within the Flash filesystem for stack member 2, use the command:

```
awplus# dir awplus-2/flash:/
```

Note that you must specify the filesystem on the stack member (**flash** in this example).

Output Figure 3-4: Example output from the **dir** command

```
awplus#dir
  630 -rw- May 19 2016 23:36:31 example.cfg
23652123 -rw- May 17 2016 03:41:18
  149 -rw- Feb  9 2016 00:40:35 exception.log
```

**Related
commands** [cd](#)
[pwd](#)

dir stack-wide

Overview This command lists the files on all stack members at once. If you don't specify a directory or file, then this command lists the files in the current directory.

Syntax `dir stack-wide [all] [recursive] [sort [reverse]
[name|size|time]] [<filename>|debug|flash|nvs|usb]`

Parameter	Description
all	List all files.
recursive	List the contents of directories recursively.
sort	Sort directory listing.
reverse	Sort using reverse order.
name	Sort by name.
size	Sort by size.
time	Sort by modification time (default).
<filename>	The name of the directory or file. If you don't specify a directory or file, then this command lists the files in the current directory.
debug	Debug root directory
flash	Flash memory root directory
nvs	NVS memory root directory
usb	USB storage device root directory

Mode Privileged Exec

Usage notes The **dir stack-wide** command behaves the same as the **dir** command, except for running on all stack members.

Examples To list the files in the current directory across all stack members, use the command:

```
awplus# dir stack-wide
```

To list files in the root flash directory across all stack members, use the command:

```
awplus# dir stack-wide flash
```

To list all files recursively in the root flash directory across all stack members, use the command:

```
awplus# dir stack-wide all recursive flash
```

To list the files in alphabetical order, use the command:

```
awplus# dir stack-wide sort name
```

To list the files by size, smallest to largest, use the command:

```
awplus# dir stack-wide sort reverse size
```

To sort the files by modification time, oldest to newest, use the command:

```
awplus# dir stack-wide sort reverse time
```

Output Figure 3-5: Example output from using the **dir stack-wide** command to list files that start with atmf

```
awplus#dir stack-wide atmf*

Stack member 1:
263 rw Nov 15 2017 15:22:52 flash:/atmfStableNodes.sh
3117 rw Nov 14 2017 13:26:31 flash:/atmf-find.sh
2346 rw Nov 14 2017 13:26:19 flash:/atmf-rec.sh

Stack member 2:
263 rw Nov 15 2017 15:22:52 flash:/atmfStableNodes.sh
3117 rw Nov 14 2017 13:26:31 flash:/atmf-find.sh
2346 rw Nov 14 2017 13:26:19 flash:/atmf-rec.sh
```

Related commands [cd](#)
[delete stack-wide force](#)

Command changes Version 5.4.8-0.2: command added.

edit

Overview This command opens a text file in the AlliedWare Plus™ text editor. Once opened you can use the editor to alter to the file.

If a filename is specified and it already exists, then the editor opens it in the text editor.

If no filename is specified, the editor prompts you for one when you exit it.

Before starting the editor make sure your terminal, terminal emulation program, or Telnet client is 100% compatible with a VT100 terminal. The editor uses VT100 control sequences to display text on the terminal.

For more information about using the editor, including control sequences, see the [File Management Feature Overview and Configuration Guide](#).

Syntax edit [<filename>]

Parameter	Description
<filename>	Name of a file in the local Flash filesystem.

Mode Privileged Exec

Examples To create and edit a new text file, use the command:

```
awplus# edit
```

To edit the existing configuration file myconfig.cfg stored on your device's Flash memory, use the command:

```
awplus# edit myconfig.cfg
```

Related commands [edit \(filename\)](#)
[show file](#)

edit (filename)

Overview This command opens a remote text file as read-only in the AlliedWare Plus™ text editor.

Before starting the editor make sure your terminal, terminal emulation program, or Telnet client is 100% compatible with a VT100 terminal. The editor uses VT100 control sequences to display text on the terminal.

Syntax edit <filename>

Parameter	Description
<filename>	The filename and path of the remote file. See Introduction on page 144 for valid syntax.

Mode Privileged Exec

Example To view the file bob . key stored in the security directory of a TFTP server, use the command:

```
awplus# edit tftp://security/bob.key
```

Related commands [copy \(filename\)](#)
[edit](#)
[show file](#)

erase factory-default

Overview This command erases all data from NVS and all data from flash **except** the following:

- the boot release file (a .rel file) and its release setting file
- all license files
- the latest GUI release file

The device is then rebooted and returned to its factory default condition. The device can then be used for AMF automatic node recovery.

Syntax erase factory-default

Mode Privileged Exec

Usage notes This command is an alias to the [atmf cleanup](#) command.
Note that this command can only be used on standalone switches, not stacked switches.

Example To erase data, use the command:

```
Node_1# erase factory-default
```

This command will erase all NVS, all flash contents except for the boot release, a GUI resource file, and any license files, and then reboot the switch. Continue? (y/n):y

Related commands [atmf cleanup](#)

erase startup-config

Overview This command deletes the file that is set as the startup-config file, which is the configuration file that the system runs when it boots up.

At the next restart, the device loads the default configuration file, default.cfg. If default.cfg no longer exists, then the device loads with the factory default configuration. This provides a mechanism for you to return the device to the factory default settings.

Syntax erase startup-config

Mode Privileged Exec

Example To delete the file currently set as the startup-config, use the command:

```
awplus# erase startup-config
```

Related commands

- [boot config-file backup](#)
- [copy running-config](#)
- [copy startup-config](#)
- [show boot](#)

ip tftp source-interface

Overview Use this command to manually specify the IP address that all TFTP requests originate from. This is useful in network configurations where TFTP servers only accept requests from certain devices, or where the server cannot dynamically determine the source of the request.

Use the **no** variant of this command to stop specifying a source.

Syntax `ip tftp source-interface [<interface>|<ip-add>]`
`no ip tftp source-interface`

Parameter	Description
<interface>	The VLAN that TFTP requests originate from. The device will use the IP address of this interface as its source IP address.
<ip-add>	The IP address that TFTP requests originate from, in dotted decimal format

Default There is no default source specified.

Mode Global Configuration

Usage This command is helpful in network configurations where TFTP traffic needs to traverse point-to-point links or subnets within your network, and you do not want to propagate those point-to-point links through your routing tables.

In those circumstances, the TFTP server cannot dynamically determine the source of the TFTP request, and therefore cannot send the requested data to the correct device. Specifying a source interface or address enables the TFTP server to send the data correctly.

Example To specify that TFTP requests originate from the IP address 192.0.2.1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip tftp source-interface 192.0.2.1
```

Related commands [copy \(filename\)](#)

ipv6 tftp source-interface

Overview Use this command to manually specify the IPv6 address that all TFTP requests originate from. This is useful in network configurations where TFTP servers only accept requests from certain devices, or where the server cannot dynamically determine the source of the request.

Use the **no** variant of this command to stop specifying a source.

Syntax `ipv6 tftp source-interface [<interface>|<ipv6-add>]`
`no ipv6 tftp source-interface`

Parameter	Description
<interface>	The VLAN that TFTP requests originate from. The device will use the IPv6 address of this interface as its source IPv6 address.
<ipv6-add>	The IPv6 address that TFTP requests originate from, in the format x:x::x:x, for example, 2001:db8::8a2e:7334.

Default There is no default source specified.

Mode Global Configuration

Usage This command is helpful in network configurations where TFTP traffic needs to traverse point-to-point links or subnets within your network, and you do not want to propagate those point-to-point links through your routing tables.

In those circumstances, the TFTP server cannot dynamically determine the source of the TFTP request, and therefore cannot send the requested data to the correct device. Specifying a source interface or address enables the TFTP server to send the data correctly.

Example To specify that TFTP requests originate from the IPv6 address 2001:db8::8a2e:7334, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# ipv6 tftp source-interface 2001:db8::8a2e:7334
```

Related commands [copy \(filename\)](#)

mkdir

Overview This command makes a new directory.

Syntax `mkdir <name>`

Parameter	Description
<code><name></code>	The name and path of the directory that you are creating.

Mode Privileged Exec

Usage You cannot name a directory or subdirectory **flash**, **nvs**, **usb**, **card**, **tftp**, **scp**, **sftp** or **http**. These keywords are reserved for tab completion when using various file commands.

Example To make a new directory called `images` in the current directory, use the command:

```
awplus# mkdir images
```

Related commands `cd`
`dir`
`pwd`

move

Overview This command renames or moves a file.

Syntax `move <source-name> <destination-name>`

Parameter	Description
<code><source-name></code>	The filename and path of the source file. See Introduction on page 144 for valid syntax.
<code><destination-name></code>	The filename and path of the destination file. See Introduction on page 144 for valid syntax.

Mode Privileged Exec

Examples To rename the file `temp.cfg` to `startup.cfg`, use the command:

```
awplus# move temp.cfg startup.cfg
```

To move the file `temp.cfg` from the root of the Flash filesystem to the directory `myconfigs`, use the command:

```
awplus# move temp.cfg myconfigs/temp.cfg
```

Related commands

- [delete](#)
- [edit](#)
- [show file](#)
- [show file systems](#)

move debug

Overview This command moves a specified debug file to a destination debug file.

Syntax `move debug {<destination-name>|debug|nvs|flash|usb}`

Parameter	Description
<code><destination-name></code>	The filename and path where you would like the debug output moved to. See Introduction on page 144 for valid syntax.

Mode Privileged Exec

Example To move debug output into Flash memory with a filename “my-debug”, use the following command:

To move debug output onto a USB storage device with a filename “my-debug”, use the following command:

```
awplus# move debug usb:my-debug
```

Output Figure 3-6: CLI prompt after entering the **move debug** command

```
Enter source file name []:
```

Related commands [copy debug](#)
[delete debug](#)

pwd

Overview This command prints the current working directory.

Syntax pwd

Mode Privileged Exec

Example To print the current working directory, use the command:

```
awplus# pwd
```

**Related
commands** [cd](#)

rmkdir

Overview This command removes a directory. This command only works on empty directories, unless you specify the optional **force** keyword.

Syntax `rmkdir [force] <name>`

Parameter	Description
force	Optional keyword that allows you to delete directories that are not empty and contain files or subdirectories.
<name>	The name and path of the directory.

Mode Privileged Exec

Usage notes In a stacked environment you can use the CLI on a stack master to access filesystems that are located on another stack member. See the [Introduction](#) on page 144 for syntax details.

Examples To remove the directory “images” from the top level of the Flash filesystem, use the command:

```
awplus# rmkdir flash:/images
```

To create a directory called “level1” containing a subdirectory called “level2”, and then force the removal of both directories, use the commands:

```
awplus# mkdir level1
awplus# mkdir level1/level2
awplus# rmkdir force level1
```

To remove a directory called “test” from the top level of the Flash filesystem on stack member 3, use the command:

```
awplus# rmkdir awplus-3/flash:/test
```

Note that you must specify the filesystem (**flash:** in this example).

Related commands

- [cd](#)
- [dir](#)
- [mkdir](#)
- [pwd](#)

show autoboot

Overview This command displays the Autoboot configuration and status.

Syntax show autoboot

Mode Privileged Exec

Example To show the Autoboot configuration and status, use the command:

```
awplus# show autoboot
```

Output Figure 3-7: Example output from the **show autoboot** command

```
awplus#show autoboot
Autoboot configuration
-----
Autoboot status           : enabled
USB file autoboot.txt exists : yes

Restore information on USB
Autoboot enable in autoboot.txt : yes
Restore release file       : x530-5.5.0-2.1.rel (file exists)
Restore configuration file  : network_1.cfg (file exists)
```

Figure 3-8: Example output from the **show autoboot** command when an external media source is not present

```
awplus#show autoboot
Autoboot configuration
-----
Autoboot status           : enabled
External media source      : USB not found.
```

Related commands

show boot

- Overview** This command displays the current boot configuration.
- We recommend that the currently running release is set as the current boot image.
- Syntax** show boot
- Mode** Privileged Exec
- Example** To show the current boot configuration, use the command:
- ```
awplus# show boot
```
- Output** Figure 3-9: Example output from **show boot**

```
awplus#show boot
Boot configuration

Current software : x530-5.5.0-2.1.rel
Current boot image : flash:/x530-5.5.0-2.1.rel
Backup boot image : flash:/x530-5.5.0-1.1.rel
Default boot config: flash:/default.cfg
Current boot config: flash:/my.cfg (file exists)
Backup boot config: flash:/backup.cfg (file not found)
Autoboot status : enabled
```

Table 3-1: Parameters in the output from **show boot**

| Parameter           | Description                                                                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Current software    | The current software release that the device is using.                                                                                                           |
| Current boot image  | The boot image currently configured for use during the next boot cycle.                                                                                          |
| Backup boot image   | The boot image to use during the next boot cycle if the device cannot load the main image.                                                                       |
| Default boot config | The default startup configuration file. The device loads this configuration script if no file is set as the startup-config file.                                 |
| Current boot config | The configuration file currently configured as the startup-config file. The device loads this configuration file during the next boot cycle if this file exists. |
| Backup boot config  | The configuration file to use during the next boot cycle if the main configuration file cannot be loaded.                                                        |
| Autoboot status     | The status of the Autoboot feature; either enabled or disabled.                                                                                                  |

**Related  
commands**

- autoboot enable
- boot config-file backup
- boot system backup
- show autoboot

# show file

**Overview** This command displays the contents of a specified file.

**Syntax** show file <filename>

| Parameter  | Description                                                                         |
|------------|-------------------------------------------------------------------------------------|
| <filename> | Name of a file on the local Flash filesystem, or name and directory path of a file. |

**Mode** Privileged Exec

**Example** To display the contents of the file oldconfig.cfg, which is in the current directory, use the command:

```
awplus# show file oldconfig.cfg
```

**Related commands**

- edit
- edit (filename)
- show file systems

# show file systems

**Overview** This command lists the file systems and their utilization information where appropriate.

**Syntax** show file systems

**Mode** Privileged Exec

**Examples** To display the file systems, use the command:

```
awplus# show file systems
```

**Output** Figure 3-10: Example output from the **show file systems** command

```
awplus#show file systems
```

| Size(b) | Free(b) | Type     | Flags | Prefixes | S/D/V   | Lcl/Ntwk | Avail |
|---------|---------|----------|-------|----------|---------|----------|-------|
| 208.2M  | 203.6M  | flash    | rw    | flash:   | static  | local    | Y     |
| -       | -       | system   | rw    | system:  | virtual | local    | -     |
| 10.0M   | 9.8M    | debug    | rw    | debug:   | static  | local    | Y     |
| 443.0K  | 403.0K  | nvs      | rw    | nvs:     | static  | local    | Y     |
| -       | -       | usbstick | rw    | usb:     | dynamic | local    | N     |
| -       | -       | fserver  | rw    | fserver: | dynamic | network  | N     |
| -       | -       | tftp     | rw    | tftp:    | -       | network  | -     |
| -       | -       | scp      | rw    | scp:     | -       | network  | -     |
| -       | -       | sftp     | ro    | sftp:    | -       | network  | -     |
| -       | -       | http     | ro    | http:    | -       | network  | -     |
| -       | -       | rsync    | rw    | rsync:   | -       | network  | -     |

**Table 4:** Parameters in the output of the **show file systems** command

| Parameter | Description                                                                                                                     |
|-----------|---------------------------------------------------------------------------------------------------------------------------------|
| Size (b)  | The total memory available to this file system. The units are given after the value and are M for Megabytes or k for kilobytes. |
| Free (b)  | The total memory free within this file system. The units are given after the value and are M for Megabytes or K for kilobytes.  |
| Type      | The memory type used for this file system, such as:<br>flash<br>system<br>nvs<br>usbstick<br>tftp<br>scp<br>sftp<br>http.       |
| Flags     | The file setting options: rw (read write), ro (read only).                                                                      |

**Table 4:** Parameters in the output of the **show file systems** command (cont.)

| Parameter  | Description                                                                                                                                    |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Prefixes   | The prefixes used when entering commands to access the file systems, such as:<br>flash<br>system<br>nvs<br>usb<br>tftp<br>scp<br>sftp<br>http. |
| S/D/V      | The memory type: Static, Dynamic, Virtual.                                                                                                     |
| Lcl / Ntwk | Whether the memory is located locally or via a network connection.                                                                             |
| Avail      | Whether the memory is accessible: Y (yes), N (no), - (not applicable)                                                                          |

- [edit](#)
- [edit \(filename\)](#)
- [show file](#)

# show running-config

**Overview** This command displays the current configuration of your device. Its output includes all non-default configuration. The default settings are not displayed.

**NOTE:** You can control the output by entering `|` or `>` at the end of the command:

- To display only lines that contain a particular word, enter:  
`| include <word>`
- To start the display at the first line that contains a particular word, enter:  
`| begin <word>`
- To save the output to a file, enter:  
`> <filename>`

**Syntax** `show running-config [full|<feature>]`

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |             |                   |           |                         |             |                           |         |                                             |                     |                                             |      |                                                   |     |                                             |                |                              |        |                                 |      |                    |     |                                      |        |                      |          |                        |           |                                                                                                 |

| isakmp               | Internet Security Association Key Management Protocol (ISAKMP) configuration |
| key chain            | Authentication key management configuration                                  |
| l2tp-profile         | L2TP tunnel profile configuration                                            |
| lldp                 | LLDP configuration                                                           |
| log                  | Logging utility configuration                                                |
| malware-protection   | Malware protection configuration                                             |
| nat                  | Network Address Translation configuration                                    |
| power-inline         | Power over Ethernet (PoE) configuration                                      |
| policy-based-routing | Policy-based routing (PBR) configuration                                     |
| pppoe-ac             | PPPoE access concentrator configuration                                      |
| prefix-list          | Prefix-list configuration                                                    |
| route-map            | Route-map configuration                                                      |
| router               | Router configuration                                                         |
| router-id            | Configuration of the router identifier for this system                       |
| security-password    | Strong password security configuration                                       |
| snmp                 | SNMP configuration                                                           |
| ssh                  | Secure Shell configuration                                                   |

| Parameter   | Description               |
|-------------|---------------------------|
| switch      | Switch configuration      |
| web-control | Web Control configuration |

**Mode** Privileged Exec and Global Configuration

**Example** To display the current configuration of your device, use the command:  
awplus# show running-config

**Output** Figure 3-11: Example output from **show running-config**

```
awplus#show running-config
!
service password-encryption
!
no banner motd
!
username manager privilege 15 password 8 1bJoVec4D$Jw0JGPr7YqoExA0GVasdE0
!
service ssh
!
no service telnet
!
service http
!
no clock timezone

...

line con 0
line vty 0 4
!
end
```

**Related commands** [copy running-config](#)  
[show running-config interface](#)

# show running-config interface

**Overview** This command displays the current configuration of one or more interfaces on the device.

You can optionally limit the command output to display only information for a given protocol or feature. The features available depend on your device and will be a subset of the features listed in the table below.

**Syntax** show running-config interface  
show running-config interface <interface-list>  
show running-config interface <interface-list> <feature>  
show running-config interface <interface-list> ip <feature>  
show running-config interface <interface-list> ipv6 <feature>

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface-list>   | The interfaces or ports to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• the loopback interface (lo)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. vlan10-20)</li><li>• a comma-separated list (e.g. vlan1,vlan10-20). Do not mix interface types in a list.</li></ul> The specified interfaces must exist. |
| cfm                | Displays running configuration for CFM (Connectivity Fault Management) for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| dot1x              | Displays running configuration for 802.1X port authentication for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| lacp               | Displays running configuration for LACP (Link Aggregation Control Protocol) for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| ip igmp            | Displays running configuration for IGMP (Internet Group Management Protocol) for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| ip multicast       | Displays running configuration for general multicast settings for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| ip pim sparse-mode | Displays running configuration for PIM-SM (Protocol Independent Multicast - Sparse Mode) for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Parameter            | Description                                                                                                              |
|----------------------|--------------------------------------------------------------------------------------------------------------------------|
| ip pim dense-mode    | Displays running configuration for PIM-DM (Protocol Independent Multicasting - Dense Mode) for the specified interfaces. |
| mstp                 | Displays running configuration for MSTP (Multiple Spanning Tree Protocol) for the specified interfaces.                  |
| ospf                 | Displays running configuration for OSPF (Open Shortest Path First) for the specified interfaces.                         |
| rip                  | Displays running configuration for RIP (Routing Information Protocol) for the specified interfaces.                      |
| ipv6 rip             | Displays running configuration for RIPng (RIP for IPv6) for the specified interfaces.                                    |
| ipv6 ospf            | Displays running configuration for IPv6 OSPF (Open Shortest Path First) for the specified interfaces.                    |
| ipv6 pim sparse-mode | Displays running configuration for PIM-SM (Protocol Independent Multicast - Sparse Mode) for the specified interfaces.   |
| rstp                 | Displays running configuration for RSTP (Rapid Spanning Tree Protocol) for the specified interfaces.                     |
| stp                  | Displays running configuration for STP (Spanning Tree Protocol) for the specified interfaces.                            |

**Mode** Privileged Exec and Global Configuration

**Default** Displays information for all protocols on all interfaces

**Examples** To display the current running configuration of your device for ports 1 to 4, use the command:

```
awplus# show running-config interface port1.0.1-port1.0.4
```

To display the current running configuration of a device for vlan2, use the command:

```
awplus# show running-config interface vlan2
```

To display the current OSPF configuration of your device for ports 1 to 4, use the command:

```
awplus# show running-config interface port1.0.1-port1.0.4 ospf
```

**Output** Figure 3-12: Example output from **show running-config interface** for a switchport

```
awplus#show running-config interface port1.0.2
!
interface port1.0.2
 switchport
 switchport mode access
!
```

**Related  
commands**   [copy running-config](#)  
[show running-config](#)

# show startup-config

**Overview** This command displays the contents of the start-up configuration file, which is the file that the device runs on start-up.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show startup-config

**Mode** Privileged Exec

**Example** To display the contents of the current start-up configuration file, use the command:

```
awplus# show startup-config
```

**Output** Figure 3-13: Example output from the **show startup-config** command

```
awplus#show startup-config
!
service password-encryption
!
no banner motd
!
username manager privilege 15 password 8 1bJoVec4D$Jw0JGPr7YqoExA0GVasdE0
!
service ssh
!
no service telnet
!
service http
!
no clock timezone

...

line con 0
line vty 0 4
!
end
```

**Related commands**

- [boot config-file backup](#)
- [copy running-config](#)
- [copy startup-config](#)
- [erase startup-config](#)
- [show boot](#)

# show version

**Overview** This command displays the version number and copyright details of the current AlliedWare Plus™ OS your device is running.

**Syntax** show version

**Mode** User Exec and Privileged Exec

**Example** To display the version details of your currently installed software, use the command:

```
awplus# show version
```

**Related commands** [boot system backup](#)  
[show boot](#)

# unmount

**Overview** Use this command to unmount an external storage device. We recommend you unmount storage devices before removing them, to avoid file corruption. This is especially important if files may be automatically written to the storage device, such as external log files or AMF backup files.

**Syntax** `unmount usb`  
`unmount usb member [<stack-ID>]`

| Parameter         | Description                       |
|-------------------|-----------------------------------|
| usb               | Unmount the USB storage device.   |
| member <stack-ID> | Stack member number, from 1 to 8. |

**Mode** Privileged Exec

**Example** To unmount a USB storage device and safely remove it from the device, use the command:

```
awplus# unmount usb
```

**Related commands** [clear log external](#)  
[log external](#)  
[show file systems](#)  
[show log config](#)  
[show log external](#)

**Command changes** Version 5.4.7-1.1: command added

# write file

**Overview** This command copies the running-config into the file that is set as the current startup-config file. This command is a synonym of the **write memory** and **copy running-config startup-config** commands.

**Syntax** write [file]

**Mode** Privileged Exec

**Example** To write configuration data to the start-up configuration file, use the command:  
awplus# write file

**Related commands**

- copy running-config
- write memory
- show running-config

# write memory

**Overview** This command copies the running-config into the file that is set as the current startup-config file. This command is a synonym of the **write file** and **copy running-config startup-config** commands.

**Syntax** write [memory]

**Mode** Privileged Exec

**Example** To write configuration data to the start-up configuration file, use the command:  
awplus# write memory

**Related commands** [copy running-config](#)  
[write file](#)  
[show running-config](#)

# write terminal

**Overview** This command displays the current configuration of the device. This command is a synonym of the [show running-config](#) command.

**Syntax** write terminal

**Mode** Privileged Exec

**Example** To display the current configuration of your device, use the command:

```
awplus# write terminal
```

**Related commands** [show running-config](#)

# aaa authentication enable default local

**Overview** This command enables local privilege level authentication.  
Use the **no** variant of this command to disable local privilege level authentication.

**Syntax** `aaa authentication enable default local`  
`no aaa authentication enable default`

**Default** Local privilege level authentication is enabled by default.

**Mode** Global Configuration

**Usage notes** The privilege level configured for a particular user in the local user database is the privilege threshold above which the user is prompted for an [enable \(Privileged Exec mode\)](#) command.

**Examples** To enable local privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default local
```

To disable local privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication enable default
```

**Related commands** [aaa authentication login](#)  
[enable \(Privileged Exec mode\)](#)  
[enable password](#)  
[enable secret \(deprecated\)](#)

# aaa local authentication attempts lockout-time

**Overview** This command configures the duration of the user lockout period.

Use the **no** variant of this command to restore the duration of the user lockout period to its default of 300 seconds (5 minutes).

**Syntax** `aaa local authentication attempts lockout-time <lockout-time>`  
`no aaa local authentication attempts lockout-time`

| Parameter                         | Description                                                         |
|-----------------------------------|---------------------------------------------------------------------|
| <code>&lt;lockout-time&gt;</code> | <code>&lt;0-10000&gt;</code> . Time in seconds to lockout the user. |

**Mode** Global Configuration

**Default** The default for the lockout-time is 300 seconds (5 minutes).

**Usage notes** While locked out all attempts to login with the locked account will fail. The lockout can be manually cleared by another privileged account using the [clear aaa local user lockout](#) command.

**Examples** To configure the lockout period to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts lockout-time
600
```

To restore the default lockout period of 5 minutes (300 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts
lockout-time
```

**Related commands** [aaa local authentication attempts max-fail](#)

# aaa local authentication attempts max-fail

**Overview** This command configures the maximum number of failed login attempts before a user account is locked out. Every time a login attempt fails the failed login counter is incremented.

Use the **no** variant of this command to restore the maximum number of failed login attempts to the default setting (five failed login attempts).

**Syntax** `aaa local authentication attempts max-fail <failed-logins>`  
`no aaa local authentication attempts max-fail`

| Parameter                          | Description                                                                             |
|------------------------------------|-----------------------------------------------------------------------------------------|
| <code>&lt;failed-logins&gt;</code> | <code>&lt;1-32&gt;</code> . Number of login failures allowed before locking out a user. |

**Mode** Global Configuration

**Default** The default for the maximum number of failed login attempts is five failed login attempts.

**Usage** When the failed login counter reaches the limit configured by this command that user account is locked out for a specified duration configured by the [aaa local authentication attempts lockout-time](#) command.

When a successful login occurs the failed login counter is reset to 0. When a user account is locked out all attempts to login using that user account will fail.

**Examples** To configure the number of login failures that will lock out a user account to two login attempts, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# aaa local authentication attempts max-fail 2
```

To restore the number of login failures that will lock out a user account to the default number of login attempts (five login attempts), use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no aaa local authentication attempts max-fail
```

**Related commands** [aaa local authentication attempts lockout-time](#)  
[clear aaa local user logout](#)

# aaa login fail-delay

**Overview** Use this command to configure the minimum time period between failed login attempts. This setting applies to login attempts via the console, SSH and Telnet. Use the **no** variant of this command to reset the minimum time period to its default value.

**Syntax** `aaa login fail-delay <1-10>`  
`no aaa login fail-delay`

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| <1 - 10>  | The minimum number of seconds required between login attempts |

**Default** 1 second

**Mode** Global configuration

**Example** To apply a delay of at least 5 seconds between login attempts, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa login fail-delay 5
```

**Related commands** [aaa authentication login](#)  
[aaa local authentication attempts lockout-time](#)  
[clear aaa local user lockout](#)

# clear aaa local user lockout

**Overview** Use this command to clear the lockout on a specific user account or all user accounts.

**Syntax** `clear aaa local user lockout {username <username>|all}`

| Parameter  | Description                           |
|------------|---------------------------------------|
| username   | Clear lockout for the specified user. |
| <username> | Specifies the user account.           |
| all        | Clear lockout for all user accounts.  |

**Mode** Privileged Exec

**Examples** To unlock the user account 'bob' use the following command:  
`awplus# clear aaa local user lockout username bob`  
To unlock all user accounts use the following command:  
`awplus# clear aaa local user lockout all`

**Related commands** [aaa local authentication attempts lockout-time](#)

# clear line console

**Overview** This command resets a console line. If a terminal session exists on the line then the terminal session is terminated. If console line settings have changed then the new settings are applied.

**Syntax** clear line console 0

**Mode** Privileged Exec

**Example** To reset the console line (asyn), use the command:

```
awplus# clear line console 0
```

% The new settings for console line 0 have been applied

**Related commands**

- [clear line vty](#)
- [flowcontrol hardware \(asyn/console\)](#)
- [line](#)
- [show users](#)

# clear line vty

**Overview** This command resets a VTY line. If a session exists on the line then it is closed.

**Syntax** clear line vty <0-32>

| Parameter | Description |
|-----------|-------------|
| <0-32>    | Line number |

**Mode** Privileged Exec

**Example** To reset the first VTY line, use the command:

```
awplus# clear line vty 1
```

**Related commands**

- [privilege level](#)
- [line](#)
- [show telnet](#)
- [show users](#)

# enable password

**Overview** Use this command to set a local password to control access to elevated privilege levels.

Use the **no** version of the command to remove the password.

Note that the [enable secret \(deprecated\)](#) command is an outdated alias for the **enable password** command.

**Secure mode** In secure mode, the **enable password** command allows changing privilege level up to the level configured for the current user, and will require a password if one has been configured for that privilege level.

**Syntax**

```
enable password <password>
enable password level <1-15> <password>]
enable password 8 <encrypted-password>
enable password 8 level <1-15> 8 <encrypted-password>
no enable password [level <1-15>]
```

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <password>           | Specifies the unencrypted password.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 8                    | Specifies that an encrypted password will follow.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <encrypted-password> | Specifies the encrypted password.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| level                | Privilege level <1-15>. Level for which the password applies. You can specify up to 16 privilege levels, using numbers 1 through 15. Level 1 is normal EXEC-mode user privileges for User Exec mode. If this argument is not specified in the command or the <b>no</b> variant of the command, the privilege level defaults to 15 (enable mode privileges) for Privileged Exec mode. A privilege level of 7 can be set for intermediate CLI security. |

**Default** Level 15

**Mode** Global Configuration

**Usage notes** This command enables the Network Administrator to set a password for entering the Privileged Exec mode when using the [enable \(Privileged Exec mode\)](#) command. There are three methods to enable a password. In the examples below, for each method, note that the configuration is different and the configuration file output is different, but the password string to be used to enter the Privileged Exec mode with the **enable** command is the same (in this example, **mypasswd**).

A user can have an intermediate CLI security level set with this command for privilege level 7 to access all the show commands in Privileged Exec mode and all

the commands in User Exec mode, but not any configuration commands in Privileged Exec mode.

### Entering plaintext passwords

The plaintext password is a clear text string that appears in the configuration file as configured. For example:

```
awplus# configure terminal
awplus(config)# enable password mypasswd
awplus(config)# end
```

This results in the following show output, with the password shown in plaintext:

```
awplus#show run
Current configuration:
...
hostname awplus
enable password mypasswd
...
```

### Entering encrypted passwords

You can configure an encrypted password using the [service password-encryption](#) command. First, use the **enable password** command to specify the string that you want to use as a password (in this example, **mypasswd**). Then, use the [service password-encryption](#) command to encrypt the specified string (**mypasswd**). The advantage of using an encrypted password is that the configuration file does not show **mypasswd**; it will only show the encrypted string **fU7zHzuutY2SA**.

For example:

```
awplus# configure terminal
awplus(config)# enable password mypasswd
awplus(config)# service password-encryption
awplus(config)# end
```

This results in the following show output:

```
awplus#show run
Current configuration:
...
hostname awplus
enable password 8 fU7zHzuutY2SA
service password-encryption
...
```

### Entering pre-encrypted passwords

You can configure an encrypted password using the **<encrypted-password>** parameter (**8**). Use this method if you already know the encrypted string corresponding to the plaintext string that you want to use as a password. You do not have to use the [service password-encryption](#) command with this method. The

output in the configuration file will show only the encrypted string, and not the text string. For example:

```
awplus# configure terminal
awplus(config)# enable password 8 fU7zHzuutY2SA
awplus(config)# end
```

This results in the following show output:

```
awplus#show run
Current configuration:
...
hostname awplus
enable password 8 fU7zHzuutY2SA
...
```

**Related  
commands**

[enable \(Privileged Exec mode\)](#)  
[enable secret \(deprecated\)](#)  
[service password-encryption](#)  
[privilege level](#)  
[show privilege](#)  
[username](#)  
[show running-config](#)

# enable secret (deprecated)

**Overview** This command has been deprecated. It has been replaced by the [enable password](#) command.

# exec-timeout

**Overview** This command sets the interval your device waits for user input from either a console or VTY connection. Once the timeout interval is reached, the connection is dropped. This command sets the time limit when the console or VTY connection automatically logs off after no activity.

The **no** variant of this command removes a specified timeout and resets to the default timeout (10 minutes).

**Syntax** `exec-timeout {<minutes>} [<seconds>]`  
`no exec-timeout`

| Parameter | Description                                           |
|-----------|-------------------------------------------------------|
| <minutes> | <0-35791> Required integer timeout value in minutes   |
| <seconds> | <0-2147483> Optional integer timeout value in seconds |

**Default** The default for the **exec-timeout** command is 10 minutes and 0 seconds (**exec-timeout 10 0**).

**Mode** Line Configuration

**Usage notes** This command is used set the time the telnet session waits for an idle VTY session, before it times out. An **exec-timeout 0 0** setting will cause the telnet session to wait indefinitely. The command **exec-timeout 0 0** is useful while configuring a device, but reduces device security.

If no input is detected during the interval then the current connection resumes. If no connections exist then the terminal returns to an idle state and disconnects incoming sessions.

**Examples** To set VTY connections to timeout after 2 minutes, 30 seconds if there is no response from the user, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# exec-timeout 2 30
```

To reset the console connection to the default timeout of 10 minutes 0 seconds if there is no response from the user, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no exec-timeout
```

**Validation Commands** `show running-config`

**Related  
commands** [line](#)  
[service telnet](#)

# flowcontrol hardware (asyn/console)

**Overview** Use this command to enable RTS/CTS (Ready To Send/Clear To Send) hardware flow control on a terminal console line (asyn port) between the DTE (Data Terminal Equipment) and the DCE (Data Communications Equipment).

**Syntax** flowcontrol hardware  
no flowcontrol hardware

**Mode** Line Configuration

**Default** Hardware flow control is disabled by default.

**Usage notes** Hardware flow control makes use of the RTS and CTS control signals between the DTE and DCE where the rate of transmitted data is faster than the rate of received data. Flow control is a technique for ensuring that a transmitting entity does not overwhelm a receiving entity with data. When the buffers on the receiving device are full, a message is sent to the sending device to suspend the transmission until the data in the buffers has been processed.

Hardware flow control can be configured on terminal console lines (e.g. asyn0). For Reverse Telnet connections, hardware flow control must be configured to match on both the Access Server and the Remote Device. For terminal console sessions, hardware flow control must be configured to match on both the DTE and the DCE. Settings are saved in the running configuration. Changes are applied after reboot, clear line console, or after closing the session.

Use **show running-config** and **show startup-config** commands to view hardware flow control settings that take effect after reboot for a terminal console line. See the **show running-config** command output:

```
awplus#show running-config
!
line con 1
 speed 9600
 mode out 2001
 flowcontrol hardware
!
```

Note that line configuration commands do not take effect immediately. Line configuration commands take effect after one of the following commands or events:

- issuing a [clear line console](#) command
- issuing a [reboot](#) command
- logging out of the current session

**Examples** To enable hardware flow control on terminal console line asyn0, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# flowcontrol hardware
```

To disable hardware flow control on terminal console line asyn0, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no flowcontrol hardware
```

**Related commands**

- [clear line console](#)
- [show running-config](#)
- [speed \(asyn\)](#)

# length (asyn)

**Overview** Use this command to specify the number of rows of output that the device will display before pausing, for the console or VTY line that you are configuring.

The **no** variant of this command restores the length of a line (terminal session) attached to a console port or to a VTY to its default length of 22 rows.

**Syntax** length <0-512>  
no length

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| <0-512>   | Number of lines on screen. Specify 0 for no pausing. |

**Mode** Line Configuration

**Default** The length of a terminal session is 22 rows. The **no length** command restores the default.

**Usage notes** If the output from a command is longer than the length of the line the output will be paused and the '–More–' prompt allows you to move to the next screen full of data.

A length of 0 will turn off pausing and data will be displayed to the console as long as there is data to display.

**Examples** To set the terminal session length on the console to 10 rows, use the command:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# length 10
```

To reset the terminal session length on the console to the default (22 rows), use the command:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no length
```

To display output to the console continuously, use the command:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# length 0
```

**Related commands** [terminal resize](#)  
[terminal length](#)

# line

**Overview** Use this command to enter line configuration mode for the specified VTYS or the console. The command prompt changes to show that the device is in Line Configuration mode.

**Syntax** `line vty <first-line> [<last-line>]`  
`line console 0`

| Parameter    | Description                                    |
|--------------|------------------------------------------------|
| <first-line> | <0-32> Specify the first line number.          |
| <last-line>  | <0-32> Specify the last line number.           |
| console      | The console terminal line(s) for local access. |
| vty          | Virtual terminal for remote console access.    |

**Mode** Global Configuration

**Usage notes** This command puts you into Line Configuration mode. Once in Line Configuration mode, you can configure console and virtual terminal settings, including setting [speed \(asyn\)](#), [length \(asyn\)](#), [privilege level](#), and authentication ([login authentication](#)) or accounting ([accounting login](#)) method lists.

To change the console (asyn) port speed, use this **line** command to enter Line Configuration mode before using the [speed \(asyn\)](#) command. Set the console speed (Baud rate) to match the transmission rate of the device connected to the console (asyn) port on your device.

Note that line configuration commands do not take effect immediately. Line configuration commands take effect after one of the following commands or events:

- issuing a [clear line console](#) command
- issuing a [reboot](#) command
- logging out of the current session

**Examples** To enter Line Configuration mode in order to configure all VTYS, use the commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)#
```

To enter Line Configuration mode to configure the console (asyn 0) port terminal line, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)#
```

**Related  
commands**

- accounting login
- clear line console
- clear line vty
- flowcontrol hardware (asyn/console)
- length (asyn)
- login authentication
- privilege level
- speed (asyn)

# privilege level

**Overview** This command sets a privilege level for VTY or console connections. The configured privilege level from this command overrides a specific user's initial privilege level at the console login.

**Syntax** `privilege level <1-15>`

**Mode** Line Configuration

**Usage notes** You can set an intermediate CLI security level for a console user with this command by applying privilege level 7 to access all show commands in Privileged Exec and all User Exec commands. However, intermediate CLI security will not show configuration commands in Privileged Exec.

**Examples** To set the console connection to have the maximum privilege level, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# privilege level 15
```

To set all VTY connections to have the minimum privilege level, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# privilege level 1
```

To set all VTY connections to have an intermediate CLI security level, to access all show commands, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# privilege level 7
```

**Related commands**

- [enable password](#)
- [line](#)
- [show privilege](#)
- [username](#)

# security-password history

**Overview** This command specifies the number of previous passwords that are unable to be reused. A new password is invalid if it matches a password retained in the password history.

The **no** variant of the command disables this feature.

**Syntax** security-password history <0-15>  
no security-password history

| Parameter | Description                                                                                                                                                                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-15>    | The allowable range of previous passwords to match against. A value of 0 will disable the history functionality and is equivalent to the <b>no security-password history</b> command. If the history functionality is disabled, all users' password history is reset and all password history is lost. |

**Default** The default history value is 0, which will disable the history functionality.

**Mode** Global Configuration

**Examples** To restrict reuse of the three most recent passwords, use the command:

```
awplus# configure terminal
```

```
awplus(config)# security-password history 3
```

To allow the reuse of recent passwords, use the command:

```
awplus# configure terminal
```

```
awplus(config)# no security-password history
```

- show security-password user

# security-password forced-change

**Overview** This command specifies whether or not a user is forced to change an expired password at the next login. If this feature is enabled, users whose passwords have expired are forced to change to a password that must comply with the current password security rules at the next login.

Note that to use this command, the lifetime feature must be enabled with the [security-password lifetime](#) command and the reject-expired-pwd feature must be disabled with the [security-password reject-expired-pwd](#) command.

The **no** variant of the command disables this feature.

**Syntax** security-password forced-change  
no security-password forced-change

**Default** The forced-change feature is disabled by default.

**Mode** Global Configuration

**Example** To force a user to change their expired password at the next login, use the command:

```
awplus# configure terminal
awplus(config)# security-password forced-change
```

# security-password lifetime

**Overview** This command enables password expiry by specifying a password lifetime in days.

Note that when the password lifetime feature is disabled, it also disables the [security-password forced-change](#) command and the [security-password warning](#) command.

The **no** variant of the command disables this feature.

**Syntax** security-password lifetime <0-1000>  
no security-password lifetime

| Parameter | Description                                                                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-1000>  | Password lifetime specified in days. A value of 0 will disable lifetime functionality and the password will never expire. This is equivalent to the <b>no security-password lifetime</b> command. |

**Default** The default password lifetime is 0, which will disable the lifetime functionality.

**Mode** Global Configuration

**Example** To configure the password lifetime to 10 days, use the command:

```
awplus# configure terminal
awplus(config)# security-password lifetime 10
```

**Related commands**

# security-password min-lifetime-enforce

**Overview** Use this command to configure a minimum number of days before a password can be changed by a user. With this feature enabled, once a user sets the password, the user cannot change it again until the minimum lifetime has passed.

Use the **no** variant of this command to remove the minimum lifetime.

**Syntax** security-password min-lifetime-enforce <0-1000>  
no security-password min-lifetime-enforce

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| <0-1000>  | The minimum number of days before a password can be changed |

**Default** By default, no minimum lifetime is enforced.

**Mode** Global Configuration

**Usage notes** The minimum lifetime is helpful in conjunction with a security policy that prevents people from re-using old passwords. For example, if you do not allow people to re-use any of their last 5 passwords, a person can bypass that restriction by changing their password 5 times in quick succession and then re-setting it to their previous password. The minimum lifetime prevents that by preventing people from changing their password in quick succession.

**Example** To force users to wait at least 2 days between changing passwords, use the command:

```
awplus(config)# security-password min-lifetime-enforce 2
```

**Related commands**

- [show running-config security-password](#)
- [show security-password configuration](#)
- [show security-password user](#)

**Command changes** Version 5.4.7-0.2: command added

# security-password minimum-categories

**Overview** This command specifies the minimum number of categories that the password must contain in order to be considered valid. The password categories are:

- uppercase letters: A to Z
- lowercase letters: a to z
- digits: 0 to 9
- special symbols: all printable ASCII characters not included in the previous three categories. The question mark (?) cannot be used as it is reserved for help functionality.

Note that to ensure password security, the minimum number of categories should align with the lifetime selected, i.e. the fewer categories specified the shorter the lifetime specified.

**Syntax** security-password minimum-categories <1-4>

| Parameter | Description                                                          |
|-----------|----------------------------------------------------------------------|
| <1-4>     | Number of categories the password must satisfy, in the range 1 to 4. |

**Default** The default number of categories that the password must satisfy is 1.

**Mode** Global Configuration

**Example** To configure the required minimum number of character categories to be 3, use the command:

```
awplus# configure terminal
awplus(config)# security-password minimum-categories 3
```

# security-password minimum-length

**Overview** This command specifies the minimum allowable password length. This value is checked against when there is a password change or a user account is created.

**Syntax** security-password minimum-length <1-23>

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| <1 - 23>  | Minimum password length in the range from 1 to 23. |

**Default** The default minimum password length is 1.

**Mode** Global Configuration

**Example** To configure the required minimum password length as 8, use the command:

```
awplus# configure terminal
awplus(config)# security-password minimum-length 8
```

**Related commands**

# security-password reject-expired-pwd

**Overview** This command specifies whether or not a user is allowed to login with an expired password. Users with expired passwords are rejected at login if this functionality is enabled. Users then have to contact the Network Administrator to change their password.

**CAUTION:** *Once all users' passwords are expired you are unable to login to the device again if the security-password reject-expired-pwd command has been executed. You will have to reboot the device with a default configuration file, or load an earlier software version that does not have the security password feature.*

*We recommend you never have the command line "security-password reject-expired-pwd" in a default config file.*

Note that when the reject-expired-pwd functionality is disabled and a user logs on with an expired password, if the forced-change feature is enabled with [security-password forced-change](#) command, a user may have to change the password during login depending on the password lifetime specified by the [security-password lifetime](#) command.

The **no** variant of the command disables this feature.

**Syntax** security-password reject-expired-pwd  
no security-password reject-expired-pwd

**Default** The reject-expired-pwd feature is disabled by default.

**Mode** Global Configuration

**Example** To configure the system to reject users with an expired password, use the command:

```
awplus# configure terminal
awplus(config)# security-password reject-expired-pwd
```

**Related commands**

# security-password warning

**Overview** This command specifies the number of days before the password expires that the user will receive a warning message specifying the remaining lifetime of the password.

Note that the warning period cannot be set unless the lifetime feature is enabled with the [security-password lifetime](#) command.

The **no** variant of the command disables this feature.

**Syntax** security-password warning <0-1000>  
no security-password warning

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-1000>  | Warning period in the range from 0 to 1000 days. A value 0 disables the warning functionality and no warning message is displayed for expiring passwords. This is equivalent to the <b>no security-password warning</b> command. The warning period must be less than, or equal to, the password lifetime set with the <a href="#">security-password lifetime</a> command. |

**Default** The default warning period is 0, which disables warning functionality.

**Mode** Global Configuration

**Example** To configure a warning period of three days, use the command:

```
awplus# configure terminal
awplus(config)# security-password warning 3
```

# service advanced-vty

**Overview** This command enables the advanced-vty help feature. This allows you to use TAB completion for commands. Where multiple options are possible, the help feature displays the possible options.

The **no service advanced-vty** command disables the advanced-vty help feature.

**Syntax** service advanced-vty  
no service advanced-vty

**Default** The advanced-vty help feature is enabled by default.

**Mode** Global Configuration

**Examples** To disable the advanced-vty help feature, use the command:

```
awplus# configure terminal
awplus(config)# no service advanced-vty
```

To re-enable the advanced-vty help feature after it has been disabled, use the following commands:

```
awplus# configure terminal
awplus(config)# service advanced-vty
```

# service password-encryption

**Overview** Use this command to enable password encryption. This is enabled by default. When password encryption is enabled, the device displays passwords in the running config in encrypted form instead of in plain text.

Use the **no service password-encryption** command to stop the device from displaying newly-entered passwords in encrypted form. This does not change the display of existing passwords.

**NOTE:** Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option 8 for GUI users.

**Syntax** service password-encryption  
no service password-encryption

**Mode** Global Configuration

**Example** awplus# configure terminal  
awplus(config)# service password-encryption

**Validation  
Commands** show running-config

**Related  
commands** enable password

# service telnet

**Overview** Use this command to enable the telnet server. The server is enabled by default. Enabling the telnet server starts the device listening for incoming telnet sessions on the configured port.

The server listens on port 23, unless you have changed the port by using the [privilege level](#) command.

Use the **no** variant of this command to disable the telnet server. Disabling the telnet server will stop the device listening for new incoming telnet sessions. However, existing telnet sessions will still be active.

**Syntax** `service telnet [ip|ipv6]`  
`no service telnet [ip|ipv6]`

**Default** The IPv4 and IPv6 telnet servers are enabled by default.  
The configured telnet port is TCP port 23 by default.

**Mode** Global Configuration

**Examples** To enable both the IPv4 and IPv6 telnet servers, use the following commands:

```
awplus# configure terminal
awplus(config)# service telnet
```

To enable the IPv6 telnet server only, use the following commands:

```
awplus# configure terminal
awplus(config)# service telnet ipv6
```

To disable both the IPv4 and IPv6 telnet servers, use the following commands:

```
awplus# configure terminal
awplus(config)# no service telnet
```

To disable the IPv6 telnet server only, use the following commands:

```
awplus# configure terminal
awplus(config)# no service telnet ipv6
```

**Related commands** [clear line vty](#)  
[show telnet](#)  
[telnet server](#)

# service terminal-length (deleted)

**Overview** This command has been deleted in Software Version 5.4.5-0.1 and later.

# show aaa local user locked

**Overview** This command displays the current number of failed attempts, last failure time and location against each user account attempting to log into the device.

Note that once the lockout count has been manually cleared by another privileged account using the [clear aaa local user lockout](#) command or a locked account successfully logs into the system after waiting for the lockout time, this command will display nothing for that particular account.

**Syntax** show aaa local user locked

**Mode** User Exec and Privileged Exec

**Example** To display the current failed attempts for local users, use the command:

```
awplus# show aaa local user locked
```

**Output** Figure 4-1: Example output from the **show aaa local user locked** command

|                                    |          |                |          |               |
|------------------------------------|----------|----------------|----------|---------------|
| awplus# show aaa local user locked |          |                |          |               |
| Login                              | Failures | Latest failure |          | From          |
| bob                                | 3        | 05/23/14       | 16:21:37 | ttyS0         |
| manager                            | 5        | 05/23/14       | 16:31:44 | 192.168.1.200 |

**Related commands**

- [aaa local authentication attempts lockout-time](#)
- [aaa local authentication attempts max-fail](#)
- [clear aaa local user lockout](#)

# show privilege

**Overview** This command displays the current user privilege level, which can be any privilege level in the range <1-15>. Privilege levels <1-6> allow limited user access (all User Exec commands), privilege levels <7-14> allow restricted user access (all User Exec commands plus Privileged Exec show commands). Privilege level 15 gives full user access to all Privileged Exec commands.

**Syntax** show privilege

**Mode** User Exec and Privileged Exec

**Usage notes** A user can have an intermediate CLI security level set with this command for privilege levels <7-14> to access all show commands in Privileged Exec mode and all commands in User Exec mode, but no configuration commands in Privileged Exec mode.

**Example** To show the current privilege level of the user, use the command:

```
awplus# show privilege
```

**Output** Figure 4-2: Example output from the **show privilege** command

```
awplus#show privilege
Current privilege level is 15
awplus#disable
awplus>show privilege
Current privilege level is 1
```

**Related commands** [privilege level](#)

# show security-password configuration

**Overview** This command displays the configuration settings for the various security password rules.

**Syntax** show security-password configuration

**Mode** Privileged Exec

**Example** To display the current security-password rule configuration settings, use the command:

```
awplus# show security-password configuration
```

**Output** Figure 4-3: Example output from the **show security-password configuration** command

```
Security Password Configuration
Minimum password length 8
Minimum password character categories to match 3
Number of previously used passwords to restrict..... 4
Password lifetime 30 day(s)
 Warning period before password expires 3 day(s)
Reject expired password at login Disabled
 Force changing expired password at login Enabled
```

# show security-password user

**Overview** This command displays user account and password information for all users.

**Syntax** show security-password user

**Mode** Privileged Exec

**Example** To display the system users' remaining lifetime or last password change, use the command:

```
awplus# show security-password user
```

**Output** Figure 4-4: Example output from the **show security-password** user command

| User account and password information |           |                 |                    |
|---------------------------------------|-----------|-----------------|--------------------|
| UserName                              | Privilege | Last-PWD-Change | Remaining-lifetime |
| -----                                 |           |                 |                    |
| manager                               | 15        | 4625 day(s) ago | No Expiry          |
| bob15                                 | 15        | 0 day(s) ago    | 30 days            |
| ted7                                  | 7         | 0 day(s) ago    | No Expiry          |
| mike1                                 | 1         | 0 day(s) ago    | No Expiry          |

# show users

**Overview** This command shows information about the users who are currently logged into the device.

**Syntax** show users

**Mode** User Exec and Privileged Exec

**Example** To show the users currently connected to the device, use the command:

```
awplus# show users
```

**Output** Figure 4-6: Example output from the **show users** command

| Line   | User    | Host(s) | Idle     | Location    | Priv | Idletime | Timeout |
|--------|---------|---------|----------|-------------|------|----------|---------|
| con 0  | manager | idle    | 00:00:00 | ttyS0       | 15   | 10       | N/A     |
| vtty 0 | bob     | idle    | 00:00:03 | 172.16.11.3 | 1    | 0        | 5       |

**Table 1:** Parameters in the output of the **show users** command

| Parameter | Description                                                                                |
|-----------|--------------------------------------------------------------------------------------------|
| Line      | Console port user is connected to.                                                         |
| User      | Login name of user.                                                                        |
| Host(s)   | Status of the host the user is connected to.                                               |
| Idle      | How long the host has been idle.                                                           |
| Location  | URL location of user.                                                                      |
| Priv      | The privilege level in the range 1 to 15, with 15 being the highest.                       |
| Idletime  | The time interval the device waits for user input from either a console or VTY connection. |
| Timeout   | The time interval before a server is considered unreachable.                               |

# telnet

**Overview** Use this command to open a telnet session to a remote device.

**Syntax** telnet {<hostname>|[ip] <ipv4-addr>|[ipv6] <ipv6-addr>} [  
<port>]

**Syntax (VRF-lite)** telnet [vrf <vrf-name>] {<hostname>|[ip] <ipv4-addr>|[ipv6] <ipv6-addr>} [  
<port>]

| Parameter   | Description                                                                                                                               |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| vrf         | Apply this command to a VRF instance.                                                                                                     |
| <vrf-name>  | The name of the VRF instance.                                                                                                             |
| <hostname>  | The host name of the remote system.                                                                                                       |
| ip          | Keyword used to specify the IPv4 address or host name of a remote system.                                                                 |
| <ipv4-addr> | An IPv4 address of the remote system.                                                                                                     |
| ipv6        | Keyword used to specify the IPv6 address of a remote system                                                                               |
| <ipv6-addr> | Placeholder for an IPv6 address in the format x:x::x:x, for example, 2001:db8::8a2e:7334                                                  |
| <port>      | Specify a TCP port number (well known ports are in the range 1-1023, registered ports are 1024-49151, and private ports are 49152-65535). |

**Mode** User Exec and Privileged Exec

**Examples** To connect to TCP port 2602 on the device at 10.2.2.2, use the command:

```
awplus# telnet 10.2.2.2 2602
```

To connect to the telnet server host .example, use the command:

```
awplus# telnet host.example
```

To connect to the telnet server host .example on TCP port 100, use the command:

```
awplus# telnet host.example 100
```

**Example (VRF-lite)** To open a telnet session to a remote host 192.168.0.1 associated with VRF instance red, use the command:

```
awplus# telnet vrf red ip 192.168.0.1
```

# telnet server

**Overview** This command enables the telnet server on the specified TCP port. If the server is already enabled then it will be restarted on the new port. Changing the port number does not affect the port used by existing sessions.

**Syntax** `telnet server {<1-65535>|default}`

| Parameter   | Description                         |
|-------------|-------------------------------------|
| <1 - 65535> | The TCP port to listen on.          |
| default     | Use the default TCP port number 23. |

**Mode** Global Configuration

**Example** To enable the telnet server on TCP port 2323, use the following commands:

```
awplus# configure terminal
awplus(config)# telnet server 2323
```

**Related commands** [show telnet](#)

# terminal length

**Overview** Use the **terminal length** command to specify the number of rows of output that the device will display before pausing, for the currently-active terminal only.

Use the **terminal no length** command to remove the length specified by this command. The default length will apply unless you have changed the length for some or all lines by using the [length \(asyn\)](#) command.

**Syntax** terminal length <length>  
terminal no length [<length>]

| Parameter | Description                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------|
| <length>  | <0-512> Number of rows that the device will display on the currently-active terminal before pausing. |

**Mode** User Exec and Privileged Exec

**Examples** The following example sets the number of lines to 15:

```
awplus# terminal length 15
```

The following example removes terminal length set previously:

```
awplus# terminal no length
```

**Related commands** [terminal resize](#)  
[length \(asyn\)](#)

# terminal resize

**Overview** Use this command to automatically adjust the number of rows of output on the console, which the device will display before pausing, to the number of rows configured on the user's terminal.

**Syntax** `terminal resize`

**Mode** User Exec and Privileged Exec

**Usage notes** When the user's terminal size is changed, then a remote session via SSH or TELNET adjusts the terminal size automatically. However, this cannot normally be done automatically for a serial or console port. This command automatically adjusts the terminal size for a serial or console port.

**Examples** The following example automatically adjusts the number of rows shown on the console:

```
awplus# terminal resize
```

**Related commands** [length \(asyn\)](#)  
[terminal length](#)

# username

**Overview** This command creates or modifies a user to assign a privilege level and a password.

**NOTE:** The default username privilege level of 1 is not shown in running-config output. Any username privilege level that has been modified from the default is shown.

**Syntax** username <name> privilege <1-15> [password [8] <password>]  
username <name> password [8] <password>  
no username <name>

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <name>     | The login name for the user. Do not use punctuation marks such as single quotes ('), double quotes (" "), or colons (:) with the user login name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| privilege  | The user's privilege level. Use the privilege levels to set the access rights for each user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <1-15>     | A privilege level: either 1-14 (limited access) or 15 (full access). A user with privilege level 1-14 can only access higher privilege levels if an <a href="#">enable password</a> has been configured for the level the user tries to access and the user enters that password.<br>A user at privilege level 1 can access the majority of show commands. A user at privilege level 7 can access the majority of show commands including platform show commands. Privilege Level 15 (to access the Privileged Exec command mode) is required to access configuration commands as well as show commands in Privileged Exec. |
| password   | A password that the user must enter when logging in.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 8          | Specifies that you are entering a password as a string that has already been encrypted, instead of entering a plain-text password. The running-config displays the new password as an encrypted string even if password encryption is turned off. Note that the user enters the plain-text version of the password when logging in.                                                                                                                                                                                                                                                                                         |
| <password> | The user's password. The password can be up to 32 characters in length and include characters from up to four categories. The password categories are: <ul style="list-style-type: none"> <li>uppercase letters: A to Z</li> <li>lowercase letters: a to z</li> <li>digits: 0 to 9</li> <li>special symbols: all printable ASCII characters not included in the previous three categories. The question mark ? cannot be used as it is reserved for help functionality.</li> </ul>                                                                                                                                          |

**Mode** Global Configuration

**Default** The privilege level is 1 by default. Note the default is not shown in running-config output.

**Usage notes** An intermediate CLI security level (privilege level 7 to privilege level 14) allows a CLI user access to the majority of show commands, including the platform show commands that are available at privilege level 1 to privilege level 6. Note that some show commands, such as **show running-configuration** and **show startup-configuration**, are only available at privilege level 15.

**Examples** To create the user "bob" with a privilege level of 15, for all show commands including show running-configuration and show startup-configuration and to access configuration commands in Privileged Exec command mode, and the password "bobs\_secret", use the commands:

```
awplus# configure terminal
```

```
awplus(config)# username bob privilege 15 password bobs_secret
```

To create a user "junior\_admin" with a privilege level of 7, which will have intermediate CLI security level access for most show commands, and the password "show\_only", use the commands:

```
awplus# configure terminal
```

```
awplus(config)# username junior_admin privilege 7 password
show_only
```

# Feature Licensing Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for each of the Feature Licensing commands. Feature Licensing enables you to use advanced features such as Layer 3 routing.

**NOTE:** *Feature licensing is not available in Secure Mode (see the [crypto secure-mode](#) command).*

To see which Feature Licenses are available for your device, see the [AlliedWare Plus Datasheet](#).

Allied Telesis Management Framework (AMF) requires a Subscription License. For information about Subscription Licensing commands, see the Subscription Licensing Commands chapter.

For step-by-step instructions about how to license AlliedWare Plus devices, see the [Licensing Feature Overview and Configuration\\_Guide](#).

- Command List**
- [“license”](#) on page 247
  - [“show license”](#) on page 249
  - [“show license brief”](#) on page 251
  - [“show license brief member”](#) on page 253
  - [“show license member”](#) on page 255

# license

**Overview** This command activates the licensed software feature set on a standalone switch, or a stack of switches.

Use the **no** variant of this command to deactivate the licensed software feature set on a standalone switch, or a stack of switches.

For feature licenses, contact your authorized distributor or reseller. If a license key expires or is incorrect so the license key is invalid, then some software features will be unavailable.

**NOTE:** See the AlliedWare Plus™ datasheet for a list of current feature licenses available by product. Purchase licenses from your authorized dealer or reseller.

**NOTE:** The **license** command is not available in Secure Mode (see the [crypto secure-mode](#) command).

In a live network, only install feature licenses during scheduled maintenance. For example, if a feature license includes EPSR, installing that license will cause EPSR to be restarted with a temporary loss of EPSR network traffic.

**Syntax** license <label> <key>  
no license <label>

| Parameter | Description                                                                                                                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <label>   | A name for the feature license. To determine names already in use, use the <a href="#">show license</a> command. This can be the default name supplied for the feature, or a renamed feature name. |
| <key>     | The encrypted license key to enable a set of software features.                                                                                                                                    |

**Mode** Privileged Exec

**Usage notes** You can change the license label using this command to make it specific to you when you initially add a license. Once a license is added, any change to the license label first requires removal of the license before adding a license again with a new license label.

The default feature license labels are issued along with encrypted license keys by e-mail for you to apply using this command to activate features. You can change default feature license labels, but they must be 15 characters or less.

For example, you may want to change the label of the premium license to "premium-license". You can check your new license label by using the [show license](#) command.

In a stacked configuration, the **license** command will add a license to all stack members and the **no license** command will remove a license from all stack members. If you introduce a new stack member and it lacks a feature license that is possessed by the other stack members, a warning message will be generated at

bootup. If this occurs, use the the **license** command to add the license to all stack members, including the new stack members.

If you add a feature license you will be prompted at the console that the feature needs to restart. Restarting of individual protocols in this manner could result in the loss of network traffic. Only install licenses in scheduled maintenance periods for devices in a live environment.

For example, if the feature license contains a license for the EPSR protocol, then that protocol will restart, but you do not need to manually restart the whole device for the new license to take effect.

**Examples** To activate the license called "Premium" that has the key 12345678ABCDE123456789ABCDE, use the command:

```
awplus# license Premium 12345678ABCDE123456789ABCDE
```

To deactivate the license called "Premium", use the command:

```
awplus# no license Premium
```

**Related commands** [show license](#)  
[show license member](#)

# show license

**Overview** This command displays information about a specific software feature license, or all enabled software feature licenses on the device.

**Syntax** `show license [feature] [<label>|index <index-number>]`

| Parameter               | Description                                                                                                                             |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| feature                 | Only display license information for any applied feature licenses.                                                                      |
| <label>                 | The license name to show information about. This can be used instead of the index number to identify a specific license.                |
| index<br><index-number> | The index number of the license to show information about. This can be used instead of the license name to identify a specific license. |

**Mode** User Exec and Privileged Exec

**Usage notes** In a stacked configuration, this command will display licenses applied to a stack master only.

Use the [show license member](#) command instead if you need to display license information for a specific stack member or all stack members.

**Examples** To display full information about all enabled licenses, use the command:

```
awplus# show license
```

To display full information about the licenses with index number 1, use the command:

```
awplus# show license index 1
```

**Output** Figure 5-1: Example output from **show license**

```
awplus#show license
Board region: Global
Software Licenses

Index : 1
License name : Base License
Customer name : Base License
Quantity of licenses : 1
Type of license : Full
License issue date : 20-Mar-2019
License expiry date : N/A
Features included : IPv6Basic, LAG-FULL, MLDSnoop, RADIUS-100, ...
```

Table 5-1: Parameters in the output of **show license**

| Parameter            | Description                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------|
| Board region         | Name of the region for the Base License features.                                                   |
| Index                | Index identifying entry. The index is assigned automatically by the software. It is not configured. |
| License name         | Name of the license key bundle (case-sensitive).                                                    |
| Customer name        | Customer name.                                                                                      |
| Quantity of licenses | Quantity of licensed installations.                                                                 |
| Type of license      | Full or Trial.                                                                                      |
| License issue date   | Date the license was generated.                                                                     |
| License expiry date  | Expiry date for trial license.                                                                      |
| Features included    | List of features included in the feature license.                                                   |

**Related commands**

- [license](#)
- [show license brief](#)
- [show license member](#)

# show license brief

**Overview** This command displays information about a specific software feature license, or all enabled software feature licenses on the device.

**Syntax** show license brief  
show license [feature] [<label>|index <index-number>] brief

| Parameter               | Description                                                                                                                             |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| feature                 | Only display license information for any applied feature licenses.                                                                      |
| <label>                 | The license name to show information about. This can be used instead of the index number to identify a specific license.                |
| index<br><index-number> | The index number of the license to show information about. This can be used instead of the license name to identify a specific license. |
| brief                   | Displays a brief summary of license information.                                                                                        |

**Mode** User Exec and Privileged Exec

**Usage notes** In a stacked configuration, this command will display licenses applied to a stack master only.

Use the [show license brief member](#) command instead if you need to display license information for a specific stack member or all stack members.

**Examples** To display a brief summary of information about all licenses, use the command:

```
awplus# show license brief
```

**Output** Figure 5-2: Example output from **show license brief**

|                                                  |              |          |               |

# show license brief member

**Overview** Use this command to display information about either a specific software license, or all software feature licenses enabled on either a specific stack member or all stack members.

**Syntax** `show license [<label>] brief member [1-8|all]`

| Parameter | Description                                           |
|-----------|-------------------------------------------------------|
| <label>   | The name of the license to show information about.    |
| brief     | Display a brief summary of license information.       |
| <1-8>     | The ID of the stack member to show information about. |
| all       | Display information about all stack members.          |

**Mode** User Exec and Privileged Exec

**Usage notes** Use the **show license brief member all** command for brief table output of all licenses per stack member.

**Examples** To display a brief summary of information about all enabled licenses on stack member 2, use the command:

```
awplus# show license brief member 2
```

To display a brief summary about all enabled licenses on all stack members, use the command:

```
awplus# show license brief member all
```

To display a brief summary about the license "name1" on all stack members, use the command:

```
awplus# show license name1 brief member all
```

**Output** Figure 5-3: Example output from **show license brief member**

```
awplus#show license brief member 1

Board region: Global

Feature licenses on stack member 1:

Index License name Quantity Customer name
 Type Period

1 Base License - Base License
 Full N/A

Current enabled features for displayed licenses:
IPv6Basic, LAG-FULL, MLDSnoop, ...
```

Table 5-3: Parameters in the output of **show license brief member**

| Parameter                                       | Description                                                                                         |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| Board region                                    | Name of the region for the Base License features.                                                   |
| Index                                           | Index identifying entry. The index is assigned automatically by the software. It is not configured. |
| License name                                    | Name of the license key bundle (case-sensitive).                                                    |
| Quantity                                        | Quantity of licensed installations.                                                                 |
| Customer name                                   | Customer name.                                                                                      |
| Type                                            | Full or Trial.                                                                                      |
| Period                                          | Expiry date for trial license.                                                                      |
| Current enabled features for displayed licenses | List of features included in the license.                                                           |

- [show license](#)
- [show license member](#)

# show license member

**Overview** Use this command to display information about either a specific software license, or all software feature licenses enabled on either a specific stack member or all stack members.

**Syntax** `show license [<label>] member [1-8|all]`

| Parameter | Description                                           |
|-----------|-------------------------------------------------------|
| <label>   | The name of the license to show information about.    |
| <1-8>     | The ID of the stack member to show information about. |
| all       | Display information about all stack members.          |

**Mode** User Exec and Privileged Exec

**Usage notes** Use the **show license member all** command to display full list output of all licenses per stack member.

**Examples** To display full information about all enabled licenses on all stack members, use the command:

```
awplus# show license member all
```

To display full information about all enabled licenses on stack member 2, use the command:

```
awplus# show license member 2
```

To display full information about the license called "name1" on all stack members, use the command:

```
awplus# show license name1 member all
```

**Output** Figure 5-4: Example output from **show license member**

```
awplus#show license member all
Board region: Global
Software Feature Licenses

Index : 1
License name : Base License
Customer name : Base License
Quantity of licenses : 1
Type of license : Full
License issue date : 12-Jan-2019
License expiry date : N/A
Features included : IPv6Basic, LAG-FULL, MLDSnoop ...
...
```

Table 5-4: Parameters in the output of **show license member**

| Parameter            | Description                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------|
| Board region         | Name of the region for the Base License features.                                                   |
| Index                | Index identifying entry. The index is assigned automatically by the software. It is not configured. |
| License name         | Name of the license key bundle (case-sensitive).                                                    |
| Customer name        | Customer name.                                                                                      |
| Quantity of licenses | Quantity of licensed installations.                                                                 |
| Type of license      | Full or Trial.                                                                                      |
| License issue date   | Date the license was generated.                                                                     |
| License expiry date  | Expiry date for trial license.                                                                      |
| Features included    | List of features included in the license.                                                           |

# Subscription Licensing Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for each of the Subscription Licensing commands.

Subscription Licensing enables you to use Allied Telesis Management Framework (AMF). You need to purchase an AMF subscription for each AMF master or controller node in your AMF network. To see the AMF subscriptions for your device, see the [AlliedWare Plus Datasheet](#).

For step-by-step instructions about how to license AlliedWare Plus devices, see the [Licensing Feature Overview and Configuration Guide](#).

- Command List**
- “[license redistribute](#)” on page 258
  - “[license update file](#)” on page 259
  - “[license update online](#)” on page 260
  - “[show license external](#)” on page 262

# license redistribute

**Overview** For subscription licenses on VCStacks, use this command to force the stack to re-synchronise its license entitlements. You need to do this when you permanently replace the stack member that you originally bought the license for. See the Example section for details.

**Syntax** `license redistribute`

**Default** n/a

**Mode** User Exec/Privileged Exec

**Example** If you buy a subscription license for a stack member, and later have to permanently replace that stack member, you can transfer the license to another stack member.

To do this:

- 1) Check which stack member the license entitlement came from originally, by using the command:

```
awplus# show license external stored
```

- 2) If you are replacing that stack member, in the [Allied Telesis Download center](#), transfer the license to another stack member's serial number.

- 3) Update the stack's licenses by using the command:

```
awplus# license update online
```

- 4) Force the stack to re-synchronise its license entitlement by using the command:

```
awplus# license redistribute
```

**Related commands** [license update online](#)  
[show license external](#)

**Command changes** Version 5.4.6-2.1: usage changed by introduction of [license update online](#)

# license update file

**Overview** Use this command to load a license, after you have manually copied the license file onto the device.

Only use this command if you cannot directly access the [Allied Telesis Download Center](#) from this device. Otherwise, use the command [license update online](#) instead.

**Syntax** `license update file <filename>`

| Parameter  | Description                                      |
|------------|--------------------------------------------------|
| <filename> | Name and path of the license file on the device. |

**Mode** Privileged Exec

**Usage notes** You can download subscription licenses from the [Allied Telesis Download Center](#), in order to copy them onto the device.

**Examples** To load a license onto a device from a file called "license\_file.bin" that is stored at the top level of Flash memory, use the following command:

```
awplus# license update file license_file.bin
```

**Related commands** [license redistribute](#)  
[license update online](#)  
[show license external](#)

**Command changes** Version 5.4.6-2.1: usage changed by introduction of [license update online](#)

# license update online

**Overview** Use this command to add or update subscription licenses from the [Allied Telesis Download Center](#), to subscribe to features such as AMF master and OpenFlow.

When you enter this command, the device will:

- 1) Connect to the Download Center
- 2) Check if new or changed licenses are available for the device, keyed to the device's serial number
- 3) For each such license it finds, download and install the license.

**Syntax** license update online

**Default** AlliedWare Plus devices do not automatically connect to the Download Center and check whether licenses are available. They only check when you run the **license update online** command.

**Mode** User Exec/Privileged Exec

**Usage notes** On VCStacks, running **license update online** updates all stack members. Each stack member individually checks for licenses on the Download Center and installs any that are found.

## Verifying the update

The update process normally takes approximately 5 seconds.

If the console does not respond for 10 or more seconds after typing the command, a network, routing or firewall configuration error is probably preventing the connection from establishing. If this happens, you can abort the command by pressing Ctrl-C, or wait for the command to time out after 30 seconds.

If the connection to the Download Centers fails and times out, an error message will be generated on the CLI to indicate the problem. If you abort the command, no error message is displayed.

If the update is successful, the device will produce log messages to say which features have had their licensing state updated (activated, deactivated, number of items changed, or expiry date changed). If the command completes successfully but there are no licenses available for the device, or no change in the licenses already on the device, no log messages will be produced.

You should also use the [show license external](#) command to confirm which licenses are active on the device after the update has been applied.

If [show license external](#) shows that the license entitlements are not from the stack member you expect, run the command [license redistribute](#) to re-synchronise the license entitlements.

**Example** To add a subscription license, use the command:

```
awplus# license update online
```

**Related commands** [show license external](#)

**Command changes** Version 5.4.6-2.1: command added

# show license external

**Overview** Use this command to show information about subscription (external) licenses.

For products with stacking, additional information may be displayed to indicate the source of the current feature entitlements. If this information indicates that a device is "NOT PRESENT", you need to take action as described in the warning in the output.

**Syntax** `show license external [stored]`

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stored    | Display all licenses that are on all stack members, including licenses that are not currently in use. Without this parameter, the output only displays licenses that are in use. In most situations, all licenses on the stack will be in use, so this parameter is only useful if the output of <b>show license external</b> does not include all the licenses that you expect to be present. |

**Mode** Privileged Exec

**Usage notes** If you subscribe to a feature on a VCStack, you only need to purchase a subscription license for one member of the stack. This command enables you to see which stack member you purchased the license for.

Subscription licenses are contained in a Capability Response File (CRF). When you load the license onto the stack, the software checks that the CRF is valid for one of the stack members (the "source stack member"). The software then applies the license entitlement to all members of the stack.

If you need to modify the license, for example to extend its expiry date, you need to know which stack member you purchased the license for. This lets you make sure you modify the source stack member's license, instead of accidentally creating a new license for a different stack member.

**Examples** To show information about what subscription features the device is licensed for, use the following command:

```
awplus#show license external
```

**Output** Figure 6-1: Example output from **show license external**, when an AMF master license was bought for stack member 2 and that stack member is still in the stack.

```
awplus#show license external

Features with installed entitlements:

AMF Master

 Sourced from: stack member 2, serial A04430H101200026

 Currently licensed: Yes
 Maximum AMF nodes: 20

 Start date: 25 Apr 2016 00:00
 Expiry date: 19 Apr 2017 23:59
 Maximum AMF nodes: 20

 Start date: 20 Apr 2017 00:00
 Expiry date: 20 Apr 2018 23:59
 Maximum AMF nodes: 50
```

Figure 6-2: Example output from **show license external**, when an AMF master license was bought for stack member 2 but that stack member has since left the stack.

```
awplus#show license external

Features with installed entitlements:

AMF Master

 Sourced from: stack member 2, serial A04430H101200026
 [NOT PRESENT]

 Currently licensed: Yes
 Maximum AMF nodes: 20

 Start date: 25 Apr 2016 00:00
 Expiry date: 19 Apr 2017 23:59
 Maximum AMF nodes: 20

 Start date: 20 Apr 2017 00:00
 Expiry date: 20 Apr 2018 23:59
 Maximum AMF nodes: 50

WARNING: The following features have license entitlements that were sourced
 from stack members that are no longer part of the stack. Upon reboot
 these entitlements will be lost. To avoid loss of functionality
 re-connect the device to the stack, or transfer the license to another
 stack member using the RMA feature on the Allied Telesis Download
 Center website.

AMF Master from stack member 2, serial A04430H101200026
```

# banner exec

**Overview** This command configures the User Exec mode banner that is displayed on the console after you login. The **banner exec default** command restores the User Exec banner to the default banner. Use the **no banner exec** command to disable the User Exec banner and remove the default User Exec banner.

**Syntax** banner exec <*banner-text*>  
banner exec default  
no banner exec

**Default** By default, the AlliedWare Plus™ version and build date is displayed at console login, such as:

```
AlliedWare Plus (TM) 5.5.0 04/05/20 12:00:00
```

**Mode** Global Configuration

**Examples** To configure a User Exec mode banner after login (in this example, to tell people to use the **enable** command to move to Privileged Exec mode), enter the following commands:

```
awplus#configure terminal
awplus(config)#banner exec Use enable to move to Priv Exec mode
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

Use enable to move to Priv Exec mode

awplus>
```

To restore the default User Exec mode banner after login, enter the following commands:

```
awplus#configure terminal
awplus(config)#banner exec default
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

AlliedWare Plus (TM) 5.5.0 04/05/20 12:00:00

awplus>
```

To remove the User Exec mode banner after login, enter the following commands:

```
awplus#configure terminal
awplus(config)#no banner exec
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

awplus>
```

**Related commands**   [banner login \(system\)](#)  
[banner motd](#)

## banner login (system)

**Overview** This command configures the login banner that is displayed on the console when you login. The login banner is displayed on all connected terminals. The login banner is displayed after the MOTD (Message-of-the-Day) banner and before the login username and password prompts.

Use the **no banner login** command to disable the login banner.

**Syntax** banner login  
no banner login

**Default** By default, no login banner is displayed at console login.

**Mode** Global Configuration

**Examples** To configure a login banner of "Authorised users only" to be displayed when you login, enter the following commands:

```
awplus#configure terminal
awplus(config)#banner login
Type CNTL/D to finish.

Authorised users only

awplus(config)#exit
awplus#exit

Authorised users only

awplus login: manager
Password:

AlliedWare Plus (TM) 5.5.0 04/05/20 12:00:00

awplus>
```

To remove the login banner, enter the following commands:

```
awplus#configure terminal
awplus(config)#no banner login
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

AlliedWare Plus (TM) 5.5.0 04/05/20 12:00:00

awplus>
```

**Related  
commands**   [banner exec](#)  
                  [banner motd](#)

# banner motd

**Overview** Use this command to create or edit the text MotD (Message-of-the-Day) banner displayed before login. The MotD banner is displayed on all connected terminals. The MotD banner is useful for sending messages that affect all network users, for example, any imminent system shutdowns.

Use the **no** variant of this command to delete the MotD banner.

**Syntax** banner motd *<motd-text>*  
no banner motd

| Parameter                | Description                                          |
|--------------------------|------------------------------------------------------|
| <i>&lt;motd-text&gt;</i> | The text to appear in the Message of the Day banner. |

**Default** By default, the device displays the AlliedWare Plus™ OS version and build date when you login.

**Mode** Global Configuration

**Examples** To configure a MotD banner of "System shutdown at 6pm today" to be displayed when you log in, enter the following commands:

```
awplus>enable
awplus#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
awplus(config)#banner motd System shutdown at 6pm today
awplus(config)#exit
awplus#exit

System shutdown at 6pm today
awplus login: manager
Password:

AlliedWare Plus (TM) 5.5.0 04/05/20 12:00:00

awplus>
```

To delete the login banner, enter the following commands:

```
awplus>enable
awplus#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
awplus(config)#no banner motd
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

AlliedWare Plus (TM) 5.5.0 04/05/20 12:00:00

awplus>
```

**Related  
commands**

[banner exec](#)

[banner login \(system\)](#)

# clock set

**Overview** This command sets the time and date for the system clock.

**Syntax** `clock set <hh:mm:ss> <day> <month> <year>`

| Parameter  | Description                                  |
|------------|----------------------------------------------|
| <hh:mm:ss> | Local time in 24-hour format                 |
| <day>      | Day of the current month, from 1 to 31       |
| <month>    | The first three letters of the current month |
| <year>     | Current year, from 2000 to 2035              |

**Mode** Privileged Exec

**Usage notes** Configure the timezone before setting the local time. Otherwise, when you change the timezone, the device applies the new offset to the local time.

**NOTE:** If Network Time Protocol (NTP) is enabled, then you cannot change the time or date using this command. NTP maintains the clock automatically using an external time source. If you wish to manually alter the time or date, you must first disable NTP.

**Example** To set the time and date on your system to 2pm on the 2nd of October 2016, use the command:

```
awplus# clock set 14:00:00 2 oct 2016
```

**Related commands** [clock timezone](#)

# clock summer-time date

**Overview** This command defines the start and end of summertime for a specific year only, and specifies summertime's offset value to Standard Time for that year.

The **no** variant of this command removes the device's summertime setting. This clears both specific summertime dates and recurring dates (set with the [clock summer-time recurring](#) command).

By default, the device has no summertime definitions set.

**Syntax** `clock summer-time <timezone-name> date <start-day> <start-month> <start-year> <start-time> <end-day> <end-month> <end-year> <end-time> <1-180>`  
`no clock summer-time`

| Parameter       | Description                                                                         |
|-----------------|-------------------------------------------------------------------------------------|
| <timezone-name> | A description of the summertime zone, up to 6 characters long.                      |
| date            | Specifies that this is a date-based summertime setting for just the specified year. |
| <start-day>     | Day that the summertime starts, from 1 to 31.                                       |
| <start-month>   | First three letters of the name of the month that the summertime starts.            |
| <start-year>    | Year that summertime starts, from 2000 to 2035.                                     |
| <start-time>    | Time of the day that summertime starts, in the 24-hour time format HH:MM.           |
| <end-day>       | Day that summertime ends, from 1 to 31.                                             |
| <end-month>     | First three letters of the name of the month that the summertime ends.              |
| <end-year>      | Year that summertime ends, from 2000 to 2035.                                       |
| <end-time>      | Time of the day that summertime ends, in the 24-hour time format HH:MM.             |
| <1-180>         | The offset in minutes.                                                              |

**Mode** Global Configuration

**Examples** To set a summertime definition for New Zealand using NZST (UTC+12:00) as the standard time, and NZDT (UTC+13:00) as summertime, with the summertime set to begin on the 25th of September 2016 and end on the 2nd of April 2017:

```
awplus(config)# clock summer-time NZDT date 25 sep 2:00 2016 2
apr 2:00 2017 60
```

To remove any summertime settings on the system, use the command:

```
awplus(config)# no clock summer-time
```

**Related  
commands** [clock summer-time recurring](#)  
[clock timezone](#)

# clock summer-time recurring

**Overview** This command defines the start and end of summertime for every year, and specifies summertime's offset value to Standard Time.

The **no** variant of this command removes the device's summertime setting. This clears both specific summertime dates (set with the [clock summer-time date](#) command) and recurring dates.

By default, the device has no summertime definitions set.

**Syntax** clock summer-time <timezone-name> recurring <start-week>  
<start-day> <start-month> <start-time> <end-week> <end-day>  
<end-month> <end-time> <1-180>  
  
no clock summer-time

| Parameter       | Description                                                                                                                                                                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <timezone-name> | A description of the summertime zone, up to 6 characters long.                                                                                                                                                                                                                |
| recurring       | Specifies that this summertime setting applies every year from now on.                                                                                                                                                                                                        |
| <start-week>    | Week of the month when summertime starts, in the range 1-5. The value 5 indicates the last week that has the specified day in it for the specified month. For example, to start summertime on the last Sunday of the month, enter 5 for <start-week> and sun for <start-day>. |
| <start-day>     | Day of the week when summertime starts. Valid values are mon, tue, wed, thu, fri, sat or sun.                                                                                                                                                                                 |
| <start-month>   | First three letters of the name of the month that summertime starts.                                                                                                                                                                                                          |
| <start-time>    | Time of the day that summertime starts, in the 24-hour time format HH:MM.                                                                                                                                                                                                     |
| <end-week>      | Week of the month when summertime ends, in the range 1-5. The value 5 indicates the last week that has the specified day in it for the specified month. For example, to end summertime on the last Sunday of the month, enter 5 for <end-week> and sun for <end-day>.         |
| <end-day>       | Day of the week when summertime ends. Valid values are mon, tue, wed, thu, fri, sat or sun.                                                                                                                                                                                   |
| <end-month>     | First three letters of the name of the month that summertime ends.                                                                                                                                                                                                            |
| <end-time>      | Time of the day that summertime ends, in the 24-hour time format HH:MM.                                                                                                                                                                                                       |
| <1-180>         | The offset in minutes.                                                                                                                                                                                                                                                        |

**Mode** Global Configuration

**Examples** To set a summertime definition for New Zealand using NZST (UTC+12:00) as the standard time, and NZDT (UTC+13:00) as summertime, with summertime set to start on the last Sunday in September, and end on the 1st Sunday in April, use the command:

```
awplus(config)# clock summer-time NZDT recurring 5 sun sep 2:00
1 sun apr 2:00 60
```

To remove any summertime settings on the system, use the command:

```
awplus(config)# no clock summer-time
```

**Related commands** [clock summer-time date](#)  
[clock timezone](#)

# clock timezone

**Overview** This command defines the device's clock timezone. The timezone is set as a offset to the UTC.

The **no** variant of this command resets the system time to UTC.

By default, the system time is set to UTC.

**Syntax** `clock timezone <timezone-name> {minus|plus}  
[<0-13>|<0-12>:<00-59>]  
no clock timezone`

| Parameter       | Description                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <timezone-name> | A description of the timezone, up to 6 characters long.                                                                                                                  |
| minusorplus     | The direction of offset from UTC. The <b>minus</b> option indicates that the timezone is behind UTC. The <b>plus</b> option indicates that the timezone is ahead of UTC. |
| <0-13>          | The offset in hours or from UTC.                                                                                                                                         |
| <0-12>:<00-59>  | The offset in hours or from UTC.                                                                                                                                         |

**Mode** Global Configuration

**Usage notes** Configure the timezone before setting the local time. Otherwise, when you change the timezone, the device applies the new offset to the local time.

**Examples** To set the timezone to New Zealand Standard Time with an offset from UTC of +12 hours, use the command:

```
awplus(config)# clock timezone NZST plus 12
```

To set the timezone to Indian Standard Time with an offset from UTC of +5:30 hours, use the command:

```
awplus(config)# clock timezone IST plus 5:30
```

To set the timezone back to UTC with no offsets, use the command:

```
awplus(config)# no clock timezone
```

**Related commands** [clock set](#)  
[clock summer-time date](#)  
[clock summer-time recurring](#)

# continuous-reboot-prevention

**Overview** Use this command to enable and to configure the continuous reboot prevention feature. Continuous reboot prevention allows the user to configure the time period during which reboot events are counted, the maximum number of times the switch can reboot within the specified time period, referred to as the threshold, and the action to take if the threshold is exceeded.

Use the **no** variant of this command to disable the continuous reboot prevention feature or to return the **period**, **threshold** and **action** parameters to the defaults.

**Syntax** continuous-reboot-prevention enable  
continuous-reboot-prevention [period <0-604800>] [threshold <1-10>] [action [linkdown|logonly|stopreboot]]  
no continuous-reboot-prevention enable  
no continuous-reboot-prevention [period] [threshold] [action]}

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable    | Enable the continuous reboot prevention feature.                                                                                                                                                                                                                                                                                                                                                                                                 |
| period    | Set the period of time in which reboot events are counted.<br><0-604800> Period value in seconds. The default is 600.                                                                                                                                                                                                                                                                                                                            |
| threshold | Set the maximum number of reboot events allowed in the specified period.<br><1-10> Threshold value. The default is 1.                                                                                                                                                                                                                                                                                                                            |
| action    | Set the action taken if the threshold is exceeded.<br>linkdown Reboot procedure continues and all switch ports and stack ports stay link-down. The reboot event is logged. This is the default action.<br>logonly Reboot procedure continues normally and the reboot event is logged.<br>stopreboot Reboot procedure stops until the user enters the key "c" via the CLI. Normal reboot procedure then continues and the reboot event is logged. |

**Default** Continuous reboot prevention is disabled by default. The default period value is 600, the default threshold value is 1 and the default action is linkdown.

**Mode** Global Configuration

**Usage notes** Note that user-initiated reboots via the CLI, and software version auto-synchronization reboots, are not counted toward the threshold value.

**Examples** To enable continuous reboot prevention, use the commands:

```
awplus# configure terminal
awplus(config)# continuous-reboot-prevention enable
```

To set the period to 500 and action to stopreboot, use the commands:

```
awplus# configure terminal
awplus(config)# continuous-reboot-prevention period 500 action
stopreboot
```

To return the period and action to the defaults and keep the continuous reboot prevention feature enabled, use the commands:

```
awplus# configure terminal
awplus(config)# no continuous-reboot-prevention period action
```

To disable continuous reboot prevention, use the commands:

```
awplus# configure terminal
awplus(config)# no continuous-reboot-prevention enable
```

# crypto secure-mode

**Overview** Use this command to put the device into Secure Mode. When in Secure Mode, the following are disabled:

- Telnet
- SSHv1
- SNMPv1/v2
- All privilege levels except 1 and 15
- Algorithms that are not supported under FIPS, including MD5, RSA-1 and DSA
- The ability to store passwords in cleartext and to specify an **enable** password.

In Secure Mode, the web server on the device (used by the Device GUI) only accepts AES128-SHA ciphers.

*Note: Stacking is not supported in Secure Mode.*

Use the **no** variant of this command to leave Secure Mode. You should delete all sensitive information first; see the ["Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide](#).

**Syntax** `crypto secure-mode`  
`no crypto secure-mode`

**Default** By default, the device is not in Secure Mode.

**Mode** Global Configuration

**Example** For step-by-step instructions about how to enter and leave Secure Mode, see "How to Enable Secure Mode" in the ["Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide](#).

**Related commands** [boot system](#)

**Command changes** Version 5.4.6-1.1: command added to x930 Series  
Version 5.4.8-1.2: command added to x220, XS900MX, x550 Series  
Version 5.4.8-2.1: command added to SBx908 GEN2, x950 Series

# debug core-file

**Overview** Use this command to enable the generation of crash core files.  
Use the **no** variant of this command to disable the generation of crash core files.

**Syntax** debug core-file  
no debug core-file

**Default** Enabled.

**Mode** Global Configuration

**Usage notes** Core files may contain raw memory content. This may not be acceptable in a security certified network. Use the **no debug core-file** command to prevent such core files from being generated.

**Example** To prevent the generation of core files, use the commands:

```
awplus# configure terminal
awplus(config)# no debug core-file
```

**Related commands** [show system](#)

**Command changes** Version 5.4.9-1.0: command added

# ecofriendly led

**Overview** Use this command to enable the eco-friendly LED (Light Emitting Diode) feature which turns off power to the port LEDs. In addition, only one segment of the seven segment LED is lit - the top segment if the switch is the VCStack master, the bottom if it is a VCStack member and the middle if it is a standalone switch.

You can also use the front-panel eco-switch button to enable or disable the eco-friendly feature. Using this button overrides the configuration set with the **ecofriendly led** command.

Use the **no** variant of this command to disable the eco-friendly LED feature.

**Syntax** `ecofriendly led`  
`no ecofriendly led`

**Default** The eco-friendly LED feature is disabled by default.

**Mode** Global Configuration

**Usage notes** When the eco-friendly LED feature is enabled, a change in port status will not affect the display of the associated LED. When the eco-friendly LED feature is disabled and power is returned to port LEDs, the LEDs will correctly show the current state of the ports.

In a stacked environment, enabling the eco-friendly LED feature on the stack master will apply the feature to every member of the stack.

For an example of how to configure a trigger to turn off power to port LEDs, see the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To enable the eco-friendly LED feature which turns off power to all port LEDs, use the following commands:

```
awplus# configure terminal
awplus(config)# ecofriendly led
```

To disable the eco-friendly LED feature, use the following command:

```
awplus# configure terminal
awplus(config)# no ecofriendly led
```

**Related commands** [ecofriendly lpi](#)  
[show ecofriendly](#)

## ecofriendly lpi

Use this command to conserve power by enabling the eco-friendly LPI (Low Power Idle) feature. This feature reduces the power supplied to the ports by the switch whenever the ports are idle and are connected to IEEE 802.3az Energy Efficient Ethernet compliant host devices.

LPI is a feature of the IEEE 802.3az Energy Efficient Ethernet (EEE) standard. LPI lowers power consumption of switch ports during periods of low link utilization when connected to IEEE 802.3az compliant host devices. If no data is sent then the switch port can enter a sleep state, called Low Power Idle (LPI), to conserve power used by the switch.

Use the **no** variant of this command to disable the eco-friendly LPI feature.

**Syntax**    `ecofriendly lpi`  
             `no ecofriendly lpi`

**Default**    The eco-friendly LPI feature is disabled by default.

**Mode**       Interface Configuration for a switch port, or Interface Configuration for a range of switch ports.

**Usage notes**    For an example of how to configure a trigger to enable the eco-friendly LPI feature, see the [Triggers Feature Overview and Configuration Guide](#).

All ports configured for LPI must support LPI in hardware and must be configured to auto negotiate by default or by using the [speed](#) and [duplex](#) commands as needed.

**Examples**    To enable the eco-friendly LPI feature on a switch port, port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# ecofriendly lpi
```

To enable the eco-friendly LPI feature on a range of switch ports, port1.0.2-port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.4
awplus(config-if)# ecofriendly lpi
```

To disable the eco-friendly feature on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no ecofriendly lpi
```

**Related commands**

# findme

**Overview** Use this command to physically locate a specific device from a group of similar devices. Activating the command causes a selected number of port LEDs to alternately flash green then amber (if that device has amber LEDs) at a rate of 1 Hz.

Use the **no** variant of this command to deactivate the Find Me feature prior to the timeout expiring.

**Syntax** findme [interface <port-list>|member <stack-ID>] [timeout <duration>]  
no findme

| Parameter             | Description                                                                                                                                                                                                                                                                                            |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface <port-list> | The ports to flash. The port list can be: <ul style="list-style-type: none"><li>• a switch port, e.g. port1.0.4</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-1.0.4</li><li>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.5-1.0.6.</li></ul> |
| member <stack-ID>     | Stack member number, from 1 to 8.                                                                                                                                                                                                                                                                      |
| timeout <duration>    | How long the LEDs flash, in seconds, in the range 5 to 3600 seconds.                                                                                                                                                                                                                                   |

**Default** By default all port LEDs flash for 60 seconds.

**Mode** Privileged Exec

**Usage notes** Running the **findme** command causes the device's port LEDs to flash. An optional **timeout** parameter specifies the flash behavior duration. Normal LED behavior is restored automatically after either the default time, or a specified time has elapsed, or a **no findme** command is used. You can specify which interface or interfaces are flashed with the optional **interface** parameter.

You can specify a particular stack member with the optional **member** parameter. All available interfaces are flashed by default.

**NOTE:** The **interface** and **member** parameters are mutually exclusive.

**Example** To activate the Find Me feature for the default duration (60 seconds) on all ports, use the following command:

```
awplus# findme
```

To activate the Find Me feature for 120 seconds on all ports, use the following command:

```
awplus# findme timeout 120
```

To activate the Find Me feature for the default duration (60 seconds) on switch port interfaces port1.0.2 through port1.0.4, use the following command:

```
awplus# findme interface port1.0.2-1.0.4
```

In the example above, ports 2 to 4 will flash 4 times and then all ports will flash twice. Each alternate flash will be amber (if that device has amber LEDs). This pattern will repeat until **timeout** (default or set) or **no findme** commands are used.

To deactivate the Find Me feature, use the following command:

```
awplus# no findme
```

To activate the Find Me feature for the default duration on stack member 2, use the following command:

```
awplus# findme member 2
```

In the example above, all ports on member 2 will flash 4 times and then all ports in the stack will flash twice. Each alternate flash will be amber (if that device has amber LEDs). This pattern will repeat until the timeout (default or set) expires or the **no findme** command is used.

# findme trigger

**Overview** When this command is enabled, the LED flashing functionality of the **find-me** command is applied whenever any or all of the selected parameter conditions is detected.

Use the **no** variant to remove the findme trigger function for the selected parameter.

**Syntax** `findme trigger {all|loopprot|thrash-limit|qsp}`  
`no findme trigger {all|loopprot|thrash-limit|qsp}`

| Parameter    | Description                                                                              |
|--------------|------------------------------------------------------------------------------------------|
| all          | Enable the find-me function whenever any of the listed parameter conditions are detected |
| loopprot     | Enable the findme function whenever a loop protection condition is detected.             |
| thrash-limit | Enable the findme function whenever a MAC address thrash-limiting condition is detected. |
| qsp          | Enable the findme function whenever a QoS Storm Protection condition is detected.        |

**Default** The findme trigger function is disabled.

**Mode** Global config

**Usage notes** Note that findme trigger is not available if you have set the switch to take the following actions in response to an event:

- For loop detection, the actions **log-only** and **none**
- For MAC address thrash-limiting, the actions **learn-disable** and **none**.

**Example** To enable action LED flashing for the loop protection function:

```
awplus# findme trigger loopprot
```

**Related commands** [findme](#)  
[loop-protection loop-detect](#)  
[storm-protection](#)

# hostname

**Overview** This command sets the name applied to the device as shown at the prompt. The hostname is:

- displayed in the output of the [show system](#) command
- displayed in the CLI prompt so you know which device you are configuring
- stored in the MIB object sysName

Use the **no** variant of this command to revert the hostname setting to its default. For devices that are not part of an AMF network, the default is "awplus".

**Syntax** `hostname <hostname>`  
`no hostname [<hostname>]`

| Parameter                     | Description                                                                                                     |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>&lt;hostname&gt;</code> | Specifies the name given to a specific device. This is also referred to as the Node name in AMF output screens. |

**Default** awplus

**Mode** Global Configuration

**Usage notes** On a stack, in a network that is not running AMF, the stack master will have a host name of "awplus" by default, and this also becomes the name of the stack. Individual stack members (excluding the master) will have a host name that is the stack name hyphenated with a numeric suffix. For example, "awplus-1", "awplus-2" and so on.

The **hostname** command can then be used to change the stack name and the stack master's host name. For example, for the hostname "Lab", the stack master's host name will be "Lab" and the other stack members will have host names "Lab-1", "Lab-2" and so on.

In case of stack master fail-over, or stack split, the new stack will use the previous stack name as its host name and the stack name, unless you change it by executing the **hostname** command on the new stack master.

Within an AMF network, any device without a user-defined hostname will automatically be assigned a name based on its MAC address.

To efficiently manage your network using AMF, we strongly advise that you devise a naming convention for your network devices and apply an appropriate hostname to each device.

The name must also follow the rules for ARPANET host names. The name must start with a letter, end with a letter or digit, and use only letters, digits, and hyphens. Refer to RFC 1035.

**Example** To set the system name to HQ-Sales, use the command:

```
awplus# configure terminal
awplus(config)# hostname HQ-Sales
```

This changes the prompt to:

```
HQ-Sales(config)#
```

To revert to the default hostname awplus, use the command:

```
HQ-Sales(config)# no hostname
```

This changes the prompt to:

```
awplus(config)#
```

**NOTE:** When AMF is configured, running the **no hostname** command will apply a hostname that is based on the MAC address of the device node, for example, **node\_0000\_5e00\_5301**.

**Related commands** [show system](#)

# max-fib-routes

**Overview** This command enables you to control the maximum number of FIB routes configured. It operates by providing parameters that enable you to configure preset maximums and warning message thresholds.

**NOTE:** When using VRF-lite, this command applies to the Global VRF instance; to set the max-fib-routes for a user-defined VRF instance use the [max-fib-routes \(VRF\)](#) command. For static routes use the [max-static-routes](#) command for the Global VRF instance and the [max-static-routes \(VRF\)](#) command for a user-defined VRF instance.

Use the **no** variant of this command to set the maximum number of FIB routes to the default of 4294967294 FIB routes.

**Syntax** max-fib-routes <1-4294967294> [<1-100>|warning-only]  
no max-fib-routes

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| max-fib-routes | This is the maximum number of routes that can be stored in the device's Forwarding Information dataBase. In practice, other practical system limits would prevent this maximum being reached.                                                                                                                                                |
| <1-4294967294> | The allowable configurable range for setting the maximum number of FIB-routes.                                                                                                                                                                                                                                                               |
| <1-100>        | This parameter enables you to optionally apply a percentage value. This percentage will be based on the maximum number of FIB routes you have specified. This will cause a warning message to appear when your routes reach your specified percentage value. Routes can continue to be added until your configured maximum value is reached. |
| warning-only   | This parameter enables you to optionally apply a warning message. If you set this option a warning message will appear if your maximum configured value is reached. Routes can continue to be added until your device reaches either the maximum capacity value of 4294967294, or a practical system limit.                                  |

**Default** The default number of FIB routes is the maximum number of FIB routes (4294967294).

**Mode** Global Configuration

**Examples** To set the maximum number of dynamic routes to 2000 and warning threshold of 75%, use the following commands:

```
awplus# config terminal
awplus(config)# max-fib-routes 2000 75
```

**Related  
commands** [max-fib-routes \(VRF\)](#)

# max-static-routes

**Overview** Use this command to set the maximum number of static routes, excluding FIB (Forwarding Information Base) routes.

**NOTE:** For FIB routes use the [max-fib-routes](#) command.

Use the **no** variant of this command to set the maximum number of static routes to the default of 1000 static routes.

**Syntax** max-static-routes <1-1000>  
no max-static-routes

**Default** The default number of static routes is the maximum number of static routes (1000).

**Mode** Global Configuration

**Example** To reset the maximum number of static routes to the default maximum, use the command:

```
awplus# configure terminal
awplus(config)# no max-static-routes
```

**NOTE:** Static routes are applied before adding routes to the RIB (Routing Information Base). Therefore, rejected static routes will not appear in the running config.

**Related commands** [max-fib-routes](#)

# no debug all

**Overview** This command disables the debugging facility for all features on your device. This stops the device from generating any diagnostic debugging messages.

You can optionally disable the debugging facility for only the given protocol or feature. The features available depend on your device and will be a subset of the features listed in the Syntax section below.

**Syntax** no debug all [bgp|ipv6 ospf|ipv6 rip|dot1x|nsm|ospf|pim  
dense-mode|pim sparse-mode|rip|vrrp]

| Parameter       | Description                                                                   |
|-----------------|-------------------------------------------------------------------------------|
| bgp             | Turns off all debugging for BGP (Border Gateway Protocol).                    |
| dot1x           | Turns off all debugging for IEEE 802.1X port-based network access- control.   |
| ipv6 ospf       | Turns off all debugging for IPv6 OSPF (Open Shortest Path First).             |
| ipv6 rip        | Turns off all debugging for IPv6 RIP (Routing Information Protocol).          |
| nsm             | Turns off all debugging for the NSM (Network Services Module).                |
| ospf            | Turns off all debugging for OSPF (Open Shortest Path First).                  |
| pim dense-mode  | Turns off all debugging for PIM (Protocol Independent Multicast) Dense Mode.  |
| pim sparse-mode | Turns off all debugging for PIM (Protocol Independent Multicast) Sparse Mode. |
| rip             | Turns off all debugging for RIP (Routing Information Protocol).               |
| vrrp            | Turns off all debugging for VRRP (Virtual Router Redundancy Protocol).        |

**Default** Disabled

**Mode** Global Configuration and Privileged Exec

**Example** To disable debugging for all features, use the command:

```
awplus# no debug all
```

To disable all BGP debugging, use the command:

```
awplus# no debug all bgp
```

To disable all 802.1X debugging, use the command:

```
awplus# no debug all dot1x
```

To disable all NSM debugging, use the command:

```
awplus# no debug all nsm
```

To disable all OSPF debugging, use the command:

```
awplus# no debug all ospf
```

To disable all PIM Dense Mode debugging, use the command:

```
awplus# no debug all pim dense-mode
```

To disable all PIM Sparse Mode debugging, use the command:

```
awplus# no debug all pim sparse-mode
```

To disable all RIP debugging, use the command:

```
awplus# no debug all rip
```

To disable all VRRP debugging, use the command:

```
awplus# no debug all vrrp
```

**Related  
commands** [undebug all](#)

**Command  
changes** Version 5.4.7-1.1: **pim dense-mode**, **pim sparse-mode**, and **rip** parameters added

# reboot

**Overview** This command halts the device and performs a cold restart (also known as reload). It displays a confirmation request before restarting.

You can reboot a stand-alone device, a stack, or a specified stack member.

**Syntax** `reboot [<stack-ID>]`  
`reload [<stack-ID>]`

| Parameter  | Description                       |
|------------|-----------------------------------|
| <stack-ID> | Stack member number, from 1 to 8. |

**Mode** Privileged Exec

**Usage notes** The **reboot** and **reload** commands perform the same action.

When restarting the whole stack, you can either use this **reboot** command to reboot all stack members immediately, or to minimize downtime, reboot the stack members in a rolling sequence by using the [reboot rolling](#) command.

**Examples** To restart a stand-alone device, use the command:

```
awplus# reboot
reboot system? (y/n): y
```

To restart all devices in a stack, use the command:

```
awplus# reboot
Are you sure you want to reboot the whole
stack? (y/n): y
```

To restart stack member 2, use the command:

```
awplus# reboot stack-member 2
reboot stack-member 2 system? (y/n): y
```

If the specified stack member ID does not exist in the current stack, the command is rejected.

**Related commands** [reboot rolling](#)  
[reload rolling](#)

# reload

**Overview** This command performs the same function as the [reboot](#) command.

# show clock

**Overview** This command displays the system's current configured local time and date. It also displays other clock related information such as timezone and summertime configuration.

**Syntax** show clock

**Mode** User Exec and Privileged Exec

**Example** To display the system's current local time, use the command:

```
awplus# show clock
```

**Output** Figure 7-1: Example output from the **show clock** command for a device using New Zealand time

```
Local Time: Mon, 17 Oct 2016 13:56:06 +1200
UTC Time: Mon, 17 Oct 2016 01:56:06 +0000
Timezone: NZST
Timezone Offset: +12:00
Summer time zone: NZDT
Summer time starts: Last Sunday in September at 02:00:00
Summer time ends: First Sunday in April at 02:00:00
Summer time offset: 60 mins
Summer time recurring: Yes
```

**Table 1:** Parameters in the output of the **show clock** command

| Parameter             | Description                                                                     |
|-----------------------|---------------------------------------------------------------------------------|
| Local Time            | Current local time.                                                             |
| UTC Time              | Current UTC time.                                                               |
| Timezone              | The current configured timezone name.                                           |
| Timezone Offset       | Number of hours offset to UTC.                                                  |
| Summer time zone      | The current configured summertime zone name.                                    |
| Summer time starts    | Date and time set as the start of summer time.                                  |
| Summer time ends      | Date and time set as the end of summer time.                                    |
| Summer time offset    | Number of minutes that summer time is offset from the system's timezone.        |
| Summer time recurring | Whether the device will apply the summer time settings every year or only once. |

# show continuous-reboot-prevention

**Overview** This command displays the current continuous reboot prevention configuration.

**Syntax** `show continuous-reboot-prevention`

**Mode** User Exec and Privileged Exec

**Examples** To show the current continuous reboot prevention configuration, use the command:

```
awplus# show continuous-reboot-prevention
```

**Output** Figure 7-2: Example output from the **show continuous-reboot-prevention** command

```

Continuous reboot prevention

status=disabled
period=600
threshold=1
action=linkdown

```

**Related commands** [continuous-reboot-prevention](#)  
[show reboot history](#)

# show cpu

**Overview** This command displays a list of running processes with their CPU utilization. For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show cpu [<stack-ID>] [sort {thrds|pri|sleep|runtime}]`

| Parameter  | Description                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <stack-ID> | Stack member number, from 1 to 8.                                                                                                           |
| sort       | Changes the sorting order using the following fields. If you do not specify a field, then the list is sorted by percentage CPU utilization. |
|            | thrds      Sort by the number of threads.                                                                                                   |
|            | pri        Sort by the process priority.                                                                                                    |
|            | sleep      Sort by the average time sleeping.                                                                                               |
|            | runtime    Sort by the runtime of the process.                                                                                              |

**Mode** User Exec and Privileged Exec

**Examples** To show the CPU utilization of current processes, sorting them by the number of threads the processes are using, use the command:

```
awplus# show cpu sort thrds
```

To show CPU utilization for a specific stack member (in this example stack member 2), use the following command:

```
awplus# show cpu 2
```

**Output** Figure 7-3: Example output from **show cpu**

```
Stack member 2:

CPU averages:
 1 second: 12%, 20 seconds: 2%, 60 seconds: 2%
System load averages:
 1 minute: 0.03, 5 minutes: 0.02, 15 minutes: 0.00

**Table 2:** Parameters in the output of the **show cpu** command

| Parameter            | Description                                                                  |
|----------------------|------------------------------------------------------------------------------|
| Stack member         | Stack member number.                                                         |
| CPU averages         | Average CPU utilization for the periods stated.                              |
| System load averages | The average number of processes waiting for CPU time for the periods stated. |
| Current CPU load     | Current CPU utilization specified by load types.                             |
| pid                  | Identifier number of the process.                                            |
| name                 | A shortened name for the process                                             |
| thrds                | Number of threads in the process.                                            |
| cpu%                 | Percentage of CPU utilization that this process is consuming.                |
| pri                  | Process priority state.                                                      |

**Table 2:** Parameters in the output of the **show cpu** command (cont.)

| Parameter | Description                                                                                                                             |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------|
| state     | Process state; one of "run", "sleep", "zombie", and "dead".                                                                             |
| sleep%    | Percentage of time that the process is in the sleep state.                                                                              |
| runtime   | The time that the process has been running for, measured in jiffies. A jiffy is the duration of one tick of the system timer interrupt. |

commands**

[show memory](#)  
[show memory allocations](#)  
[show memory history](#)  
[show memory pools](#)  
[show process](#)

# show cpu history

**Overview** This command prints a graph showing the historical CPU utilization.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show [*<stack-ID>*] cpu history

| Parameter               | Description                       |
|-------------------------|-----------------------------------|
| <i>&lt;stack-ID&gt;</i> | Stack member number, from 1 to 8. |

**Mode** User Exec and Privileged Exec

**Usage notes** This command’s output displays three graphs of the percentage CPU utilization:

- per second for the last minute, then
- per minute for the last hour, then
- per 30 minutes for the last 30 hours.

If this command is entered on the stack master, it will print graphs for all the stack members. A stack member heading will be displayed to distinguish the different graphs for every stack member.

**Examples** To display a graph showing the historical CPU utilization of the device, use the command:

```
awplus# show cpu history
```

To display the CPU utilization history graph for stack member 2, use the command:

```
awplus# show 2 cpu history
```

where 2 is the node ID of the stack member.

**Output** Figure 7-4: Example output from the **show cpu history** command

port1.0.6 Port 6 off off
port1.0.7 off -
port1.0.8 off -
port1.0.9 off -
port1.0.10 off -
...
```

**Table 3:** Parameters in the output of the **show ecofriendly** command

| Parameter                                                | Description                                                                                                                                                                                                      |
|----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| normal                                                   | The eco-friendly LED feature is disabled and port LEDs show the current state of the ports. This is the default setting.                                                                                         |
| off                                                      | The eco-friendly LED feature is enabled and power to the port LEDs is disabled.                                                                                                                                  |
| normal<br>(configuration<br>overridden by eco<br>button) | The eco-friendly LED feature has been disabled with the eco-switch button, overriding the configuration set with the <a href="#">ecofriendly led</a> command. The port LEDs show the current state of the ports. |

**Table 3:** Parameters in the output of the **show ecofriendly** command (cont.)

| Parameter                                    | Description                                                                                                                                                                                      |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| off (configuration overridden by eco button) | The eco-friendly LED feature has been enabled with the eco-switch button, overriding the configuration set with the <a href="#">ecofriendly led</a> command. Power to the port LEDs is disabled. |
| Port                                         | Displays the port number as assigned by the switch.                                                                                                                                              |
| Name                                         | Displays the port name if a name is configured for a port number.                                                                                                                                |
| Configured                                   | The eco-friendly LPI feature is configured on the port. Either LPI or off is displayed.                                                                                                          |
| Status                                       | The eco-friendly LPI feature is active on the port. Either LPI or off is displayed. Ports that are not running show a dash (-).                                                                  |

**Related commands** [ecofriendly led](#)  
[ecofriendly lpi](#)

# show interface memory

**Overview** This command displays the shared memory used by either all interfaces, or the specified interface or interfaces. The output is useful for diagnostic purposes by Allied Telesis authorized service personnel.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show interface memory  
show interface <port-list> memory

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port-list> | Display information about only the specified port or ports. The port list can be: <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)</li><li>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list.</li></ul> |

**Mode** User Exec and Privileged Exec

**Example** To display the shared memory used by all interfaces, use the command:

```
awplus# show interface memory
```

To display the shared memory used by port1.0.1 and port1.0.3 to port1.0.4, use the command:

```
awplus# show interface port1.0.1,port1.0.3-port1.0.4 memory
```

**Output** Figure 7-7: Example output from the **show interface memory** command

|                                         |         |            |        |        |

[show interface status](#)

[show interface switchport](#)

# show memory

**Overview** This command displays the memory used by each process that is currently running.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show memory [<stack-ID>] [sort {size|peak|stk}]

| Parameter  | Description                                                                                                                                |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <stack-ID> | Stack member number, from 1 to 8.                                                                                                          |
| sort       | Changes the sorting order for the list of processes. If you do not specify this, then the list is sorted by percentage memory utilization. |
|            | size Sort by the amount of memory the process is currently using.                                                                          |
|            | peak Sort by the amount of memory the process is currently using.                                                                          |
|            | stk Sort by the stack size of the process.                                                                                                 |

**Mode** User Exec and Privileged Exec

**Example** To display the memory used by the current running processes, use the command:

```
awplus# show memory
```

**Output** Figure 7-9: Example output from **show memory**

```
awplus#show memory

Stack member 1:

RAM total: 514920 kB; free: 382716; buffers: 16368 kB

...
```

**Table 4:** Parameters in the output of the **show memory** command

| Parameter    | Description                                                      |
|--------------|------------------------------------------------------------------|
| Stack member | Stack member number.                                             |
| RAM total    | Total amount of RAM memory free.                                 |
| free         | Available memory size.                                           |
| buffers      | Memory allocated kernel buffers.                                 |
| pid          | Identifier number for the process.                               |
| name         | Short name used to describe the process.                         |
| mem%         | Percentage of memory utilization the process is currently using. |
| size         | Amount of memory currently used by the process.                  |
| peak         | Greatest amount of memory ever used by the process.              |
| data         | Amount of memory used for data.                                  |
| stk          | The stack size.                                                  |

**Related commands**

- [show memory history](#)
- [show memory pools](#)
- [show memory shared](#)

# show memory allocations

**Overview** This command displays the memory allocations used by processes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show memory allocations [<process>]

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| <process> | Displays the memory allocation used by the specified process. |

**Mode** User Exec and Privileged Exec

**Example** To display the memory allocations used by all processes on your device, use the command:

```
awplus# show memory allocations
```

**Output** Figure 7-10: Example output from the **show memory allocations** command

```
awplus#show memory allocations
Memory allocations for imi

Current 15093760 (peak 15093760)

Statically allocated memory:
- binary/exe : 1675264
- libraries : 8916992
- bss/global data : 2985984
- stack : 139264

Dynamically allocated memory (heap):
- total allocated : 1351680
- in use : 1282440
- non-mmapped : 1351680
- maximum total allocated : 1351680
- total free space : 69240
- releasable : 68968
- space in freed fastbins : 16

Context
 filename:line allocated freed
+ lib.c:749 484
.
.
.
```

**Related  
commands**

- show memory
- show memory history
- show memory pools
- show memory shared
- show tech-support

# show memory history

**Overview** This command prints a graph showing the historical memory usage.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show memory history [<stack-ID>]

| Parameter  | Description                       |
|------------|-----------------------------------|
| <stack-ID> | Stack member number, from 1 to 8. |

**Mode** User Exec and Privileged Exec

**Usage notes** This command’s output displays three graphs of the percentage memory utilization:

- per second for the last minute, then
- per minute for the last hour, then
- per 30 minutes for the last 30 hours.

**Examples** To show a graph displaying the historical memory usage for either a single unstacked device, or a complete stack, use the command:

```
awplus# show memory history
```

To show a graph displaying the historical memory usage for specific stack member (stack member 2 in this example) within a stack, use the command:

```
awplus# show memory history 2
```

**Output** Figure 7-11: Example output from the **show memory history** command

**Related commands**

- show memory allocations
- show memory pools
- show memory shared
- show tech-support

# show memory pools

**Overview** This command shows the memory pools used by processes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show memory pools [<process>]

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| <process> | Displays the memory pools used by the specified process. |

**Mode** User Exec and Privileged Exec

**Example** To show the memory pools used by processes, use the command:

```
awplus# show memory pools
```

**Output** Figure 7-12: Example output from the **show memory pools** command

```
awplus#show memory pools
Memory pools for imi

Current 15290368 (peak 15290368)

Statically allocated memory:
- binary/exe : 1675264

# show memory shared

**Overview** This command displays shared memory allocation information. The output is useful for diagnostic purposes by Allied Telesis authorized service personnel.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show memory shared

**Mode** User Exec and Privileged Exec

**Example** To display information about the shared memory allocation used on the device, use the command:

```
awplus# show memory shared
```

**Output** Figure 7-13: Example output from the **show memory shared** command

```
awplus#show memory shared
Shared Memory Status

Segment allocated = 39
Pages allocated = 39
Pages resident = 11

Shared Memory Limits

Maximum number of segments = 4096
Maximum segment size (kbytes) = 32768
Maximum total shared memory (pages) = 2097152
Minimum segment size (bytes) = 1
```

**Related commands**

- [show memory allocations](#)
- [show memory history](#)
- [show memory](#)

# show process

**Overview** This command lists a summary of the current running processes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show process [*<stack-ID>*] [sort {cpu|mem}]

| Parameter               | Description                                                 |
|-------------------------|-------------------------------------------------------------|
| <i>&lt;stack-ID&gt;</i> | Stack member number, from 1 to 8.                           |
| sort                    | Changes the sorting order for the list of processes.        |
|                         | cpu Sorts the list by the percentage of CPU utilization.    |
|                         | mem Sorts the list by the percentage of memory utilization. |

**Mode** User Exec and Privileged Exec

**Usage notes** This command displays a snapshot of currently-running processes. If you want to see CPU or memory utilization history instead, use the commands [show cpu history](#) or [show memory history](#).

**Example** To display a summary of the current running processes, use the command:

```
awplus# show process
```

To display a summary of the current running processes on stack member 2, use the command:

```
awplus# show process 2
```

**Output** Figure 7-14: Example output from the **show process** command

```
Stack member 2:

CPU averages:

**Table 5:** Parameters in the output from the **show process** command

| Parameter            | Description                                                                  |
|----------------------|------------------------------------------------------------------------------|
| Stack member         | Stack member number.                                                         |
| CPU averages         | Average CPU utilization for the periods stated.                              |
| System load averages | The average number of processes waiting for CPU time for the periods stated. |
| Current CPU load     | Current CPU utilization specified by load types                              |
| RAM total            | Total memory size.                                                           |
| free                 | Available memory.                                                            |
| buffers              | Memory allocated to kernel buffers.                                          |
| pid                  | Identifier for the process.                                                  |
| name                 | Short name to describe the process.                                          |
| thrds                | Number of threads in the process.                                            |
| cpu%                 | Percentage of CPU utilization that this process is consuming.                |
| mem%                 | Percentage of memory utilization that this process is consuming.             |

**Table 5:** Parameters in the output from the **show process** command (cont.)

| Parameter | Description                                                        |
|-----------|--------------------------------------------------------------------|
| pri       | Process priority.                                                  |
| state     | Process state; one of "run", "sleep", "stop", "zombie", or "dead". |
| sleep%    | Percentage of time the process is in the sleep state.              |

**Related  
commands**

[show cpu](#)

[show cpu history](#)

# show reboot history

**Overview** Use this command to display the device's reboot history.

**Syntax** show reboot history [<stack-ID>]

| Parameter  | Description                       |
|------------|-----------------------------------|
| <stack-ID> | Stack member number, from 1 to 8. |

**Mode** User Exec and Privileged Exec

**Example** To show the reboot history of stack member 2, use the command:

```
awplus# show reboot history 2
```

**Output** Figure 7-15: Example output from the **show reboot history** command

|                              |          |            |                                                                      |

**Table 6:** Parameters in the output from the **show reboot history** command

| Parameter  | Description                                                                                                                                                                             |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Unexpected | A non-intended reboot. The reboot is counted by the continuous reboot prevention feature, as long as the reboot occurred in the time period specified for continuous reboot prevention. |
| Expected   | A planned or user-triggered reboot. The reboot is not counted by the continuous reboot prevention feature.                                                                              |

**Table 6:** Parameters in the output from the **show reboot history** command

| Parameter                    | Description                                                                                                                                                                                                                 |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Continuous reboot prevention | A continuous reboot prevention event has occurred. The action taken is configured with the <b>continuous-reboot-prevention</b> command. The next time period during which reboot events are counted begins from this event. |
| User request                 | User initiated reboot via the CLI.                                                                                                                                                                                          |

**Related commands** [show continuous-reboot-prevention](#)  
[show tech-support](#)

# show router-id

**Overview** Use this command to show the Router ID of the current system.

**Syntax** show router-id

**Mode** User Exec and Privileged Exec

**Example** To display the Router ID of the current system, use the command:

```
awplus# show router-id
```

**Output** Figure 7-16: Example output from the **show router-id** command

```
awplus>show router-id
Router ID: 10.55.0.2 (automatic)
```

# show secure-mode

**Overview** Use this command to see whether secure mode is enabled or not. Secure mode disables a number of insecure features, such as Telnet.

**Syntax** show secure-mode

**Mode** User Exec/Privileged Exec

**Example** To see if secure mode is enabled, use the command:

```
awplus# show secure-mode
```

**Output** Figure 7-17: Example output from **show secure-mode**

```
awplus#show secure-mode
Secure mode is enabled
```

**Related commands** [crypto secure-mode](#)

# show system

**Overview** This command displays general system information about the device, including the hardware, memory usage, and software version. It also displays location and contact details when these have been set.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show system

**Mode** User Exec and Privileged Exec

**Example** To display configuration information, use the command:

```
awplus# show system
```

**Output** Figure 7-18: Example output from **show system**

Table 7-1: Parameters in the output from **show system environment counters**

| Parameter          | Description                                                                                                            |
|--------------------|------------------------------------------------------------------------------------------------------------------------|
| Value readings     | Number of times that the value of this sensor has been read.                                                           |
| Threshold readings | Number of times that a threshold value related to this sensor has been read.                                           |
| Checked readings   | Number of times that this sensor has gone outside a threshold and has been re-read to confirm this is a genuine error. |
| Read errors        | Number of times that there was an error returned when reading this sensor or one of its threshold values.              |
| Alarm asserted     | Number of times that this sensor has entered the fault state.                                                          |
| Alarm cleared      | Number of times that this sensor has left the fault state.                                                             |

[show system environment](#)

**Command changes** Version 5.5.0-0.1: command added

# show system interrupts

**Overview** Use this command to display the number of interrupts for each IRQ (Interrupt Request) used to interrupt input lines on a PIC (Programmable Interrupt Controller) on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show system interrupts

**Mode** User Exec and Privileged Exec

**Example** To display information about the number of interrupts for each IRQ in your device, use the command:

```
awplus# show system interrupts
```

**Output** Figure 7-21: Example output from the **show system interrupts** command

|                               |         |          |               |   |                     |  |

**Related commands** [show system environment](#)

# show system mac

**Overview** This command displays the physical MAC address available on a standalone switch or a stack. This command also shows the virtual MAC address for a stack if the stack virtual MAC address feature is enabled with the [stack virtual-mac](#) command or the [stack enable](#) command.

**Syntax** show system mac

**Mode** User Exec and Privileged Exec

**Usage notes** For more information about the virtual MAC address feature, see the [VCStack Feature Overview and Configuration Guide](#).

**Example** To display the physical MAC address enter the following command:

```
awplus# show system mac
```

**Output** Figure 7-22: Example output from the **show system mac** command

```
awplus#show system mac
eccd.6d9d.4eed (system)
```

**Output** Figure 7-23: Example output showing how to use the **stack virtual-mac** command and the **show system mac** command

```
awplus#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
awplus(config)#stack virtual-mac
% Please check that the new MAC 0000.cd37.0065 is unique within
the network.
% Save the config and restart the system for this change to take
effect.

# show system serialnumber

**Overview** This command shows the serial number information for the device.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show system serialnumber

**Mode** User Exec and Privileged Exec

**Example** To display the serial number information for the device, use the command:

```
awplus# show system serialnumber
```

**Output** Figure 7-26: Example output from the **show system serialnumber** command

```
awplus#show system serialnumber
45AX5300X
```

# show tech-support

**Overview** This command generates system and debugging information for the device and saves it to a file.

This command is useful for collecting a large amount of information so that it can then be analyzed for troubleshooting purposes. The output of this command can be provided to technical support staff when reporting a problem.

You can optionally limit the command output to display only information for a given protocol or feature. The features available depend on your device and will be a subset of the features listed in the table below.

**Syntax** `show tech-support`  
`{[all|atmf|auth|bgp|card|dhcpsn|epsr|firewall|igmp|ip|ipv6|mld`  
`|openflow|ospf|ospf6|pim|rip|ripng|stack|stp|system|tacacs+`  
`update]}` `[outfile <filename>]`

| Parameter | Description                                |
|-----------|--------------------------------------------|
| all       | Display full information                   |
| atmf      | Display ATMF-specific information          |
| auth      | Display authentication-related information |
| bgp       | Display BGP-related information            |
| card      | Display Chassis Card specific information  |
| dhcpsn    | Display DHCP Snooping specific information |
| epsr      | Display EPSR specific information          |
| firewall  | Display firewall specific information      |
| igmp      | Display IGMP specific information          |
| ip        | Display IP specific information            |
| ipv6      | Display IPv6 specific information          |
| mld       | Display MLD specific information           |
| openflow  | Display information related to OpenFlow    |
| ospf      | Display OSPF related information           |
| ospf6     | Display OSPF6 specific information         |
| pim       | Display PIM related information            |
| rip       | RIP related information                    |
| ripng     | Display RIPNG specific information         |
| stack     | Display stacking device information        |
| stp       | Display STP specific information           |
| system    | Display general system information         |

| Parameter  | Description                                                                                                     |
|------------|-----------------------------------------------------------------------------------------------------------------|
| tacacs+    | Display TACACS+ information                                                                                     |
| update     | Display resource update specific information                                                                    |
|            | Output modifier                                                                                                 |
| >          | Output redirection                                                                                              |
| >>         | Output redirection (append)                                                                                     |
| outfile    | Output file name                                                                                                |
| <filename> | Specifies a name for the output file. If no name is specified, this file will be saved as: tech-support.txt.gz. |

**Default** Captures **all** information for the device.

By default the output is saved to the file 'tech-support.txt.gz' in the current directory. If this file already exists in the current directory then a new file is generated with the time stamp appended to the file name, for example 'tech-support20161009.txt.gz', so the previous file is retained.

**Usage notes** The command generates a large amount of output, which is saved to a file in compressed format. The output file name can be specified by outfile option. If the output file already exists, a new file name is generated with the current time stamp. If the output filename does not end with ".gz", then ".gz" is appended to the filename. Since output files may be too large for Flash on the device we recommend saving files to external memory or a TFTP server whenever possible to avoid device lockup. This method is not likely to be appropriate when running the working set option of AMF across a range of physically separated devices.

**Mode** Privileged Exec

**Examples** To produce the output needed by technical support staff, use the command:  
`awplus# show tech-support`

## speed (asyn)

**Overview** This command changes the console speed from the device. Note that a change in console speed is applied for subsequent console sessions. Exit the current session to enable the console speed change using the [clear line console](#) command.

**Syntax** speed <console-speed-in-bps>

| Parameter              | Description                                       |
|------------------------|---------------------------------------------------|
| <console-speed-in-bps> | Console speed Baud rate in bps (bits per second). |
|                        | 1200 1200 Baud                                    |
|                        | 2400 2400 Baud                                    |
|                        | 9600 9600 Baud                                    |
|                        | 19200 19200 Baud                                  |
|                        | 38400 38400 Baud                                  |
|                        | 57600 57600 Baud                                  |
|                        | 115200 115200 Baud                                |

**Default** The default console speed baud rate is 9600 bps.

**Mode** Line Configuration

**Usage notes** This command is used to change the console (asyn) port speed. Set the console speed to match the transmission rate of the device connected to the console (asyn) port on your device.

**Example** To set the terminal console (asyn0) port speed from the device to 57600 bps, then exit the session, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# speed 57600
awplus(config-line)# exit
awplus(config)# exit
awplus# exit
```

Then log in again to enable the change:

```
awplus login:
Password:
awplus>
```

# terminal monitor

**Overview** Use this command to display debugging output on a terminal.

To display the cursor after a line of debugging output, press the Enter key.

Use the command **terminal no monitor** or **no terminal monitor** to stop displaying debugging output on the terminal. Alternatively, you can use the timeout option to stop displaying debugging output on the terminal after a set time.

**Syntax** terminal monitor [<1-60>]  
terminal no monitor  
no terminal monitor

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| <1 - 60>  | Set a timeout between 1 and 60 seconds for terminal output. |

**Default** Disabled

**Mode** User Exec and Privileged Exec

**Examples** To display debugging output on a terminal, enter the command:

```
awplus# terminal monitor
```

To display debugging on the terminal for 60 seconds, enter the command:

```
awplus# terminal monitor 60
```

To stop displaying debugging output on the terminal, use the command:

```
awplus# no terminal monitor
```

**Related commands** All debug commands

**Command changes** Version 5.4.8-0.2: **no terminal monitor** added as an alias for **terminal no monitor**

# undebug all

**Overview** This command applies the functionality of the [no debug all](#) command.

# Pluggables and Cabling Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure and monitor Pluggables and Cabling, including:

- Cable Fault Locator for finding faults in copper cabling
- Optical Digital Diagnostic Monitoring (DDM) to help find fiber issues when links go down
- Active Fiber Monitoring for detecting changes in optical power received over fiber cables.

For more information, see the [Pluggables and Cabling Feature Overview and Configuration Guide](#).

# clear fiber-monitoring interface

**Overview** Use this command to clear the Active Fiber Monitoring state of a port. It clears the alarm, baseline and history and starts monitoring from the beginning. It does not change the configuration.

**Syntax** `clear fiber-monitoring interface <port>`

| Parameter | Description                                               |
|-----------|-----------------------------------------------------------|
| <port>    | The name of the port to reset Active Fiber Monitoring on. |

**Default** n/a

**Mode** Privileged Exec

**Usage notes** Normally, you do not need to clear the Active Fiber Monitoring state of a port. If the issue resolves itself and the monitored optical power returns to the baseline, the alarm clears automatically.

However, you may need to clear the Active Fiber Monitoring state if the optical power level reduces for a known reason, causing the port to be stuck in the alarm state. In this situation, the alarm will not clear automatically, because Active Fiber Monitoring does not update the baseline when the port is in the alarm state, for security reasons.

**Example** To clear the Active Fiber Monitoring state for interface port1.0.25, use the command:

```
awplus# clear fiber-monitoring interface port1.0.25
```

**Related commands** [show system fiber-monitoring](#)

**Command changes** Version 5.4.8-0.2: command added

# clear test cable-diagnostics tdr

**Overview** Use this command to clear the results of the last cable test that was run.

**Syntax** clear test cable-diagnostics tdr

**Mode** Privileged Exec

**Examples** To clear the results of a previous cable-diagnostics test use the following commands:

```
awplus# clear test cable-diagnostics tdr
```

**Related commands** [show test cable-diagnostics tdr](#)  
[test cable-diagnostics tdr interface](#)

# debug fiber-monitoring

**Overview** Use this command to enable debugging of active fiber monitoring on the specified ports.

Use the **no** variant of this command to disable debugging on all ports or the specified ports.

**Syntax** debug fiber-monitoring interface *<port-list>*  
no debug fiber-monitoring [interface *<port-list>*]

| Parameter                | Description                                                                                                                 |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | The list of fiber ports to enable or disable debugging for, as a single port, a comma separated list or a hyphenated range. |

**Default** Debugging of active fiber monitoring is disabled by default.

**Mode** User Exec/Privileged Exec

**Usage** While debugging is enabled by this command for a port, all the optical power readings for the port are sent to the console.

**Example** To enable debugging messages for active fiber monitoring of port1.0.25 to be sent to the console, use the commands:

```
awplus# debug fiber-monitoring interface port1.0.25
awplus# terminal monitor
```

To disable debugging messages for active fiber monitoring on port1.0.25, use the command:

```
awplus# no debug fiber-monitoring interface port1.0.25
```

To disable all debugging messages for active fiber monitoring, use the command:

```
awplus# no debug fiber-monitoring
```

**Output** Figure 8-1: Example output from **debug fiber-monitoring**

```
awplus#debug fiber-monitoring interface port1.0.25
awplus#terminal monitor
% Warning: Console logging enabled

```

**Related commands** [show system fiber-monitoring](#)

# fiber-monitoring action

**Overview** Use this command to specify an action to be taken if the optical power received on the port changes from the baseline by the amount specified in the **fiber-monitoring sensitivity** command.

Use the **no** variant of this command to remove the specified action or all actions from the port.

**Syntax** fiber-monitoring action [trap] [shutdown] [continuous]  
no fiber-monitoring action [trap|shutdown]

| Parameter  | Description                                                                                                                                                                                |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| trap       | Send an SNMP notification.                                                                                                                                                                 |
| shutdown   | Shutdown the port.                                                                                                                                                                         |
| continuous | Make the action or actions happen continuously (every polling interval) while the sensor is in the alarm state. Otherwise, the action only happens when the alarm is triggered or cleared. |

**Default** By default a log message is generated, but no additional action is performed.

**Mode** Interface Configuration mode for a fiber port.

**Usage** If fiber monitoring is enabled and this command is not used to set an action, a change in received power on a fiber port only generates a log message.

**Example** To set the device to send an SNMP trap when port1.0.25 or port1.0.28 receive reduced power and when that reduced-power alarm is cleared, use the commands:

```
awplus(config)# interface port1.0.25-port1.0.28
awplus(config-if)# fiber-monitoring action trap
```

To set the device to send an SNMP trap when port1.0.25 or port1.0.28 receive reduced power, and every polling interval after that until the alarm is cleared, use the commands:

```
awplus(config)# interface port1.0.25-port1.0.28
awplus(config-if)# fiber-monitoring action trap continuous
```

To set the device to send an SNMP trap and to shut down the port when port1.0.25 or port1.0.28 receive reduced power, use the commands:

```
awplus(config)# interface port1.0.25-port1.0.28
awplus(config-if)# fiber-monitoring action trap shutdown
```

To set the device to stop shutting down the port if port1.0.25 or port1.0.28 receive reduced power, use the commands:

```
awplus(config)# interface port1.0.25-port1.0.28
awplus(config-if)# no fiber-monitoring action shutdown
```

If the device is set to send an SNMP trap for those ports, it will continue to do so.

To set the device not to perform any action when it receives reduced power on port1.0.25 or port1.0.28, except sending a log message, use the commands:

```
awplus(config)# interface port1.0.25-port1.0.28
awplus(config-if)# no fiber-monitoring action
```

**Command  
changes**

Version 5.4.8-0.2: **continuous** parameter added

# fiber-monitoring baseline

**Overview** Use this command to configure how the baseline value for comparison is calculated for active fiber monitoring on the port.

Note that alarm generation will not commence until the link has been up for a full averaging period.

Use the **no** variant of this command to set the fiber-monitoring baseline to its default value.

**Syntax** fiber-monitoring baseline average <12-150> [interval <2-86400>]  
fiber-monitoring baseline fixed <1-65535>  
no fiber-monitoring baseline

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| average<br><12-150>   | Set the baseline optical power received to be based on the moving average of the specified number of most recent (non-zero) values. Default is to use this setting and 12 values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| interval<br><2-86400> | Optionally, specify the optical power polling interval for determining the baseline, in seconds. By default, the baseline polling interval is the same as the monitoring polling interval, which is 5 seconds by default.<br>If specified, this baseline interval should be larger than the monitoring interval.<br>Even if you specify a baseline interval, Active Fiber Monitoring will use the monitoring interval to calculate the initial baseline average. This means the first x baseline readings will be taken at the monitoring interval, where x is the number of readings specified in the <b>average</b> parameter.<br>See Usage below for more information. |
| fixed<br><1-65535>    | Set the baseline to a fixed level of received optical power in 0.0001mW. Not recommended—see Usage below.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Default** The default is a moving average of the last 12 values, taken at the same interval as the monitoring interval. The monitoring interval is set using the **fiber-monitoring interval** command. If the monitoring interval is set to its default of 5 seconds, the **fiber-monitoring baseline** default will be the average over the last minute.

**Mode** Interface Configuration for a fiber port

**Usage notes** There are two ways to configure the baseline. The first is to choose a number of readings to average. This is the default and recommended method. The second is to set a fixed value in units of x0.0001mW.

If a fixed value is required, the easiest way to choose a value is to enable fiber monitoring on the port and use the **show system fiber-monitoring** command to see what readings you can expect.

**CAUTION:** *We do not recommend setting a fixed value because gradual change over time caused by temperature fluctuations, etc. could lead to unnecessary alarms.*

If you use the averaging method, you can optionally specify how often Active Fiber Monitoring polls the cable to determine the baseline. This allows Active Fiber Monitoring to update the baseline less often than it polls the device for monitoring.

In order to prevent the theoretical possibility of slow clamping, you can set the baseline interval to a large value, so that the baseline average is only updated with the current reading (for example) once per day or once per hour.

As fiber attenuation can be affected by ambient temperature, take care if changing the baseline interval in environments with large daily temperature fluctuations.

**Example** To set the baseline optical power to a moving average of the last 30 monitoring readings on port1.0.25 and port1.0.28, use the command:

```
awplus(config)# interface port1.0.25-port1.0.28
awplus(config-if)# fiber-monitoring baseline average 30
```

To calculate the baseline based on 12 values taken 24 hours (86400 seconds) apart, instead of using the monitoring interval, use the command:

```
awplus(config)# interface port1.0.25-port1.0.28
awplus(config-if)# fiber-monitoring baseline average 12
interval 86400
```

To set the baseline to its default, averaging the last 12 readings, use the command:

```
awplus(config)# interface port1.0.25-port1.0.28
awplus(config-if)# no fiber-monitoring baseline
```

**Related commands** [fiber-monitoring interval](#)  
[fiber-monitoring sensitivity](#)

**Command changes** Version 5.4.8-0.2: **interval** parameter added

# fiber-monitoring enable

**Overview** Use this command to enable active fiber monitoring on a fiber port. If the port can support fiber monitoring but does not have the correct SFP or fiber type installed, the configuration will be saved, and monitoring will commence when a supported SFP is inserted. Disabling and re-enabling fiber monitoring on a port resets the baseline calculation.

Use the **no** variants of this command to disable active fiber monitoring on the interface, or to remove all the configuration and state for the ports, respectively.

**Syntax** fiber-monitoring enable  
no fiber-monitoring enable  
no fiber-monitoring

**Default** Active fiber monitoring is disabled by default.

**Mode** Interface Configuration mode for a fiber port

**Examples** To enable active fiber monitoring on port1.0.25 and port1.0.28, use the commands:

```
awplus(config)# interface port1.0.25-port1.0.28
awplus(config-if)# fiber-monitoring enable
```

To disable fiber monitoring on the ports, use the commands:

```
awplus(config)# interface port1.0.25-port1.0.28
awplus(config-if)# no fiber-monitoring enable
```

To remove all fiber-monitoring configuration and state for the ports, use the commands:

```
awplus(config)# interface port1.0.25-port1.0.28
awplus(config-if)# no fiber-monitoring
```

**Related commands** [fiber-monitoring action](#)  
[fiber-monitoring sensitivity](#)  
[show system fiber-monitoring](#)

# fiber-monitoring interval

**Overview** Use this command to configure the fiber monitoring polling interval in seconds for the port. The optical power will be read every <interval> seconds and compared against the calculated threshold values to see if a log message or other action is required.

Use the **no** variant of this command to reset the polling interval to the default (5 seconds).

**Syntax** fiber-monitoring interval <2-60>  
no fiber-monitoring interval

| Parameter | Description                                |
|-----------|--------------------------------------------|
| <2-60>    | Optical power polling interval in seconds. |

**Default** The interval is set to 5 seconds by default.

**Mode** Interface configuration mode for a fiber port.

**Example** To set the fiber monitoring polling interval for port1.0.25 to 30 seconds, use the commands:

```
awplus(config)# interface port1.0.25
awplus(config-if)# fiber-monitoring interval 30
```

To reset the fiber monitoring polling interval back to the default (5s), use the commands:

```
awplus(config)# interface port1.0.25
awplus(config-if)# no fiber-monitoring interval
```

**Related commands** [fiber-monitoring baseline](#)  
[show system fiber-monitoring](#)

# fiber-monitoring sensitivity

**Overview** Use this command to configure the sensitivity of the alarm thresholds on the port for active fiber monitoring.

Use the **no** variant of this command to reset the sensitivity to the default.

**Syntax** `fiber-monitoring sensitivity (low|medium|high|highest|fixed <25-65535>)|relative <0.01-10.0>`  
`no fiber-monitoring sensitivity`

| Parameter            | Description                                            |
|----------------------|--------------------------------------------------------|
| low                  | Low sensitivity (+/-2 dB)                              |
| medium               | Medium sensitivity (1 dB) (default)                    |
| high                 | High sensitivity (the greater of 0.5 dB and 0.0025 mW) |
| highest              | The highest sensitivity available: 0.0025mW            |
| fixed <25-65535>     | Fixed sensitivity at the specified level in 0.0001 mW. |
| relative <0.01-10.0> | Relative sensitivity at the specified level in dB.     |

**Default** Medium sensitivity.

**Mode** User Exec/Privileged Exec

**Usage** A log message is generated and configured actions are taken if the received optical power drops below the baseline value by the sensitivity configured with this command.

The sensitivity can be configured to one of four pre-defined levels in decibels or to a fixed absolute delta in units of 0.0001mW. The alarm thresholds can be seen in the **show system fiber-monitoring** output. The maximum absolute sensitivity configurable is 0.0025 mW. Note that 0.0025 mW equates to a reduction of approximately 1dB at the maximum attenuation of an AT-SPLX10/1.

**Example** To set the fiber monitoring sensitivity for port1.0.25 to a relative sensitivity of 0.1 dB, use the commands:

```
awplus(config)# interface port1.0.25
awplus(config-if)# fiber-monitoring sensitivity relative 0.1
```

To reset the fiber monitoring sensitivity to the default (medium), use the commands:

```
awplus(config)# interface port1.0.25
awplus(config-if)# no fiber-monitoring sensitivity
```

Table 8-1: Parameters in the output from **show system fiber-monitoring**

| Parameter        | Description                                                                                                                                                 |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reading units    | The units for optical power readings in the rest of the display, e.g. 0.0001mW.                                                                             |
| Status           | Whether active fiber monitoring is enabled or disabled for this port.                                                                                       |
| Supported        | Whether the pluggable inserted in this port supports active fiber monitoring.                                                                               |
| Debugging        | Whether debugging of active fiber monitoring is enabled or disabled for this port.                                                                          |
| Interval         | The configured interval between readings of optical power on this port.                                                                                     |
| Sensitivity      | The configured sensitivity threshold for optical power changes on this port.                                                                                |
| Baseline type    | How the baseline optical power level is calculated: either the average of the specified number of previous readings or a specified fixed value in 0.0001mW. |
| Status           | Current values for the following parameters.                                                                                                                |
| Baseline value   | The baseline value, calculated according to the configured baseline method, in 0.0001mW.                                                                    |
| Alarm threshold  | The current threshold for a change in optical power, calculated according to the configured sensitivity method, that will result in action.                 |
| Alarm            | Whether the optical power at the most recent reading fallen below the threshold.                                                                            |
| Last 12 readings | The last 12 optical power values measured, in 0.0001mW, with oldest value first.                                                                            |
| Minimum reading  | The lowest optical power reading since the fiber pluggable was last inserted, or since active fiber monitoring was last enabled on the port.                |
| Maximum reading  | The highest optical power reading since the fiber pluggable was last inserted, or since active fiber monitoring was last enabled on the port.               |

fiber-monitoring interval

fiber-monitoring sensitivity

# show system pluggable

**Overview** This command displays **brief** pluggable transceiver information showing the pluggable type, the pluggable serial number, and the pluggable port on the device. Different types of pluggable transceivers are supported in different models of device. See your Allied Telesis dealer for more information about the models of pluggables that your device supports.

**Syntax** show system pluggable [*<port-list>*]

| Parameter                | Description                                                                                                                                                                                                                                                                                                                   |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>a switch port (e.g. port1.0.25)</li><li>a continuous range of ports separated by a hyphen (e.g. portport1.0.25-port1.0.28)</li><li>a comma-separated list of ports and port ranges (e.g. port1.0.25,port1.0.28)</li></ul> |

**Mode** User Exec and Privileged Exec

**Example** To display brief information about all installed pluggable transceivers, use the command:

```
awplus# show system pluggable
```

**Output** Figure 8-3: Example output from **show system pluggable**

|                              |        |         |                  |          |             |
|------------------------------|--------|---------|------------------|----------|-------------|
| awplus#show system pluggable |        |         |                  |          |             |
| System Pluggable Information |        |         |                  |          |             |
| Port                         | Vendor | Device  | Serial Number    | Datecode | Type        |
| -----                        |        |         |                  |          |             |
| port1.0.25                   | ATI    | AT-SPSX | A03240R151300867 | 15032801 | 1000BASE-SX |
| port1.0.28                   | ATI    | AT-SPSX | A03240R111800076 | 15032801 | 1000BASE-SX |
| -----                        |        |         |                  |          |             |

**Table 9:** Parameters in the output from the **show system pluggable** command

| Parameter    | Description                                                          |
|--------------|----------------------------------------------------------------------|
| Stack member | The stack member number.                                             |
| Port         | Specifies the port number for the installed pluggable transceiver.   |
| Vendor       | Specifies the vendor's name for the installed pluggable transceiver. |

**Table 9:** Parameters in the output from the **show system pluggable** command

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device        | Specifies the device name for the installed pluggable transceiver.                                                                                                                                                                                                                                                                                           |
| Serial Number | Specifies the serial number for the installed pluggable transceiver.                                                                                                                                                                                                                                                                                         |
| Datecode      | Specifies the manufacturing datecode for the installed pluggable transceiver. Checking the manufacturing datecode with the vendor may be useful when determining Laser Diode aging issues. For more information, see "Troubleshooting Fiber and Pluggable Issues" in the <a href="#">"Pluggables and Cabling" Feature Overview and Configuration Guide</a> . |
| Type          | Specifies the device type for the installed pluggable transceiver.                                                                                                                                                                                                                                                                                           |

# show system pluggable detail

**Overview** This command displays detailed pluggable transceiver information showing the pluggable type, the pluggable serial number, and the pluggable port on the device. Different types of pluggable transceivers are supported in different models of device. See your Allied Telesis dealer for more information about the models of pluggables that your device supports.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show system pluggable [*<port-list>*] detail

| Parameter                | Description                                                                                                                                                                                                                                                                                                                   |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>a switch port (e.g. port1.0.25)</li><li>a continuous range of ports separated by a hyphen (e.g. portport1.0.25-port1.0.28)</li><li>a comma-separated list of ports and port ranges (e.g. port1.0.25,port1.0.28)</li></ul> |

**Mode** User Exec and Privileged Exec

**Usage notes** In addition to the information about pluggable transceivers displayed using the [show system pluggable](#) command (port, manufacturer, serial number, manufacturing datecode, and type information), the **show system pluggable detail** command displays the following information:

- SFP Laser Wavelength:** Specifies the laser wavelength of the installed pluggable transceiver
- Single mode Fiber:** Specifies the link length supported by the pluggable transceiver using single mode fiber
- OM1 (62.5μ m) Fiber:** Specifies the link length, in meters (m) or kilometers (km) supported by the pluggable transceiver using 62.5 micron multi-mode fiber.
- OM2 (50μ m) Fiber:** Specifies the link length (in meters or kilometers) supported by the pluggable transceiver using 50 micron multi-mode fiber.
- Diagnostic Calibration:** Specifies whether the pluggable transceiver supports DDM or DOM Internal or External Calibration.
  - Internal** is displayed if the pluggable transceiver supports DDM or DOM Internal Calibration.
  - External** is displayed if the pluggable transceiver supports DDM or DOM External Calibration.
  - a dash (-) is displayed if neither Internal Calibration or External Calibration is supported.

- **Power Monitoring:** Displays the received power measurement type, which can be either **OMA**(Optical Module Amplitude) or **Avg**(Average Power) measured in  $\mu$ W.

**NOTE:** For parameters that are not supported or not specified, a hyphen is displayed instead.

**Example** To display detailed information about the pluggable transceivers installed in a particular port on the device, use a command like:

```
awplus# show system pluggable port1.0.25 detail
```

To display detailed information about all the pluggable transceivers installed on the device, use the command:

```
awplus# show system pluggable detail
```

**Output** Figure 8-4: Example output from **show system pluggable detail** for a port

```
awplus#show system pluggable port1.0.25 detail
System Pluggable Information Detail
port1.0.25
=====
Vendor Name: ATI

Table 8-1: Parameters in the output from **show system pluggable detail**

| Parameter       | Description                                                                                                                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Stack member    | The stack member number.                                                                                                                                                                    |
| Port            | Specifies the port the pluggable transceiver is installed in.                                                                                                                               |
| Vendor Name     | Specifies the vendor's name for the installed pluggable transceiver.                                                                                                                        |
| Device Name     | Specifies the device name for the installed pluggable transceiver.                                                                                                                          |
| Device Revision | Specifies the hardware revision code for the pluggable transceiver. This may be useful for troubleshooting because different devices may support different pluggable transceiver revisions. |

Table 8-1: Parameters in the output from **show system pluggable detail** (cont.)

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device Type            | Specifies the device type for the installed pluggable transceiver.                                                                                                                                                                                                                                                                                                                                      |
| Serial Number          | Specifies the serial number for the installed pluggable transceiver.                                                                                                                                                                                                                                                                                                                                    |
| Manufacturing Datecode | Specifies the manufacturing datecode for the installed pluggable transceiver. Checking the manufacturing datecode with the vendor may be useful when determining Laser Diode aging issues. For more information, see "Troubleshooting Fiber and Pluggable Issues" in the <a href="#">"Pluggables and Cabling" Feature Overview and Configuration Guide</a> .                                            |
| SFP Laser Wavelength   | Specifies the laser wavelength of the installed pluggable transceiver.                                                                                                                                                                                                                                                                                                                                  |
| Single Mode Fiber      | Specifies the link length supported by the pluggable transceiver using single mode fiber.                                                                                                                                                                                                                                                                                                               |
| OM1 (62.5um) Fiber     | Specifies the link length (in $\mu\text{m}$ - micron) supported by the pluggable transceiver using 62.5 micron multi-mode fiber.                                                                                                                                                                                                                                                                        |
| OM2 (50um) Fiber       | Specifies the link length (in $\mu\text{m}$ - micron) supported by the pluggable transceiver using 50 micron multi-mode fiber.                                                                                                                                                                                                                                                                          |
| Diagnostic Calibration | Specifies whether the pluggable transceiver supports DDM or DOM Internal or External Calibration:<br><b>Internal</b> is displayed if the pluggable transceiver supports DDM or DOM Internal Calibration.<br><b>External</b> is displayed if the pluggable transceiver supports DDM or DOM External Calibration.<br>- is displayed if neither Internal Calibration or External Calibration is supported. |
| Power Monitoring       | Displays the received power measurement type, which can be either <b>OMA</b> (Optical Module Amplitude) or <b>Avg</b> (Average Power) measured in $\mu\text{W}$ .                                                                                                                                                                                                                                       |

# show system pluggable diagnostics

**Overview** This command displays diagnostic information about pluggable transceivers that support Digital Diagnostic Monitoring (DDM).

Different types of pluggable transceivers are supported in different models of device. See your device's Datasheet for more information about the models of pluggables that your device supports.

For information on filtering and saving command output, see the ["Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide](#).

**Syntax** show system pluggable [*<port-list>*] diagnostics

| Parameter                | Description                                                                                                                                                                                                                                                                                                                         |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.0.25)</li><li>• a continuous range of ports separated by a hyphen (e.g. portport1.0.25-port1.0.28)</li><li>• a comma-separated list of ports and port ranges (e.g. port1.0.25,port1.0.28)</li></ul> |

**Mode** User Exec and Privileged Exec

**Usage notes** Diagnostic monitoring features allow you to monitor real-time parameters of the pluggable transceiver, such as optical output power, optical input power, temperature, laser bias current, and transceiver supply voltage. Additionally, RX LOS (Loss of Signal) is shown when the received optical level is below a preset threshold. Monitor these parameters to check on the health of all transceivers, selected transceivers or a specific transceiver installed in a device.

**Examples** To display detailed information about all pluggable transceivers installed on a standalone device, use the command:

```
awplus# show system pluggable diagnostics
```

**Output** Figure 8-5: Example output from the **show system pluggable diagnostics** command on a device

```
awplus#show system pluggable diagnostics

**Table 9:** Parameters in the output from the **show system pluggables diagnostics** command

| Parameter        | Description                                                                                                                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Temp (Degrees C) | Shows the temperature inside the transceiver.                                                                                                                                                                                               |
| Vcc (Volts)      | Shows voltage supplied to the transceiver.                                                                                                                                                                                                  |
| Tx Bias (mA)     | Shows current to the Laser Diode in the transceiver.                                                                                                                                                                                        |
| Tx Power (mW)    | Shows the amount of light transmitted from the transceiver.                                                                                                                                                                                 |
| Rx Power (mW)    | Shows the amount of light received in the transceiver.                                                                                                                                                                                      |
| Rx LOS           | Rx Loss of Signal. This indicates whether: <ul style="list-style-type: none"> <li>light is being received (Rx Up) and therefore the link is up, or</li> <li>light is not being received (Rx Down) and therefore the link is down</li> </ul> |

# show test cable-diagnostics tdr

**Overview** Use this command to display the results of the last cable-diagnostics test that was run using the TDR (Time Domain Reflectometer) on a fixed copper cable port.

The displayed status of the cable can be either:

- OK
- Open
- Short (within-pair)
- Short (across-pair)
- Error

**Syntax** show test cable-diagnostics tdr

**Mode** Privileged Exec

**Examples** To show the results of a cable-diagnostics test use the following command:

```
awplus# show test cable-diagnostics tdr
```

**Output** Figure 8-6: Example output from the **show test cable-diagnostics tdr** command

| Port  | Pair | Length | Status |
|-------|------|--------|--------|
| ----- |      |        |        |
| 1.0.1 | A    | -      | OK     |
|       | B    | -      | OK     |
|       | C    | -      | OK     |
|       | D    | -      | OK     |

**Related commands** [clear test cable-diagnostics tdr](#)  
[test cable-diagnostics tdr interface](#)

## test cable-diagnostics tdr interface

**Overview** Use this command to apply the Cable Fault Locator's cable-diagnostics tests to twisted pair data cables for a selected port. The tests will detect either correct, short circuit, or open, circuit terminations. For more information on running the CFL, see the [Pluggables and Cabling Feature Overview and Configuration Guide](#).

The test can take several seconds to complete. See the related show command to display the test results.

A new test can only be started if no other test is in progress. CFL cannot run on a port that is currently supplying power via PoE.

The displayed status of the cable can be either, OK, Short (within-pair), or Open. The "Open" or "Short" status is accompanied with the distance from the source port to the incorrect termination.

**Syntax** test cable-diagnostics tdr interface <interface>

| Parameter         | Description                                                |
|-------------------|------------------------------------------------------------|
| cable-diagnostics | The cable diagnostic tests.                                |
| tdr               | Time Domain Reflectometry.                                 |
| interface         | Selects the interface to test.                             |
| <interface>       | Interface number of the port to be tested, e.g. port1.0.2. |

**Mode** Privileged Exec

**Example** To run a cable test on the cable inserted into port1.0.1 use the following command:

```
awplus# test cable-diagnostics tdr interface port1.0.1
```

You will receive the following message:

```
Link will go down while test is in progress. Continue? (y/n): y
Select y to continue.
```

```
awplus# y
```

You will then receive the following message:

```
Test started. This will take several seconds to complete. Use
"show test cable-diagnostics tdr" to print results.
```

# cc interval

**Overview** Use this command to set the CCM Interval.

**Syntax** `cc ma-name <ma-name> interval <interval>`

| Parameter  | Description                                                                                                                                                                                                                                                                                                |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ma - name  | Specify the Maintenance Association for which the Interval is used.                                                                                                                                                                                                                                        |
| <ma-name>  | Specify the Maintenance Association's CLI instance name.                                                                                                                                                                                                                                                   |
| interval   | Specify the CCM Interval.                                                                                                                                                                                                                                                                                  |
| <interval> | Specify the CCM Interval (CCI), using one of the following:<br>1 - CCI of 3 milliseconds (currently not supported)<br>2 - CCI of 10 milliseconds (currently not supported)<br>3 - CCI of 100 milliseconds<br>4 - CCI of 1 second<br>5 - CCI of 10 seconds<br>6 - CCI of 1 minute<br>7 - CCI of 10 minutes. |

**Default** The default interval is 4 (1 second).

**Mode** Ethernet CFM Configuration

**Usage notes** Continuity Checks is another term for connectivity fault detection. This makes use of Continuity Check Messages (CCMs) that are periodically sent by an MEP (multicast or unicast) and received by other MEP(s). CCMs can be used to detect connectivity faults across a link (using Link Level MEPs) or across a segment of a VLAN using VLAN aware MEPs, both of which are used within an MD/MA. CCMs are sent periodically at a given rate (or frame interval) that is agreed upon by all the MEPs in the MA. The faster the rate, the more quickly faults can be detected.

If an MEP does not receive a CCM within 3.5 times the expected interval from a peer MEP(s), that MEP declares a connectivity fault. This is known as a "defect". Upon detecting a defect, the detecting MEP will also set the Remote Defect Indicator (RDI) bit for its outgoing CCM messages to its peer MEP(s) so as to notify the peer MEPs that a defect has been detected. If the defect persists long enough (generally 2.5 seconds), then an "alarm" is declared. If an alarm is declared, then the defect has to abate long enough (generally 10 seconds) for the alarm to clear.

**Example** To set the CCM interval of a Maintenance Association named "MA-INST2-1" to the value of "4", use the commands:

```
awplus(config)# ethernet cfm domain-name MD-INST2
awplus(config-ether-cfm)# cc ma-name MA-INST2-1 interval 4
```

**Related commands** [ethernet cfm domain-name](#)

service ma-name

Version 5.4.8-0.2: added to SBx8100 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# cc multicast

**Overview** Use this command to enable a Local MEP to send CCMs using multicast, or to disable sending CCMs altogether.

**Syntax** `cc multicast state {enable|disable}`

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| state     | Specify to either enable or disable CFM multicast CCMs. |
| enable    | Start sending periodic multicast frames.                |
| disable   | Stop sending multicast frames.                          |

**Default** Multicast is disabled by default.

**Mode** Interface Ethernet CFM MEP Configuration

**Usage notes** Continuity Checks is another term for connectivity fault detection. This makes use of Continuity Check Messages (CCMs) that are periodically sent by an MEP (multicast or unicast) and received by other MEP(s). CCMs can be used to detect connectivity faults across a link (using Link Level MEPs) or across a segment of a VLAN using VLAN aware MEPs, both of which are used within an MD/MA. CCMs are sent using multicast or unicast (but not both).

In order to enable a Local MEP to send, the Local MEP's "active" administrative state must be set to true, using the command [mep active](#).

**Example** To configure a Local MEP to send CCMs using multicast, use the commands:

```
awplus(config)# interface port1.0.2
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name
MD-INST2 ma-name MA-INST2-1
awplus(config-if-eth-cfm-mep)# cc multicast state enable
```

**Related commands** [ethernet cfm domain-name](#)  
[ethernet cfm mep](#)  
[service ma-name](#)

**Command changes** Version 5.4.7-1.1: command added  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# cc unicast

**Overview** Use this command to enable a Local MEP to send CCMs using unicast, or to disable sending CCMs altogether.

**Syntax** `cc unicast rmpid <rmep-id> state {enable|disable}`

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| rmpid     | The remote MEP that the Local MEP is to unicast to. |
| <rmep-id> | The remote MEP ID in the range 1-8191.              |

**Mode** Interface Ethernet CFM MEP Configuration

**Usage notes** Continuity Checks is another term for connectivity fault detection. This makes use of Continuity Check Messages (CCMs) that are periodically sent by an MEP (multicast or unicast) and received by other MEP(s). CCMs can be used to detect connectivity faults across a link (using Link Level MEPs) or across a segment of a VLAN using VLAN aware MEPs, both of which are used within an MD/MA. CCMs are sent using multicast or unicast (but not both).

In order to enable a Local MEP to send, the Local MEP's "active" administrative state must be set to true, using the command [mep active](#).

In order to send unicast CCMs, the Remote MEP has to be configured along with its MAC address.

**Example** To configure a Local MEP to send CCMs using unicast, use the commands:

```
awplus(config)# interface port1.0.2
awplus(config-if)# ethernet cfm mep down rmpid 12 domain-name
MD-INST2 ma-name MA-INST2-1
awplus(config-if-eth-cfm-mep)# cc unicast rmpid 21 state enable
```

**Related commands** [ethernet cfm domain-name](#)  
[ethernet cfm mep](#)

[service ma-name](#)

**Command changes** Version 5.4.7-1.1: command added  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# clear (MEP Attribute)

**Overview** Use this command to clear a Local MEP attribute.

**Syntax** `clear {ccm-ltm-priority|lowest-priority-defect|fng-alarm-time  
|reset-fng-time|active|all}`

| Parameter              | Description                                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| ccm-ltm-priority       | Set the queuing and p-bit priority for CCM messages to their default value of 7.                                                           |
| lowest-priority-defect | Set the Fault Notification Generation (FNG) lowest alarm priority defect to the default value of 2.                                        |
| fng-alarm-time         | Set the Fault Notification Generation (FNG) time for a defect to be present before an alarm is raised to the default value of 2.5 seconds. |
| reset-fng-time         | Set the Fault Notification Generation (FNG) time for a defect to abate before an alarm is cleared to the default value of 10 seconds.      |
| active                 | Set the Local MEP's Active state to the default value of False, which sets the Local MEP's Administrative State to Down.                   |
| all                    | Set all of the above attributes to their default values.                                                                                   |

**Mode** Interface Ethernet CFM MEP Configuration

**Example** To set the active state of the Local MEP to False, use the commands:

```
awplus(config)# interface port1.0.2
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name
MD-INST2 ma-name MA-INST2-1
awplus(config-if-eth-cfm-mep)# clear active
```

**Related commands** [ethernet cfm domain-name](#)  
[ethernet cfm mep](#)  
[mep \(FNG attributes\)](#)  
[service ma-name](#)

**Command changes** Version 5.4.7-1.1: command added  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# clear ethernet cfm errorlog

**Overview** Use this command to clear the Event List for all Maintenance Associations (MAs) associated with the specified Maintenance Domain (MD).

**Syntax** `clear ethernet cfm errorlog domain <domain-name>`

| Parameter                        | Description             |
|----------------------------------|-------------------------|
| <code>&lt;domain-name&gt;</code> | Specify the domain name |

**Mode** Privileged Exec

**Usage notes** When a new error is detected for an MA that is associated with an MD, and the error is due to an error from a received or missing CCM from a Remote MEP, an event is logged to the CFM Errors Event List.

**Example** To clear the event list for all MA's associated with an MD named "MD-INST2", use the command:

```
awplus# clear ethernet cfm errorlog domain MD-INST2
```

**Related commands** [show ethernet cfm errorlog](#)

**Command changes**

- Version 5.4.7-1.1: command added
- Version 5.4.8-0.2: added to SBx8100 series products
- Version 5.4.8-1.1: added to SBx908 GEN2 series products

# clear mep counter

**Overview** Use this command to clear statistics counters for all Local MEPs within a given Maintenance Association (MA) and its associated Maintenance Domain (MD), or to optionally clear counters for one specific Local MEP.

**Syntax** `clear mep counter domain <domain-name> service <ma-name> [mep <mep-id>]`

| Parameter     | Description                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| domain        | Specify the Maintenance Domain that Local MEP(s) are to have their counters cleared for. Both domain and service must be specified.          |
| <domain-name> | Specify the Maintenance Domain's CLI instance name.                                                                                          |
| service       | Specify the Maintenance Association that the Local MEP(s) are to have their counters cleared for. Both domain and service must be specified. |
| <ma-name>     | Specify the CLI name that identifies the service (Maintenance Association (MA)) instance.                                                    |
| mep           | Specify one specific Local MEP.                                                                                                              |
| <mep-id>      | Specify the Local MEP instance by MEP-id.                                                                                                    |

**Mode** User Exec/Privileged Exec

**Example** To clear the statistic counter for an MEP with the MEP ID "12", use the command:

```
awplus# clear mep counter domain MD-INST1 service MA-INST1-1 mep 12
```

**Related commands** [show ethernet cfm maintenance-points local mep](#)

# ethernet cfm domain-name

**Overview** Use this command to create and configure a CFM Maintenance Domain, or to enter Ethernet CFM Configuration mode for an existing Maintenance Domain instance.

Use the **no** variant of this command to destroy the Maintenance Domain's instance that was previously created.

**Syntax** ethernet cfm domain-name <domain-name>  
ethernet cfm domain-name <domain-name> md-type character-string  
md-type-name <md-type-name> level <level> [mip-creation none]  
ethernet cfm domain-name <domain-name> md-type dns-based  
md-type-name <md-type-name> level <level> [mip-creation none]  
ethernet cfm domain-name <domain-name> md-type mac md-type-name  
<md-type-name> level <level> [mip-creation none]  
ethernet cfm domain-name <domain-name> md-type no-name level  
<level> [mip-creation none]  
no ethernet cfm domain-name <domain-name>

| Parameter          | Description                                                                                                                                                                                                                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <domain-name>      | The name that identifies this Maintenance Domain instance. If creating this instance, specify the remaining parameters. If re-entering configuration mode for this instance, use this parameter to identify this instance, and do not enter the remaining parameters.                                     |
| md - type          | Specify the name type. The MD name part of the MAID field may or may not appear in the CCM message. There are different formats and conventions for the name depending on type.                                                                                                                           |
| character - string | Specify the md-type as Character String-based MD name format. The <md-type-name> is a character string of 1 to 43 characters. This character string plus the Short MA name that is configured for an MA make up the MAID field in a CCM message.                                                          |
| md - type - name   | The Maintenance Domain type.                                                                                                                                                                                                                                                                              |
| <md - type - name> | The value of the MD type name, which depends on the md-type selected.                                                                                                                                                                                                                                     |
| dns - based        | Specify the md-type as DNS-based MD name format. The <md-type-name> is a Domain Name like string of 1 to 43 characters. This is a globally unique text string derived from a DNS name. This DNS based string plus the Short MA name that is configured for an MA make up the MAID field in a CCM message. |

| Parameter    | Description                                                                                                                                                                                                                                                                                    |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mac          | Specify the md-type as MAC-based MD name format. The <md-type-name> consists of a MAC address + 2-octet (unsigned) integer in the form of HHHH.HHHH.HHHH:<2-octet integer>. This MAC based string plus the Short MA name that is configured for an MA make up the MAID field in a CCM message. |
| no - name    | Specify the md-type whereby no MD name is to appear in the CCM message.                                                                                                                                                                                                                        |
| level        | Specify the Level the Domain operates in.                                                                                                                                                                                                                                                      |
| <level>      | 0 to 7.                                                                                                                                                                                                                                                                                        |
| mip-creation | Optional parameter that specifies the MIP creation permission value.                                                                                                                                                                                                                           |
| none         | Specifies that no MIPs are to be created (default and only choice).                                                                                                                                                                                                                            |

**Mode** Global Configuration

**Usage notes** A Maintenance Domain is a Connectivity Fault Management (CFM) term that represents the administrative area of a network from which an operator can manage VLANs that traverse their area. An MD can also be scoped to a simple Ethernet link. To differentiate different administrative areas, an MD is made up of a name and a level. As part of CFM, a Connectivity Check Message (CCM) is used to detect Ethernet connectivity faults amongst nodes that participate in CFM. CCM messages carry the MD name within the MAID field as well as carries the level of the MD.

This command is used to configure the MD name, which can be chosen from a variety of name format types, as well as the level.

**Example** To create a Maintenance Domain instance named "MD-INST2" with a character string-based name of "MD-12L3" and a level of 3, use the command:

```
awplus(config)# ethernet cfm domain-name MD-INST2 md-type
character-string md-type-name MD-12L3 level 3
```

To enter Ethernet CFM Configuration mode for an existing MD instance named "MD-INST2", use the command:

```
awplus(config)# ethernet cfm domain-name MD-INST2
awplus(config-ether-cfm)#
```

To destroy a Maintenance Domain instance named "MD-INST2", use the command:

```
awplus(config)# no ethernet cfm domain-name MD-INST2
```

# ethernet cfm mep

**Overview** Use this command to create a Local MEP instance, or to enter Interface Ethernet CFM MEP Configuration mode for an existing Local MEP's instance, so you can configure it.

Use the **no** variant of this command to destroy the Local MEP instance.

**Syntax** ethernet cfm mep down mpid <mep-id> domain-name <domain-name>  
ma-name <ma-name>  
  
no ethernet cfm mep down mpid <mep-id> domain-name <domain-name>  
ma-name <ma-name>

| Parameter     | Description                                                                      |
|---------------|----------------------------------------------------------------------------------|
| down          | Specify the Local MEP as a Down MEP.                                             |
| mpid          | Specify the Local MEP ID.                                                        |
| <mep-id>      | 1-8191. This must be unique ID for all MEPs in the MA (both local and remote).   |
| domain-name   | Specify the Maintenance Domain that the Local MEP is to be associated with.      |
| <domain-name> | Specify the Maintenance Domain's CLI instance name.                              |
| ma-name       | Specify the Maintenance Association that the Local MEP is to be associated with. |
| <ma-name>     | Specify the Maintenance Association's CLI instance name.                         |

**Mode** Interface Configuration

**Usage notes** Maintenance Points are entities that exist within an MD/MA and can perform the CFM/802.1ag functions such as Continuity Checks for fault management. The main type of MP is a Maintenance End Point (MEP). This type of maintenance point sits at the edges of a Maintenance Domain but is a member of only one MA within the Maintenance Domain. Thus an MEP is used at the end of a VLAN segment, or it is used at the end of a link. MPs live on bridge ports and station ports. On a bridge port, there are two types.

- An Up Maintenance Entity is considered an inward MP. It communicates across the inside of the bridge to the other side, and this allows it to reach the outside world. It lives on a bridge port for a given VLAN, but it does not use this port to send or receive to get to the outside world. Instead, it sends and receives through the inside of the bridge and communicates to the outside world through the other VLAN port members. An Up MP cannot be used for Link Level CFM.
- A Down Maintenance Entity is considered an outward MP. It sends and receives only through its bridge port outwardly to the outside world, and does not communicate inside the bridge. A Down MP is not subject to blocking due to Spanning Tree Protocol (STP) or any other protocol trying to

prevent loops in the network. As such, it is important that Down MPs be used in an MD/MA that is not subject to topology loops. A Down MP can be VLAN aware or link-local.

An MEP can be either Up or Down for a given MD/MA, but within a bridge for the same MD/MA, there can only be one Up or Down MEP (not both). An Up MEP must be VLAN aware. A Down MEP may be VLAN aware. Otherwise, a Down MEP is allowed to be link local (VLAN unaware), and its scope is that of the entire link.

AlliedWare Plus supports Down Maintenance Entities only.

**Example** To create a local MEP instance context with a domain name of “MD-INST2” and an MA name of “MA-INST2-1”, use the commands:

```
awplus(config)# interface port1.0.2
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name
MD-INST2 ma-name MA-INST2-1
```

To re-enter a local MEP instance context with the domain name “MD-INST2” and the MA name “MA-INST2-1”, use the commands:

```
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name
MD-INST2 ma-name MA-INST2-1
awplus(config-if-eth-cfm-mep)#
```

To destroy a local MEP instance context with the domain name “MD-INST2” and the MA name “MA-INST2-1”, use the commands:

```
awplus(config-if)# no ethernet cfm mep down mpid 12 domain-name
MD-INST2 ma-name MA-INST2-1
```

## mep (FNG attributes)

**Overview** Use this command to configure the Fault Notification Generation (FNG) attributes of a Local MEP.

**Syntax** `mep {lowest-priority-defect <defect-priority>|  
fng-alarm-time <soak-time>|reset-fng-time <abate-time>}`

| Parameter                                   | Description                                                                                                                                                              |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lowest-priority-defect<br><defect-priority> | The lowest level defect allowed to generate alarms. An integer in the range 1 to 6. The default is 2.                                                                    |
| fng-alarm-time<br><soak-time>               | The time that the defects must be present before an alarm is generated. An integer in the range of 250 to 1000 in increments of 10 ms. The default is 250 (2.5 seconds). |
| reset-fng-time<br><abate-time>              | The time that the defect must be absent before the alarm is cleared. An integer in the range of 250 to 1000 in increments of 10 ms. The default is 1000 (10 seconds).    |

**Mode** Interface Ethernet CFM MEP Configuration

**Usage notes** Maintenance Points are entities that exist within an MD/MA and can perform the CFM/802.1ag functions such as Continuity Checks for fault management. The main type of MP is a Maintenance End Point (MEP). This type of maintenance point sits at the edges of a Maintenance Domain but is a member of only one MA within the Maintenance Domain. Thus an MEP is used at the end of a VLAN segment, or it is used at the end of a link.

A Local MEP can detect defects in connectivity of a VLAN or a local link using Continuity Check Messages (CCM) by sending and receiving CCMs with Remote MEP peers. Any defects detected locally can also be conveyed to Remote MEP peers by sending a Remote Defect Indicator (RDI) to the peers within a Continuity Check Message (CCM). If defects persist long enough, an alarm can be generated.

Use this command to configure the following attributes of a Local MEP:

- **Fault Notification Generation Lowest Alarm Priority Defect** — the lowest defect priority that can cause an alarm to be raised. This configuration parameter specifies the lowest defect that has to occur before an alarm can be generated. Any priority less than this will not result in an alarm notification. Note that if a local defect is detected and its priority is not high enough to generate an alarm, then the Local MEP will not send an RDI to its Remote MEP peers, which is used to notify the peers of a connectivity fault. We recommend you keep the lowest alarm priority defect set to 2.
- **Fault Notification Generation Alarm timers** — the timers that determine whether a defect has been present long enough to result in an alarm being generated, or whether a defect has been abated for long enough to clear an alarm.

**Example** To clear an alarm after the defect has been abated for 6 seconds, use the commands:

```
awplus(config)# interface port1.0.2
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name
MD-INST2 ma-name MA-INST2-1
awplus(config-if-eth-cfm-mep)# mep reset-fng-time 600
```

**Related commands**

- clear (MEP Attribute)
- ethernet cfm domain-name
- ethernet cfm mep
- service ma-name
- show mep-alarm status

**Command changes**

- Version 5.4.7-1.1: command added

- Version 5.4.8-1.1: added to SBx908 GEN2 series products

# mep active

**Overview** Use this command to specify the administrative state of the Local MEP.

**Syntax** mep active {true|false}

| Parameter | Description                                                                                                              |
|-----------|--------------------------------------------------------------------------------------------------------------------------|
| true      | Put the Local MEP into a state of active, which enables it to perform various functions such as processing CCM messages. |
| false     | Specify the state of the Local MEP to cease functioning.                                                                 |

**Default** false

**Mode** Interface Ethernet CFM MEP Configuration

**Usage notes** Maintenance Points are entities that exist within an MD/MA and can perform the CFM/802.1ag functions such as Continuity Checks for fault management. The main type of MP is a Maintenance End Point (MEP). This type of maintenance point sits at the edges of a Maintenance Domain but is a member of only one MA within the Maintenance Domain. Thus an MEP is used at the end of a VLAN segment, or it is used at the end of a link.

A Local MEP can detect defects in connectivity of a VLAN or a local link using Continuity Check Messages (CCM) by sending and receiving CCMs with Remote MEP peers. Any defects detected locally can also be conveyed to Remote MEP peers by sending a Remote Defect Indicator (RDI) to the peers within a Continuity Check Message (CCM). If defects persist long enough, an alarm can be generated.

Setting the Local MEP's Administrative State to true enables it to perform various functions such as processing CCM messages. Setting the state to false deactivates the Local MEP.

**Example** To set the administrative state of the local MEP to "active", use the commands:

```
awplus(config)# interface port1.0.2
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name
MD-INST2 ma-name MA-INST2-1
awplus(config-if-eth-cfm-mep)# mep active true
```

# mep ccm-ltm-priority

**Overview** Use this command to specify the queuing and p-bit priority for CCM messages.

**Syntax** `mep ccm-ltm-priority <0-7>`

| Parameter | Description                                      |
|-----------|--------------------------------------------------|
| <0-7>     | The queuing and p-bit priority for CCM messages. |

**Default** 7

**Mode** Interface Ethernet CFM MEP Configuration

**Usage notes** Maintenance Points are entities that exist within an MD/MA and can perform the CFM/802.1ag functions such as Continuity Checks for fault management. The main type of MP is a Maintenance End Point (MEP). This type of maintenance point sits at the edges of a Maintenance Domain but is a member of only one MA within the Maintenance Domain. Thus an MEP is used at the end of a VLAN segment, or it is used at the end of a link.

A Local MEP can detect defects in connectivity of a VLAN or a local link using Continuity Check Messages (CCM) by sending and receiving CCMs with Remote MEP peers. CCMs are high priority messages by default, but the priority is configurable, although we do not recommend changing it. Any defects detected locally can also be conveyed to Remote MEP peers by sending a Remote Defect Indicator (RDI) to the peers within a Continuity Check Message (CCM). If defects persist long enough, an alarm can be generated.

**Example** To set the queuing and p-bit priority for CCM messages to 6, use the commands:

```
awplus(config)# interface port1.0.2
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name
MD-INST2 ma-name MA-INST2-1
awplus(config-if-eth-cfm-mep)# mep ccm-ltm-priority 6
```

CCMs should be the highest priority message so we recommend leaving their priority as 7.

# mep crosscheck

**Overview** Use this command within the MD instance context to create a Remote MEP instance and configure its parameters.

Use the **no** variant of this command to destroy the Remote MEP instance.

**Syntax** `mep crosscheck mpid <rmep-id> ma-name <ma-name> [mac <HHHH.HHHH.HHHH>]`  
`no mep crosscheck mpid <rmep-id> ma-name <ma-name>`

| Parameter        | Description                                                                                                                  |
|------------------|------------------------------------------------------------------------------------------------------------------------------|
| mpid             | Specify the Remote MEP id.                                                                                                   |
| <rmep-id>        | 1-8191. This must be unique ID for all MEPs in the MA (both local and remote).                                               |
| ma-name          | Specify the Maintenance Association that the Remote MEP is to be associated with.                                            |
| <ma-name>        | Specify the Maintenance Association's CLI instance name.                                                                     |
| mac              | Optionally, when using unicast for communication between a Local MEP and a Remote MEP, specify the remote MEP's MAC address. |
| <HHHH.HHHH.HHHH> | Specify the Remote MEP's MAC address using the HHHH.HHHH.HHHH format where H is a hexadecimal value.                         |

**Mode** Ethernet CFM Configuration

**Usage notes** Maintenance Points are entities that exist within an MD/MA and can perform the CFM/802.1ag functions such as Continuity Checks for fault management. The main type of MP is a Maintenance End Point (MEP). This type of maintenance point sits at the edges of a Maintenance Domain but is a member of only one MA within the Maintenance Domain. Thus an MEP is used at the end of a VLAN segment, or it is used at the end of a link. MPs live on bridge ports and station ports. On a bridge port, there are two types.

- An Up Maintenance Entity is considered an inward MP. It communicates across the inside of the bridge to the other side, and this allows it to reach the outside world. It lives on a bridge port for a given VLAN, but it does not use this port to send or receive to get to the outside world. Instead, it sends and receives through the inside of the bridge and communicates to the outside world through the other VLAN port members. An Up MP cannot be used for Link Level CFM.
- A Down Maintenance Entity is considered an outward MP. It sends and receives only through its bridge port outwardly to the outside world, and does not communicate inside the bridge. A Down MP is not subject to blocking due to Spanning Tree Protocol (STP) or any other protocol trying to prevent loops in the network. As such, it is important that Down MPs be used

in an MD/MA that is not subject to topology loops. A Down MP can be VLAN aware or link-local.

An MEP can be either Up or Down for a given MD/MA, but within a bridge for the same MD/MA, there can only be one Up or Down MEP (not both). An Up MEP must be VLAN aware. A Down MEP may be VLAN aware. Otherwise, a Down MEP is allowed to be link local (VLAN unaware), and its scope is that of the entire link.

**Example** To create a remote MEP instance named "MA-INST2-1" with an MEP ID of 21, use the command:

```
awplus(config-ether-cfm)# mep crosscheck mpid 21 ma-name
MA-INST2-1
```

To destroy the remote MEP instance named "MA-INST2-1" with the MEP ID of 21, use the command:

```
awplus(config-ether-cfm)# no mep crosscheck mpid 21 ma-name
MA-INST2-1
```

# service ma-name

**Overview** Use this command to create a Maintenance Association instance within the MD instance context and configure its parameters.

Use the **no** variant of this command to destroy the Maintenance Association instance.

**Syntax** service ma-name <ma-name> ma-type  
{icc|integer|primary-vid|string|vpn-id} ma-type-name  
<ma-type-name> [vlan <primary-vid> [mip-creation {none}]]  
no service <ma-name>

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ma-name>      | The CLI name that identifies this Maintenance Association (MA) instance.                                                                                                                                                                                                                                                                                                                                  |
| ma-type        | Specify the MA name type. The MA name part of the MAID field appears in the CCM message. There are different formats and conventions for the name depending on the type.                                                                                                                                                                                                                                  |
| icc            | Specify the ma-type as ICC based MA name format. The <ma-type-name> is a 13 byte character string consisting of a 1 to 6 character ITU Carrier Code (ICC) plus a 1 to 6 character Unique MEGID (UMC) code for the name. Any remaining characters are padding out with NULLs by the system to fill out the 13 bytes. This can only be used with Maintenance Domain whose name md-type is set to "No name". |
| integer        | Specify the ma-type as Integer based MA name format. The <ma-type-name> Is a number up to 2 Bytes (0..65535).                                                                                                                                                                                                                                                                                             |
| primary-vid    | Specify the ma-type as Primary VLAN-id based MA name format. The <ma-type-name> Is the VLAN id number that has been assigned to the MA as the primary VLAN.                                                                                                                                                                                                                                               |
| string         | Specify the ma-type as Character String based MA name format. The <ma-type-name> is a string of 1 to 45 characters.                                                                                                                                                                                                                                                                                       |
| vpn-id         | Specify the ma-type as an RFC2685 VPN ID based MA name format. The <ma-type-name> is a 7 Byte value divided into two parts. The first part makes up the VPN's OUI which is three octets and the remaining four octets make up the VPN Index. The format is HHHHHH.HHHHHHHH where H is a hexadecimal digit.                                                                                                |
| ma-type-name   | The Maintenance Association (MA) name type.                                                                                                                                                                                                                                                                                                                                                               |
| <ma-type-name> | The value of the MA type name, which depends on the ma-type selected (icc, integer, primary-vid, string, vpn-id).                                                                                                                                                                                                                                                                                         |
| vlan           | An optional parameter that specifies the VLAN.                                                                                                                                                                                                                                                                                                                                                            |
| <primvary-vid> | Specify the ID of the primary VLAN in the MA.                                                                                                                                                                                                                                                                                                                                                             |

| Parameter    | Description                                                             |
|--------------|-------------------------------------------------------------------------|
| mip-creation | Optional parameter that specifies the MIP creation permission value.    |
| none         | Specifies that no MIPs are to be created (the default and only choice). |

**Mode** Ethernet CFM Configuration

**Usage notes** A Maintenance Association is a Connectivity Fault Management (CFM) term that represents a particular segment of a network within a Maintenance Domain. An MA can represent a segment of a VLAN that is managed for connectivity within that segment. As a VLAN is often the granularity that a Network Service Provider sells to their customer, an MA is often referred to as a “Service”. An MA can also be used to represent a link and in this case the MA is VLAN unaware.

As part of CFM, a Connectivity Check Message (CCM) is used to detect Ethernet connectivity faults amongst nodes that participate in CFM. CCM messages carry the MA name within the MAID field. Within an MD instance context, this command is used to configure the MA name, which can be chosen from a variety of format types.

**Example** To create a Maintenance Association instance named “MA-INST2-1” with an MA name type of “string” and value of “MA-12V100”, use the command:

```
awplus(config-ether-cfm)# service ma-name MA-INST2-1 ma-type
string ma-type-name MA-12V100
```

To destroy a Maintenance Association instance named “MA-INST2-1”, use the command:

```
awplus(config-ether-cfm)# no service MA-INST2-1
```

# show ethernet cfm details

**Overview** Use this command to show CFM configuration, status, and statistics in detail for all CFM entities that the system knows about.

**Syntax** show ethernet cfm details

**Mode** User Exec/Privileged Exec

**Example** To show CFM configuration, status, and statistics in detail for all CFM entities, use the command:

```
awplus# show ethernet cfm details
```

The output loops through the hierarchy of MDs, then MAs within each MD, then local MEPs within that MA, and finally remote MEPs within that MA.

**Output** Figure 9-1: Example output from **show ethernet cfm details**

```
awplus#show ethernet cfm details

# show ethernet cfm domain

**Overview** Use this command to show the Ethernet CFM Domain(s) that have been configured in summary format. Options include the ability to show all domains with detailed information, or to show a specified domain with detailed information.

**Syntax** show ethernet cfm domain  
show ethernet cfm domain details  
show ethernet cfm domain <domain-name> details

| Parameter     | Description                                                    |
|---------------|----------------------------------------------------------------|
| <domain-name> | The CLI name that identifies this Maintenance Domain instance. |
| details       | Provide detailed information in the output.                    |

**Mode** Privileged Exec

**Example** To show all domain configurations in summary format, use the command:

```
awplus# show ethernet cfm domain
```

To show all domains in detail, use the command:

```
awplus# show ethernet cfm domain details
```

To show a specific domain named "MD-INST1" in detail, use the command:

```
awplus# show ethernet cfm domain MD-INST1 details
```

**Output** Figure 9-2: Example output from **show ethernet cfm domain**

|                                 |       |
|---------------------------------|-------|
| awplus#show ethernet cfm domain |       |
| CFM Domain Name                 | Level |
| -----                           | ----- |
| MD-INST1                        | 0     |
| MD-INST2                        | 3     |

# show ethernet cfm errorlog

**Overview** Use this command to list the CFM Errors that are in the CFM Errors Event List, starting from the oldest at the top to the latest at the end.

**Syntax** show ethernet cfm errorlog domain *<domain-name>*

| Parameter                  | Description                    |
|----------------------------|--------------------------------|
| <i>&lt;domain-name&gt;</i> | Specify the domain name value. |

**Mode** Privileged Exec

**Usage notes** When a new error is detected for a Maintenance Association (MA) that is associated with a Maintenance Domain (MD), and such is due to an error from a received or missing CCM from a Remote MEP, an event is logged to the CFM Errors Event List.

**Example** To show the list of errors for an MD named "MD-INST2", use the command:  
awplus# show ethernet cfm errorlog domain MD-INST2

**Output** Figure 9-5: Example output from **show ethernet cfm errorlog domain MD-INST2**

| awplus#show ethernet cfm errorlog domain MD-INST2 |       |      |       |                |                 |  |
|---------------------------------------------------|-------|------|-------|----------------|-----------------|--|
| CFM Service Name                                  | Level | VLAN | MEPID | Remote MAC     | Error Reason    |  |
| -----                                             |       |      |       |                |                 |  |
| MA-INST2-1                                        | 0     | 0    | 12    | 0000.0000.0000 | Remote MEP Down |  |

Table 9-3: Parameters in the output from **show ethernet cfm errorlog domain MD-INST2**

| Parameter  | Description                                                                                      |
|------------|--------------------------------------------------------------------------------------------------|
| Level      | The level configured for the MD.                                                                 |
| VLAN       | The VLAN ID used by the MA if any, otherwise is "0".                                             |
| MEPID      | The MEP ID of the local MEP that detected the error.                                             |
| Remote MAC | The source MAC address of the received CCM causing the error if known, 0000.0000.0000 otherwise. |

Table 9-3: Parameters in the output from **show ethernet cfm errorlog domain MD-INST2** (cont.)

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Error Reason     | <p>One of the following:</p> <p>“Remote MEP Down” - an RMEPCCMDefect has been declared for this remote MEP. CCMs have not been received from this remote MEP within the CCM interval.</p> <p>“MEP Configuration” - the CCM received from the remote MEP has the same MEP ID as the local MEP that received the CCM. For unicast remote MEPs this error can also indicate that even though the CCM received from the remote MEP has an MEP ID that matches a configured remote MEP ID in the MA, the source MAC address differs from the configured MAC address for that remote MEP.</p> <p>“Forwarding Loop” - the CCM received from the remote MEP has an MEP ID that matches a configured local MEP ID in the MA, and also has the same source MAC address as the local MEP's MAC address that received the CCM.</p> <p>“Cross Connected” - a xconCCMdefect was detected.</p> |
| CFM Service Name | The name of the MA associated with the MD for this error(s).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

# show ethernet cfm maintenance-points local mep

**Overview** Use this command to show one or more Local MEPs, and their configuration and status in summary format. Options include the ability to show Local MEP(s) for a given interface with further option to show statistics counters. Another option is to show Local MEPs for a given Maintenance Association (MA) and Maintenance Domain (MD) either for statistics counters, or for one specific Local MEP with either detailed information or statistics counters.

**Syntax** `show ethernet cfm maintenance-points local mep interface <port> [counters]`  
`show ethernet cfm maintenance-points local mep domain <domain-name> service <ma-name> [counters]`  
`show ethernet cfm maintenance-points local mep domain <domain-name> service <ma-name> mep <mep-id> {details|counters}`

| Parameter        | Description                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------|
| interface        | Specify the interface for which Local MEP(s) are to be shown.                                                          |
| <interface-name> | Specify the interface by name.                                                                                         |
| counters         | Specify that counter statistics are to be shown.                                                                       |
| domain           | Specify the Maintenance Domain that Local MEP(s) are to be shown for. Both this and service must be specified.         |
| <domain-name>    | Specify the Maintenance Domain's CLI instance name.                                                                    |
| service          | Specify the Maintenance Association that the Local MEP(s) are to be shown for. Both this and domain must be specified. |
| <ma-name>        | Specify CLI name that identifies the service (Maintenance Association (MA)) instance of interest.                      |
| mep              | Specify one particular Local MEP of interest.                                                                          |
| <mep-id>         | Specify the Local MEP instance by MEP-id.                                                                              |
| details          | Specify that details are to be included in the output.                                                                 |

**Mode** User Exec/Privileged Exec

**Examples** To show the configuration and status of all the Local MEP(s) on an interface, use the command:

```
awplus# show ethernet cfm maintenance-points local mep
interface port1.0.2
```

To show details of a specific Local MEP on an MA and its associated MD, use the command:

```
awplus# show ethernet cfm maintenance-points local mep domain
MD-INST1 service MA-INST1-1 mep 12 details
```

**Output** Figure 9-6: Example output from **show ethernet cfm maintenance-points local mep interface port1.0.2**

```
awplus#show ethernet cfm maintenance-points local mep interface
port1.0.2
```

| Service Name | MEPID | Dir | Interface | State | Defect |
|--------------|-------|-----|-----------|-------|--------|
| MA-INST1-1   | 12    | D   | port1.0.2 | En    | ..3..  |

Table 9-4: Parameters in the output from **show ethernet cfm maintenance-points local mep interface <interface-name>**

| Parameter    | Description                                                                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service Name | The MA service name.                                                                                                                                                     |
| MEPID        | The MEP ID of the local MEP of interest within the MA.                                                                                                                   |
| Dir          | The direction of this local MEP:<br>D - Down MEP.<br>U - Up MEP.<br>Note: Only Down is currently supported.                                                              |
| Interface    | The interface on which the local MEP resides.                                                                                                                            |
| State        | Whether the local MEP's CCM processing is enabled "En" or disabled "Dis".                                                                                                |
| Defect       | Defect bit list <dbl> indicating which of 5 possible defects are currently being detected with each bit showing the detected <defect-number> or . if there is no defect. |

Figure 9-7: Example output from **show ethernet cfm maintenance-points local mep domain MD-INST1 service MA-INST1-1 mep 12 details**

```

MD-INST1 service MA-INST1-1 mep 12 details

Domain Name..... MD-INST1
MA Service Name..... MA-INST1-1
MA Primary VLAN..... 0
MEP ID..... 12
Direction..... Down
Interface..... port1.0.2
 MEP Active State..... True
 CC State..... Enabled
 CC Type..... Multicast
 PDU VLAN Priority..... 7
 MAC-address..... 000c.2526.95a1
 Tx-RDI..... True
 Current Defects..... 3 (someMEPCCMdefect)
 Current Highest Defect Alarm.. 4 (someMEPCCMdefect)
 Alarm Minimum Defect..... 2 (someMACstatusDefect)
 Alarm Trip Time..... AUTO (2.5 seconds)
 Alarm Reset Time..... AUTO (10 seconds)
 Configured Remote MEPs..... 21
 Missing Remote MEPs..... 21
 Error CCM Reason..... N/A
 Last Error CCM..... N/A
 Cross-connect Defect Reason... N/A
 Last Cross Connect CCM..... N/A
```

Table 9-5: Parameters in the output from **show ethernet cfm maintenance-points local mep domain <domain-name> service <ma-name> mep <mep-id> details**

| Parameter                       | Description                                                                   |
|---------------------------------|-------------------------------------------------------------------------------|
| Domain Name and MA Service Name | Uniquely identify the MD and MA this local MEP is associated with.            |
| MA Primary VLAN                 | The VLAN used by this MEP. A link-local MEP VLAN is indicated by "-".         |
| MEP ID                          | The local MEP's ID.                                                           |
| Direction                       | The direction of the local MEP, either Down or Up.                            |
| Interface                       | The Interface port or Interface lag that the local MEP is configured against. |
| MEP Active State                | The MEP's configured administrative state:<br>Up: True<br>Down: False.        |

Table 9-5: Parameters in the output from **show ethernet cfm maintenance-points local mep domain <domain-name> service <ma-name> mep <mep-id> details** (cont.)

| Parameter                    | Description                                                                                                                                                                                                                |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CC State                     | The MEP's CCM configured administrative state:<br>Up: Enable<br>Down: Disable.                                                                                                                                             |
| CC Type                      | The configured CCM sending and receiving type, either multicast or unicast. If not yet configured, it shows as None.                                                                                                       |
| Tx - RDI                     | Whether this local MEP is sending RDI or not. An RDI is sent when one or more of the following defects have been declared by the local MEP:<br>someRMEPCCMdefect<br>someMACstatusDefect<br>errorCCMdefect<br>xconCCMdefect |
| Current Defects              | A list of defects the local MEP is currently detecting. It shows the defect(s), as both a defect priority and name.                                                                                                        |
| Current Highest Defect Alarm | The highest defect priority that has been encountered while the local MEP has been in an alarm state.                                                                                                                      |
| Alarm Minimum Defect         | The minimum defect the local MEP has to see before declaring an alarm.                                                                                                                                                     |
| Alarm Trip Time              | The amount of time the defect has to exist before an alarm is declared.                                                                                                                                                    |
| Configured Remote MEP IDs    | A comma separated list of configured remote MEPs (by MEP IDs) known by this local MEP. If the remote MEP also has a configured unicast MAC address, the MEP ID will also include -HHHH.HHHH.HHHH.                          |
| Missing Remote MEPs          | The remote MEPs (by MEP ID) that have been configured against this local MEP but have not been heard from.                                                                                                                 |

Table 9-5: Parameters in the output from **show ethernet cfm maintenance-points local mep domain <domain-name> service <ma-name> mep <mep-id> details** (cont.)

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Error CCM Reason            | <p>The reason that the local MEP is detecting the errorCCMdefect condition (if any):</p> <p>Wrong MEP ID Received - CCM received with correct level and MAID, but MEP ID has not been configured in this MA.</p> <p>My MEP ID Received - CCM received with correct level and MAID, but an MEP ID that is the same as a local MEP in this MA.</p> <p>My MEP ID Received (loop) - as above, but the CCM received also has the same MAC address as the local MEP in the MA.</p> <p>CCM Interval Mismatch - CCM received with correct level and MAID, but CCM interval does not match that configured for this MA.</p> <p>MAC address mismatch - for a configured unicast RMEP (via crosscheck) the MAC address did not match the provisioned value in the associated MA.</p> <p>N/A - indicates there is no error CCM defect being detected.</p> |
| Last Error CCM              | If an errorCCMdefect condition is detected, portions of the CCM that caused this condition are displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Cross Connect Defect Reason | <p>The reason that the local MEP is detecting the xconCCMdefect condition (if any):</p> <p>Wrong MAID - CCM received with correct level but incorrect MAID (mismatch in the domain name and/or short MA name versus configured).</p> <p>Wrong Level - CCM received with a level that is lower than the level configured for this local MEP's domain.</p> <p>N/A - indicates there is no error CCM defect being detected.</p>                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Last Cross Connect CCM      | If a xconCCMdefect condition is detected, portions of the CCM that caused this condition are displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

# show ethernet cfm maintenance-points remote mep

**Overview** Use this command to show one or more Ethernet CFM maintenance points, namely Remote Maintenance End Points (MEPs) within a given Maintenance Association (MA) and its associated Maintenance Domain (MD), and their configuration and status in summary format. Options include the ability to show an individual Remote MEP in detail.

**Syntax** show ethernet cfm maintenance-points remote mep domain <domain-name> service <ma-name> [{mac <rmeop-mac-address>|rmeop <mep-id>} details]

| Parameter           | Description                                                                                                       |
|---------------------|-------------------------------------------------------------------------------------------------------------------|
| domain              | Specify the Maintenance Domain that Remote MEP(s) are to be shown for.                                            |
| <domain-name>       | Specify the Maintenance Domain's CLI instance name.                                                               |
| service             | Specify the Maintenance Association that the Remote MEP(s) are to be shown for.                                   |
| <ma-name>           | Specify the service's (Maintenance Association (MA)) CLI instance name.                                           |
| mac                 | Specify the remote MEP of interest by its MAC address.                                                            |
| <rmeop-mac-address> | Specify the value of the remote MEP's MAC address using the format HHHH.HHHH.HHHH where H is a hexadecimal digit. |
| rmeop               | Specify the remote MEP of interest by its ID.                                                                     |
| <mep-id>            | Specify the value of the remote MEP's ID in the range 1 to 8191.                                                  |

**Mode** User Exec/Privileged Exec

**Example** To show all the remote MEP(s)'s status for this MA and MD in summary form, use the command:

```
awplus# show ethernet cfm maintenance-points remote mep domain MD-INST1 service MA-INST1-1
```

To show a specific remote MEP by its ID in detail, use the command:

```
awplus# show ethernet cfm maintenance-points remote mep domain MD-INST1 service MA-INST1-1 rmeop 21 details
```

To show a specific remote MEP by its MAC address in detail, use the command:

```
awplus# show ethernet cfm maintenance-points remote mep domain MD-INST1 service MA-INST1-1 mac 000c.2526.95bf details
```

**Output** Figure 9-8: Example output from **show ethernet cfm maintenance-points remote mep domain MD-INST1 service MA-INST1-1**

Table 9-6: Parameters in the output from **show ethernet cfm maintenance-points remote mep**

| Parameter                            | Description                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CFM Domain Name and CFM Service Name | The instance identifiers that uniquely identify the MA and MD for the remote MEP(s) of interest.                                                                                                                                                                                                                                                            |
| Remote MEPID                         | The remote MEP ID that is configured for this MA.                                                                                                                                                                                                                                                                                                           |
| Receiving CCMs                       | The current state of the 802.1ag remote MEP state machine:<br>Yes - RMEP_OK. CCMs are being received without any error.<br>Wait - RMEP_START. Still preparing to receive remote MEP CCMs without a timeout occurring.<br>Failed - RMEP_FAILED. While waiting to receive CCMs from a remote MEP, a timeout occurred.<br>-- the state machine is not running. |
| RX RDI                               | The current RDI being received from this remote MEP:<br>True - the last CCM received from the remote MEP has the RDI set. This means the remote MEP itself is seeing one of the following defects: someRMEPCCMDefect, someMACstatusDefect, errorCCMdefect, xconCCMdefect.<br>False - the last CCM received from the remote MEP does not have its RDI set.   |
| MAC Address                          | The configured or discovered MAC address of the remote MEP.                                                                                                                                                                                                                                                                                                 |
| Port Status                          | If the CCM was received with a port status TLV, this indicates the last value received, or "-" if none received.                                                                                                                                                                                                                                            |
| Interface Status                     | If the CCM was received with an interface status TLV, this indicates the last value received, or "-" if none received.                                                                                                                                                                                                                                      |

# show ethernet cfm service

**Overview** Use this command to show the Ethernet CFM Services (Maintenance Associations (MA)) configuration in summary format, or show a specified MA with detailed information.

**Syntax** show ethernet cfm service [*<ma-name>* domain *<domain-name>* details]

| Parameter                  | Description                                                                                   |
|----------------------------|-----------------------------------------------------------------------------------------------|
| <i>&lt;ma-name&gt;</i>     | The CLI name that identifies the service (Maintenance Association (MA)) instance of interest. |
| domain                     | Specify the domain name by name.                                                              |
| <i>&lt;domain-name&gt;</i> | The CLI name that identifies this Maintenance Domain instance.                                |

**Mode** User Exec/Privileged Exec

**Example** To show details for all MAs in summary form, use the command:

```
awplus# show ethernet cfm service
```

To show a specified MA in detailed form, use the command:

```
awplus# show ethernet cfm service MA-INST2-1 domain MD-INST2 details
```

**Output** Figure 9-11: Example output from **show ethernet cfm service**

|                                  |                  |       |        |
|----------------------------------|------------------|-------|--------|
| awplus#show ethernet cfm service |                  |       |        |
| CFM Domain Name                  | CFM Service Name | VLAN  | Defect |
| -----                            | -----            | ----- | -----  |
| MD-INST1                         | MA-INST1-1       | NONE  | .....  |
| MD-INST2                         | MA-INST2-1       | NONE  | ..3..  |

Table 9-7: Parameters in the output from **show ethernet cfm service**

| Parameter        | Description                                         |
|------------------|-----------------------------------------------------|
| CFM Domain Name  | The Maintenance Domain name for the managed object. |
| CFM Service Name | The Maintenance Associations (MA) instance name.    |

Table 9-7: Parameters in the output from **show ethernet cfm service** (cont.)

| Parameter | Description                                                                                                                                                                                                                                                  |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN      | The Primary VLAN.                                                                                                                                                                                                                                            |
| Defect    | A list of defects detected by the MA's Local MEPs. The defects shown can be:<br>1 - someRDldefect is declared<br>2 - someMACstatusDefect is declared<br>3 - someRMEPCCMdefect is declared<br>4 - errorCCMdefect is declared<br>5 - xconCCMdefect is declared |

Figure 9-12: Example output from **show ethernet cfm service MA-INST2-1 domain MD-INST2 details**

```
awplus#show ethernet cfm service MA-INST2-1 domain MD-INST2
details

CFM Service Name..... MA-INST2-1
CFM Domain Name..... MD-INST2
CFM Domain Level..... 3
Primary VLAN..... -

Maintenance Assoc Name Format... string
Maintenance Assoc Name Value... MA-12V100
CCM Transmission Interval..... 1 second
Local MEPs..... MEP DOWN
 12 (interface port1.0.2)

Configured Remote MEPs..... 21
Missing Remote MEPs..... 21
Current MEP Defects..... 3 (someRMEPCCMdefect)
MIP Creation..... None
```

Table 9-8: Parameters in the output from **show ethernet cfm service <ma-name> domain <domain-name> details**

| Parameter        | Description                                         |
|------------------|-----------------------------------------------------|
| CFM Service Name | The Maintenance Associations (MA) instance name.    |
| CFM Domain Name  | The Maintenance Domain name for the managed object. |
| CFM Domain Level | The level of the domain.                            |
| Primary VLAN     | The Primary VLAN that was configured (if any).      |

Table 9-8: Parameters in the output from **show ethernet cfm service <ma-name> domain <domain-name> details** (cont.)

| Parameter                               | Description                                                                                                                                                                                                                                                                                   |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maintenance Assoc Name Format and Value | The name and name format of the MA. The name format is one of the following:<br>ICC - ICC string based name format<br>Integer - Integer based name format<br>Primary-vid - Primary VLAN based name format<br>String - Character string based name format<br>VPN-ID - VPN-ID based name format |
| CCM Transmission Interval               | The CCI that was configured for this MA. It can be one of the following:<br>3 - CCI of 100 milliseconds<br>4 - CCI of 1 second (default)<br>5 - CCI of 10 seconds<br>6 - CCI of 1 minute<br>7 - CCI of 10 minutes                                                                             |
| Local MEPs                              | A list of the Local MEPs configured for this MA. For each MEP, it displays the MEP direction Up or Down, its MEP-id, and the interface it was configured on.                                                                                                                                  |
| Configured Remote MEPs                  | A list of Remote MEPs by MEP-id.                                                                                                                                                                                                                                                              |
| Missing Remote MEPs                     | A list of the configured Remote MEPs that this MA has not received any CCM messages from within 3.5 times the configured CCI.                                                                                                                                                                 |
| Defect                                  | A list of defects detected by the MA's Local MEPs. The defects shown can be:<br>1 - someRDIdefect is declared<br>2 - someMACstatusDefect is declared<br>3 - someRMEPCCMdefect is declared<br>4 - errorCCMdefect is declared<br>5 - xconCCMdefect is declared                                  |

**Related commands**

# show mep-alarm status

**Overview** Use this command to show any alarms that have been declared by Local MEPs, and the defect(s) that caused the alarm.

**Syntax** show mep-alarm status

**Mode** User Exec/Privileged Exec

**Usage notes** A Local MEP is used to detect connectivity faults with other remote MEPs that are in the same Maintenance Association (MA) and Maintenance Domain (MD) as the Local MEP. A Local MEP looks first for connectivity defects, and if these defects persist for a long enough period of time (typically 2.5 seconds), then an alarm is declared.

**Example** To show the alarms on local MEPs, use the command:

```
awplus# show mep-alarm status
```

**Output** Figure 9-13: Example output from **show mep-alarm status**

|                              |                  |     |              |
|------------------------------|------------------|-----|--------------|
| awplus#show mep-alarm status |                  |     |              |
| CFM Domain Name              | CFM Service Name | MEP | Active Alarm |
| -----                        |                  |     |              |
| MD-INST1                     | MA-INST1-1       | 12  | someRMEPCCM  |

Table 9-9: Parameters in the output from **show mep-alarm status**

| Parameter        | Description                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------|
| CFM Domain Name  | The domain name.                                                                                                                |
| CFM Service Name | The MA name.                                                                                                                    |
| Active Alarms    | The highest priority defect causing the alarm, one of the following: someRDI, someMACstatus, someRMEPCCM, errorCCM, or xconCCM. |
| MEP              | The local MEP's ID.                                                                                                             |

# Logging Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure logging. See the [Logging Feature Overview and Configuration Guide](#) for more information about the different types of log and how to filter log messages.

- Command List**
- [“clear exception log”](#) on page 418
  - [“clear log”](#) on page 419
  - [“clear log buffered”](#) on page 420
  - [“clear log external”](#) on page 421
  - [“clear log permanent”](#) on page 422
  - [“copy buffered-log”](#) on page 423
  - [“copy permanent-log”](#) on page 424
  - [“default log buffered”](#) on page 425
  - [“default log console”](#) on page 426
  - [“default log email”](#) on page 427
  - [“default log external”](#) on page 428
  - [“default log host”](#) on page 429
  - [“default log monitor”](#) on page 430
  - [“default log permanent”](#) on page 431
  - [“log buffered”](#) on page 432
  - [“log buffered \(filter\)”](#) on page 433
  - [“log buffered exclude”](#) on page 436
  - [“log buffered size”](#) on page 439
  - [“log console”](#) on page 440

- ["log console \(filter\)"](#) on page 441
- ["log console exclude"](#) on page 444
- ["log email"](#) on page 447
- ["log email \(filter\)"](#) on page 448
- ["log email exclude"](#) on page 451
- ["log email time"](#) on page 454
- ["log external"](#) on page 456
- ["log external \(filter\)"](#) on page 458
- ["log external exclude"](#) on page 461
- ["log external rotate"](#) on page 464
- ["log external size"](#) on page 466
- ["log facility"](#) on page 467
- ["log host"](#) on page 469
- ["log host \(filter\)"](#) on page 471
- ["log host exclude"](#) on page 474
- ["log host source"](#) on page 477
- ["log host startup-delay"](#) on page 478
- ["log host time"](#) on page 480
- ["log monitor \(filter\)"](#) on page 482
- ["log monitor exclude"](#) on page 485
- ["log permanent"](#) on page 488
- ["log permanent \(filter\)"](#) on page 489
- ["log permanent exclude"](#) on page 492
- ["log permanent size"](#) on page 495
- ["log-rate-limit nsm"](#) on page 496
- ["log trustpoint"](#) on page 497
- ["show counter log"](#) on page 498
- ["show exception log"](#) on page 499
- ["show log"](#) on page 500
- ["show log config"](#) on page 502
- ["show log external"](#) on page 504
- ["show log permanent"](#) on page 505
- ["show running-config log"](#) on page 507
- ["unmount"](#) on page 508

# clear exception log

**Overview** This command resets the contents of the exception log, but does not remove the associated core files.

**NOTE:** *When this command is used within a stacked environment, it will remove the contents of the exception logs in all stack members.*

**Syntax** `clear exception log`

**Mode** Privileged Exec

**Example** `awplus# clear exception log`

# clear log

**Overview** This command removes the contents of the buffered and permanent logs.

**NOTE:** *When this command is used within a stacked environment, it will remove the contents of the buffered and permanent logs in all stack members.*

**Syntax** `clear log`

**Mode** Privileged Exec

**Example** To delete the contents of the buffered and permanent log use the command:

```
awplus# clear log
```

**Related commands**

- [clear log buffered](#)
- [clear log permanent](#)
- [show log](#)

# clear log buffered

**Overview** This command removes the contents of the buffered log.

**NOTE:** When this command is used within a stacked environment, it will remove the contents of the buffered logs in all stack members.

**Syntax** clear log buffered

**Mode** Privileged Exec

**Example** To delete the contents of the buffered log use the following commands:

```
awplus# clear log buffered
```

**Related commands**

- default log buffered
- log buffered
- log buffered (filter)
- log buffered size
- log buffered exclude
- show log
- show log config

# clear log external

**Overview** Use this command to delete the external log file from the USB storage device it is stored on.

If the external log is rotating between multiple files, this command deletes all those files, not just the most recent one.

When this command is used within a stacked environment, it will delete the external logs on all stack members.

**Syntax** `clear log external`

**Mode** Privileged Exec

**Example** To delete the external log file, use the command:

```
awplus# clear log external
```

**Related commands**

- [default log external](#)
- [log external](#)
- [log external \(filter\)](#)
- [log external exclude](#)
- [log external rotate](#)
- [log external size](#)
- [show log config](#)
- [show log external](#)
- [unmount](#)

**Command changes** Version 5.4.7-1.1: command added

# clear log permanent

**Overview** This command removes the contents of the permanent log.

**NOTE:** When this command is used within a stacked environment, it will remove the contents of the permanent logs in all stack members.

**Syntax** clear log permanent

**Mode** Privileged Exec

**Example** To delete the contents of the permanent log use the following commands:

```
awplus# clear log permanent
```

**Related commands**

- default log permanent
- log permanent
- log permanent (filter)
- log permanent exclude
- log permanent size
- show log config
- show log permanent

# copy buffered-log

**Overview** Use this command to copy the buffered log to an internal or external destination.

**Syntax** `copy buffered-log <destination-name>`

| Parameter                             | Description                                                                                                    |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <code>&lt;destination-name&gt;</code> | The filename and path for the destination file. See <a href="#">Introduction</a> on page 144 for valid syntax. |

**Mode** Privileged Exec

**Example** To copy the buffered log file into a folder in Flash named "buffered-log" and name the file "buffered-log.log", use the command:

```
awplus# copy buffered-log flash:/buffered-log/buffered-log.log
```

To copy the buffered log file onto a USB storage device and name the file "buffered-log.log", use the command:

```
awplus# copy buffered-log usb:/buffered-log.log
```

**Related commands**

- [log buffered](#)
- [show file systems](#)
- [show log](#)

**Command changes** Version 5.4.7-1.1: command added

# copy permanent-log

**Overview** Use this command to copy the permanent log to an internal or external destination.

**Syntax** `copy permanent-log <destination-name>`

| Parameter                             | Description                                                                                                    |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <code>&lt;destination-name&gt;</code> | The filename and path for the destination file. See <a href="#">Introduction</a> on page 144 for valid syntax. |

**Mode** Privileged Exec

**Example** To copy the permanent log file into a folder in Flash named “perm-log” and name the file “permanent-log.log”, use the command:

```
awplus# copy permanent-log flash:/perm-log/permanent-log.log
```

To copy the permanent log file onto a USB storage device and name the file “permanent-log.log”, use the command:

```
awplus# copy permanent-log usb:/permanent-log.log
```

**Command changes** Version 5.4.7-1.1: command added

# default log buffered

**Overview** This command restores the default settings for the buffered log stored in RAM. By default the size of the buffered log is 50 kB and it accepts messages with the severity level of "warnings" and above.

**Syntax** `default log buffered`

**Default** The buffered log is enabled by default.

**Mode** Global Configuration

**Example** To restore the buffered log to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log buffered
```

**Related commands**

- `clear log buffered`
- `log buffered`
- `log buffered (filter)`
- `log buffered size`
- `log buffered exclude`
- `show log`
- `show log config`

# default log console

**Overview** This command restores the default settings for log messages sent to the terminal when a [log console](#) command is issued. By default all messages are sent to the console when a **log console** command is issued.

**Syntax** default log console

**Mode** Global Configuration

**Example** To restore the log console to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log console
```

**Related commands**

- [log console](#)
- [log console \(filter\)](#)
- [log console exclude](#)
- [show log config](#)

# default log email

**Overview** This command restores the default settings for log messages sent to an email address. By default no filters are defined for email addresses. Filters must be defined before messages will be sent. This command also restores the remote syslog server time offset value to local (no offset).

**Syntax** `default log email <email-address>`

| Parameter                          | Description                               |
|------------------------------------|-------------------------------------------|
| <code>&lt;email-address&gt;</code> | The email address to send log messages to |

**Mode** Global Configuration

**Example** To restore the default settings for log messages sent to the email address `admin@alliedtelesis.com` use the following commands:

```
awplus# configure terminal
awplus(config)# default log email admin@alliedtelesis.com
```

**Related commands**

- [log email](#)
- [log email \(filter\)](#)
- [log email exclude](#)
- [log email time](#)
- [show log config](#)

# default log external

**Overview** Use this command to restore the default settings for the external log. By default, the size of the external log is 50 kB, it rotates through 1 additional file, and it accepts messages with a severity level of notices and above.

Note that this command does not clear the configured filename for the external log.

**Syntax** `default log external`

**Mode** Global Configuration

**Example** To restore the default settings for the external log, use the commands:

```
awplus# configure terminal
awplus(config)# default log external
```

**Related commands**

- [clear log external](#)
- [log external](#)
- [log external \(filter\)](#)
- [log external exclude](#)
- [log external rotate](#)
- [log external size](#)
- [show log config](#)
- [show log external](#)
- [unmount](#)

**Command changes** Version 5.4.7-1.1: command added

# default log host

**Overview** This command restores the default settings for log sent to a remote syslog server. By default no filters are defined for remote syslog servers. Filters must be defined before messages will be sent. This command also restores the remote syslog server time offset value to local (no offset).

**Syntax** `default log host <ip-addr>`

| Parameter                    | Description                              |
|------------------------------|------------------------------------------|
| <code>&lt;ip-addr&gt;</code> | The IP address of a remote syslog server |

**Mode** Global Configuration

**Example** To restore the default settings for messages sent to the remote syslog server with IP address 10.32.16.21 use the following commands:

```
awplus# configure terminal
awplus(config)# default log host 10.32.16.21
```

**Related commands**

- [log host](#)
- [log host \(filter\)](#)
- [log host exclude](#)
- [log host source](#)
- [log host time](#)
- [show log config](#)

# default log monitor

**Overview** This command restores the default settings for log messages sent to the terminal when a [terminal monitor](#) command is used.

**Syntax** default log monitor

**Default** All messages are sent to the terminal when a [terminal monitor](#) command is used.

**Mode** Global Configuration

**Example** To restore the log monitor to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log monitor
```

**Related commands**

- [log monitor \(filter\)](#)
- [log monitor exclude](#)
- [show log config](#)
- [terminal monitor](#)

# default log permanent

**Overview** This command restores the default settings for the permanent log stored in NVS. By default, the size of the permanent log is 50 kB and it accepts messages with the severity level of warnings and above.

**Syntax** `default log permanent`

**Default** The permanent log is enabled by default.

**Mode** Global Configuration

**Example** To restore the permanent log to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log permanent
```

**Related commands**

- `clear log permanent`
- `log permanent`
- `log permanent (filter)`
- `log permanent exclude`
- `log permanent size`
- `show log config`
- `show log permanent`

# log buffered

**Overview** This command configures the device to store log messages in RAM. Messages stored in RAM are not retained on the device over a restart. Once the buffered log reaches its configured maximum allowable size old messages will be deleted to make way for new ones.

**Syntax** log buffered  
no log buffered

**Default** The buffered log is configured by default.

**Mode** Global Configuration

**Examples** To configured the device to store log messages in RAM use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered
```

To configure the device to not store log messages in a RAM buffer use the following commands:

```
awplus# configure terminal
awplus(config)# no log buffered
```

**Related commands**

- clear log buffered
- copy buffered-log
- default log buffered
- log buffered (filter)
- log buffered size
- log buffered exclude
- show log
- show log config

# log buffered (filter)

**Overview** Use this command to create a filter to select messages to be sent to the buffered log. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

The **no** variant of this command removes the corresponding filter, so that the specified messages are no longer sent to the buffered log.

**Syntax** `log buffered [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log buffered [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                                                                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Filter messages to the buffered log by severity level.                                                                                                                                                                                                                                                  |
| <level>         | The minimum severity of message to send to the buffered log. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:                                                                                                   |
| 0 emergencies   | System is unusable                                                                                                                                                                                                                                                                                      |
| 1 alerts        | Action must be taken immediately                                                                                                                                                                                                                                                                        |
| 2 critical      | Critical conditions                                                                                                                                                                                                                                                                                     |
| 3 errors        | Error conditions                                                                                                                                                                                                                                                                                        |
| 4 warnings      | Warning conditions                                                                                                                                                                                                                                                                                      |
| 5 notices       | Normal, but significant, conditions                                                                                                                                                                                                                                                                     |
| 6 informational | Informational messages                                                                                                                                                                                                                                                                                  |
| 7 debugging     | Debug-level messages                                                                                                                                                                                                                                                                                    |
| program         | Filter messages to the buffered log by program. Include messages from a specified program in the buffered log.                                                                                                                                                                                          |
| <program-name>  | The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. |
| rip             | Routing Information Protocol (RIP)                                                                                                                                                                                                                                                                      |
| ripng           | Routing Information Protocol - next generation (RIPng)                                                                                                                                                                                                                                                  |

| auth          | Security/authorization messages                                                                                         |
| syslog        | Messages generated internally by syslogd                                                                                |
| lpr           | Line printer subsystem                                                                                                  |
| news          | Network news subsystem                                                                                                  |
| uucp          | UUCP subsystem                                                                                                          |
| cron          | Clock daemon                                                                                                            |
| authpriv      | Security/authorization messages (private)                                                                               |
| ftp           | FTP daemon                                                                                                              |
| msgtext       | Select messages containing a certain text string.                                                                       |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** By default the buffered log has a filter to select messages whose severity level is "notices (5)" or higher. This filter may be removed using the **no** variant of this command.

**Mode** Global Configuration

**Examples** To add a filter to send all messages generated by EPSR that have a severity of **notices** or higher to the buffered log, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# log buffered level notices program epsr
```

To add a filter to send all messages containing the text "Bridging initialization" to the buffered log, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# log buffered msgtext Bridging initialization
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to the buffered log, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no log buffered level notices program epsr
```

To remove a filter that sends all messages containing the text "Bridging initialization" to the buffered log, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no log buffered msgtext Bridging initialization
```

# log buffered exclude

**Overview** Use this command to exclude specified log messages from the buffered log. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log buffered exclude [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log buffered exclude [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Exclude messages of the specified severity level.                                                                                                                                                                                                                                  |
| <level>         | The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:                                                                                                            |
| 0 emergencies   | System is unusable                                                                                                                                                                                                                                                                 |
| 1 alerts        | Action must be taken immediately                                                                                                                                                                                                                                                   |
| 2 critical      | Critical conditions                                                                                                                                                                                                                                                                |
| 3 errors        | Error conditions                                                                                                                                                                                                                                                                   |
| 4 warnings      | Warning conditions                                                                                                                                                                                                                                                                 |
| 5 notices       | Normal, but significant, conditions                                                                                                                                                                                                                                                |
| 6 informational | Informational messages                                                                                                                                                                                                                                                             |
| 7 debugging     | Debug-level messages                                                                                                                                                                                                                                                               |
| program         | Exclude messages from a specified program.                                                                                                                                                                                                                                         |
| <program-name>  | The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. |
| rip             | Routing Information Protocol (RIP)                                                                                                                                                                                                                                                 |
| ripng           | Routing Information Protocol - next generation (RIPng)                                                                                                                                                                                                                             |

| news          | Network news subsystem                                                                                                  |
| uucp          | UUCP subsystem                                                                                                          |
| cron          | Clock daemon                                                                                                            |
| authpriv      | Security/authorization messages (private)                                                                               |
| ftp           | FTP daemon                                                                                                              |
| msgtext       | Exclude messages containing a certain text string.                                                                      |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# log buffered exclude msgtext example of
irrelevant message
```

**Related  
commands**

- clear log buffered
- default log buffered
- log buffered
- log buffered (filter)
- log buffered size
- show log
- show log config

# log buffered size

**Overview** This command configures the amount of memory that the buffered log is permitted to use. Once this memory allocation has been filled old messages will be deleted to make room for new messages.

Use the **no** variant of this command to return to the default.

**Syntax** log buffered size <50-250>  
no log buffered size

| Parameter | Description                      |
|-----------|----------------------------------|
| <50-250>  | Size of the RAM log in kilobytes |

**Default** 50 kilobytes

**Mode** Global Configuration

**Example** To allow the buffered log to use up to 100 kilobytes of RAM, use the commands:

```
awplus# configure terminal
awplus(config)# log buffered size 100
```

To return to the default value, use the commands:

```
awplus# configure terminal
awplus(config)# no log buffered size
```

**Related commands**

- clear log buffered
- copy buffered-log
- default log buffered
- log buffered
- log buffered (filter)
- log buffered exclude
- show log
- show log config

# log console

**Overview** This command configures the device to send log messages to consoles. The console log is configured by default to send messages to the device's main console port.

Use the **no** variant of this command to configure the device not to send log messages to consoles.

**Syntax** log console  
no log console

**Mode** Global Configuration

**Examples** To configure the device to send log messages use the following commands:

```
awplus# configure terminal
awplus(config)# log console
```

To configure the device not to send log messages in all consoles use the following commands:

```
awplus# configure terminal
awplus(config)# no log console
```

**Related commands** default log console  
log console (filter)  
log console exclude  
show log config

# log console (filter)

**Overview** This command creates a filter to select messages to be sent to all consoles when the **log console** command is given. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

**Syntax** `log console [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log console [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                                                                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Filter messages by severity level.                                                                                                                                                                                                                                                                      |
| <level>         | The minimum severity of message to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:                                                                                                                       |
| 0 emergencies   | System is unusable                                                                                                                                                                                                                                                                                      |
| 1 alerts        | Action must be taken immediately                                                                                                                                                                                                                                                                        |
| 2 critical      | Critical conditions                                                                                                                                                                                                                                                                                     |
| 3 errors        | Error conditions                                                                                                                                                                                                                                                                                        |
| 4 warnings      | Warning conditions                                                                                                                                                                                                                                                                                      |
| 5 notices       | Normal, but significant, conditions                                                                                                                                                                                                                                                                     |
| 6 informational | Informational messages                                                                                                                                                                                                                                                                                  |
| 7 debugging     | Debug-level messages                                                                                                                                                                                                                                                                                    |
| program         | Filter messages by program. Include messages from a specified program.                                                                                                                                                                                                                                  |
| <program-name>  | The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. |
| rip             | Routing Information Protocol (RIP)                                                                                                                                                                                                                                                                      |

| auth          | Security/authorization messages                                                                                         |
| syslog        | Messages generated internally by syslogd                                                                                |
| lpr           | Line printer subsystem                                                                                                  |
| news          | Network news subsystem                                                                                                  |
| uucp          | UUCP subsystem                                                                                                          |
| cron          | Clock daemon                                                                                                            |
| authpriv      | Security/authorization messages (private)                                                                               |
| ftp           | FTP daemon                                                                                                              |
| msgtext       | Select messages containing a certain text string.                                                                       |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** By default the console log has a filter to select messages whose severity level is **critical** or higher. This filter may be removed using the **no** variant of this command. This filter may be removed and replaced by filters that are more selective.

**Mode** Global Configuration

**Examples** To create a filter to send all messages containing the text "Bridging initialization" to console instances where the **log console** command has been entered, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# log console msgtext "Bridging initialization"
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to consoles, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no log console level notices program epsr
```

To remove a default filter that includes sending **critical**, **alert** and **emergency** level messages to the console, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no log console level critical
```

**Related commands**

- [default log console](#)
- [log console](#)
- [log console exclude](#)
- [show log config](#)

# log console exclude

**Overview** Use this command to prevent specified log messages from being sent to the console, when console logging is turned on. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log console exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log console exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Exclude messages of the specified severity level.                                                                                                                                                                                                                                  |
| <level>         | The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:                                                                                                            |
| 0 emergencies   | System is unusable                                                                                                                                                                                                                                                                 |
| 1 alerts        | Action must be taken immediately                                                                                                                                                                                                                                                   |
| 2 critical      | Critical conditions                                                                                                                                                                                                                                                                |
| 3 errors        | Error conditions                                                                                                                                                                                                                                                                   |
| 4 warnings      | Warning conditions                                                                                                                                                                                                                                                                 |
| 5 notices       | Normal, but significant, conditions                                                                                                                                                                                                                                                |
| 6 informational | Informational messages                                                                                                                                                                                                                                                             |
| 7 debugging     | Debug-level messages                                                                                                                                                                                                                                                               |
| program         | Exclude messages from a specified program.                                                                                                                                                                                                                                         |
| <program-name>  | The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. |
| rip             | Routing Information Protocol (RIP)                                                                                                                                                                                                                                                 |

| cron       | Clock daemon                                                             |
| authpriv   | Security/authorization messages (private)                                |
| ftp        | FTP daemon                                                               |

| Parameter     | Description                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------|
| msgtext       | Exclude messages containing a certain text string.                                                                      |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# log console exclude msgtext example of
irrelevant message
```

**Related  
commands** [default log console](#)

[log console \(filter\)](#)  
[show log config](#)

# log email

**Overview** This command configures the device to send log messages to an email address. The email address is specified in this command.

**Syntax** `log email <email-address>`

| Parameter                          | Description                               |
|------------------------------------|-------------------------------------------|
| <code>&lt;email-address&gt;</code> | The email address to send log messages to |

**Default** By default no filters are defined for email log targets. Filters must be defined before messages will be sent.

**Mode** Global Configuration

**Example** To have log messages emailed to the email address `admin@alliedtelesis.com` use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@alliedtelesis.com
```

**Related commands**

- [log email exclude](#)
- [log email time](#)
- [show log config](#)

# log email (filter)

**Overview** This command creates a filter to select messages to be sent to an email address. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

The **no** variant of this command configures the device to no longer send log messages to a specified email address. All configuration relating to this log target will be removed.

**Syntax** `log email <email-address> [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log email <email-address> [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| auth          | Security/authorization messages                                                                                         |
| syslog        | Messages generated internally by syslogd                                                                                |
| lpr           | Line printer subsystem                                                                                                  |
| news          | Network news subsystem                                                                                                  |
| uucp          | UUCP subsystem                                                                                                          |
| cron          | Clock daemon                                                                                                            |
| authpriv      | Security/authorization messages (private)                                                                               |
| ftp           | FTP daemon                                                                                                              |
| msgtext       | Select messages containing a certain text string.                                                                       |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Mode** Global Configuration

**Examples** To create a filter to send all messages generated by EPSR that have a severity of **notices** or higher to the email address admin@homebase.com, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@homebase.com level notices
program epsr
```

To create a filter to send all messages containing the text "Bridging initialization", to the email address admin@homebase.com, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@homebase.com msgtext "Bridging
initialization"
```

To create a filter to send messages with a severity level of **informational** and above to the email address admin@alliedtelesis.com, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@alliedtelesis.com level
informational
```

To stop the device emailing log messages emailed to the email address admin@alliedtelesis.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no log email admin@homebase.com
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to the email address admin@homebase.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no log email admin@homebase.com level notices
program epsr
```

To remove a filter that sends messages with a severity level of **informational** and above to the email address admin@alliedtelesis.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no log email admin@alliedtelesis.com level
informational
```

**Related commands**

- [log email](#)
- [log email exclude](#)
- [log email time](#)
- [show log config](#)

# log email exclude

**Overview** Use this command to prevent specified log messages from being emailed, when the device is configured to send log messages to an email address. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log email exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log email exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`

|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Exclude messages of the specified severity level.                                                                                                                                                                                                                                  |
| <level>         | The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:                                                                                                            |
| 0 emergencies   | System is unusable                                                                                                                                                                                                                                                                 |
| 1 alerts        | Action must be taken immediately                                                                                                                                                                                                                                                   |
| 2 critical      | Critical conditions                                                                                                                                                                                                                                                                |
| 3 errors        | Error conditions                                                                                                                                                                                                                                                                   |
| 4 warnings      | Warning conditions                                                                                                                                                                                                                                                                 |
| 5 notices       | Normal, but significant, conditions                                                                                                                                                                                                                                                |
| 6 informational | Informational messages                                                                                                                                                                                                                                                             |
| 7 debugging     | Debug-level messages                                                                                                                                                                                                                                                               |
| program         | Exclude messages from a specified program.                                                                                                                                                                                                                                         |
| <program-name>  | The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. |
| rip             | Routing Information Protocol (RIP)                                                                                                                                                                                                                                                 |
| ripng           | Routing Information Protocol - next generation (RIPng)                                                                                                                                                                                                                             |

| facility   | Exclude messages from a syslog facility.                                 |
| <facility> | Specify one of the following syslog facilities to exclude messages from: |
| kern       | Kernel messages                                                          |
| user       | Random user-level messages                                               |
| mail       | Mail system                                                              |
| daemon     | System daemons                                                           |
| auth       | Security/authorization messages                                          |
| syslog     | Messages generated internally by syslogd                                 |
| lpr        | Line printer subsystem                                                   |
| news       | Network news subsystem                                                   |
| uucp       | UUCP subsystem                                                           |
| cron       | Clock daemon                                                             |
| authpriv   | Security/authorization messages (private)                                |
| ftp        | FTP daemon                                                               |

| Parameter     | Description                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------|
| msgtext       | Exclude messages containing a certain text string.                                                                      |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# log email exclude msgtext example of irrelevant message
```

# log email time

**Overview** This command configures the time used in messages sent to an email address. If the syslog server is in a different time zone to your device then the time offset can be configured using either the **utc-offset** parameter option keyword or the **local-offset** parameter option keyword, where **utc-offset** is the time difference from UTC (Universal Time, Coordinated) and **local-offset** is the difference from local time.

**Syntax** `log email <email-address> time {local|local-offset|utc-offset {plus|minus}<0-24>}`

| Parameter       | Description                                                                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <email-address> | The email address to send log messages to                                                                                                                                                                      |
| time            | Specify the time difference between the email recipient and the device you are configuring.                                                                                                                    |
| local           | The device is in the same time zone as the email recipient                                                                                                                                                     |
| local-offset    | The device is in a different time zone to the email recipient. Use the <b>plus</b> or <b>minus</b> keywords and specify the difference (offset) from local time of the device to the email recipient in hours. |
| utc-offset      | The device is in a different time zone to the email recipient. Use the <b>plus</b> or <b>minus</b> keywords and specify the difference (offset) from UTC time of the device to the email recipient in hours.   |
| plus            | Negative offset (difference) from the device to the email recipient.                                                                                                                                           |
| minus           | Positive offset (difference) from the device to the email recipient.                                                                                                                                           |
| <0-24>          | World Time zone offset in hours                                                                                                                                                                                |

**Default** The default is **local** time.

**Mode** Global Configuration

**Usage notes** Use the **local** option if the email recipient is in the same time zone as this device. Messages will display the time as on the local device when the message was generated.

Use the **offset** option if the email recipient is in a different time zone to this device. Specify the time offset of the email recipient in hours. Messages will display the time they were generated on this device but converted to the time zone of the email recipient.

**Examples** To send messages to the email address `test@home.com` in the same time zone as the device's local time zone, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# log email admin@base.com time local 0
```

To send messages to the email address `admin@base.com` with the time information converted to the time zone of the email recipient, which is 3 hours ahead of the device's local time zone, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# log email admin@base.com time local-offset plus
3
```

To send messages to the email address `user@remote.com` with the time information converted to the time zone of the email recipient, which is 3 hours behind the device's UTC time zone, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# log email user@remote.com time utc-offset minus
3
```

# log external

- Overview** Use this command to enable external logging. External logging sends syslog messages to a file on a USB storage device.
- If the file does not already exist on the storage device, it (and any specified subdirectory) will be automatically created. If the file already exists, messages are appended to it.
- Use the **no** variant of this command to disable external logging.

- Syntax** `log external <filename>`  
`no log external`

| Parameter  | Description                                                                                                                         |
|------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <filename> | The file and optionally directory path to store the log messages in. See <a href="#">Introduction</a> on page 144 for valid syntax. |

- Default** External logging is disabled by default.

- Mode** Global Configuration

- Usage notes** We strongly recommend using ext3 or ext4 as the file system on the external storage device. These file systems have a lower risk of file corruption occurring if the switch or firewall loses power.
- You should also unmount the storage device before removing it from the switch or firewall, to avoid corrupting the log file. To unmount the device, use the **unmount** command.
- If you are using this on a VCSwitch, each stack member needs to have its own external storage device. Enabling or disabling external logging enables or disables it on all stack members.

- Example** To save messages to a file called "messages.log" in a directory called "log" on a USB storage device, use the command:

```
awplus# configure terminal
awplus(config)# log external usb:/log/messages.log
```

Version 5.4.7-1.1: command added

# log external (filter)

**Overview** Use this command to create a filter to select messages to be sent to the external log. You can include messages based on:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

The **no** variant of this command removes the corresponding filter, so that the specified messages are no longer sent to the external log.

**Syntax** `log external [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log external [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                                                                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Filter messages to the external log by severity level.                                                                                                                                                                                                                                                  |
| <level>         | The minimum severity of message to send to the external log. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:                                                                                                   |
| 0 emergencies   | System is unusable                                                                                                                                                                                                                                                                                      |
| 1 alerts        | Action must be taken immediately                                                                                                                                                                                                                                                                        |
| 2 critical      | Critical conditions                                                                                                                                                                                                                                                                                     |
| 3 errors        | Error conditions                                                                                                                                                                                                                                                                                        |
| 4 warnings      | Warning conditions                                                                                                                                                                                                                                                                                      |
| 5 notices       | Normal, but significant, conditions                                                                                                                                                                                                                                                                     |
| 6 informational | Informational messages                                                                                                                                                                                                                                                                                  |
| 7 debugging     | Debug-level messages                                                                                                                                                                                                                                                                                    |
| program         | Filter messages to the external log by program. Include messages from a specified program in the external log.                                                                                                                                                                                          |
| <program-name>  | The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. |
| rip             | Routing Information Protocol (RIP)                                                                                                                                                                                                                                                                      |
| ripng           | Routing Information Protocol - next generation (RIPng)                                                                                                                                                                                                                                                  |

| irdp       | ICMP Router Discovery Protocol (IRDP)                                               |
| rmon       | Remote Monitoring                                                                   |
| loopprot   | Loop Protection                                                                     |
| poe        | Power-inline (Power over Ethernet)                                                  |
| dhcpcn     | DHCP snooping (DHCP SN)                                                             |
| facility   | Filter messages to the external log by syslog facility.                             |
| <facility> | Specify one of the following syslog facilities to include messages from in the log: |
| kern       | Kernel messages                                                                     |
| user       | Random user-level messages                                                          |
| mail       | Mail system                                                                         |
| daemon     | System daemons                                                                      |
| auth       | Security/authorization messages                                                     |
| syslog     | Messages generated internally by syslogd                                            |
| lpr        | Line printer subsystem                                                              |
| news       | Network news subsystem                                                              |
| uucp       | UUCP subsystem                                                                      |
| cron       | Clock daemon                                                                        |
| authpriv   | Security/authorization messages (private)                                           |
| ftp        | FTP daemon                                                                          |

| Parameter     | Description                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------|
| msgtext       | Select messages containing a certain text string.                                                                       |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** By default the external log has a filter to select messages whose severity level is "notices (5)" or higher. This filter may be removed using the **no** variant of this command.

**Mode** Global Configuration

**Examples** To add a filter to send all messages generated by EPSR that have a severity of **notices** or higher to the external log, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# log external level notices program epsr
```

To add a filter to send all messages containing the text "Bridging initialization" to the external log, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# log external msgtext Bridging initialization
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to the external log, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no log external level notices program epsr
```

To remove a filter that sends all messages containing the text "Bridging initialization" to the external log, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no log external msgtext Bridging initialization
```

**Related commands**

- clear log external
- default log external
- log external
- log external exclude
- log external rotate
- log external size
- show log config
- show log external
- unmount

**Command changes** Version 5.4.7-1.1: command added

# log external exclude

**Overview** Use this command to exclude specified log messages from the external log. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log external exclude [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log external exclude [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Exclude messages of the specified severity level.                                                                                                                                                                                                                                  |
| <level>         | The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:                                                                                                            |
| 0 emergencies   | System is unusable                                                                                                                                                                                                                                                                 |
| 1 alerts        | Action must be taken immediately                                                                                                                                                                                                                                                   |
| 2 critical      | Critical conditions                                                                                                                                                                                                                                                                |
| 3 errors        | Error conditions                                                                                                                                                                                                                                                                   |
| 4 warnings      | Warning conditions                                                                                                                                                                                                                                                                 |
| 5 notices       | Normal, but significant, conditions                                                                                                                                                                                                                                                |
| 6 informational | Informational messages                                                                                                                                                                                                                                                             |
| 7 debugging     | Debug-level messages                                                                                                                                                                                                                                                               |
| program         | Exclude messages from a specified program.                                                                                                                                                                                                                                         |
| <program-name>  | The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. |
| rip             | Routing Information Protocol (RIP)                                                                                                                                                                                                                                                 |

| <b>uucp</b>                | UUCP subsystem                                                                                                          |
| <b>cron</b>                | Clock daemon                                                                                                            |
| <b>authpriv</b>            | Security/authorization messages (private)                                                                               |
| <b>ftp</b>                 | FTP daemon                                                                                                              |
| <b>msgtext</b>             | Exclude messages containing a certain text string.                                                                      |
| <b>&lt;text-string&gt;</b> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global Configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
awplus(config)# log external exclude msgtext example of
irrelevant message
```

**Related commands**

- clear log external
- default log external
- log external
- log external (filter)
- log external rotate
- log external size
- show log config
- show log external
- unmount

**Command changes** Version 5.4.7-1.1: command added

# log external rotate

**Overview** Use this command to configure the number of files that the external log can rotate through.

Use the **no** variant of this command to return to the default.

**Syntax** log external rotate <0-255>  
no log external rotate

| Parameter | Description                                                                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-255>   | The number of additional files to rotate through. Note that the device rotates between the initial file and the number of additional files specified by this value - see the Usage section below. |

**Default** The default is 1, which rotates between the initial file and 1 additional file (for example, rotates between messages.log and messages.log.1)

**Mode** Global Configuration

**Usage notes** The device rotates between the initial file and the number of additional files specified by this command. For example, the diagram below shows how setting rotate to 2 makes the device rotate through 3 files.

Note that if you set rotate to 0, and the external log file becomes full, then the device deletes the full log file and creates a new (empty) file of the same name to save messages into. For this reason, we recommend setting rotate to at least 1.

**Example** To set the rotation value to 2, and therefore rotate between 3 files, use the commands:

```
awplus# configure terminal
awplus(config)# log external rotate 2
```

**Related commands** clear log external

default log external  
log external  
log external (filter)  
log external exclude  
log external size  
show log config  
show log external  
unmount

**Command  
changes**

Version 5.4.7-1.1: command added

# log external size

**Overview** Use this command to configure the total amount of size that the external log is permitted to use, in kilobytes. The maximum possible depends on the storage device's file system.

Note that if you are rotating between multiple files, this is the maximum size of all files, not of each individual file. For example, if you are rotating between 2 files (**log external rotate 1**), each file will have a maximum size of 25 kBytes by default.

Use the **no** variant of this command to return to the default size.

**Syntax** log external size [**<50-4194304>**]  
no log external size

| Parameter                 | Description                                                                       |
|---------------------------|-----------------------------------------------------------------------------------|
| <b>&lt;50-4194304&gt;</b> | The total amount of size that the external log is permitted to use, in kilobytes. |

**Default** 50 kBytes

**Mode** Global Configuration

**Example** To configure a total log size of 100 kBytes, use the commands:

```
awplus# configure terminal
awplus(config)# log external size 100
```

**Related commands**

- clear log external
- default log external
- log external
- log external (filter)
- log external exclude
- log external rotate
- log external size
- show log config
- show log external
- unmount

**Command changes** Version 5.4.7-1.1: command added

# log facility

**Overview** Use this command to assign a facility to all log messages generated on this device. This facility overrides any facility that is automatically generated as part of the log message.

Use the **no** variant of this command to remove the configured facility.

**Syntax** `log facility {kern|user|mail|daemon|auth|syslog|lpr|news|uucp|cron|authpriv|ftp|local0|local1|local2|local3|local4|local5|local6|local7}`  
`no log facility`

**Default** None. The outgoing syslog facility depends on the log message.

**Mode** Global Configuration

**Usage notes** Specifying different facilities for log messages generated on different devices can allow messages from multiple devices sent to a common server to be distinguished from each other.

Ordinarily, the facility values generated in log messages have meanings as shown in the following table. Using this command will override these meanings, and the new meanings will depend on the use you put them to.

Table 10-1: Ordinary meanings of the facility parameter in log messages

| Facility | Description                                        |
|----------|----------------------------------------------------|
| kern     | Kernel messages                                    |
| user     | User-level messages                                |
| mail     | Mail system                                        |
| daemon   | System daemons                                     |
| auth     | Security/authorization messages                    |
| syslog   | Messages generated internally by the syslog daemon |
| lpr      | Line printer subsystem                             |
| news     | Network news subsystem                             |
| uucp     | UNIX-to-UNIX Copy Program subsystem                |
| cron     | Clock daemon                                       |
| authpriv | Security/authorization (private) messages          |

Table 10-1: Ordinary meanings of the facility parameter in log messages (cont.)

| Facility    | Description                                                                                                                                                                                                                                                                                             |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ftp         | FTP daemon                                                                                                                                                                                                                                                                                              |
| local<0..7> | The facility labels above have specific meanings, while the local facility labels are intended to be put to local use. In AlliedWare Plus, some of these local facility labels are used in log messages. In particular, local5 is assigned to log messages generated by UTM Firewall security features. |

**Example** To specify a facility of local6, use the following commands:

```
awplus# configure terminal
awplus(config)# log facility local6
```

**Related commands** [show log config](#)

# log host

**Overview** This command configures the device to send log messages to a remote syslog server via UDP port 514. The IP address of the remote server must be specified. By default no filters are defined for remote syslog servers. Filters must be defined before messages will be sent.

Use the **no** variant of this command to stop sending log messages to the remote syslog server.

**Syntax** log host <ipv4-addr> [secure]  
log host <ipv6-addr>  
no log host <ipv4-addr>|<ipv6-addr>

| Parameter   | Description                                                                                  |
|-------------|----------------------------------------------------------------------------------------------|
| <ipv4-addr> | Specify the source IPv4 address, in dotted decimal notation (A.B.C.D).                       |
| <ipv6-addr> | Specify the source IPv6 address, in X:X::X:X notation.                                       |
| secure      | Optional value to create a secure log destination. This option is only valid for IPv4 hosts. |

**Mode** Global Configuration

**Usage notes** Use the optional **secure** parameter to configure a secure IPv4 syslog host. For secure hosts, syslog over TLS is used to encrypt the logs. The certificate received from the remote log server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

The remote server may also request that a certificate is transmitted from the local device. In this situation the first trustpoint added to the syslog application will be transmitted to the remote server.

For detailed information about securing syslog, see the [PKI Feature Overview\\_and Configuration\\_Guide](#).

**Examples** To configure the device to send log messages to a remote secure syslog server with IP address 10.32.16.99, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.99 secure
```

To stop the device from sending log messages to the remote syslog server with IP address 10.32.16.99, use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.99
```

**Related commands** default log host  
log host (filter)

log host exclude  
log host source  
log host startup-delay  
log host time  
log trustpoint  
show log config

# log host (filter)

**Overview** This command creates a filter to select messages to be sent to a remote syslog server. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a substring within the message or a combination of some or all of these.

The **no** variant of this command configures the device to no longer send log messages to a remote syslog server. The IP address of the syslog server must be specified. All configuration relating to this log target will be removed.

**Syntax** `log host <ip-addr> [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log host <ip-addr> [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |               |                                    |          |                                                        |            |                                 |          |                                                    |            |                               |           |                                      |                 |                        |             |                      |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|------------------------------------|----------|--------------------------------------------------------|------------|---------------------------------|----------|----------------------------------------------------|------------|-------------------------------|-----------|--------------------------------------|-----------------|------------------------|-------------|----------------------|
| <code>&lt;ip-addr&gt;</code>      | The IP address of a remote syslog server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |               |                                    |          |                                                        |            |                                 |          |                                                    |            |                               |           |                                      |                 |                        |             |                      |
| <code>level</code>                | Filter messages by severity level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |               |                                    |          |                                                        |            |                                 |          |                                                    |            |                               |           |                                      |                 |                        |             |                      |
| <code>&lt;level&gt;</code>        | The minimum severity of message to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: <table> <tr> <td>0 emergencies</td><td>System is unusable</td></tr> <tr> <td>1 alerts</td><td>Action must be taken immediately</td></tr> <tr> <td>2 critical</td><td>Critical conditions</td></tr> <tr> <td>3 errors</td><td>Error conditions</td></tr> <tr> <td>4 warnings</td><td>Warning conditions</td></tr> <tr> <td>5 notices</td><td>Normal, but significant, conditions</td></tr> <tr> <td>6 informational</td><td>Informational messages</td></tr> <tr> <td>7 debugging</td><td>Debug-level messages</td></tr> </table>                                                        | 0 emergencies | System is unusable                 | 1 alerts | Action must be taken immediately                       | 2 critical | Critical conditions             | 3 errors | Error conditions                                   | 4 warnings | Warning conditions            | 5 notices | Normal, but significant, conditions  | 6 informational | Informational messages | 7 debugging | Debug-level messages |

| auth          | Security/authorization messages                                                                                         |
| syslog        | Messages generated internally by syslogd                                                                                |
| lpr           | Line printer subsystem                                                                                                  |
| news          | Network news subsystem                                                                                                  |
| uucp          | UUCP subsystem                                                                                                          |
| cron          | Clock daemon                                                                                                            |
| authpriv      | Security/authorization messages (private)                                                                               |
| ftp           | FTP daemon                                                                                                              |
| msgtext       | Select messages containing a certain text string.                                                                       |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Mode** Global Configuration

**Examples** To create a filter to send all messages generated by EPSR that have a severity of **notices** or higher to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 level notices program epsr
```

To create a filter to send all messages containing the text "Bridging initialization", to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 msgtext "Bridging
initialization"
```

To create a filter to send messages with a severity level of **informational** and above to the syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 level informational
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.21 level notices program
epsr
```

To remove a filter that sends all messages containing the text "Bridging initialization", to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.21 msgtext "Bridging
initialization"
```

To remove a filter that sends messages with a severity level of **informational** and above to the syslog server with IP address 10.32.16.21, use the following commands:

```
awplusawpluls# configure terminal
awplus(config)# no log host 10.32.16.21 level informational
```

[log host](#)

[log host exclude](#)

[log host source](#)

[log host time](#)

[show log config](#)

# log host exclude

**Overview** Use this command to prevent specified log messages from being sent to the remote syslog server, when **log host** is enabled. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log host exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log host exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Exclude messages of the specified severity level.                                                                                                                                                                                                                                  |
| <level>         | The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:                                                                                                            |
| 0 emergencies   | System is unusable                                                                                                                                                                                                                                                                 |
| 1 alerts        | Action must be taken immediately                                                                                                                                                                                                                                                   |
| 2 critical      | Critical conditions                                                                                                                                                                                                                                                                |
| 3 errors        | Error conditions                                                                                                                                                                                                                                                                   |
| 4 warnings      | Warning conditions                                                                                                                                                                                                                                                                 |
| 5 notices       | Normal, but significant, conditions                                                                                                                                                                                                                                                |
| 6 informational | Informational messages                                                                                                                                                                                                                                                             |
| 7 debugging     | Debug-level messages                                                                                                                                                                                                                                                               |
| program         | Exclude messages from a specified program.                                                                                                                                                                                                                                         |
| <program-name>  | The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. |
| rip             | Routing Information Protocol (RIP)                                                                                                                                                                                                                                                 |

| cron       | Clock daemon                                                             |
| authpriv   | Security/authorization messages (private)                                |
| ftp        | FTP daemon                                                               |

| Parameter     | Description                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------|
| msgtext       | Exclude messages containing a certain text string.                                                                      |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# log host exclude msgtext example of irrelevant message
```

# log host source

**Overview** Use this command to specify a source interface or IP address for the device to send syslog messages from. You can specify any one of an interface name, an IPv4 address or an IPv6 address.

This is useful if the device can reach the syslog server via multiple interfaces or addresses and you want to control which interface/address the device uses.

Note that AlliedWare Plus does not support source interface settings on secure log hosts (which are hosts configured using "log host <ip-address> secure").

Use the **no** variant of this command to stop specifying a source interface or address.

**Syntax** log host source {<interface-name>|<ipv4-addr>|<ipv6-addr>}  
no log host source

| Parameter        | Description                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------|
| <interface-name> | Specify the source interface name. You can enter a VLAN, eth interface or loopback interface. |
| <ipv4-addr>      | Specify the source IPv4 address, in dotted decimal notation (A.B.C.D).                        |
| <ipv6-addr>      | Specify the source IPv6 address, in X:X::X:X notation.                                        |

**Default** None (no source is configured)

**Mode** Global Configuration

**Example** To send syslog messages from 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# log host source 192.168.1.1
```

**Related commands**

- default log host
- log host
- log host (filter)
- log host exclude
- log host time
- show log config

# log host startup-delay

**Overview** Use this command to set the delay between the device booting up and it attempting to connect to remote log hosts. This is to allow time for network connectivity to the remote host to be established. During this period, the device buffers log messages and sends them once it has connected to the remote host.

The startup delay begins when the message "syslog-ng starting up" appears in the log.

If the default startup delay is not long enough for the boot and configuration process to complete and the links to come up, you may see logging failure messages on startup. In these cases, you can use the command to increase the startup delay.

Use the **no** variant of this command to return to the default delay values.

**Syntax** log host startup-delay [delay <1-600>] [messages <1-5000>]  
no log host startup-delay

| Parameter         | Description                                                                                                                            |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| delay <1-600>     | The time, in seconds, from when syslog starts before the device attempts to filter and transmit the buffered messages to remote hosts. |
| messages <1-5000> | The maximum number of messages that the device will buffer during the delay period.                                                    |

**Default** By default the system will buffer up to 2000 messages and wait 120 seconds from when syslog starts before attempting to filter and transmit the buffered messages to remote hosts.

**Mode** Global Configuration

**Example** To increase the delay to 180 seconds, use the commands:  
awplus# configure terminal  
awplus(config)# log host startup-delay delay 180

**Command changes** Version 5.4.8-0.2: defaults changed

# log host time

**Overview** This command configures the time used in messages sent to a remote syslog server. If the syslog server is in a different time zone to your device then the time offset can be configured using either the **utc-offset** parameter option keyword or the **local-offset** parameter option keyword, where **utc-offset** is the time difference from UTC (Universal Time, Coordinated) and **local-offset** is the difference from local time.

**Syntax** `log host <email-address> time {local|local-offset|utc-offset {plus|minus} <0-24>}`

| Parameter       | Description                                                                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <email-address> | The email address to send log messages to                                                                                                                                                                      |
| time            | Specify the time difference between the email recipient and the device you are configuring.                                                                                                                    |
| local           | The device is in the same time zone as the email recipient                                                                                                                                                     |
| local-offset    | The device is in a different time zone to the email recipient. Use the <b>plus</b> or <b>minus</b> keywords and specify the difference (offset) from local time of the device to the email recipient in hours. |
| utc-offset      | The device is in a different time zone to the email recipient. Use the <b>plus</b> or <b>minus</b> keywords and specify the difference (offset) from UTC time of the device to the email recipient in hours.   |
| plus            | Negative offset (difference) from the device to the syslog server.                                                                                                                                             |
| minus           | Positive offset (difference) from the device to the syslog server.                                                                                                                                             |
| <0-24>          | World Time zone offset in hours                                                                                                                                                                                |

**Default** The default is **local** time.

**Mode** Global Configuration

**Usage notes** Use the **local** option if the remote syslog server is in the same time zone as the device. Messages will display the time as on the local device when the message was generated.

Use the **offset** option if the email recipient is in a different time zone to this device. Specify the time offset of the remote syslog server in hours. Messages will display the time they were generated on this device but converted to the time zone of the remote syslog server.

**Examples** To send messages to the remote syslog server with the IP address 10.32.16.21 in the same time zone as the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 time local 0
```

To send messages to the remote syslog server with the IP address 10.32.16.12 with the time information converted to the time zone of the remote syslog server, which is 3 hours ahead of the device's local time zone, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# log host 10.32.16.12 time local-offset plus 3
```

To send messages to the remote syslog server with the IP address 10.32.16.02 with the time information converted to the time zone of the email recipient, which is 3 hours behind the device's UTC time zone, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# log host 10.32.16.02 time utc-offset minus 3
```

[log host](#)

[log host \(filter\)](#)

[log host exclude](#)

[log host source](#)

[show log config](#)

# log monitor (filter)

**Overview** This command creates a filter to select messages to be sent to the terminal when the **terminal monitor** command is given. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

**Syntax** `log monitor [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log monitor [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| epsr          | Ethernet Protection Switched Rings (EPSR)                                                                               |
| irdp          | ICMP Router Discovery Protocol (IRDP)                                                                                   |
| rmon          | Remote Monitoring                                                                                                       |
| loopprot      | Loop Protection                                                                                                         |
| poe           | Power-inline (Power over Ethernet)                                                                                      |
| dhcpsn        | DHCP snooping (DHCP SN)                                                                                                 |
| facility      | Filter messages by syslog facility.                                                                                     |
| <facility>    | Specify one of the following syslog facilities to include messages from:                                                |
| kern          | Kernel messages                                                                                                         |
| user          | Random user-level messages                                                                                              |
| mail          | Mail system                                                                                                             |
| daemon        | System daemons                                                                                                          |
| auth          | Security/authorization messages                                                                                         |
| syslog        | Messages generated internally by syslogd                                                                                |
| lpr           | Line printer subsystem                                                                                                  |
| news          | Network news subsystem                                                                                                  |
| uucp          | UUCP subsystem                                                                                                          |
| cron          | Clock daemon                                                                                                            |
| authpriv      | Security/authorization messages (private)                                                                               |
| ftp           | FTP daemon                                                                                                              |
| msgtext       | Select messages containing a certain text string.                                                                       |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** By default there is a filter to select all messages. This filter may be removed and replaced by filters that are more selective.

**Mode** Global Configuration

**Examples** To create a filter to send all messages that are generated by authentication and have a severity of **info** or higher to terminal instances where the terminal monitor command has been given, use the following commands:

```
awplus# configure terminal
awplus(config)# log monitor level info program auth
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to the terminal, use the following commands:

```
awplus# configure terminal
awplus(config)# no log monitor level notices program epsr
```

To remove a default filter that includes sending everything to the terminal, use the following commands:

```
awplus# configure terminal
awplus(config)# no log monitor level debugging
```

**Related commands**

- [default log monitor](#)
- [log monitor exclude](#)
- [show log config](#)
- [terminal monitor](#)

# log monitor exclude

**Overview** Use this command to prevent specified log messages from being displayed on a terminal, when **terminal monitor** is enabled. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log console exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log console exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |               |                                    |          |                                                        |            |                                 |          |                                                    |            |                    |           |                                     |                 |                        |             |                      |

| cron       | Clock daemon                                                             |
| authpriv   | Security/authorization messages (private)                                |
| ftp        | FTP daemon                                                               |

| Parameter     | Description                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------|
| msgtext       | Exclude messages containing a certain text string.                                                                      |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# log monitor exclude msgtext example of
irrelevant message
```

**Related commands**

- [default log monitor](#)
- [log monitor \(filter\)](#)
- [show log config](#)
- [terminal monitor](#)

# log permanent

**Overview** This command configures the device to send permanent log messages to non-volatile storage (NVS) on the device. The content of the permanent log is retained over a reboot. Once the permanent log reaches its configured maximum allowable size old messages will be deleted to make way for new messages.

The **no** variant of this command configures the device not to send any messages to the permanent log. Log messages will not be retained over a restart.

**Syntax** log permanent  
no log permanent

**Mode** Global Configuration

**Examples** To enable permanent logging use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent
```

To disable permanent logging use the following commands:

```
awplus# configure terminal
awplus(config)# no log permanent
```

**Related commands**

- clear log permanent
- copy permanent-log
- default log permanent
- log permanent (filter)
- log permanent exclude
- log permanent size
- show log config
- show log permanent

# log permanent (filter)

**Overview** This command creates a filter to select messages to be sent to the permanent log. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

The **no** variant of this command removes the corresponding filter, so that the specified messages are no longer sent to the permanent log.

**Syntax** log permanent [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log permanent [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]

| Parameter       | Description                                                                                                                                                                                                                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Filter messages sent to the permanent log by severity level.                                                                                                                                                                                                                                            |
| <level>         | The minimum severity of message to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:                                                                                                                       |
| 0 emergencies   | System is unusable                                                                                                                                                                                                                                                                                      |
| 1 alerts        | Action must be taken immediately                                                                                                                                                                                                                                                                        |
| 2 critical      | Critical conditions                                                                                                                                                                                                                                                                                     |
| 3 errors        | Error conditions                                                                                                                                                                                                                                                                                        |
| 4 warnings      | Warning conditions                                                                                                                                                                                                                                                                                      |
| 5 notices       | Normal, but significant, conditions                                                                                                                                                                                                                                                                     |
| 6 informational | Informational messages                                                                                                                                                                                                                                                                                  |
| 7 debugging     | Debug-level messages                                                                                                                                                                                                                                                                                    |
| program         | Filter messages by program. Include messages from a specified program.                                                                                                                                                                                                                                  |
| <program-name>  | The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. |
| rip             | Routing Information Protocol (RIP)                                                                                                                                                                                                                                                                      |
| ripng           | Routing Information Protocol - next generation (RIPng)                                                                                                                                                                                                                                                  |
| ospf            | Open Shortest Path First (OSPF)                                                                                                                                                                                                                                                                         |
| ospfv3          | Open Shortest Path First (OSPF) version 3 (OSPFv3)                                                                                                                                                                                                                                                      |
| bgp             | Border Gateway Protocol (BGP)                                                                                                                                                                                                                                                                           |
| rsvp            | Resource Reservation Protocol (RSVP)                                                                                                                                                                                                                                                                    |
| pim-dm          | Protocol Independent Multicast - Dense Mode (PIM-DM)                                                                                                                                                                                                                                                    |
| pim-sm          | Protocol Independent Multicast - Sparse Mode (PIM-SM)                                                                                                                                                                                                                                                   |

| Parameter     | Description                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------|

| dhcpcn        | DHCP snooping (DHCP SN)                                                                                                 |
| facility      | Filter messages by syslog facility.                                                                                     |
| <facility>    | Specify one of the following syslog facilities to include messages from:                                                |
| kern          | Kernel messages                                                                                                         |
| user          | Random user-level messages                                                                                              |
| mail          | Mail system                                                                                                             |
| daemon        | System daemons                                                                                                          |
| auth          | Security/authorization messages                                                                                         |
| syslog        | Messages generated internally by syslogd                                                                                |
| lpr           | Line printer subsystem                                                                                                  |
| news          | Network news subsystem                                                                                                  |
| uucp          | UUCP subsystem                                                                                                          |
| cron          | Clock daemon                                                                                                            |
| authpriv      | Security/authorization messages (private)                                                                               |
| ftp           | FTP daemon                                                                                                              |
| msgtext       | Select messages containing a certain text string.                                                                       |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** By default the buffered log has a filter to select messages whose severity level is notices (5) or higher. This filter may be removed using the **no** variant of this command.

**Mode** Global Configuration

**Examples** To create a filter to send all messages generated by EPSR that have a severity of notices or higher to the permanent log use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# log permanent level notices program epsr
```

To create a filter to send all messages containing the text "Bridging initialization", to the permanent log use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# log permanent msgtext Bridging initialization
```

**Related commands**

- clear log permanent
- default log permanent
- log permanent
- log permanent exclude
- log permanent size
- show log config
- show log permanent

# log permanent exclude

**Overview** Use this command to prevent specified log messages from being sent to the permanent log. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log permanent exclude [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log permanent exclude [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Exclude messages of the specified severity level.                                                                                                                                                                                                                                  |
| <level>         | The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:                                                                                                            |
| 0 emergencies   | System is unusable                                                                                                                                                                                                                                                                 |
| 1 alerts        | Action must be taken immediately                                                                                                                                                                                                                                                   |
| 2 critical      | Critical conditions                                                                                                                                                                                                                                                                |
| 3 errors        | Error conditions                                                                                                                                                                                                                                                                   |
| 4 warnings      | Warning conditions                                                                                                                                                                                                                                                                 |
| 5 notices       | Normal, but significant, conditions                                                                                                                                                                                                                                                |
| 6 informational | Informational messages                                                                                                                                                                                                                                                             |
| 7 debugging     | Debug-level messages                                                                                                                                                                                                                                                               |
| program         | Exclude messages from a specified program.                                                                                                                                                                                                                                         |
| <program-name>  | The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. |
| rip             | Routing Information Protocol (RIP)                                                                                                                                                                                                                                                 |
| ripng           | Routing Information Protocol - next generation (RIPng)                                                                                                                                                                                                                             |
| ospf            | Open Shortest Path First (OSPF)                                                                                                                                                                                                                                                    |

| facility      | Exclude messages from a syslog facility.                                                                                |
| <facility>    | Specify one of the following syslog facilities to exclude messages from:                                                |
| kern          | Kernel messages                                                                                                         |
| user          | Random user-level messages                                                                                              |
| mail          | Mail system                                                                                                             |
| daemon        | System daemons                                                                                                          |
| auth          | Security/authorization messages                                                                                         |
| syslog        | Messages generated internally by syslogd                                                                                |
| lpr           | Line printer subsystem                                                                                                  |
| news          | Network news subsystem                                                                                                  |
| uucp          | UUCP subsystem                                                                                                          |
| cron          | Clock daemon                                                                                                            |
| authpriv      | Security/authorization messages (private)                                                                               |
| ftp           | FTP daemon                                                                                                              |
| msgtext       | Exclude messages containing a certain text string.                                                                      |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# log permanent exclude msgtext example of
irrelevant message
```

**Related  
commands**

- clear log permanent
- default log permanent
- log permanent
- log permanent (filter)
- log permanent size
- show log config
- show log permanent

# log permanent size

**Overview** This command configures the amount of memory that the permanent log is permitted to use. Once this memory allocation has been filled old messages will be deleted to make room for new messages.

Use the **no** variant of this command to return to the default.

**Syntax** log permanent size <50-250>  
no log permanent size

| Parameter | Description                            |
|-----------|----------------------------------------|
| <50-250>  | Size of the permanent log in kilobytes |

**Default** 50 kilobytes

**Mode** Global Configuration

**Example** To allow the permanent log to use up to 100 kilobytes of NVS, use the commands:

```
awplus# configure terminal
awplus(config)# log permanent size 100
```

To return to the default value, use the commands:

```
awplus# configure terminal
awplus(config)# no log permanent size
```

**Related commands**

- clear log permanent
- copy permanent-log
- default log permanent
- log permanent
- log permanent (filter)
- log permanent exclude
- show log config
- show log permanent

# log-rate-limit nsm

**Overview** This command limits the number of log messages generated by the device for a specified time interval.

Use the **no** variant of this command to revert to the default number of log messages, which is up to 200 log messages per second.

**Syntax** log-rate-limit nsm messages *<message-limit>* interval *<time-interval>*  
no log-rate-limit nsm

| Parameter                    | Description                                                                                                                                                           |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;message-limit&gt;</i> | <i>&lt;1-65535&gt;</i><br>The number of log messages generated by the device.                                                                                         |
| <i>&lt;time-interval&gt;</i> | <i>&lt;0-65535&gt;</i><br>The time period for log message generation in 1/100 seconds. If an interval of 0 is specified then no log message rate limiting is applied. |

**Default** By default, the device will allow 200 log messages to be generated per second.

**Mode** Global Configuration

**Usage notes** This command limits the rate that log messages are generated. Limiting log messages protects the device from running out of memory in extreme conditions, such as during a broadcast storm.

Once the specified number of log messages per interval is exceeded, any excess log messages are dropped. When this occurs a summary log message is generated at the end of the interval. This summary message includes the number of log messages dropped.

If you expect a lot of dropped log messages, we recommend setting the time interval to no less than 100. This limits the number of summary messages to one per second, which prevents the log from filling up with these summary messages.

**Examples** To allow the device to generate a maximum of 300 log messages per second, use the following commands:

```
awplus# configure terminal
awplus(config)# log-rate-limit nsm messages 300 interval 100
```

To return the device to the default setting, use the following commands:

```
awplus# configure terminal
awplus(config)# no log-rate-limit nsm
```

# log trustpoint

**Overview** This command adds one or more trustpoints to be used with the syslog application. Multiple trustpoints may be specified, or the command may be executed multiple times, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

**Syntax** log trustpoint [*<trustpoint-list>*]  
no log trustpoint [*<trustpoint-list>*]

| Parameter                      | Description                                             |
|--------------------------------|---------------------------------------------------------|
| <i>&lt;trustpoint-list&gt;</i> | Specify one or more trustpoints to be added or deleted. |

**Default** No trustpoints are created by default.

**Mode** Global Configuration

**Usage notes** The device certificate associated with first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If no trustpoints are specified in the command, the trustpoint list will be unchanged.

If **no log trustpoint** is issued without specifying any trustpoints, then all trustpoints will be disassociated from the application.

**Example** You can add multiple trustpoints by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# log trustpoint trustpoint_1
awplus(config)# log trustpoint trustpoint_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config)# log trustpoint trustpoint_2 trustpoint_3
```

Disassociate all trustpoints from the syslog application using the command:

```
awplus(config)# log trustpoint trustpoint_2 trustpoint_3
```

**Related commands** [log host](#)  
[show log config](#)

# show counter log

**Overview** This command displays log counter information.

**Syntax** show counter log

**Mode** User Exec and Privileged Exec

**Example** To display the log counter information, use the command:

```
awplus# show counter log
```

**Output** Figure 10-1: Example output from the **show counter log** command

|                   |            |
|-------------------|------------|
| Log counters      |            |
| Total Received    | ..... 2328 |
| Total Received P0 | ..... 0    |
| Total Received P1 | ..... 0    |
| Total Received P2 | ..... 1    |
| Total Received P3 | ..... 9    |
| Total Received P4 | ..... 32   |
| Total Received P5 | ..... 312  |
| Total Received P6 | ..... 1602 |
| Total Received P7 | ..... 372  |

**Table 11:** Parameters in output of the **show counter log** command

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| Total Received    | Total number of messages received by the log             |
| Total Received P0 | Total number of Priority 0 (Emergency) messages received |
| Total Received P1 | Total number of Priority 1 (Alert) messages received     |
| Total Received P2 | Total number of Priority 2 (Critical) messages received  |
| Total Received P3 | Total number of Priority 3 (Error) messages received     |
| Total Received P4 | Total number of Priority 4 (Warning) messages received   |
| Total Received P5 | Total number of Priority 5 (Notice) messages received    |
| Total Received P6 | Total number of Priority 6 (Info) messages received      |
| Total Received P7 | Total number of Priority 7 (Debug) messages received     |

**Related commands** [show log config](#)

# show exception log

**Overview** This command displays the contents of the exception log.

**Syntax** show exception log

**Mode** User Exec and Privileged Exec

**Example** To display the exception log, use the command:

```
awplus# show exception log
```

**Output** Figure 10-2: Example output from the **show exception log** command on a device

```
awplus#show exception log
<date> <time> <facility>.<severity> <program[<pid>]>: <message>

2019 Sep 29 06:07:24 local7.debug awplus corehandler : Process imi (PID:775) signal

```

**Output** Figure 10-3: Example output from the **show exception log** command on a device that has never had an exception occur

```
awplus#show exception log
<date> <time> <facility>.<severity> <program[<pid>]>: <message>

None

awplus#
```

# show log

**Overview** This command displays the contents of the buffered log.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

**Syntax** show log [tail [<10-250>]]

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| tail      | Display only the latest log entries.          |
| <10-250>  | Specify the number of log entries to display. |

**Default** By default the entire contents of the buffered log is displayed.

**Mode** User Exec, Privileged Exec and Global Configuration

**Usage notes** If the optional **tail** parameter is specified, only the latest 10 messages in the buffered log are displayed. A numerical value can be specified after the **tail** parameter to select how many of the latest messages should be displayed.  
The **show log** command is only available to users at privilege level 7 and above. To set a user’s privilege level, use the command:

```
awplus(config)# username <name> privilege <1-15>
```

**Examples** To display the contents of the buffered log use the command:

```
awplus# show log
```

To display the 10 latest entries in the buffered log use the command:

```
awplus# show log tail 10
```

**Output** Figure 10-4: Example output from **show log**

```
awplus#show log

<date> <time> <facility>.<severity> <program[<pid>]>: <message>

- [show log config](#)

# show log config

**Overview** This command displays information about the logging system. This includes the configuration of the various log destinations, such as buffered, permanent, syslog servers (hosts) and email addresses. This also displays the latest status information for each log destination.

**Syntax** show log config

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the logging configuration use the command:

```
awplus# show log config
```

**Output** Figure 10-5: Example output from **show log config**

```
Facility: default
PKI trustpoints: example_trustpoint
Buffered log:
Status enabled
Maximum size ... 100kb
Filters:
*1 Level notices
 Program any
 Facility any
 Message text . any
 2 Level informational
 Program auth
 Facility daemon
 Message text . any
 Statistics 1327 messages received, 821 accepted by filter (2016 Oct 11
10:36:16)
Permanent log:
Status enabled
Maximum size ... 60kb
Filters:
 1 Level error
 Program any
 Facility any
 Message text . any
*2 Level warnings
 Program dhcp
 Facility any
 Message text . "pool exhausted"
 Statistics 1327 messages received, 12 accepted by filter (2016 Oct 11
10:36:16)
```

```
Host 10.32.16.21:
 Time offset +2:00
 Offset type UTC
 Source -
 Secured enabled
 Filters:
 1 Level critical
 Program any
 Facility any
 Message text . any
 Statistics 1327 messages received, 1 accepted by filter (2016 Oct 11
10:36:16)
Email admin@alliedtelesis.com:
 Time offset +0:00
 Offset type Local
 Filters:
 1 Level emergencies
 Program any
 Facility any
 Message text . any
 Statistics 1327 messages received, 0 accepted by filter (2016 Oct 11
10:36:16)
...
```

In the above example the '\*' next to filter 1 in the buffered log configuration indicates that this is the default filter. The permanent log has had its default filter removed, so none of the filters are marked with '\*'.

**NOTE:** Terminal log and console log cannot be set at the same time. If console logging is enabled then the terminal logging is turned off.

**Related commands**

- [show counter log](#)
- [show log](#)
- [show log permanent](#)

# show log external

**Overview** Use this command to display the contents of the external log, which is stored on a USB storage device.

**Syntax** `show log external [tail [<10-250>]]`

| Parameter                   | Description                                   |
|-----------------------------|-----------------------------------------------|
| <code>tail</code>           | Display only the latest log entries.          |
| <code>&lt;10-250&gt;</code> | Specify the number of log entries to display. |

**Mode** Global Configuration  
Privileged Exec  
User Exec

**Usage notes** If the optional **tail** parameter is specified, only the latest 10 messages in the permanent log are displayed. A numerical value can be specified after the **tail** parameter to change how many of the latest messages should be displayed.

**Example** To display the last 5 entries in the external log, use the command:  
`awplus# show log external tail 5`

**Related commands** [clear log external](#)

**Command changes** Version 5.4.7-1.1: command added

# show log permanent

**Overview** This command displays the contents of the permanent log.

**Syntax** show log permanent [<stack-ID>] [tail [<10-250>]]

| Parameter  | Description                                   |
|------------|-----------------------------------------------|
| <stack-ID> | Stack member number, from 1 to 8.             |
| tail       | Display only the latest log entries.          |
| <10-250>   | Specify the number of log entries to display. |

**Usage notes** If the optional **tail** parameter is specified, only the latest 10 messages in the permanent log are displayed. A numerical value can be specified after the **tail** parameter to change how many of the latest messages should be displayed.

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the permanent log, use the command:

```
awplus# show log permanent
```

To display the permanent log of stack member 2, use the command:

```
awplus# show log permanent 2
```

**Output** Figure 10-6: Example output from **show log permanent**

```
awplus#show log permanent 2

Stack member 2:

<date> <time> <facility>.<severity> <program[<pid>]>: <message>

# show running-config log

**Overview** This command displays the current running configuration of the Log utility.

**Syntax** show running-config log

**Mode** Privileged Exec and Global Configuration

**Example** To display the current configuration of the log utility, use the command:

```
awplus# show running-config log
```

**Related commands** [show log](#)  
[show log config](#)

# unmount

**Overview** Use this command to unmount an external storage device. We recommend you unmount storage devices before removing them, to avoid file corruption. This is especially important if files may be automatically written to the storage device, such as external log files or AMF backup files.

**Syntax** `unmount usb`  
`unmount usb member [<stack-ID>]`

| Parameter         | Description                       |
|-------------------|-----------------------------------|
| usb               | Unmount the USB storage device.   |
| member <stack-ID> | Stack member number, from 1 to 8. |

**Mode** Privileged Exec

**Example** To unmount a USB storage device and safely remove it from the device, use the command:

```
awplus# unmount usb
```

# 11

# Scripting Commands

## Introduction

**Overview** This chapter provides commands used for command scripts.

- Command List**
- “[activate](#)” on page 510
  - “[echo](#)” on page 512
  - “[wait](#)” on page 513

# activate

**Overview** This command activates a script file.

**Syntax** activate [background] <script>

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                   |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| background | Activate a script to run in the background. A process that is running in the background will operate as a separate task, and will not interrupt foreground processing. Generally, we recommend running short, interactive scripts in the foreground and longer scripts in the background. The default is to run the script in the foreground. |
| <script>   | The file name of the script to activate. The script is a command script consisting of commands documented in this software reference. Note that you must use either a <b>.scp</b> or a <b>.sh</b> filename extension for a valid script text file, as described below in the usage section for this command.                                  |

**Mode** Privileged Exec

**Usage notes** In a stacked environment you can use the CLI on a stack master to access file systems that are located on a stack backup member. In this case the command specifies a file on the backup member. The stack member's file system will be denoted by: <hostname>- <member-id> For example, **awplus-1** for member 1, **awplus-2** for member 2.

When a script is activated, the privilege level is set to 1 enabling User Exec commands to run in the script. If you need to run Privileged Exec commands in your script you need to add an [enable \(Privileged Exec mode\)](#) command to the start of your script. If you need to run Global Configuration commands in your script you need to add a [configure terminal](#) command after the **enable** command at the start of your script.

The **activate** command executes the script in a new shell. A [terminal length](#) shell command, such as **terminal length 0** may also be required to disable a delay that would pause the display.

A script must be a text file with a filename extension of either **.sh** or **.scp** only for the AlliedWare Plus™ CLI to activate the script file. The **.sh** filename extension indicates the file is an ASH script, and the **.scp** filename extension indicates the file is an AlliedWare Plus™ script.

**Examples** To activate a command script to run as a background process, use the command:

```
awplus# activate background test.scp
```

To activate a script named "/flash:/test.scp" on stack member 2, use the command:

```
awplus-2# activate awplus-2/flash:/test.scp
```

**Related commands**

- configure terminal
- echo
- enable (Privileged Exec mode)
- wait

# echo

**Overview** This command echoes a string to the terminal, followed by a blank line.

**Syntax** echo <line>

| Parameter | Description        |
|-----------|--------------------|
| <line>    | The string to echo |

**Mode** User Exec and Privileged Exec

**Usage** This command may be useful in CLI scripts, to make the script print user-visible comments.

**Example** To echo the string Hello World to the console, use the command:  
awplus# echo Hello World

**Output**

|             |
|-------------|
| Hello World |
|-------------|

**Related commands** activate  
wait

# wait

**Overview** This command pauses execution of the active script for the specified period of time.

**Syntax** wait <delay>

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| <delay>   | <1 - 65335> Specify the time delay in seconds |

**Default** No wait delay is specified by default.

**Mode** Privileged Exec (when executed from a script not directly from the command line)

**Usage notes** Use this command to pause script execution in an **.scp** (AlliedWare Plus™ script) or an **.sh** (ASH script) file executed by the [activate](#) command. The script must contain an **enable** command, because the **wait** command is only executed in the Privileged Exec mode.

**Example** See an **.scp** script file extract below that will show port counters for interface port1.0.2 over a 10 second interval:

```
enable

show interface port1.0.2

wait 10

show interface port1.0.2
```

**Related commands** [activate](#)  
[echo](#)  
[enable \(Privileged Exec mode\)](#)

# 12

# Interface Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure and display interfaces.

- Command List**
- “[description \(interface\)](#)” on page 515
  - “[interface \(to configure\)](#)” on page 516
  - “[platform jumboframe](#)” on page 518
  - “[mtu](#)” on page 519
  - “[service statistics interfaces counter](#)” on page 520
  - “[show interface](#)” on page 521
  - “[show interface brief](#)” on page 524
  - “[show interface memory](#)” on page 525
  - “[show interface status](#)” on page 527
  - “[shutdown](#)” on page 529

# description (interface)

**Overview** Use this command to add a description to a specific port or interface.

**Syntax** `description <description>`

| Parameter                        | Description                                                                                                     |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>&lt;description&gt;</code> | Text describing the specific interface. Descriptions can contain any printable ASCII characters (ASCII 32-126). |

**Mode** Interface Configuration

**Example** The following example uses this command to describe the device that an interface is connected to.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# description Boardroom PC
```

**Command changes** Version 5.4.7-1.1: valid character set changed to printable ASCII characters

# interface (to configure)

**Overview** Use this command to select one or more interfaces to configure.

**Syntax** `interface <interface-list>`

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;interface-list&gt;</code> | <p>The interfaces to configure. An interface-list can be:</p> <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• the loopback interface (lo)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. vlan10-20)</li><li>• a comma-separated list (e.g. vlan1,vlan10-20). Do not mix interface types in a list.</li></ul> <p>The specified interfaces must exist.</p> |

**Usage notes** A local loopback interface is one that is always available for higher layer protocols to use and advertise to the network. Although a local loopback interface is assigned an IP address, it does not have the usual requirement of connecting to a lower layer physical entity. This lack of physical attachment creates the perception of a local loopback interface always being accessible via the network.

Local loopback interfaces can be utilized by a number of protocols for various purposes. They can be used to improve access to the device and also increase its reliability, security, scalability and protection. In addition, local loopback interfaces can add flexibility and simplify management, information gathering and filtering.

One example of this increased reliability is for OSPF to advertise a local loopback interface as an interface-route into the network irrespective of the physical links that may be 'up' or 'down' at the time. This provides a higher probability that the routing traffic will be received and subsequently forwarded.

**Mode** Global Configuration

**Examples** The following example shows how to enter Interface mode to configure VLAN interface vlan1. Note how the prompt changes.

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)#
```

The following example shows how to enter Interface mode to configure the local loopback interface.

```
awplus# configure terminal
awplus(config)# interface lo
awplus(config-if)#
```

**Related commands**

- [ip address \(IP Addressing and Protocol\)](#)
- [show interface](#)
- [show interface brief](#)

# platform jumboframe

**Overview** This command enables the device to forward jumbo frames. See the [Switching Feature Overview and Configuration Guide](#) for more information.

When jumbo frame support is enabled, the maximum size of packets that the device can forward is 10218 bytes of payload.

Use the **no** variant of this command to remove jumbo frame support. This stops the ports from forwarding packets larger than VLAN tagged frames (1522 bytes).

**NOTE:** The number above specifies the payload only. For an IEEE 802.1q frame, provision is made (internally) for the following additional components:

- Source and Destination addresses
- EtherType field
- Priority and VLAN tag fields
- FCS

These additional components increase the frame size (to 1522 bytes in the default case).

**Syntax** platform jumboframe  
no platform jumboframe

**Default** By default, jumbo frames is off.

**Mode** Global Configuration

**Usage notes** You must save the configuration and restart the device after entering this command for it to take effect. You can use the [reboot](#) command to restart the device.

**Example** To enable the device to forward jumbo frames, use the following commands:

```
awplus# configure terminal
awplus(config)# platform jumboframe
```

**Related commands** [show platform](#)  
[show running-config](#)

## mtu

**Overview** Use this command to set the Maximum Transmission Unit (MTU) size for interfaces, where MTU is the maximum packet size that interfaces can transmit. The MTU size setting is applied to both IPv4 and IPv6 packet transmission.

Use the **no** variant of this command to remove a previously specified Maximum Transmission Unit (MTU) size, and restore the default MTU size. For example the VLAN interface default is 1500 bytes.

**Syntax** `mtu <68-1582>`  
`no mtu`

**Default** The default MTU size, for example 1500 bytes for VLAN interfaces.

**Mode** Interface Configuration

**Usage notes** If a device receives an IPv4 packet for Layer 3 switching to another interface with an MTU size smaller than the packet size, and if the packet has the '**don't fragment**' bit set, then the device will send an ICMP '**destination unreachable**' (3) packet type and a '**fragmentation needed and DF set**' (4) code back to the source. For IPv6 packets bigger than the MTU size of the transmitting interface, an ICMP '**packet too big**' (ICMP type 2 code 0) message is sent to the source.

Note that [show interface](#) output will only show MTU size for VLAN interfaces.

**Examples** To configure an MTU size of 1555 bytes on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# mtu 1555
```

To restore the MTU size to the default MTU size of 1500 bytes on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no mtu
```

**Related commands** [show interface](#)

# service statistics interfaces counter

- Overview** Use this command to enable the interface statistics counter.  
Use the **no** variant of this command to disable the interface statistics counter.
- Syntax** service statistics interfaces counter  
no service statistics interfaces counter
- Default** The interface statistics counter is enabled by default.
- Mode** Global Configuration
- Example** To enable the interface statistics counter, use the following commands:  
awplus# configure terminal  
awplus(config)# service statistics interfaces counter  
To disable the interface statistics counter, use the following commands:  
awplus# configure terminal  
awplus(config)# no service statistics interfaces counter
- Command changes** Version 5.4.7-2.1: command added

# show interface

**Overview** Use this command to display interface configuration and status.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show interface [<interface-list>]`

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface-list> | <p>The interfaces or ports to display. An interface-list can be:</p> <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• the loopback interface (lo)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. vlan10-20)</li><li>• a comma-separated list (e.g. vlan1,vlan10-20). Do not mix interface types in a list.</li></ul> <p>The specified interfaces must exist.</p> |

**Mode** User Exec and Privileged Exec

**Usage notes** Note that the output displayed with this command will show MTU (Maximum Transmission Unit) size for VLAN interfaces, and MRU (Maximum Received Unit) size for switch ports.

**Example** To display configuration and status information for all interfaces, use the command:

```
awplus# show interface
```

Figure 12-1: Example output from the **show interface** command:

```
awplus#show interface
Interface port1.0.1
 Link is UP, administrative state is UP
 Hardware is Ethernet, address is 0000.cd38.026c
 index 5001 metric 1 mru 1500
 current duplex full, current speed 1000, current polarity mdix
 configured duplex auto, configured speed auto, configured polarity auto
 <UP,BROADCAST,RUNNING,MULTICAST>
 SNMP link-status traps: Disabled
 input packets 2927667, bytes 224929311, dropped 0, multicast packets 1242629
 output packets 378084, bytes 54372424, multicast packets 1, broadcast packets 10
 input average rate : 30 seconds 5.19 Kbps, 5 minutes 8.16 Kbps
 output average rate: 30 seconds 6.04 Kbps, 5 minutes 73.89 Kbps
 input peak rate 268.60 Kbps at 2018/04/10 17:46:43
 output peak rate 6.81 Mbps at 2018/04/10 18:15:44
 Time since last state change: 7 days 01:58:10
...
```

To display configuration and status information for the loopback interface lo, use the command:

```
awplus# show interface lo
```

Figure 12-2: Example output from the **show interface lo** command:

```
awplus#show interface lo
Interface lo
 Scope: both
 Link is UP, administrative state is UP
 Hardware is Loopback
 index 1 metric 1
 <UP,LOOPBACK,RUNNING>
 SNMP link-status traps: Disabled
 Router Advertisement is disabled
 Router Advertisement default routes are accepted
 Router Advertisement prefix info is accepted
 Time since last state change: 8 days 00:01:09
```

To display configuration and status information for interface vlan1, use the command:

```
awplus# show interface vlan1
```

Figure 12-3: Example output from the **show interface vlan1** command:

```
awplus#show interface vlan1
Interface vlan1
 Link is UP, administrative state is UP
 Hardware is VLAN, address is 0000.cd38.026c
 IPv4 address 192.168.1.1/24 broadcast 192.168.1.255
 index 301 metric 1 mtu 1500
 arp ageing timeout 300
 <UP,BROADCAST,RUNNING,MULTICAST>
 VRF Binding: Not bound
 SNMP link-status traps: Disabled
 Router Advertisement is disabled
 Router Advertisement default routes are accepted
 Router Advertisement prefix info is accepted
 input packets 0, bytes 0, dropped 0, multicast packets 0
 output packets 9, bytes 612, multicast packets 0, broadcast packets 0
 input average rate : 30 seconds 0 bps, 5 minutes 0 bps
 output average rate: 30 seconds 0 bps, 5 minutes 0 bps
 output peak rate 140 bps at 2018/04/10 16:40:56
 Time since last state change: 8 days 19:09:19
```

**Related  
commands**

[show interface brief](#)

[show interface status](#)

[show interface switchport](#)

# show interface status

**Overview** Use this command to display the status of the specified interface or interfaces. Note that when no interface or interfaces are specified then the status of all interfaces on the device are shown.

**Syntax** `show interface [<port-list>] status`

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port-list> | The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)</li><li>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list.</li></ul> |

**Examples** To display the status of port1.0.1 to port1.0.3, use the command:

```
awplus# show interface port1.0.1-port1.0.3 status
```

**Table 13:** Example output from the **show interface <port-list> status** command

| awplus#show interface port1.0.1-port1.0.3 status |      |            |      |        |       |            |
|--------------------------------------------------|------|------------|------|--------|-------|------------|
| Port                                             | Name | Status     | Vlan | Duplex | Speed | Type       |
| port1.0.1                                        |      | notconnect | 1    | auto   | auto  | 1000BASE-T |
| port1.0.2                                        |      | notconnect | 1    | auto   | auto  | 1000BASE-T |
| port1.0.3                                        |      | notconnect | 1    | auto   | auto  | 1000BASE-T |

To display the status of all ports, use the command:

```
awplus# show interface status
```

**Table 14:** Example output from the **show interface status** command

| awplus#show interface status |             |           |       |        |        |            |
|------------------------------|-------------|-----------|-------|--------|--------|------------|
| Port                         | Name        | Status    | Vlan  | Duplex | Speed  | Type       |
| port1.0.1                    | Trunk_Net   | connected | trunk | a-full | a-1000 | 1000BaseTX |
| port1.0.2                    | Access_Net1 | connected | 1     | full   | 1000   | 1000BaseTX |
| port1.0.3                    | Access_Net1 | disabled  | 1     | auto   | auto   | 1000BaseTX |
| ...                          |             |           |       |        |        |            |

**Table 15:** Parameters in the output from the **show interface status** command

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port      | Name/Type of the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Name      | Description of the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Status    | The administrative and operational status of the interface; one of: <ul style="list-style-type: none"> <li>disabled: the interface is administratively down.</li> <li>connect: the interface is operationally up.</li> <li>notconnect: the interface is operationally down.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Vlan      | VLAN type or VLAN IDs associated with the port: <ul style="list-style-type: none"> <li>When the VLAN mode is trunk, it displays <b>trunk</b> (it does not display the VLAN IDs).</li> <li>When the VLAN mode is access, it displays the VLAN ID.</li> <li>When the VLAN mode is private promiscuous, it displays the primary VLAN ID if it has one, and <b>promiscuous</b> if it does not have a VLAN ID.</li> <li>When the VLAN mode is private host, it displays the primary and secondary VLAN IDs.</li> <li>When the VLAN is dynamically assigned, it displays the current dynamically assigned VLAN ID (not the access VLAN ID), or <b>dynamic</b> if it has multiple VLANs dynamically assigned.</li> </ul> |
| Duplex    | The actual duplex mode of the interface, preceded by <b>a-</b> if it has autonegotiated this duplex mode. If the port is disabled or not connected, it displays the configured duplex setting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Speed     | The actual link speed of the interface, preceded by <b>a-</b> if it has autonegotiated this speed. If the port is disabled or not connected, it displays the configured speed setting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Type      | The type of interface, e.g. 1000BaseTX. For SFP bays, it displays <b>Unknown</b> if it does not recognize the type of SFP installed, or <b>Not present</b> if an SFP is not installed or is faulty.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

[show interface memory](#)

# shutdown

**Overview** This command shuts down the selected interface. This administratively disables the link and takes the link down at the physical (electrical) layer.

Use the **no** variant of this command to disable this function and bring the link back up again.

**Syntax** shutdown  
no shutdown

**Mode** Interface Configuration

**Usage notes** If you shutdown an aggregator, the device shows the admin status of the aggregator and its component ports as “admin down”. While the aggregator is down, the device accepts **shutdown** and **no shutdown** commands on component ports, but these have no effect on port status. Ports will not come up again while the aggregator is down.

**Example** To shut down port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# shutdown
```

To bring up port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no shutdown
```

To shut down vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# shutdown
```

To bring up vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no shutdown
```

# Port Mirroring and Remote Mirroring Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Port Mirroring and Remote Mirroring (also known as RSPAN).

For more information, see the [Mirroring Feature Overview and Configuration Guide](#).

- Command List**
- “[mirror interface](#)” on page 531
  - “[remote-mirror interface](#)” on page 533
  - “[show mirror](#)” on page 535
  - “[show mirror interface](#)” on page 536
  - “[show remote-mirror](#)” on page 537
  - “[switchport remote-mirror-egress](#)” on page 539
  - “[vlan mode remote-mirror-vlan](#)” on page 540

# mirror interface

**Overview** Use this command to define a mirror port and mirrored (monitored) ports and direction of traffic to be mirrored. The port for which you enter interface mode will be the mirror port.

The destination port is removed from all VLANs, and no longer participates in other switching.

Use the **no** variant of this command to disable port mirroring by the destination port on the specified source port.

Use the **none** variant of this command when using copy-to-mirror ACL and QoS commands.

**Syntax** mirror interface <source-port-list> direction  
{both|receive|transmit}  
mirror interface none  
no mirror interface <source-port-list>  
no mirror interface none

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <source-port-list> | The source switch ports to mirror. A port-list can be: <ul style="list-style-type: none"><li>• a port (e.g. port1.0.2)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-port1.0.3</li><li>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.2-port1.0.4</li></ul> The source port list cannot include dynamic or static channel groups (link aggregators).                             |
| direction          | Specifies whether to mirror traffic that the source port receives, transmits, or both.                                                                                                                                                                                                                                                                                                                                                    |
| both               | Mirroring traffic both received and transmitted by the source port.                                                                                                                                                                                                                                                                                                                                                                       |
| receive            | Mirroring traffic received by the source port.                                                                                                                                                                                                                                                                                                                                                                                            |
| transmit           | Mirroring traffic transmitted by the source port.                                                                                                                                                                                                                                                                                                                                                                                         |
| none               | Specify this parameter for use with the <b>copy-to-mirror</b> parameter of: <ul style="list-style-type: none"><li>- the ACL (Access Control List) <b>access-list</b> and <b>ipv6 access-list</b> commands or</li><li>- the QoS (Quality of Service) <b>default action</b> command.</li></ul> The <b>none</b> parameter lets you specify the destination port (the analyzer port) for the traffic without specifying a source mirror port. |

**Mode** Interface Configuration

**Usage notes** Use this command to send traffic to another device connected to the mirror port for monitoring.

For more information, see the [Mirroring Feature Overview and Configuration Guide](#).

A mirror port cannot be associated with a VLAN. If a switch port is configured to be a mirror port, it is automatically removed from any VLAN it was associated with.

This command can only be applied to a single mirror (destination) port, not to a range of ports, nor to a static or dynamic channel group. Do not apply multiple interfaces with an interface command before issuing the mirror interface command. One interface may have multiple mirror interfaces.

Access control lists can be used to mirror a subset of traffic from the mirrored port by using the copy-to-mirror parameter in hardware ACL commands.

**Example** To mirror traffic received and transmitted on port1.0.1 to destination port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# mirror interface port1.0.1 direction both
```

To enable use with the [access-list \(numbered hardware ACL for IP packets\)](#) ACL and [default-action](#) QoS commands to destination port1.0.1 without specifying a source port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# mirror interface none
```

To mirror all received or transmitted TCP traffic to analyzer port1.0.1, use the sample configuration snippet below:

```
awplus#show running-config

mls qos enable
access-list 3000 copy-to-mirror tcp any any
access-group 3000
!
interface port1.0.1
 mirror interface none
```

**Related commands**

[access-list \(numbered hardware ACL for MAC addresses\)](#)

[default-action](#)

[ipv6 access-list \(named IPv6 hardware ACL\)](#)

# remote-mirror interface

**Overview** Use this command on the source device to specify the source port whose traffic is to be remote-mirrored (monitored), and the remote mirroring VLAN ID these mirrored frames will be tagged with when they egress from the source device. The port for which Interface Configuration mode is entered is the port via which the mirrored traffic egresses the source device towards the remote destination device.

Use the **no** variant of this command to disable remote mirroring of the specified mirrored port by the egress (destination) port on the source device.

**Syntax** `remote-mirror interface <port-list> direction  
{both|receive|transmit} vlan <2-4090> [priority <0-7>]  
remote-mirror interface none vlan <2-4090> [priority <0-7>]  
no remote-mirror interface <port-list> [direction  
{receive|transmit}]  
no remote-mirror interface none`

| Parameter                      | Description                                                                                                                                                                                                                                                                                                               |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;port-list&gt;</code> | The ports from which to mirror traffic. A port-list can be: <ul style="list-style-type: none"><li>• a port (e.g. port1.0.1)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-port1.0.4</li><li>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.3-port1.0.4</li></ul> |
| <code>direction</code>         | Specifies whether to mirror traffic that the source port receives, transmits, or both.                                                                                                                                                                                                                                    |
| <code>both</code>              | Mirroring traffic both received and transmitted by the source port.                                                                                                                                                                                                                                                       |
| <code>receive</code>           | Mirroring traffic received by the source port.                                                                                                                                                                                                                                                                            |
| <code>transmit</code>          | Mirroring traffic transmitted by the source port.                                                                                                                                                                                                                                                                         |
| <code>2 - 4090</code>          | The VLAN ID of the remote mirroring VLAN that this mirrored traffic is to be tagged with at the egress port on the source device.                                                                                                                                                                                         |
| <code>priority</code>          | The 802.1p priority tag to apply to mirrored packets.                                                                                                                                                                                                                                                                     |

**Default** No ports are set to be remote mirrored by default.

**Mode** Interface Configuration

**Usage notes** To prevent unwanted processing of mirrored traffic, we recommend configuring remote monitoring on the receiving device before configuring it on the source device.

This command can only be used to configure a single egress port on the source device, not a range of egress ports. Do not use the **interface** command with multiple interfaces before using this **remote-mirror interface** command. One egress (destination) port on the source device can transmit mirrored frames from up to four remote mirrored (source) ports.

The egress port on the source device can be associated with other VLANs in addition to the remote mirror VLAN, so it can function as an uplink for traffic from multiple VLANs. This command does not change the VLAN associations of the mirrored ports.

Only one port on the device can be configured as either a mirror port for port mirroring (**mirror interface** command) or as an egress port on the source device for remote mirroring (**remote-mirror interface** command).

All mirrored ports on a single device must use the same remote mirror VLAN and priority.

Access control lists can be used to mirror a subset of traffic from the mirrored port by using the copy-to-mirror parameter in hardware ACL commands.

**Example** To configure the source device to send all the traffic that it receives on remote-mirrored port port1.0.2 out egress port port1.0.1 tagged with remote mirroring VLAN ID 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# remote-mirror interface port1.0.2 direction
receive vlan 2
```

To stop port1.0.1 remote-mirroring traffic received on mirrored port port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no remote-mirror interface port1.0.2
direction receive
```

# show mirror

**Overview** Use this command to display the status of all mirrored ports.

**Syntax** show mirror

**Mode** User Exec and Privileged Exec

**Example** To display the status of all mirrored ports, use the following command:

```
awplus# show mirror
```

**Output** Figure 13-1: Example output from the **show mirror** command

```
Mirror Test Port Name: port1.0.1
Mirror option: Enabled
Mirror direction: both
Monitored Port Name: port1.0.2
```

# show mirror interface

**Overview** Use this command to display port mirroring configuration for a mirrored (monitored) switch port.

**Syntax** show mirror interface *<port>*

| Parameter           | Description                                             |
|---------------------|---------------------------------------------------------|
| <i>&lt;port&gt;</i> | The monitored switch port to display information about. |

**Mode** User Exec, Privileged Exec and Interface Configuration

**Example** To display port mirroring configuration for port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# show mirror interface port1.0.2
```

**Output** Figure 13-2: Example output from the **show mirror interface** command

```
Mirror Test Port Name: port1.0.1
Mirror option: Enabled
Mirror direction: both
Monitored Port Name: port1.0.2
```

# show remote-mirror

**Overview** Use this command to display information for remote-mirroring.

**Syntax** show remote-mirror

**Mode** User Exec

**Example** To display information about remote mirroring, use the command:

```
awplus# show remote-mirror
```

**Output** Figure 13-3: Example output from **show remote-mirror**

```
awplus#show remote-mirror
Remote mirror information:
Remote mirror destination:
 Port: port1.0.3
 VLAN: 259
 User priority: 0

Monitored ports:
 port1.0.1
 direction: both

Remote mirror egress ports:

Remote mirror VLANs:
 VLAN 259
```

Table 13-1: Parameters in the output from **show remote-mirror**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote mirror destination | On the source device, this displays information about: <ul style="list-style-type: none"><li>the egress port for the mirrored traffic on the source device</li><li>the remote mirroring VLAN ID this traffic is tagged with on egress</li><li>the user priority this traffic is tagged with on egress</li></ul>                                                              |
| Monitored ports           | On the source device, this displays: <ul style="list-style-type: none"><li>the ports being mirrored (monitored)</li><li>the direction—whether both received traffic, transmitted traffic or both are mirrored</li><li>'none (via ACL)' if it is configured with the command <b>remote-mirror interface none</b> to allow ACLs to select the traffic to be mirrored</li></ul> |

Table 13-1: Parameters in the output from **show remote-mirror** (cont.)

| Parameter                  | Description                                                                                                                                                                                                                |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote mirror egress ports | On the destination device, this displays : <ul style="list-style-type: none"><li>• the remote mirror egress ports</li><li>• the remote mirror VLANs they are associated with</li></ul>                                     |
| Remote mirror VLANs        | On source, destination and intermediate devices, this displays a list of any VLANs configured in remote mirror VLAN mode. To see a list of the ports associated with these VLANs, use the command <b>show vlan brief</b> . |

**Related commands**

- [remote-mirror interface](#)

- [vlan mode remote-mirror-vlan](#)

# switchport remote-mirror-egress

**Overview** Use this command on the device receiving remote mirrored traffic to set the remote mirroring egress port for the specified remote mirroring VLAN. This port removes the remote mirror VLAN tagging before transmitting the mirrored traffic. Ingress traffic on this port is disabled.

Use the **no** variant of this command to reset the port to no longer function as a remote mirror egress port.

**Syntax** `switchport remote-mirror-egress vlan <vlan-id>`  
`no switchport remote-mirror-egress`

| Parameter | Description                                                                           |
|-----------|---------------------------------------------------------------------------------------|
| <vlan-id> | The port will transmit the mirrored traffic it receives from this remote mirror VLAN. |

**Default** There is no remote mirror egress port by default.

**Mode** Interface Configuration for a switch port

**Usage notes** To prevent unwanted processing of mirrored traffic, we recommend configuring remote monitoring on the receiving device before configuring it on the source device.

This command would typically be used for the port that transmits the remote-mirrored traffic to a device that will analyze it. The port effectively functions as an access port in the remote mirror VLAN, with the added feature of not allowing ingress traffic on the port.

**Example** To set port1.0.2 on the destination device as the remote mirror egress port for mirrored traffic that is tagged with VLAN ID 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport remote-mirror-egress vlan 2
```

To unset port1.0.2 as a remote mirror egress port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport remote-mirror-egress
```

**Related commands** [remote-mirror interface](#)  
[show remote-mirror](#)  
[vlan mode remote-mirror-vlan](#)

# vlan mode remote-mirror-vlan

**Overview** Use this command to create a single VLAN or a range of VLANs in remote mirror mode to be used for remote mirroring.

Use the **no** variant of this command to remove the remote mirror VLAN from the VLAN database and its configurations.

**Syntax** `vlan [<vid>|<vid-range>] mode remote-mirror-vlan`  
`no vlan [<vid>|<vid-range>]`

| Parameter   | Description                                                         |
|-------------|---------------------------------------------------------------------|
| <vid>       | The VLAN ID of the remote mirroring VLAN to be created.             |
| <vid-range> | The range of VLAN IDs for the remote mirroring VLANs to be created. |

**Default** There is no remote mirror VLAN by default.

**Mode** VLAN Configuration

**Usage notes** This remote mirror VLAN needs to be configured on the remote mirroring source device, the destination (receiving) device, and any devices in between that are to forward the mirrored traffic. We recommend configuring this on the receiving device and intermediate devices before configuring the source device.

The remote mirror VLAN operates in a special mode— all traffic on the remote mirror VLAN is flooded, and no learning or CPU processing is done for packets in the VLAN. BPDU packets (link-local packets used to control features like spanning tree or AMF) are dropped on remote mirror VLANs.

Disabling the remote-mirroring VLAN on the source switch does not prevent the mirrored packets from being sent with the remote-mirror VLAN tag. To stop the mirroring, the command **no remote-mirror interface** must be used.

**Example** To create a VLAN with VLAN ID 3 in remote mirror VLAN mode, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 3 mode remote-mirror-vlan
```

To remove the remote mirror VLAN with ID 3, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no vlan 3
```

# backpressure

**Overview** This command provides a method of applying flow control to ports running in half duplex mode. The setting will only apply when the link is in the half-duplex state.

You can disable backpressure on an interface using the **off** parameter or the **no** variant of this command.

**Syntax** backpressure {on|off}  
no backpressure

| Parameters | Description                        |
|------------|------------------------------------|
| on         | Enables half-duplex flow control.  |
| off        | Disables half-duplex flow control. |

**Default** Backpressure is turned off by default. You can determine whether an interface has backpressure enabled by viewing the running-config output; **backpressure on** is shown for interfaces if this feature is enabled.

**Mode** Interface Configuration

**Usage notes** The backpressure feature enables half duplex Ethernet ports to control traffic flow during congestion by preventing further packets arriving. Back pressure utilizes a pre-802.3x mechanism in order to apply Ethernet flow control to switch ports that are configured in the half duplex mode.

The flow control applied by the [flowcontrol \(switch port\)](#) command operates only on full-duplex links, whereas back pressure operates only on half-duplex links.

If a port has insufficient capacity to receive further frames, the device will simulate a collision by transmitting a CSMA/CD jamming signal from this port until the buffer empties. The jamming signal causes the sending device to stop transmitting and wait a random period of time, before retransmitting its data, thus providing time for the buffer to clear. Although this command is only valid for switch ports operating in half-duplex mode the remote device (the one sending the data) can be operating in the full duplex mode.

To see the currently-negotiated duplex mode for ports whose links are up, use the command [show interface](#). To see the configured duplex mode (when different from the default), use the command [show running-config](#).

**Examples** To enable back pressure flow control on interfaces port1.0.1-port1.0.2 enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.2
awplus(config-if)# backpressure on
```

To disable back pressure flow control on interface port1.0.2 enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# backpressure off
```

**Validation  
Commands**    [show running-config](#)  
                  [show interface](#)

**Related  
commands**    [duplex](#)

# clear loop-protection action

**Overview** Use this command to clear the loop protection actions on the specified interfaces.

**Syntax** `clear loop-protection [interface <port-list>] action`

| Parameters  | Description                                    |
|-------------|------------------------------------------------|
| interface   | The interface whose actions are to be cleared. |
| <port-list> | A port, a port range, or an aggregated link.   |

**Mode** Privileged Exec

**Example** To clear the loop protection actions on interface port1.0.2, use the command:

```
awplus# clear loop-protection interface port1.0.2 action
```

To clear the loop protection actions of all interfaces on a device, use the command:

```
awplus# clear loop-protection action
```

**Related commands** [loop-protection loop-detect](#)  
[loop-protection action](#)  
[show loop-protection](#)

# clear loop-protection counters

**Overview** Use this command to clear the loop protection counters.

**Syntax** `clear loop-protection [interface <port-list>] counters`

| Parameters  | Description                                     |
|-------------|-------------------------------------------------|
| interface   | The interface whose counters are to be cleared. |
| <port-list> | A port, a port range, or an aggregated link.    |

**Mode** Privileged Exec

**Examples** To clear the counter information for all interfaces:

```
awplus# clear loop-protection counters
```

To clear the counter information for a single port:

```
awplus# clear loop-protection interface port1.0.1 counters
```

**Related commands** [show loop-protection](#)

# clear mac address-table dynamic

**Overview** Use this command to clear the filtering database of all entries learned for a selected MAC address, an MSTP instance, a switch port interface, or a VLAN interface.

**Syntax** `clear mac address-table dynamic`  
`[address <mac-address>|interface <port> [instance <inst>]]|`  
`vlan <vid>]`

| Parameter                | Description                                                                                                                                                                                                                                                       |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| address<br><mac-address> | Specify a MAC (Media Access Control) address to be cleared from the filtering database, in the format HHHH.HHHH.HHHH.                                                                                                                                             |
| interface <port>         | Specify a switch port to be cleared from the filtering database. The port can be: <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li></ul> |
| instance <inst>          | Specify an MSTP (Multiple Spanning Tree) instance in the range 1 to 63 to be cleared from the filtering database.                                                                                                                                                 |
| vlan <vid>               | Specify a VID (VLAN ID) in the range 1 to 4094 to be cleared from the filtering database.                                                                                                                                                                         |

**Mode** Privileged Exec

**Usage notes** Use this command with options to clear the filtering database of all entries learned for a given MAC address, interface or VLAN. Use this command without options to clear any learned entries.

Use the optional **instance** parameter to clear the filtering database entries associated with a specified MSTP instance. Note that you must first specify a switch port interface before you can specify an MSTP instance.

Compare this usage and operation with the [clear mac address-table static](#) command. Note that an MSTP instance cannot be specified with the command **clear mac address-table static**.

**Examples** This example shows how to clear all dynamically learned filtering database entries.

```
awplus# clear mac address-table dynamic
```

This example shows how to clear all dynamically learned filtering database entries when learned through device operation for the MAC address 0000.5E00.5302.

```
awplus# clear mac address-table dynamic address 0000.5E00.5302
```

This example shows how to clear all dynamically learned filtering database entries when learned through device operation for a given MSTP instance 1 on switch port interface port1.0.3.

```
awplus# clear mac address-table dynamic interface port1.0.3
instance 1
```

**Related commands**   [clear mac address-table static](#)  
[show mac address-table](#)

# clear mac address-table static

**Overview** Use this command to clear the filtering database of all statically configured entries for a selected MAC address, interface, or VLAN.

**Syntax** `clear mac address-table static [address <mac-address>|interface <port>|vlan <vid>]`

| Parameter             | Description                                                                                                                                                                                                                                                            |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| address <mac-address> | Specify a MAC (Media Access Control) address to be cleared from the filtering database, in the format HHHH.HHHH.HHHH.                                                                                                                                                  |
| interface <port>      | Specify the port from which statically configured entries are to be cleared. The port can be <ul style="list-style-type: none"><li>a switchport (e.g. port1.0.4)</li><li>a static channel group (e.g. sa2)</li><li>a dynamic (LACP) channel group (e.g. po2)</li></ul> |
| vlan <vid>            | Specify a VID (VLAN ID) in the range 1 to 4094 to be cleared from the filtering database.                                                                                                                                                                              |

**Mode** Privileged Exec

**Usage notes** Use this command with options to clear the filtering database of all entries made from the CLI for a given MAC address, interface or VLAN. Use this command without options to clear any entries made from the CLI.

Compare this usage with [clear mac address-table dynamic](#) command.

**Examples** This example shows how to clear all filtering database entries configured through the CLI.

```
awplus# clear mac address-table static
```

This example shows how to clear all filtering database entries for a specific interface configured through the CLI.

```
awplus# clear mac address-table static interface port1.0.3
```

This example shows how to clear filtering database entries configured through the CLI for the MAC address 0000.5E00.5302.

```
awplus# clear mac address-table static address 0000.5E00.5302
```

**Related commands** [clear mac address-table dynamic](#)  
[mac address-table static](#)

# clear port counter

**Overview** Use this command to clear the packet counters of the port.

**Syntax** clear port counter [*<port>*]

| Parameter           | Description              |
|---------------------|--------------------------|
| <i>&lt;port&gt;</i> | The port number or range |

**Mode** Privileged Exec

**Example** To clear the packet counter for port1.0.1, use the command:

```
awplus# clear port counter port1.0.1
```

**Related commands** [show platform port](#)

# clear port counter stackports

**Overview** Use this command to allow accumulating stackport counters to be cleared.

**Syntax** clear port counter stackports

**Mode** Privileged Exec

**Example** To clear the packet counter for all stackports, use the command:

```
awplus# clear port counter stackports
```

**Related commands** [clear port counter](#)

**Command changes** Version 5.4.6-0: command added

# clear port-security intrusion

**Overview** Use this command to clear the history of the port-security intrusion list on all ports, or an individual port. If a port is not specified, the intrusion lists of all ports are cleared. This command does not clear any MAC addresses the device has already learned on the ports. If you want to clear MAC addresses on a switch port from the filtering database, you can use the [clear mac address-table dynamic](#) command or the [clear mac address-table static](#) command.

**Syntax** `clear port-security intrusion [interface <port>]`

| Parameter | Description                                                                                                                                                                                                                          |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port>    | Specify the switch port from which the history of violated address entries will be cleared. The port can be a single switch port, (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |

**Mode** Privileged Exec

**Examples** To see the port-security status on port1.0.2, use the following command:

```
awplus# show port-security interface port1.0.2
```

Table 14-1: Example output from **show port-security interface**

```
awplus#show port-security interface port1.0.2
Port Security configuration

Security Enabled : YES
Port Status : ENABLED
Violation Mode : TRAP
Aging : OFF
Maximum MAC Addresses : 1
Total MAC Addresses : 1
Lock Status : LOCKED
Security Violation Count : 1
Last Violation Source Address : 801f.0200.19da
```

To see the intrusion list on port1.0.2, use the following command:

```
awplus# show port-security intrusion interface port1.0.2
```

Table 14-2: Example output from **show port-security intrusion**

```
awplus#show port-security intrusion interface port1.0.2
Port Security Intrusion List

Interface: port1.0.2 - 1 intrusion(s) detected
801f.0200.19da
```

To clear the history of port-security intrusion list on port1.0.2, use the following command:

```
awplus# clear port-security intrusion interface port1.0.2
```

To see the port-security status on port1.0.2, use the following command:

```
awplus# show port-security interface port1.0.2
```

Table 14-3: Example output from **show port-security interface**

```
awplus#show port-security interface port1.0.2
Port Security configuration

Security Enabled : YES
Port Status : ENABLED
Violation Mode : TRAP
Aging : OFF
Maximum MAC Addresses : 1
Total MAC Addresses : 1
Lock Status : LOCKED
Security Violation Count : 0
Last Violation Source Address : None
```

**NOTE:** Note that the port status is still locked while the history of port violation is cleared from the database.

To see the intrusion list on port1.0.2, use the following command:

```
awplus# show port-security intrusion interface port1.0.2
```

Table 14-4: Example output from **show port-security intrusion**

```
awplus#show port-security intrusion interface port1.0.2
Port Security Intrusion List

Interface: port1.0.2 - no intrusions detected
```

- show port-security intrusion
- switchport port-security
- switchport port-security aging
- switchport port-security maximum
- switchport port-security violation

# cut-through

**Overview** This command changes the switching method setting to the cut-through switching method on the specified port.

Use the no variant of this command to restore the switching method setting to the default store-and-forward switching method on the specified port.

**Syntax** cut-through  
no cut-through

**Default** The store-and forward switching method

**Mode** Interface Configuration for a switch port interface

**Usage** Use this command to change the switching method setting to cut-through switching on a port.

In store-and-forward switching, the switch stores the entire frame in the buffers and performs error checking before forwarding the frame. In cut-through switching, the switch forwards a frame without waiting to receive the entire frame. Because the switch does not wait for the entire frame to receive, nor perform error checking, cut-through switching is faster than store-and-forward switching.

To make the link operate in the cut-through method, both egress and ingress ports must be set to the cut-through method using the **cut-through** command. In addition, if the ingress port speed is slower than the egress port speed, the link between the two ports operates in the store-and-forward method.

**Examples** To change the switching method on port1.0.1 to port1.0.8 to cut-through switching, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.8
awplus(config-router)# cut-through
```

To change the switching method to store-and-forward switching, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.8
awplus(config-router)# no cut-through
```

**Related Command** [show running-config](#)

# debug loopprot

**Overview** This command enables Loop Protection debugging.  
The **no** variant of this command disables Loop Protection debugging.

**Syntax** debug loopprot {info|msg|pkt|state|nsm|all}  
no debug loopprot {info|msg|pkt|state|nsm|all}

| Parameter | Description                                                                    |
|-----------|--------------------------------------------------------------------------------|
| info      | General Loop Protection information.                                           |
| msg       | Received and transmitted Loop Detection Frames (LDFs).                         |
| pkt       | Echo raw ASCII display of received and transmitted LDF packets to the console. |
| state     | Loop Protection states transitions.                                            |
| nsm       | Network Service Module information.                                            |
| all       | All debugging information.                                                     |

**Mode** Privileged Exec and Global Configuration

**Example** To enable debug for all state transitions, use the command:  
awplus# debug loopprot state

**Related commands** show debugging loopprot  
undebg loopprot

# debug platform packet

**Overview** This command enables platform to CPU level packet debug functionality on the device.

Use the **no** variant of this command to disable platform to CPU level packet debug. If the result means both send and receive packet debug are disabled, then any active timeout will be canceled.

**Syntax** debug platform packet [recv] [send] [sflow] [timeout <timeout>]  
[vlan <vid>|all]  
no debug platform packet [recv] [send]

| Parameter         | Description                                                                 |
|-------------------|-----------------------------------------------------------------------------|
| recv              | Debug packets received.                                                     |
| send              | Debug packets sent.                                                         |
| sflow             | Debug sFlow packets.                                                        |
| timeout <timeout> | Stop debug after a specified time. Specify the time in seconds.             |
| vlan <vid>        | Specify a VID (VLAN ID) in the range 1 to 4094 to limit debug to that VLAN. |
| all               | Debug all VLANs (default setting).                                          |

**Default** A 5 minute timeout is configured by default if no other timeout duration is specified.

**Mode** Privileged Exec and Global Configuration

**Usage notes** This command can be used to trace packets sent and received by the CPU. If a timeout is not specified, then a default 5 minute timeout will be applied.

If a timeout of 0 is specified, packet debug will be generated until the **no** variant of this command is used or another timeout value is specified. The timeout value applies to both send and receive debug and is updated whenever the **debug platform packet** command is used.

**Examples** To enable both receive and send packet debug for the default timeout of 5 minutes, enter:

```
awplus# debug platform packet
```

To enable receive packet debug for 10 seconds, enter:

```
awplus# debug platform packet recv timeout 10
```

To enable packet debug for sFlow packets only for the default timeout of 5 minutes, enter:

```
awplus# debug platform packet sflow
```

To enable send packet debug with no timeout, enter:

```
awplus# debug platform packet send timeout 0
```

To enable VLAN packet debug for VLAN 1 with a timeout duration of 3 minutes, enter:

```
awplus# debug platform packet vlan 1 timeout 180
```

To disable receive packet debug, enter:

```
awplus# no debug platform packet recv
```

**Related  
commands**

[show debugging platform packet](#)

[undebug platform packet](#)

# duplex

**Overview** This command changes the duplex mode for the specified port.

To see the currently-negotiated duplex mode for ports whose links are up, use the command [show interface](#). To see the configured duplex mode (when different from the default), use the command [show running-config](#).

**Syntax** duplex {auto|full|half}

| Parameter | Description                       |
|-----------|-----------------------------------|
| auto      | Auto-negotiate duplex mode.       |
| full      | Operate in full duplex mode only. |
| half      | Operate in half duplex mode only. |

**Default** By default, ports auto-negotiate duplex mode (except for 100Base-FX ports which do not support auto-negotiation, so default to full duplex mode).

**Mode** Interface Configuration

**Usage notes** Switch ports in a static or dynamic (LACP) channel group must have the same port speed and be in full duplex mode. Once switch ports have been aggregated into a channel group, you can set the duplex mode of all the switch ports in the channel group by applying this command to the channel group.

**Examples** To specify full duplex for port1.0.4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# duplex full
```

To specify half duplex for port1.0.4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# duplex half
```

To auto-negotiate duplex mode for port1.0.4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# duplex auto
```

**Related commands** [polarity](#)  
[speed](#)  
[show interface](#)

# flowcontrol (switch port)

**Overview** Use this command to enable flow control, and configure the flow control mode for the switch port.

Use the **no** variant of this command to disable flow control for the specified switch port.

**Syntax** flowcontrol {send|receive} {off|on}  
no flowcontrol

| Parameter | Description                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| receive   | When the port receives pause frames, it temporarily stops (pauses) sending traffic.                                                                  |
| on        | Enable the specified flow control.                                                                                                                   |
| off       | Disable the specified flow control.                                                                                                                  |
| send      | When the port is congested (receiving too much traffic), it sends pause frames to request the other end to temporarily stop (pause) sending traffic. |

**Default** By default, flow control is disabled.

**Mode** Interface Configuration

**Usage notes** The flow control mechanism specified by 802.3x is only for full duplex links. It operates by sending PAUSE frames to the link partner to temporarily suspend transmission on the link.

Flow control enables connected Ethernet ports to control traffic rates during congestion by allowing congested nodes to pause link operation at the other end. If one port experiences congestion, and cannot receive any more traffic, it notifies the other port to stop sending until the condition clears. When the local device detects congestion at its end, it notifies the remote device by sending a pause frame. On receiving a pause frame, the remote device stops sending data packets, which prevents loss of data packets during the congestion period.

Flow control is not recommended when running QoS or ACLs, because the complex queuing, scheduling, and filtering configured by QoS or ACLs may be slowed by applying flow control.

For half-duplex links, an older form of flow control known as backpressure is supported. See the related [backpressure](#) command.

For flow control on async serial (console) ports, see the [flowcontrol hardware \(asyn/console\)](#) command.

**Examples** To enable flow control on port1.0.2 (receive only), use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# flowcontrol receive on
```

To enable flow control on port1.0.2 (send only), use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# flowcontrol send on
```

To disable flow control on port1.0.2 (receive only), use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# flowcontrol receive off
```

To disable flow control on port1.0.2 (send only), use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# flowcontrol send off
```

**Related commands** [backpressure](#)  
[show running-config](#)

# linkflap action

**Overview** Use this command to detect flapping on all ports. If more than 15 flaps occur in less than 15 seconds the flapping port will shut down.

Use the **no** variant of this command to disable flapping detection at this rate.

**Syntax** linkflap action [shutdown]  
no linkflap action

| Parameter | Description                       |
|-----------|-----------------------------------|
| linkflap  | Global setting for link flapping. |
| action    | Specify the action for port.      |
| shutdown  | Shutdown the port.                |

**Default** Linkflap action is disabled by default.

**Mode** Global Configuration

**Example** To enable the linkflap action command on the device, use the following commands:

```
awplus# configure terminal
awplus(config)# linkflap action shutdown
```

# loop-protection loop-detect

**Overview** Use this command to enable the loop-protection loop-detect feature and configure its parameters.

Use the **no** variant of this command to disable the loop-protection loop-detect feature.

**Syntax** loop-protection loop-detect [ldf-interval <period>]  
[ldf-rx-window <frames>] [fast-block]  
no loop-protection loop-detect

| Parameter     | Description                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------|
| ldf-interval  | The time (in seconds) between successive loop-detect frames being sent.                                                  |
| <period>      | Specify a period between 1 and 600 seconds. The default is 10 seconds.                                                   |
| ldf-rx-window | The number of transmitted loop detect frames whose details are held for comparing with frames arriving at the same port. |
| <frames>      | Specify a value for the window size between 1 and 5 frames. The default is 3 frames.                                     |
| [fast-block]  | The fast-block blocks transmitting port to keep partial connectivity.                                                    |

**Default** The loop-protection loop-detect feature is disabled by default. The default interval is 10 seconds, and the default window size is 3 frames.

**Mode** Global Configuration

**Usage notes** See the “Loop Protection” section in the [Switching Feature Overview and Configuration Guide](#) for relevant conceptual, configuration, and overview information prior to applying this command.

**Example** To enable the loop-detect mechanism on the switch, and generate loop-detect frames once every 5 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# loop-protection loop-detect ldf-interval 5
```

**Related commands** [loop-protection action](#)  
[loop-protection timeout](#)  
[show loop-protection](#)

# loop-protection action

**Overview** Use this command to specify the protective action to apply when a network loop is detected on an interface.

Use the **no** variant of this command to reset the loop protection actions to the default action, vlan-disable, on an interface.

**Syntax** loop-protection action  
{link-down|log-only|port-disable|vlan-disable|none}  
no loop-protection action

| Parameter    | Description                                                                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| link-down    | Block all traffic on a port (or aggregated link) that detected the loop, and take <b>down</b> the link.                                                                 |
| log-only     | Details of loop conditions are logged. No action is applied to the port (or aggregated link).                                                                           |
| port-disable | Block all traffic on interface for which the loop occurred, but keep the link in the <b>up</b> state.                                                                   |
| vlan-disable | Block all traffic for the VLAN on which the loop traffic was detected. Note that setting this parameter will also enable ingress filtering. This is the default action. |
| none         | Applies no protective action.                                                                                                                                           |

**Default** loop-protection action vlan-disable

**Mode** Interface Configuration

**Usage notes** See the “Loop Protection” section in the [Switching Feature Overview and Configuration Guide](#) for relevant conceptual, configuration, and overview information prior to applying this command.

**Example** To disable the interface port1.0.2 and bring the link down when a network loop is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# loop-protection action link-down
```

**Related commands** [loop-protection loop-detect](#)  
[loop-protection timeout](#)  
[show loop-protection](#)

# loop-protection action-delay-time

**Overview** Use this command to sets the loop protection action delay time for an interface to specified values in seconds. The action delay time specifies the waiting period for the action.

Use the **no** variant of this command to reset the loop protection action delay time for an interface to default.

**Syntax** `loop-protection action-delay-time <0-86400>`  
`no loop-protection action`

| Parameter                    | Description                                              |
|------------------------------|----------------------------------------------------------|
| <code>&lt;0-86400&gt;</code> | Time in seconds; 0 means action delay timer is disabled. |

**Default** Action delay timer is disabled by default.

**Mode** Interface Configuration

**Example** To configure a loop protection action delay time of 10 seconds on port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# loop-protection action-delay-time 10
```

**Related commands** [loop-protection loop-detect](#)  
[loop-protection timeout](#)  
[show loop-protection](#)

# loop-protection timeout

**Overview** Use this command to specify the Loop Protection recovery action duration on an interface.

Use the **no** variant of this command to set the loop protection timeout to the default.

**Syntax** loop-protection timeout *<duration>*  
no loop-protection timeout

| Parameter               | Description                                                                                                                                                                                                      |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;duration&gt;</i> | The time (in seconds) for which the configured action will apply before being disabled. This duration can be set between 0 and 86400 seconds (24 hours). The set of 0 means infinity so timeout does not expire. |

**Default** The default is 7 seconds.

**Mode** Interface Configuration

**Usage notes** See the “Loop Protection” section in the [Switching\\_Feature\\_Overview\\_and\\_Configuration\\_Guide](#) for relevant conceptual, configuration, and overview information prior to applying this command.

**Example** To configure a loop protection action timeout of 10 seconds for port1.0.4, use the command:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# loop-protection timeout 10
```

**Related commands** [loop-protection loop-detect](#)  
[loop-protection action](#)  
[show loop-protection](#)

# mac address-table acquire

**Overview** Use this command to enable MAC address learning on the device.

Use the **no** variant of this command to disable learning.

**Syntax** mac address-table acquire  
no mac address-table acquire

**Default** Learning is enabled by default for all instances.

**Mode** Global Configuration

**Example** awplus# configure terminal  
awplus(config)# mac address-table acquire

# mac address-table ageing-time

**Overview** Use this command to specify an ageing-out time for a learned MAC address. The learned MAC address will persist for at least the specified time.

The **no** variant of this command will reset the ageing-out time back to the default of 300 seconds (5 minutes).

**Syntax** mac address-table ageing-time *<ageing-timer>* none  
no mac address-table ageing-time

| Parameter                   | Description                                                     |
|-----------------------------|-----------------------------------------------------------------|
| <i>&lt;ageing-timer&gt;</i> | <i>&lt;10-1000000&gt;</i> The number of seconds of persistence. |
| none                        | Disable learned MAC address timeout.                            |

**Default** The default ageing time is 300 seconds.

**Mode** Global Configuration

**Examples** The following commands specify various ageing timeouts on the device:

```
awplus# configure terminal
awplus(config)# mac address-table ageing-time 1000
awplus# configure terminal
awplus(config)# mac address-table ageing-time none
awplus# configure terminal
awplus(config)# no mac address-table ageing-time
```

# mac address-table logging

**Overview** Use this command to create log entries when the content of the FDB (forwarding database) changes. Log messages are produced when a MAC address is added to or removed from the FDB.

**CAUTION:** *MAC address table logging may impact the performance of the switch. Only enable it when necessary as a debug tool.*

Use the **no** variant of this command to stop creating log entries when the content of the FDB changes.

**Syntax** mac address-table logging  
no mac address-table logging

**Default** MAC address table logging is disabled by default.

**Mode** User Exec/Privileged Exec

**Usage** When MAC address table logging is enabled, the switch produces the following messages:

| Change       | Message format                  | Example                                    |
|--------------|---------------------------------|--------------------------------------------|
| MAC added    | MAC add <mac> <port> <vlan>     | MAC add eccd.6db5.68a7 port1.0.1 vlan2     |
| MAC deleted  | MAC delete <mac> <port> <vlan>  | MAC delete eccd.6db5.68a7 port1.0.1 vlan2  |
| MAC aged out | MAC age-out <mac> <port> <vlan> | MAC age-out eccd.6db5.68a7 port1.0.1 vlan2 |

To see whether MAC address table logging is enabled, use the command [show running-config](#).

**Example** To create log messages when the content of the FDB changes, use the command:  
awplus# mac address-table logging

**Related commands** [show running-config](#)

# mac address-table static

**Overview** Use this command to statically configure the MAC address-table to forward or discard frames with a matching destination MAC address.

**Syntax** `mac address-table static <mac-addr> {forward|discard} interface <port> [vlan <vid>]`  
`no mac address-table static <mac-addr> {forward|discard} interface <port> [vlan <vid>]`

| Parameter        | Description                                                                                                                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <mac-addr>       | The destination MAC address in HHHH . HHHH . HHHH format.                                                                                                                                                                                                         |
| interface <port> | Specify a switch port to be cleared from the filtering database. The port can be: <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li></ul> |
| vlan <vid>       | The ID of a VLAN to apply the command to, in the range 1 to 4094. If you do not specify a VLAN, the command applies to VLAN1.                                                                                                                                     |

**Mode** Global Configuration

**Usage notes** The **mac address-table static** command is only applicable to Layer 2 switched traffic within a single VLAN. Do not apply the **mac address-table static** command to Layer 3 switched traffic passing from one VLAN to another VLAN. Frames will not be discarded across VLANs because packets are routed across VLANs. This command only works on Layer 2 traffic.

**Example** `awplus# configure terminal`  
`awplus(config)# mac address-table static 2222.2222.2222 forward`  
`interface port1.0.4 vlan 3`

**Related commands** [clear mac address-table static](#)  
[show mac address-table](#)

# mac address-table thrash-limit

**Overview** Use this command to set the thrash limit on the device or stack.

Thrashing occurs when a MAC address table rapidly “flips” its mapping of a single MAC address between two switchports on the same VLAN. This is usually because of a network loop.

Use the **no** variant of this command to return the thrash limit to its default setting.

**Syntax** `mac address-table thrash-limit <rate>`  
`no mac address-table thrash-limit`

| Parameter                 | Description                                                                                                                                                                                                    |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;rate&gt;</code> | The maximum thrash rate at which limiting is applied. This rate can be set to between 5 and 255 MAC thrashing flips per second. Once the thrash limit rate is reached, the port is considered to be thrashing. |

**Default** 10 MAC thrashing flips per second

**Mode** Global Configuration

**Usage notes** Use this command to limit thrashing on the selected port range.

**Example** To apply a thrash limit of 20 MAC address flips per second:  
`awplus# configure terminal`  
`awplus(config)# mac address-table thrash-limit 20`

**Related commands** [show interface](#)  
[show mac address-table thrash-limit](#)  
[thrash-limiting](#)

# platform acls-to-vlanclassifiers

**Overview** Use this command to configure the amount of memory allocated (or split) between ACLs and VLAN classifiers.

Use the **no** variant of this command to reset the allocation to the default setting.

**Syntax** `platform acls-to-vlanclassifiers {more-vlan-classifiers | half-and-half | more-acls} [tunnel-support]`  
`no platform acls-to-vlanclassifiers`

| Parameter             | Description                                                          |
|-----------------------|----------------------------------------------------------------------|
| more-vlan-classifiers | Support more dynamic VLAN classifiers.                               |
| half-and-half         | Support the same number of ACLs and VLAN classifiers.                |
| more-acls             | Support more ACLs.                                                   |
| tunnel-support        | Enable tunnel support for features such as IPv6 over IPv4 tunneling. |

**Default** More dynamic VLAN classifiers

**Mode** Global Configuration

**Usage notes** Access-lists and VLAN classifiers use the same memory/table in hardware. This command is used to split this memory to support more ACLs, more VLAN classifiers or the same number of ACLs and VLAN classifiers.

Note: For this command to take effect, you must copy it to the startup configuration using the **copy running-config startup-config** command and then reboot the switch.

**Example** To store more dynamic VLAN classifiers, use the commands:

```
awplus# configure terminal
awplus(config)# platform acls-to-vlanclassifiers
more-vlan-classifiers
```

To store the same number of ACLs and VLAN classifiers, use the commands:

```
awplus# configure terminal
awplus(config)# platform acls-to-vlanclassifiers half-and-half
```

To store more ACLs, use the following commands:

```
awplus# configure terminal
awplus(config)# platform acls-to-vlanclassifiers more-acls
```

To reset the allocation to the default settings, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no platform acls-to-vlanclassifiers
```

To store more ACLs, and enable tunnel support for features such as IPv6 over IPv4 tunneling, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# platform acls-to-vlanclassifiers more-acls
tunnel-support
```

[show startup-config](#)

**Command  
changes**

Version 5.4.9-0.1: command added

Version 5.5.0-0.1: **tunnel-support** parameter added for x530 series

# platform control-plane-prioritization rate

**Overview** The feature ensures that different traffic types can share the CPU effectively.

Use this command to set the maximum traffic rate on the CPU port to limit the data rate to the CPU. This is to prevent the CPU becoming overloaded with unnecessary data packets, which in turn could result in poor performance in situations such as a CLI console lock up, or control packet loss following a broadcast storm.

Use the **no** variant of this command to restore the rate limiting on the CPU port to the default.

Note that only integer values are accepted for rate limits.

Set the rate to 0 using **platform control-plane prioritization rate** to disable CPU protection.

**Syntax** platform control-plane-prioritization rate *<rate-limit>*  
no platform control-plane-prioritization rate

| Parameter                 | Description                                                  |
|---------------------------|--------------------------------------------------------------|
| <i>&lt;rate-limit&gt;</i> | <1000-1000000> 1000Kbps to 1000000Kbps (1 Mbps to 1000Mbps). |

**Default** 1000 Mbps

**Mode** Global Configuration

**Usage notes** **Confirming default settings:**

Use [show platform](#) to confirm the default rate limit settings displayed with platform information:

```
awplus# show platform
```

**Disabling CPU protection:**

To disable the CPU protection feature you can set the control plane prioritization rate to 0:

```
awplus# platform control-plane-prioritization 0
```

Then you can confirm the CPU protection feature has been disabled using [show platform](#):

```
awplus# show platform
```

|                              |                         |
|------------------------------|-------------------------|
| Load Balancing               | srt-dst-mac, src-dst-ip |
| Control-plane-prioritization | Max 0 Mbps              |
| Jumboframe support           | off                     |
| Enhanced mode                | qos counters            |
| Vlan-stacking TPID           | 0x8100                  |

**Examples** To set the maximum traffic rate on the CPU port to 20 Mbps enter the following command:

```
awplus# configure terminal
```

```
awplus(config)# platform control-plane-prioritization 20000
```

Confirm the maximum traffic rate has been configured using the following **show** command:

```
awplus#show platform
Load Balancing srt-dst-mac, src-dst-ip
Control-plane-prioritization Max 20 Mbps
Jumboframe support off
Enhanced mode qos counters
Vlan-stacking TPID 0x8100
```

To reset the maximum traffic rate on the CPU port to the default enter the following command:

```
awplus# configure terminal
```

```
awplus(config)# no platform control-plane-prioritization
```

**Related commands** [show platform](#)  
[show running-config](#)

# platform jumboframe

**Overview** This command enables the device to forward jumbo frames. See the [Switching Feature Overview and Configuration Guide](#) for more information.

When jumbo frame support is enabled, the maximum size of packets that the device can forward is 10218 bytes of payload.

Use the **no** variant of this command to remove jumbo frame support. This stops the ports from forwarding packets larger than VLAN tagged frames (1522 bytes).

**NOTE:** The number above specifies the payload only. For an IEEE 802.1q frame, provision is made (internally) for the following additional components:

- Source and Destination addresses
- EtherType field
- Priority and VLAN tag fields
- FCS

These additional components increase the frame size (to 1522 bytes in the default case).

**Syntax** platform jumboframe  
no platform jumboframe

**Default** By default, jumbo frames is off.

**Mode** Global Configuration

**Usage notes** You must save the configuration and restart the device after entering this command for it to take effect. You can use the [reboot](#) command to restart the device.

**Example** To enable the device to forward jumbo frames, use the following commands:

```
awplus# configure terminal
awplus(config)# platform jumboframe
```

**Related commands** [show platform](#)  
[show running-config](#)

# platform l2mc-table mode

**Overview** Use this command to control the way in which hardware layer-2 multicast forwarding entries are allocated to multicast groups. You can choose either to share entries between groups when possible, or to allocate one entry per multicast group. Sharing entries minimizes how many hardware entries are used for L2 multicast forwarding.

Use the **no** variant of this command to return to the default, which is **compact**.

**Syntax** platform l2mc-table mode {compact|entry-per-group}  
no platform l2mc-table mode

| Parameter       | Description                                  |
|-----------------|----------------------------------------------|
| compact         | Share hardware entries across similar groups |
| entry-per-group | Allocate a distinct entry to each group      |

**Default** Compact

**Mode** Global Configuration

**Usage notes** This command controls the way in which hardware layer-2 multicast forwarding entries are allocated to multicast groups. These hardware entries represent a set of ports in a VLAN, to which a multicast group is being sent. More than one multicast group may be sent to the same set of egress ports in a given VLAN at the same time. If this is the case, then the default behaviour is to create just the one hardware forwarding entry representing that set of egress ports on that VLAN, and have multiple multicast groups share that one entry. The entry-per-group option changes this behaviour, so that each multicast group has its own hardware entry representing the egress ports to which it is being forwarded on a given VLAN. With this option, if multiple groups are being forwarded to the same set of ports on a particular VLAN, each group will have its own hardware entry, each comprising that same set of ports. The default mode (compact) is usually well suited to a core switch, which is forwarding many groups to a relatively few ports, and not often changing which groups are sent to which ports. Because the usage of hardware entries is minimized, this maximises the number of multicast groups that the switch can forward. However, sometimes the entry-per-group mode is preferable, especially in the following situations:

- If multicast data is being forwarded out through an aggregated link.  
  
The hardware forwarding entries do not allocate data to aggregated links as such; they just work with sets of individual ports, and cannot include aggregations in their set of egress ports. If groups are being forwarded to an aggregated link, a given forwarding entry will include just one port of that aggregation. If multiple multicast groups share the same forwarding entry, they will all be sent down the same single link in the aggregation. The

multicast data will not be shared across the aggregated links, and therefore the bandwidth of the aggregation will not be fully utilised.

If you change the mode to entry-per-group, then each group will have its own forwarding entry, and a statistical process will put different members of the aggregation into different forwarding entries. Therefore, the multicast data will be statistically distributed across the links in the aggregation.

- If the switch is forwarding a large number of groups to a large number of ports in a dynamic environment, where end hosts are frequently joining and leaving groups.

In compact mode, every time a group membership changes, the switch needs to check to see if the mapping of groups to forwarding entries is still optimized. If not, then it needs to rearrange the mapping, to return to an optimized state. In a highly dynamic environment, this activity adds significant processing overhead, and can lead to some disruption of multicast forwarding if hardware entries are being frequently updated. In this case, changing to entry-per-group mode removes the need to perform frequent re-optimisations, thereby reducing processing overhead, and avoiding such frequent updating of hardware entries.

**Example** To change to entry-per-group mode, use the commands:

```
awplus# configure terminal
awplus(config)# platform l2mc-table mode entry-per-group
```

# platform l2mc-overlap

**Overview** Use this command to enable checking for overlapping (shared) multicast entries, so that shared entries are not deleted if they are still in use.

Use the **no** version of this command to disable checking for overlapping entries before deletion.

**Syntax** platform l2mc-overlap  
no platform l2mc-overlap

**Mode** Global Configuration

**Default** By default, Layer 2 multicast overlap checking is disabled.

**Example** To prevent the deletion of overlapping (shared) Layer 2 multicast entries, use the command:

```
awplus# configure terminal
awplus(config)# platform l2mc-overlap
```

**Related commands** [show platform](#)

# platform load-balancing

**Overview** This command determines which address fields are used as inputs into the load balancing algorithm for aggregated links. The output from this algorithm is used to select which individual path a given packet will traverse within an aggregated link.

The **no** variant of this command removes the specified packet type from the calculation.

**Syntax** `platform load-balancing [src-dst-mac] [src-dst-ip]  
[src-dst-port]`  
`no platform load-balancing [src-dst-mac] [src-dst-ip]  
[src-dst-port]`

| Parameter    | Description                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------|
| src-dst-mac  | The source and destination MAC addresses (Layer 2)                                                                                     |
| src-dst-ip   | The source and destination IP addresses (Layer 3)                                                                                      |
| src-dst-port | The source and destination TCP/UDP port data (Layer 4). If you include this option, make sure that <b>src-dst-ip</b> is also selected. |

**Default** Includes the **src-dst-mac** and **src-dst-ip** addresses as inputs into the platform load balancing algorithm.

**Mode** Global configuration

**Usage notes** Useful combinations of inputs are:

- MAC address and IP address (the default)
- MAC address only
- MAC address, IP address and Layer 4 port number
- IP address and Layer 4 port number
- IP address only

The following examples show how to configure each of these combinations.

Note the following restrictions:

- you can only stop using MAC addresses (**src-dst-mac**) if you still have IP addresses (**src-dst-ip**) selected
- if you specify Layer 4 ports (**src-dst-port**), you should also specify IP addresses (**src-dst-ip**)

Use the `show platform` command to verify this command's setting.

**Examples** To use MAC addresses and IP addresses, you do not have to enter any commands, because this is the default. Note that this setting is not displayed in the **show running-config** output. Use the [show platform](#) command to verify this setting.

To use MAC addresses only, remove IP addresses by using the commands:

```
awplus# configure terminal
```

```
awplus(config)# no platform load-balancing src-dst-ip
```

To use MAC addresses, IP addresses and Layer 4 port numbers, add Layer 4 port numbers by using the commands:

```
awplus# configure terminal
```

```
awplus(config)# platform load-balancing src-dst-port
```

To use IP addresses and Layer 4 port numbers, remove MAC addresses and add Layer 4 port numbers by using the commands:

```
awplus# configure terminal
```

```
awplus(config)# no platform load-balancing src-dst-mac
```

```
awplus(config)# platform load-balancing src-dst-port
```

To use IP addresses only, remove MAC addresses by using the commands:

```
awplus# configure terminal
```

```
awplus(config)# no platform load-balancing src-dst-mac
```

**Related commands** [show platform](#)

# platform multicast-address-mismatch-action

**Overview** Use this command to change the action taken by the switch when it receives IP multicast packets that have mismatched destination MAC address and destination IP address. Such packets are used by services like Microsoft Network Load Balancing (MS-NLB), in which case they need to be flooded across the switch.

Use the **no** variant of this command to return to the default action.

**Syntax** `platform multicast-address-mismatch-action {bridge|drop}`  
`no platform multicast-address-mismatch-action`

| Parameter | Description                                                                 |
|-----------|-----------------------------------------------------------------------------|
| drop      | Drop IP multicast packets with mismatched destination addresses on ingress. |
| bridge    | Flood IP multicast packets with mismatched destination addresses.           |

**Default** The default behavior depends on whether **arp-mac-disparity multicast** or **arp-mac-disparity multicast-igmp** has been configured on an interface:

- If one of these has been configured, then the default action is to flood the packets.
- If neither of these has been configured, then the default action is to drop the packets.

**Mode** Global Configuration

**Usage notes** You must also turn on L3 multicast, using the [ip multicast-routing](#) command. Otherwise, L2 flooding will occur, because no L3 processing is being done.

**Example** To ensure that the switch floods packets it receives that have IP multicast packets with mismatched L2/L3 destination addresses, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast-routing
awplus(config)# platform multicast-address-mismatch-action
bridge
```

To return to the default, where the behavior depends on the [arp-mac-disparity](#) command setting, use the commands:

```
awplus# configure terminal
awplus(config)# no platform multicast-address-mismatch-action
```

**Related  
commands**

[ip multicast-routing](#)

**Command  
changes**

Version 5.4.8-2.1: command added

# platform multicast-ratelimit

**Overview** Use this command to set the maximum number of multicast packets to be forwarded to the CPU (in packets per second). Setting the value to zero disables rate limiting.

This command should be used with care. Increasing or removing the limit could make the device less responsive under heavy multicast load.

Use the **no** variant of this command to return the limit to its default.

**Syntax** platform multicast-ratelimit <0-1000>  
no platform multicast-ratelimit

**Default** 10 packets per second (pps)

**Mode** Global Configuration

**Usage notes** If you find that the CPU load on your device from multicast traffic is higher than desired, reducing this rate may reduce the CPU load.

If you need the device to process a large amount of multicast traffic, increasing this rate may improve performance.

**Example** To set the rate to 30pps, use the commands:

```
awplus# configure terminal
awplus(config)# platform multicast-ratelimit 30
```

**Command changes** Version 5.4.8-1.1: default changed to 100pps on SBx908 GEN2, SBx8100, and x930 Series switches.

# platform routingratio

**Overview** This command changes the amount of memory allocated to unicast and multicast entries.

Use the **no** variant of this command to restore to the default setting.

For this command or the **no** variant to take effect, you must copy it to the startup configuration and then reboot the switch.

**Syntax** platform routingratio ipv4andipv6 [weighting  
{balanced|unicast}]  
no platform routingratio

| Parameter   | Description                                                                                                        |
|-------------|--------------------------------------------------------------------------------------------------------------------|
| ipv4andipv6 | Allocate 50% of memory resources to IPv4 address entries, and 50% to IPv6 address entries.                         |
| weighting   | Determine the split between multicast and unicast entries.                                                         |
| balanced    | Allocate up to 2048 entries to multicast.                                                                          |
| unicast     | Allocate up to 1024 entries to multicast and the rest to unicast. This option is not available on SBx81XLEM cards. |

**Default** The weighting is set to **balanced** by default.

**Mode** Global Configuration

**Usage notes** The switching hardware contains memory that it uses to store tables of routes and next hop addresses. This command adjusts the memory allocations.

The default weighting is set to **balanced**. If you need to maximize the number of unicast entries, then set the weighting to **unicast**.

**Examples** To apply unicast weighting for IPv4 and IPv6 addresses, use the following commands:

```
awplus# configure terminal
awplus(config)# platform routingratio ipv4andipv6 weighting
unicast
awplus(config)# exit
awplus# copy running-config startup-config
awplus# reboot
```

To reset the route and next hop tables to the default setting, use the following commands:

```
awplus# configure terminal
awplus(config)# no platform routingratio
awplus(config)# exit
awplus# copy running-config startup-config
awplus# reboot
```

**Related  
commands**    [show platform](#)  
              [show running-config](#)

# platform sdn-route-ratio

**Overview** Use this command to reserve 1024 routing entries for policy-based routing (PBR) in the hardware.

Use the **no** variant of this command to revert the PBR reservation back to the default of 128.

**Syntax** platform sdn-route-ratio enhanced  
no platform sdn-route-ratio

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| enhanced  | Increase the reserved PBR entries from 128 to 1024. |

**Default** Not enabled.

**Mode** Global Configuration

**Usage notes** OpenFlow can make use of PBR entries in the hardware to carry out modifications to the IP header or to set the source MAC address. This command can be used to reserve 1024 routing entries for PBR in the hardware, which can then be used by OpenFlow or PBR.

Reserving 1024 entries for PBR reduces the number of entries available for regular unicast routing. This in turn reduces the number of unicast routes that can be stored in the device hardware by approximately 700 IPv6 routes or 600 IPv4 routes (the exact reduction will depend on the route prefixes in use).

**NOTE:** The command must be saved to the startup configuration and the device rebooted for this to take effect.

**Example** To reserve additional entries for use by PBR, use the following commands:

```
awplus# configure terminal
awplus(config)# platform sdn-route-ratio enhanced
```

To set the PBR reservation back to the default of 128, use the following commands:

```
awplus# configure terminal
awplus(config)# no platform sdn-route-ratio
```

**Related commands** [platform routingratio](#)

**Command changes** Version 5.4.9-2.1: command added

# platform vlan-stacking-tpid

**Overview** This command specifies the Tag Protocol Identifier (TPID) value that applies to all frames that are carrying double tagged VLANs. All such VLANs must use the same TPID value. (This feature can be referred to as nested VLANs, VLAN stacking, Q-in-Q, or VLAN double-tagging.)

Use the **no** variant of this command to revert to the default TPID value (0x8100).

**NOTE:** Because the additional tag increases the frame size beyond 1522 bytes, you must turn on Jumbo frames to activate VLAN-stacking. Use the [platform jumboframe](#) command.

**Syntax** platform vlan-stacking-tpid <tpid>  
no platform vlan-stacking-tpid

| Parameter | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| <tpid>    | The Ethernet type of the tagged packet, as a two byte hexadecimal number. |

**Default** The default TPID value is 0x8100.

**Mode** Global Configuration

**Examples** To set the VLAN stacking TPID value to 0x9100, use the following commands:

```
awplus# configure terminal
awplus(config)# platform vlan-stacking-tpid 9100
```

To reset the VLAN stacking TPID value to the default (0x8100), use the following commands:

```
awplus# configure terminal
awplus(config)# no platform vlan-stacking-tpid
```

**Related commands** [switchport vlan-stacking \(double-tagging\)](#)  
[show platform](#)  
[show running-config](#)

# polarity

**Overview** This command sets the MDI/MDIX polarity on a copper-based switch port.

**Syntax** `polarity {auto|mdi|mdix}`

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| mdi       | Sets the polarity to MDI (medium dependent interface).                       |
| mdix      | Sets the polarity to MDI-X (medium dependent interface crossover).           |
| auto      | The switch port sets the polarity automatically. This is the default option. |

**Default** By default, switch ports set the polarity automatically (**auto**).

**Mode** Interface Configuration

**Usage notes** We recommend the default **auto** setting for MDI/MDIX polarity. Polarity applies to copper 10BASE-T, 100BASE-T, and 1000BASE-T switch ports; it does not apply to fiber ports. See the “MDI/MDIX Connection Modes” section in the [Switching Feature Overview and Configuration Guide](#) for more information.

**Example** To set the polarity for port1.0.4 to fixed MDI mode, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# polarity mdi
```

# show debugging loopprot

**Overview** This command shows Loop Protection debugging information.

**Syntax** show debugging loopprot

**Mode** User Exec and Privileged Exec

**Example** To display the enabled Loop Protection debugging modes, use the command:

```
awplus# show debugging loopprot
```

**Related commands** [debug loopprot](#)

# show debugging platform packet

**Overview** This command shows platform to CPU level packet debugging information.

**Syntax** show debugging platform packet

**Mode** User Exec and Privileged Exec

**Example** To display the platform packet debugging information, use the command:

```
awplus# show debugging platform packet
```

**Related commands** [debug platform packet](#)  
[undebg platform packet](#)

# show flowcontrol interface

**Overview** Use this command to display flow control information.

**Syntax** show flowcontrol interface *<port>*

| Parameter           | Description                                     |
|---------------------|-------------------------------------------------|
| <i>&lt;port&gt;</i> | Specifies the name of the port to be displayed. |

**Mode** User Exec and Privileged Exec

**Example** To display the flow control for port1.0.3, use the command:

```
awplus# show flowcontrol interface port1.0.3
```

**Output** Figure 14-1: Example output from the **show flowcontrol interface** command for a specific interface

| Port      | Send<br>admin | FlowControl<br>oper | Receive<br>admin | FlowControl<br>oper | RxPause | TxPause |
|-----------|---------------|---------------------|------------------|---------------------|---------|---------|
| -----     | -----         | -----               | -----            | -----               | -----   | -----   |
| port1.0.3 | on            | on                  | on               | on                  | 0       | 0       |

# show interface err-disabled

**Overview** Use this command to show the ports which have been dynamically shut down by protocols running on the device and the protocols responsible for the shutdown.

**Syntax** `show interface [<interface-range> err-disabled]`

| Parameter         | Description                                        |
|-------------------|----------------------------------------------------|
| <interface-range> | Interface range                                    |
| err-disabled      | Brief summary of interfaces shut down by protocols |

**Mode** User Exec and Privileged Exec

**Example** To show which protocols have shut down ports, use the commands:  
`awplus# show interface err-disabled`

**Output** Figure 14-2: Example output from **show interface err-disabled**

|                                    |                 |
|------------------------------------|-----------------|
| awplus#show interface err-disabled |                 |
| Interface                          | Reason          |
| port1.0.1                          | loop protection |
| port1.0.2                          | loop protection |

# show interface switchport

**Overview** Use this command to show VLAN information about each switch port.

**Syntax** show interface switchport

**Mode** User Exec and Privileged Exec

**Example** To display VLAN information about each switch port, enter the command:

```
awplus# show interface switchport
```

**Output** Figure 14-3: Example output from the **show interface switchport** command

```
Interface name : port1.0.1
Switchport mode : access
Ingress filter : enable
Acceptable frame types : all
Default Vlan : 1
Configured Vlans : 2
Dynamic Vlans :

Interface name : port1.0.2
Switchport mode : trunk
Ingress filter : enable
Acceptable frame types : all
Default Vlan : 1
Configured Vlans : 1 4 5 6 7 8
Dynamic Vlans :

...
```

**Related commands** [show interface memory](#)

# show loop-protection

**Overview** Use this command to display the current loop protection setup for the device.

**Syntax** show loop-protection [interface <port-list>] [counters]

| Parameter   | Description                                       |
|-------------|---------------------------------------------------|
| interface   | The interface selected for display.               |
| <port-list> | A port, a port range, or an aggregated link.      |
| counters    | Displays counter information for loop protection. |

**Mode** User Exec and Privileged Exec

**Usage notes** This command is used to display the current configuration and operation of the Loop Protection feature.

**Example** To display the current configuration status, use the command:

```
awplus# show loop-protection
```

**Output** Figure 14-4: Example output from the **show loop-protection** command:

```
awplus#show loop-protection
```

| LDF Interval: |         | 10       |        |         |                   |         |
|---------------|---------|----------|--------|---------|-------------------|---------|
| Fast Block:   |         | Disabled |        |         |                   |         |

**Related commands**

- [clear loop-protection counters](#)
- [loop-protection action](#)
- [loop-protection loop-detect](#)

# show mac address-table

**Overview** Use this command to display the MAC address-table for all configured VLANs.

**Syntax** show mac address-table

**Mode** User Exec and Privileged Exec

**Usage notes** The **show mac address-table** command is only applicable to view a MAC address-table for Layer 2 switched traffic within VLANs.

**Example** To display the MAC address-table, use the following command:

```
awplus# show mac address-table
```

**Output** See the following sample output captured when there was no traffic being switched:

```
awplus#show mac address-table
```

| VLAN | port    | mac            | type    |        |
|------|---------|----------------|---------|--------|
| 1    | unknown | 0000.cd28.0752 | forward | static |
| ARP  | -       | 0000.cd00.0000 | forward | static |

See the sample output captured when packets were switched and MAC addresses were learned:

```
awplus#show mac address-table
```

| VLAN | port      | mac            | type    |         |
|------|-----------|----------------|---------|---------|
| 1    | unknown   | 0000.cd28.0752 | forward | static  |
| 1    | port1.0.2 | 0030.846e.9bf4 | forward | dynamic |
| 1    | port1.0.3 | 0030.846e.bac7 | forward | dynamic |
| ARP  | -         | 0000.cd00.0000 | forward | static  |

Note the new MAC addresses learned for port1.0.2 and port1.0.3 added as dynamic entries.

Note the first column of the output below shows VLAN IDs if multiple VLANs are configured:

```
awplus#show mac address-table
```

| VLAN | port      | mac            | type    |         |
|------|-----------|----------------|---------|---------|
| 1    | unknown   | 0000.cd28.0752 | forward | static  |
| 1    | port1.0.2 | 0030.846e.bac7 | forward | dynamic |
| 2    | unknown   | 0000.cd28.0752 | forward | static  |
| 2    | port1.0.3 | 0030.846e.9bf4 | forward | dynamic |
| ARP  | -         | 0000.cd00.0000 | forward | static  |

Also note if manually configured static MAC addresses exist, this is shown to the right of the type column:

```
awplus(config)#mac address-table static 0000.1111.2222 for int
port1.0.3 vlan 1
awplus(config)#end
awplus#
awplus#show mac address-table
```

| VLAN | port      | mac            | type    |         |
|------|-----------|----------------|---------|---------|
| 1    | unknown   | 0000.cd28.0752 | forward | static  |
| 1    | port1.0.2 | 0030.846e.bac7 | forward | dynamic |

# show mac address-table thrash-limit

**Overview** Use this command to display the current thrash limit set for all interfaces on the device.

**Syntax** `show mac address-table thrash-limit`

**Mode** User Exec and Privileged Exec

**Example** To display the current, use the following command:

```
awplus# show mac address-table thrash-limit
```

**Output** Figure 14-6: Example output from the **show mac address-table thrash-limit** command

```
% Thrash-limit 7 movements per second
```

**Related commands** [mac address-table thrash-limit](#)

# show platform

**Overview** This command displays the settings configured by using the **platform** commands.

**Syntax** show platform

**Mode** Privileged Exec

**Usage notes** This command displays the settings in the running config. For changes in some of these settings to take effect, the device must be rebooted with the new settings in the startup config.

**Example** To check the settings configured with **platform** commands on the device, use the following command:

```
awplus# show platform
```

**Output** Figure 14-7: Example output from the **show platform** command:

```
awplus# show platform
Routing ratio IPv4 and IPv6
Route Weighting balanced
Load Balancing src-dst-mac,src-dst-ip
Control-plane-prioritization Max 1000 Mbps
L2MC overlapped group check off
fdb-l3-hosts mode Disabled
acls to vlanclassifiers more-vlan-classifiers
MC address mismatch action Drop
Jumboframe support off
Vlan-stacking TPID 0x8100
```

**Table 15:** Parameters in the output of the **show platform** command. Note that the parameters displayed depend on your device, and that not all displayed parameters can be modified on all devices.

| Parameter                  | Description                                                                                                                                                                                                                               |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Routing Ratio              | Whether all memory is allocated to IPv4 address table entries only, or whether it is allocated evenly to both IPv4 and IPv6 addresses (set with the <b>platform routingratio</b> command).                                                |
| Route Weighting            | The split between multicast and unicast route entries (set with the <b>platform routingratio</b> command).                                                                                                                                |
| MAC vlan hashing algorithm | The MAC VLAN hash-key-generating algorithm (set with the <b>platform mac-vlan-hashing-algorithm</b> command). The default algorithm is crc32l. The algorithm may need to be changed in rare circumstances in which hash collisions occur. |

**Table 15:** Parameters in the output of the **show platform** command. Note that the parameters displayed depend on your device, and that not all displayed parameters can be modified on all devices. (cont.)

| Parameter                    | Description                                                                                                                                                                                                                                                            |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| L3 hashing algorithm         | The L3 VLAN hash-key-generating algorithm (set with the <b>platform l3-vlan-hashing-algorithm</b> command). The default algorithm is crc32l. The algorithm may need to be changed in rare circumstances in which hash collisions occur.                                |
| Load Balancing               | Which packet fields are used in the channel load balancing algorithm (set with the <b>platform load-balancing</b> command).                                                                                                                                            |
| Control-plane-prioritization | Maximum traffic rate on the CPU port (set with the <b>platform control-plane-prioritization rate</b> command).                                                                                                                                                         |
| Fdb-chain-length             | The length of the FDB hash chain (set with the <b>platform fdb-chain-length</b> command). FDB entries are hashed and indexed using a hash. In rare circumstances it may be useful to reduce the chain length.                                                          |
| L2MC overlapped group check  | Whether Layer 2 multicast entries are checked before deletion (set with the <b>platform l2mc-overlap</b> command).                                                                                                                                                     |
| silicon-profile              | The silicon profile setting (set with the <b>platform silicon-profile</b> command) for the switch hardware; one of: <ul style="list-style-type: none"> <li>• profile 1</li> <li>• profile 2</li> <li>• profile 3</li> <li>• None (default)</li> </ul>                  |
| fdb-l3-hosts mode            | Whether Host Mode is turned on or not. Host Mode increases the number of host entries and is available for systems containing SBx81CFC960 controller cards and SBx81XLEM line cards. See <b>platform silicon-profile</b> and <b>platform fdb-l3-hosts</b> for details. |
| Jumboframe support           | Whether the jumbo frames setting is enabled or disabled (set with the <b>platform jumboframe</b> command).                                                                                                                                                             |
| Traffic Manager              | A test setting that is disabled by default.                                                                                                                                                                                                                            |
| stop-unreg-mc-flooding       | Whether the stop-unreg-mc-flooding feature is on or off (set with the <b>platform stop-unreg-mc-flooding</b> command). This feature prevents flooding of unregistered multicast packets in the occasional situations in which IGMP snooping does not prevent it.       |
| Port Mode                    | Whether each port on the AT-StackQS is configured as one 40Gbps port or four 10Gbps ports, if they are operating as network ports (set with the <b>platform portmode interface</b> command).                                                                           |
| Vlan-stacking TPID           | The value of the TPID set in the Ethernet type field when a frame has a double VLAN tag (set with the <b>platform vlan-stacking-tpid</b> command).                                                                                                                     |
| PBR enabled                  | Whether policy-based routing is globally enabled or not (set with the <b>platform pbr-enable</b> command).                                                                                                                                                             |

**Table 15:** Parameters in the output of the **show platform** command. Note that the parameters displayed depend on your device, and that not all displayed parameters can be modified on all devices. (cont.)

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hardware Filter Size          | Whether hardware ACLs can filter on IPv6 addresses (ipv4-full-ipv6) or not (ipv4-limited-ipv6). This is set with the <b>platform hwfilter-size</b> command.                                                                                                                                                                                                                                                                                         |
| Vlan Ingress Filter Hard Drop | <p>The Bridge Vlan Ingress Filtering drops traffic if the VID assigned to the packet does not match with the port's VLAN membership.</p> <p>There are two ways the traffic is dropped by the Ingress Filtering mechanism:</p> <ul style="list-style-type: none"> <li>• HARD DROP - Traffic is dropped by the Bridge Engine and not forwarded or trapped.</li> <li>• SOFT DROP - Traffic may be mirrored or trapped by the Bridge Engine.</li> </ul> |

# show platform classifier statistics utilization brief

**Overview** This command displays the number of used entries available for various platform functions, and the percentage that number of entries represents of the total available.

**Syntax** show platform classifier statistics utilization brief

**Mode** Privileged Exec

**Example** To display the platform classifier utilization statistics, use the following command:  
awplus# show platform classifier statistics utilization brief

**Output** Figure 14-8: Output from **show platform classifier statistics utilization brief**

```

**Output parameters** Depending on your switch, you will see some of the following parameters in the output from **show platform classifier statistics utilization brief**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                   |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPv6 Multicast | Reserved hardware space for use by IPv6 multicast, when the <a href="#">ipv6 multicast-routing</a> command is used.                                                                                                                                                                                                           |
| System         | Fixed system entries. For example, resiliency links make use of system ACLs.                                                                                                                                                                                                                                                  |
| MLD Snooping   | Entries to send various packets that MLD Snooping is interested in to the CPU.                                                                                                                                                                                                                                                |
| DHCP Snooping  | Entries used to send DHCP and ARP packets to the CPU. User-added DHCP Snooping filters under ACLs are counted under the ACL or QoS categories.                                                                                                                                                                                |
| Loop Detection | Entries uses to send the special loop detection frame to the CPU.                                                                                                                                                                                                                                                             |
| EPSR           | Entries used to send EPSR control traffic to the CPU.                                                                                                                                                                                                                                                                         |
| CFM            | Entries used by Connectivity Fault Management.                                                                                                                                                                                                                                                                                |
| G8032          | Entries used to send G.8032 control traffic to the CPU.                                                                                                                                                                                                                                                                       |
| Global ACLs    | Entries for ACLs appear here if the ACLs are applied globally instead of per switchport.                                                                                                                                                                                                                                      |
| ACL            | Entries for ACL filters that have been applied directly to ports using the <a href="#">access-group</a> command.                                                                                                                                                                                                              |
| VACL           | Entries for VLAN-based ACLs (ACLs that are applied to VLANs instead of ports).                                                                                                                                                                                                                                                |
| DOS            | Entries used for Denial of Service protection.                                                                                                                                                                                                                                                                                |
| UFO            | Entries used by Upward Forwarding Only (UFO).                                                                                                                                                                                                                                                                                 |
| QoS            | Entries for ACL filters and other class-map configurations, such as policers, applied through policy maps using the service input command.                                                                                                                                                                                    |
| RA Guard       | Entries used to block IPv6 router advertisements, configured with the <b>ipv6 nd raguard</b> command.                                                                                                                                                                                                                         |
| AMFAPPS        | Entries used by AMF Application Proxy. These entries enable the SES Controller to block infected ports.                                                                                                                                                                                                                       |
| Pre-Ingress    | Entries used for VLAN ID Translation (and also for subnet-based and MAC-based VLAN entries on SBx81XLEM cards).                                                                                                                                                                                                               |
| Egress         | Entries used for VLAN ID Translation.                                                                                                                                                                                                                                                                                         |
| UDB            | User Defined Bytes (UDB), which are a limited resource of bytes that can be used to implement additional arbitrary matching on packet bytes on some switches. The software manages the use and allocation of these bytes automatically. The output of this table is intended for use by Allied Telesis Customer Support only. |

# show platform port

**Overview** This command displays the various port registers or platform counters for specified switchports.

**Syntax** `show platform port [<port-list>] [counters]`

| Parameter   | Description                                                                                                                                                                                                                                                                                     |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port-list> | The ports to display information about. A port-list can be: <ul style="list-style-type: none"> <li>a switchport (e.g. port1.0.4)</li> <li>a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)</li> <li>a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4).</li> </ul> |
| counters    | Show the platform counters.                                                                                                                                                                                                                                                                     |

**Mode** Privileged Exec

**Examples** To display port registers for port1.0.1 to port1.0.4, use the command:

```
awplus# show platform port port1.0.1-port1.0.4
```

To display platform counters for port1.0.1 to port1.0.4, use the command:

```
awplus# show platform port port1.0.1-port1.0.4 counters
```

**Output** Figure 14-9: Example output from the **show platform port** command

```
awplus#show platform port port1.0.1

# show port-security interface

**Overview** Use this command to show the current port-security configuration and the switch port status.

**Syntax** show port-security interface <port>

| Parameter | Description                                                                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port>    | The port to display information about. The port may be a switch port (e.g. port1.0.2), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4). |

**Mode** Privileged Exec

**Example** To see the port-security status on port1.0.2, use the following command:

```
awplus# show port-security interface port1.0.2
```

**Output** Figure 14-10: Example output from the **show port-security interface** command

|                               |            |
|-------------------------------|------------|
| Port Security configuration   |            |
| Security Enabled              | : YES      |
| Port Status                   | : ENABLED  |
| Violation Mode                | : TRAP     |
| Aging                         | : OFF      |
| Maximum MAC Addresses         | : 3        |
| Total MAC ddresses            | : 1        |
| Lock Status                   | : UNLOCKED |
| Security Violation Count      | : 0        |
| Last Violation Source Address | : None     |

**Related commands**

- clear port-security intrusion
- show port-security intrusion
- switchport port-security
- switchport port-security aging
- switchport port-security maximum
- switchport port-security violation

# show port-security intrusion

**Overview** Use this command to show the intrusion list. If the port is not specified, the entire intrusion table is shown.

**Syntax** show port-security intrusion [interface <port>]

| Parameter | Description                                                                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface | Specify a port                                                                                                                                                          |
| <port>    | The port to display information about. The port may be a switch port (e.g. port1.0.2), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4). |

**Mode** Privileged Exec

**Example** To see the intrusion list on port1.0.2, use the following command:  
awplus# show port-security intrusion interface port1.0.2

**Output** Figure 14-11: Example output from the **show port-security intrusion** command for port1.0.2

```

- switchport port-security maximum
- switchport port-security violation

# show storm-control

**Overview** Use this command to display storm-control information for all interfaces or a particular interface.

**Syntax** `show storm-control [<port>]`

| Parameter | Description                                                                                                                                                                                                                             |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port>    | The port to display information about. The port may be: <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li></ul> |

**Mode** User Exec and Privileged Exec

**Example** To display storm-control information for port1.0.2, use the following command:

```
awplus# show storm-control port1.0.2
```

**Output** Figure 14-12: Example output from the **show storm-control** command for port1.0.2

| Port      | BcastLevel | McastLevel | DlfLevel |
|-----------|------------|------------|----------|
| port1.0.2 | 40. 0%     | 100. 0%    | 100. 0%  |

**Related commands** [storm-control level](#)

# speed

**Overview** This command changes the speed of the specified port. You can optionally specify the speed or speeds that get autonegotiated, so autonegotiation is only attempted at the specified speeds.

To see the currently-negotiated speed for ports whose links are up, use the [show interface](#) command. To see the configured speed (when different from the default), use the [show running-config](#) command.

**Syntax** speed {10 | 100 | 1000 | 2500 | 5000 | 10000}  
speed auto [10] [100] [1000] [2500] [5000] [10000]

The following table shows the speed options for each type of port.

| Port type                            | Speed Options (units are Mbps)                                                                |
|--------------------------------------|-----------------------------------------------------------------------------------------------|
| RJ-45 copper ports                   | auto (default)<br>10<br>100<br>1000<br>2500 (on relevant models)<br>5000 (on relevant models) |
| 100 Mbps fiber SFPs                  | 100                                                                                           |
| 1000 Mbps fiber SFPs                 | auto (default)<br>1000                                                                        |
| 10000 Mbps fiber SFP+                | auto (default)<br>10000                                                                       |
| 10000 Mbps copper SFP+               | auto (default)<br>10000                                                                       |
| 10000 Mbps Direct Attach Cable (DAC) | auto (default)<br>10000                                                                       |

**Mode** Interface Configuration

**Default** By default, ports autonegotiate speed (except for 100Base-FX ports which do not support auto-negotiation, so default to 100 Mbps).

**Usage notes** We recommend having autonegotiation enabled for link speeds of 1000 Mbps and above. For example, to apply a fixed speed of 1000 Mbps use the command **speed auto 1000**.

If multiple speeds are specified after the auto option to autonegotiate speeds, then the device only attempts autonegotiation at those specified speeds.

Switch ports in a static or dynamic (LACP) channel group must have the same port speed and be in full duplex mode. Once switch ports have been aggregated into a channel group, you can set the speed of all the switch ports in the channel group by applying this command to the channel group.

**Examples** To set a port to auto-negotiate its speed at 1 Gbps only, which will fix this port speed to 1 Gbps, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# speed auto 1000
```

To return the port to auto-negotiating its speed, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# speed auto
```

# storm-control level

**Overview** Use this command to specify the speed limiting level for broadcast, multicast, or dlf (destination lookup failure) traffic for the port. Storm-control limits the selected traffic type to the specified percentage of the maximum port speed.

Use the **no** variant of this command to disable storm-control for broadcast, multicast or dlf traffic.

**Syntax** storm-control {broadcast|multicast|dlf} level <level>  
no storm-control {broadcast|multicast|dlf} level

| Parameter | Description                                                                                                                          |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------|
| <level>   | <0 - 100> Specifies the percentage of the maximum port speed allowed for broadcast, multicast or destination lookup failure traffic. |
| broadcast | Applies the storm-control to broadcast frames.                                                                                       |
| multicast | Applies the storm-control to multicast frames.                                                                                       |
| dlf       | Applies the storm-control to destination lookup failure traffic.                                                                     |

**Default** Disabled

**Mode** Interface Configuration

**Usage notes** Flooding techniques are used to block the forwarding of unnecessary flooded traffic. A packet storm occurs when a large number of broadcast packets are received on a port. Forwarding these packets can cause the network to slow down or time out.

More than one limit type can be set at a time. For example, you can configure both broadcast and multicast levels on the same port, at the same time.

**Example** To limit broadcast traffic on port1.0.2 to 30% of the maximum port speed, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# storm-control broadcast level 30
```

**Related commands** [show storm-control](#)

**Command changes** Version 5.4.9-1.3: Multiple limit types available on x530 series  
Version 5.5.0-2.1: Multiple limit types available on x220 and GS980M series

# switchport port-security

**Overview** Use this command to enable the port-security feature. This feature is also known as the port-based learn limit. It allows the user to set the maximum number of MAC addresses that each port can learn.

Use the **no** variant of this command to disable the port-security feature.

**Syntax** switchport port-security  
no switchport port-security

**Mode** Interface Configuration

**Examples** To enable the port-security feature on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport port-security
```

To disable the port-security feature on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport port-security
```

**Related commands**

- clear port-security intrusion
- show port-security interface
- show port-security intrusion
- switchport port-security aging
- switchport port-security maximum
- switchport port-security violation

# switchport port-security aging

**Overview** Use this command to set MAC addresses that have been learned by port security to age out.

Use the **no** variant of this command to set the MAC addresses to not age out.

**Syntax** switchport port-security aging  
no switchport port-security aging

**Mode** Interface Configuration

**Examples** To set port1.0.2 so that the MAC addresses that have been learned by port security age out, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport port-security aging
```

To stop the MAC addresses that have been learned by port security from aging out on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport port-security aging
```

**Related commands**

- clear port-security intrusion
- show port-security interface
- show port-security intrusion
- switchport port-security
- switchport port-security maximum
- switchport port-security violation

# switchport port-security maximum

**Overview** Use this command to set the maximum number of MAC addresses that each port can learn.

Use the **no** variant of this command to unset the maximum number of MAC addresses that each port can learn. This is same as setting the maximum number to 0. This command also resets the intrusion list table.

If a new MAC is seen on a port with port security enabled and the MAC is statically configured for another port, a violation is triggered. The maximum learn limit will be ignored and the specified intrusion action for the port will be carried out.

**Syntax** switchport port-security maximum <0-256>  
no switchport port-security maximum

| Parameter       | Description                                       |
|-----------------|---------------------------------------------------|
| maximum <0-256> | Specify the maximum number of addresses to learn. |

**Mode** Interface Configuration

**Examples** To learn 3 MAC addresses on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport port-security maximum 3
```

To remove the MAC learning limit on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport port-security maximum
```

**Related commands**

- [clear port-security intrusion](#)
- [show port-security interface](#)
- [show port-security intrusion](#)
- [switchport port-security](#)
- [switchport port-security aging](#)
- [switchport port-security violation](#)

# switchport port-security violation

**Overview** Use this command to set the action taken on a switch port when the port exceeds the learning limits. The port action can be either **shutdown**, **restrict** or **protect**. If **shutdown** is set, the physical link will be disabled and "shutdown" will be shown in the config. If **restrict** is set, the packet from the un-authorized MAC will be discarded and SNMP TRAP will be generated to alert management. If **protect** is set, the packet will simply be discarded by the packet processor silently.

Use the **no** variant of this command to set the violation action to default. The default violation action is protect.

**Syntax** switchport port-security violation {shutdown|restrict|protect}  
no switchport port-security violation

| Parameter | Description                      |
|-----------|----------------------------------|
| shutdown  | Disable the port.                |
| restrict  | Alert the network administrator. |
| protect   | Discard the packet.              |

**Mode** Interface Configuration

**Examples** To set the action to be shutdown on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport port-security violation shutdown
```

To set the port-security action to the default (protect) on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport port-security violation
```

**Related commands**

# thrash-limiting

**Overview** Use this command to configure the thrash limit action that will be applied to a port on the device when a thrashing condition is detected. The thrash-limiting timeout specifies the time, in seconds, for which the action is employed.

Use the **no** variant of this command to return the action or timeout to its default setting.

**Syntax** thrash-limiting {[action  
{learn-disable|link-down|port-disable|vlan-disable|none}}  
[timeout <0-86400>]]  
no thrash-limiting {action|timeout}

| Parameter     | Description                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| action        | The action taken when MAC thrashing is detected.                                                                                                                     |
| learn-disable | Disable MAC address learning                                                                                                                                         |
| link-down     | Block all traffic on an interface - link down                                                                                                                        |
| port-disable  | Block all traffic on an interface - link remains up                                                                                                                  |
| vlan-disable  | Block all traffic on a VLAN if the switch detects thrashing for that VLAN on the selected port. Note that setting this parameter will also enable ingress filtering. |
| none          | No thrash action                                                                                                                                                     |
| timeout       | Set the duration for the thrash action                                                                                                                               |
| <0-86400>     | The duration of the applied thrash action in seconds. The default is 1 seconds.                                                                                      |

**Default** The default action is learn-disable and the default timeout is 1 second.

**Mode** Interface Configuration

**Usage** Thrash-limiting actions are initiated when MAC addresses are added and removed from a port's MAC table faster than a given rate. The rate is 10 MAC address changes per second by default. You can change it with the [mac address-table thrash-limit](#) command.

See the "Thrash Limiting" section in the [Switching Feature Overview and Configuration Guide](#) for more information.

**Examples** To set the action to learn disable for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# thrash-limiting action learn-disable
```

To block all traffic on a VLAN on port1.0.1 if the switch detects thrashing for that VLAN on that port, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# thrash-limiting action vlan-disable
```

To set the thrash limiting action to its default on port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no thrash-limiting action
```

To set the thrash limiting timeout to 5 seconds on port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# thrash-limiting timeout 5
```

To set the thrash limiting timeout value to its default on port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no thrash-limiting timeout
```

# clear vlan statistics

**Overview** This command resets the counters for either a specific VLAN statistics instance or (by not specifying an instance) resets the counters for all instances.

The terms **frame** and **packet** are used interchangeably.

**Syntax** `clear vlan statistics [name <instance-name>]`

| Parameter                          | Description                                                                     |
|------------------------------------|---------------------------------------------------------------------------------|
| <code>vlan statistics</code>       | The count of incoming frames or bytes collected on a per VLAN basis.            |
| <code>&lt;instance-name&gt;</code> | The name of the instance for which incoming frames and their bytes are counted. |

**Mode** Privileged Exec

**Examples** To reset all packet counters for the packet counter instance "vlan2-data", use the command:

```
awplus# clear vlan statistics name vlan2-data
```

To reset all packet counters for all packet counter instances, use the command:

```
awplus# clear vlan statistics
```

**Related commands** [show vlan statistics](#)  
[vlan statistics](#)

# debug private-vlan ufo

**Overview** Use this command to enable private-vlan Upward Forwarding Only (UFO) debugging.  
Use the **no** variant of this command to disable private-vlan UFO debugging.

**Syntax** debug private-vlan ufo  
no debug private-vlan ufo

**Mode** Privileged Exec

**Usage notes** Use this command to enable or disable private-vlan ufo debugging.

**Example** To enable private-vlan UFO debugging, use the commands:

```
awplus# configure terminal
awplus(config)# debug private-vlan ufo
```

**Related commands** [show debugging private-vlan](#)  
[private-vlan ufo trap](#)  
[switchport mode private-vlan ufo](#)

**Command changes** Version 5.4.7-2.1: command added  
Version 5.4.8-2.1: added to SBx8100 Series products  
Version 5.4.9-0.1: added to x530 Series products

# platform acls-to-vlanclassifiers

**Overview** Use this command to configure the amount of memory allocated (or split) between ACLs and VLAN classifiers.

Use the **no** variant of this command to reset the allocation to the default setting.

**Syntax** platform acls-to-vlanclassifiers {more-vlan-classifiers | half-and-half | more-acls} [tunnel-support]  
no platform acls-to-vlanclassifiers

| Parameter             | Description                                                          |
|-----------------------|----------------------------------------------------------------------|
| more-vlan-classifiers | Support more dynamic VLAN classifiers.                               |
| half-and-half         | Support the same number of ACLs and VLAN classifiers.                |
| more-acls             | Support more ACLs.                                                   |
| tunnel-support        | Enable tunnel support for features such as IPv6 over IPv4 tunneling. |

**Default** More dynamic VLAN classifiers

**Mode** Global Configuration

**Usage notes** Access-lists and VLAN classifiers use the same memory/table in hardware. This command is used to split this memory to support more ACLs, more VLAN classifiers or the same number of ACLs and VLAN classifiers.

Note: For this command to take effect, you must copy it to the startup configuration using the **copy running-config startup-config** command and then reboot the switch.

**Example** To store more dynamic VLAN classifiers, use the commands:

```
awplus# configure terminal
awplus(config)# platform acls-to-vlanclassifiers
more-vlan-classifiers
```

To store the same number of ACLs and VLAN classifiers, use the commands:

```
awplus# configure terminal
awplus(config)# platform acls-to-vlanclassifiers half-and-half
```

To store more ACLs, use the following commands:

```
awplus# configure terminal
awplus(config)# platform acls-to-vlanclassifiers more-acls
```

To reset the allocation to the default settings, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no platform acls-to-vlanclassifiers
```

To store more ACLs, and enable tunnel support for features such as IPv6 over IPv4 tunneling, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# platform acls-to-vlanclassifiers more-acls
tunnel-support
```

Version 5.4.9-0.1: command added

Version 5.5.0-0.1: **tunnel-support** parameter added for x530 series

# platform vlan-stacking-tpid

**Overview** This command specifies the Tag Protocol Identifier (TPID) value that applies to all frames that are carrying double tagged VLANs. All such VLANs must use the same TPID value. (This feature can be referred to as nested VLANs, VLAN stacking, Q-in-Q, or VLAN double-tagging.)

Use the **no** variant of this command to revert to the default TPID value (0x8100).

**NOTE:** Because the additional tag increases the frame size beyond 1522 bytes, you must turn on Jumbo frames to activate VLAN-stacking. Use the [platform jumboframe](#) command.

**Syntax** platform vlan-stacking-tpid <tpid>  
no platform vlan-stacking-tpid

| Parameter | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| <tpid>    | The Ethernet type of the tagged packet, as a two byte hexadecimal number. |

**Default** The default TPID value is 0x8100.

**Mode** Global Configuration

**Examples** To set the VLAN stacking TPID value to 0x9100, use the following commands:

```
awplus# configure terminal
awplus(config)# platform vlan-stacking-tpid 9100
```

To reset the VLAN stacking TPID value to the default (0x8100), use the following commands:

```
awplus# configure terminal
awplus(config)# no platform vlan-stacking-tpid
```

**Related commands** [switchport vlan-stacking \(double-tagging\)](#)  
[show platform](#)  
[show running-config](#)

# port-vlan-forwarding-priority

**Overview** Use this command to specify which protocol has the highest priority for controlling transitions from blocking to forwarding traffic, when more than one of EPSR, Loop Protection, and MAC thrashing protection are used on the switch.

These protocols use the same mechanism to block or forward traffic. This command specifies either EPSR or Loop Protection as the highest priority protocol. Setting the priority stops contention between protocols.

For more information, see the Usage section below.

**CAUTION:** The **loop-protection** and **none** parameter options must not be set on an EPSR master node. Use the **epsr** parameter option on an EPSR master node instead. Setting this command incorrectly on an EPSR master node could cause unexpected broadcast storms.

Use the **no** variant of this command to restore the default highest priority protocol back to the default of EPSR.

For more information about EPSR, see the [EPSR Feature Overview and Configuration\\_Guide](#).

**Syntax** port-vlan-forwarding-priority {epsr|loop-protection|none}  
no port-vlan-forwarding-priority

| Parameter       | Description                                                                                                                                                                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| epsr            | Sets EPSR as the highest priority protocol. Use this parameter on an EPSR master node to avoid unexpected broadcast storms.                                                                                                                                                                    |
| loop-protection | Sets Loop Protection as the highest priority protocol. Note that this option must not be set on an EPSR master node. Use the <b>epsr</b> parameter option on an EPSR master node to avoid unexpected broadcast storms.                                                                         |
| none            | Sets the protocols to have equal priority. This allows protocols to override each other to set a port to forwarding for a VLAN. Note that this option must not be set on a EPSR master node. Use the <b>epsr</b> parameter option on an EPSR master node to avoid unexpected broadcast storms. |

**Default** By default, the highest priority protocol is EPSR

**Mode** Global Configuration

**Usage notes** Usually, you only need to configure one of EPSR, Loop Protection and MAC Thrashing protection on a switch, because they perform similar functions—each prevents network loops by blocking a selected port for each (loop-containing) VLAN.

However, if more than one of these three features is configured on a switch, you can use this command to prioritize either EPSR or Loop Protection when their

effects on a port would conflict and override each other. Without this command, each protocol could set a port to forwarding for a VLAN, sometimes overriding the previous setting by another protocol to block the port. This could sometimes lead to unexpected broadcast storms.

This command means that, when a protocol is set to have the highest priority over a data VLAN on a port, it will not allow other protocols to put that port-vlan into a forwarding state if the highest priority protocol blocked it.

The priority mechanism is only used for blocking-to-forwarding transitions; protocols remain independent on the forwarding-to-blocking transitions.

For example, consider an EPSR master node in a two-node EPSR ring with the following settings:

- The EPSR master node primary port is configured to switchport interface port1.0.1
- The EPSR master node secondary port is configured to switchport interface port1.0.2
- The EPSR master node control VLAN is configured to VLAN interface vlan10
- The EPSR master node has a first data VLAN configured to VLAN interface vlan20
- The EPSR master node has a second data VLAN configured to VLAN interface vlan30.

Initially, the EPSR ring is complete, with port1.0.2 blocking data VLANs vlan20 and vlan30 and some broadcast traffic flowing through. If the user removes vlan30 from EPSR, a storm is created on vlan30. MAC thrashing protection detects it and blocks vlan30.

Then after the storm has stopped, MAC thrashing protection sets it to forwarding again and it keeps oscillating between forwarding and blocking. In the meantime, the user adds back vlan30 to EPSR as a data VLAN and EPSR blocks it on port1.0.2.

If the priority is set to none (**port-vlan-forwarding-priority none**), MAC thrashing protection notices that the storm has stopped again and decides to put vlan30 on port1.0.2 into forwarding state. This overrides what EPSR requires for this port-VLAN and creates a storm.

If the priority is set to EPSR or default (**port-vlan-forwarding-priority epsr**), MAC thrashing protection notices that the storm has stopped again and attempts to put vlan30 on port1.0.2 into forwarding state. The higher priority protocol (EPSR) is blocking the VLAN on this port, so it stays blocking and no storm occurs.

**Example** To prioritize EPSR over Loop Protection or MAC Thrashing protection settings, so that Loop Protection or MAC Thrashing protection cannot set a port to the forwarding state for a VLAN if EPSR has set it to the blocking state, use the commands:

```
awplus# configure terminal
awplus(config)# port-vlan-forwarding-priority epsr
```

To prioritize Loop Protection over EPSR or MAC Thrashing protection settings, so that EPSR or MAC Thrashing protection cannot set a port to the forwarding state for a VLAN if Loop Protection has set it to the blocking state, use the commands:

```
awplus# configure terminal
awplus(config)# port-vlan-forwarding-priority loop-protection
```

To set EPSR, Loop Protection, and MAC Thrashing protection protocols to have equal priority for port forwarding and blocking, which allows the protocols to override each other to set a port to the forwarding or blocking states, use the commands:

```
awplus# configure terminal
awplus(config)# port-vlan-forwarding-priority none
```

To restore the default highest priority protocol back to the default of EPSR, use the commands:

```
awplus# configure terminal
awplus(config)# no port-vlan-forwarding-priority
```

**Related commands**   [show port-vlan-forwarding-priority](#)

# private-vlan

**Overview** Use this command to create a private VLAN. Private VLANs can be either primary or secondary. Secondary VLANs can be either community or isolated.

Alternatively, private VLANs can be UFO (Upstream Forwarding Only). Private VLAN port members are either 'downstream' or 'upstream'. Once a private VLAN is configured as UFO, its port members by default are downstream.

Use the **no** variant of this command to remove the specified private VLAN.

For more information, see the [VLAN Feature Overview and Configuration Guide](#).

**Syntax** `private-vlan <vlan-id> {community|isolated|primary|ufo}`  
`no private-vlan <vlan-id> {community|isolated|primary|ufo}`

| Parameter | Description                                                                    |
|-----------|--------------------------------------------------------------------------------|
| <vlan-id> | VLAN ID in the range <2-4094> for the VLAN which is to be made a private VLAN. |
| community | Community VLAN.                                                                |
| isolated  | Isolated VLAN.                                                                 |
| primary   | Primary VLAN.                                                                  |
| ufo       | Upstream Forwarding Only (UFO) VLAN.                                           |

**Mode** VLAN Configuration

**Examples** To configure a set of private VLANs, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 2 name vlan2 state enable
awplus(config-vlan)# vlan 3 name vlan3 state enable
awplus(config-vlan)# vlan 4 name vlan4 state enable
awplus(config-vlan)# private-vlan 2 primary
awplus(config-vlan)# private-vlan 3 isolated
awplus(config-vlan)# private-vlan 4 community
```

To remove a set of private VLANs, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no private-vlan 2 primary
awplus(config-vlan)# no private-vlan 3 isolated
awplus(config-vlan)# no private-vlan 4 community
```

To configure a private VLAN for Upward Forwarding Only (UFO), use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 512 name vlan512 state enable
awplus(config-vlan)# private-vlan 512 ufo
```

**Related commands**    [show vlan private-vlan](#)

**Command changes**

- Version 5.4.7-2.1: **ufo** parameter added
- Version 5.4.8-2.1: **ufo** parameter added to SBx8100 Series products
- Version 5.4.9-0.1: **ufo** parameter added to x530 Series products

# private-vlan association

**Overview** Use this command to associate a secondary VLAN to a primary VLAN. Only one isolated VLAN can be associated to a primary VLAN. Multiple community VLANs can be associated to a primary VLAN.

Use the **no** variant of this command to remove association of all the secondary VLANs to a primary VLAN.

For more information, see the [VLAN\\_Feature Overview and Configuration Guide](#).

**Syntax** `private-vlan <primary-vlan-id> association {add  
<secondary-vlan-id>|remove <secondary-vlan-id>}  
no private-vlan <primary-vlan-id> association`

| Parameter           | Description                                                   |
|---------------------|---------------------------------------------------------------|
| <primary-vlan-id>   | VLAN ID of the primary VLAN.                                  |
| <secondary-vlan-id> | VLAN ID of the secondary VLAN (either isolated or community). |

**Mode** VLAN Configuration

**Examples** The following commands associate primary VLAN 2 with secondary VLAN 3:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# private-vlan 2 association add 3
```

The following commands remove the association of primary VLAN 2 with secondary VLAN 3:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# private-vlan 2 association remove 3
```

The following commands remove all secondary VLAN associations of primary VLAN 2:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no private-vlan 2 association
```

# private-vlan ufo trap

**Overview** Use this command to enable the sending of SNMP traps for private VLAN UFO. Use the **no** variant of this command to disable the sending of SNMP traps for private VLAN UFO.

**Syntax** private-vlan ufo trap  
no private-vlan ufo trap

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| ufo       | Specifies private-vlan for those VLANs in UFO mode.         |
| trap      | Enables or disables SNMP trap sending for private-vlan UFO. |

**Default** Enabled.

**Mode** Global Configuration

**Usage notes** This command enables SNMP traps for private-vlan UFO. If enabled, traps will be sent when any UFO VLAN becomes "isolated", which occurs when traffic can not be forwarded at Layer 2 because there is no upstream port for the UFO VLAN, and Layer3 forwarding has not been configured for the VLAN.

**Example** To configure a private-vlan UFO trap use the commands:

```
awplus# configure terminal
awplus(config)# private-vlan ufo trap
```

**Related commands** [private-vlan](#)  
[snmp-server enable trap](#)

**Command changes** Version 5.4.7-2.1: command added  
Version 5.4.8-2.1: added to SBx8100 Series products  
Version 5.4.9-0.1: added to x530 Series products

# show debugging private-vlan

**Overview** Use this command to show whether debugging for a private-vlan, namely UFO, is enabled.

**Syntax** show debugging private-vlan

**Mode** Privileged Exec

**Example** To show if debugging is enabled for private-vlan UFO, use the command:

```
awplus# show debugging private-vlan
```

**Output** Figure 15-1: Example output from **show debugging private-vlan**

```
awplus#show debugging private-vlan

Private-VLAN debugging status:
UFO debugging is off
```

**Related commands** [debug private-vlan ufo](#)

**Command changes** Version 5.4.7-2.1: command added.

# show interface switchport vlan translation

**Overview** Use this command to display VLAN translation information for some or all interfaces.

**Syntax** show interface switchport vlan translation [interface <int>]

| Parameter       | Description                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface <int> | The interface to display information about. An interface can be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po2). |

**Mode** User Exec and Privileged Exec

**Example** To display VLAN translation information for port1.0.1, use the command:

```
awplus# show interface switchport vlan translation interface port1.0.1
```

**Output** Figure 15-2: Example output from **show interface switchport vlan translation interface port1.0.1**

```
awplus#show interface switchport vlan translation interface port1.0.1
```

| VLAN on Wire | VLAN   | Outer Vlan |
|--------------|--------|------------|
| =====        | =====  | =====      |
| 200          | 100    | 300        |
| default      | accept |            |

**Output** Figure 15-3: Example output from **show interface switchport vlan translation**

```
awplus#show interface switchport vlan translation
```

| Interface: port1.0.1 |        |            |
|----------------------|--------|------------|
| VLAN on Wire         | VLAN   | Outer Vlan |
| =====                | =====  | =====      |
| 200                  | 100    | 300        |
| default              | accept |            |

| Interface: port1.0.2 |        |            |
|----------------------|--------|------------|
| VLAN on Wire         | VLAN   | Outer Vlan |
| =====                | =====  | =====      |
| 69                   | 1      |            |
| default              | accept |            |

Table 15-1: Parameters in the output from **show interface switchport vlan translation**

| Parameter    | Description                                                                                                                  |
|--------------|------------------------------------------------------------------------------------------------------------------------------|
| Interface    | The interface on which VLAN-IDs will be translated.                                                                          |
| VLAN on Wire | VLAN-ID of the packet as it will be seen on the wire.                                                                        |
| VLAN         | VLAN-ID of the VLAN as it was assigned when the VLAN was created.                                                            |
| Outer Vlan   | VLAN-ID of the outer-tag-VLAN added by VLAN double-tagging.                                                                  |
| default      | The action taken on inbound tagged packets that do not match a VLAN translation entry; either <b>drop</b> or <b>accept</b> . |

**Related commands** [switchport vlan translation](#)  
[switchport vlan translation default drop](#)

**Command changes** Version 5.4.8-0.2: added to SBx908 GEN2, x930 Series products  
Version 5.4.8-1.1: added to SBx8100 Series products  
Version 5.4.9-0.1: added to x530 Series products

# show port-vlan-forwarding-priority

**Overview** Use this command to display the highest priority protocol that controls port-vlan forwarding or blocking traffic. This command displays whether EPSR or Loop Protection is set as the highest priority for determining whether a port forwards a VLAN, as set by the [port-vlan-forwarding-priority](#) command.

For more information about EPSR, see the [EPSR Feature Overview and Configuration\\_Guide](#).

**Syntax** show port-vlan-forwarding-priority

**Mode** Privileged Exec

**Example** To display the highest priority protocol, use the command:

```
awplus# show port-vlan-forwarding-priority
```

**Output** Figure 15-4: Example output from the **show port-vlan-forwarding-priority** command

```
Port-vlan Forwarding Priority: EPSR
```

**Related commands** [port-vlan-forwarding-priority](#)

# show vlan

**Overview** Use this command to display information about a particular VLAN by specifying its VLAN ID. Selecting **all** will display information for all the VLANs configured.

**Syntax** `show vlan`  
`{all|brief|dynamic|static|auto|static-ports|<1-4094>}`

| Parameter    | Description                                                  |
|--------------|--------------------------------------------------------------|
| <1-4094>     | Display information about the VLAN specified by the VLAN ID. |
| all          | Display information about all VLANs on the device.           |
| brief        | Display information about all VLANs on the device.           |
| dynamic      | Display information about all VLANs learned dynamically.     |
| static       | Display information about all statically configured VLANs.   |
| auto         | Display information about all auto-configured VLANs.         |
| static-ports | Display static egress/forbidden ports.                       |

**Mode** User Exec and Privileged Exec

**Example** To display information about VLAN 2, use the command:

```
awplus# show vlan 2
```

**Output** Figure 15-5: Example output from the **show vlan** command

| VLAN ID                  | Name     | Type   | State  | Member ports                                           |
|--------------------------|----------|--------|--------|--------------------------------------------------------|
| (u)-Untagged, (t)-Tagged |          |        |        |                                                        |
| 2                        | VLAN0002 | STATIC | ACTIVE | port1.0.3(u) port1.0.4(u) port1.0.5(u)<br>port1.0.6(u) |
| ...                      |          |        |        |                                                        |

**Related commands** [vlan](#)

**Command changes** Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

# show vlan access-map

**Overview** Use this command to display information about the configured VLAN access-maps. VLAN access-maps contain a series of ACLs and enable you to filter traffic ingressing specified VLANs.

**Syntax** show vlan access-map [*<name>*]

| Parameter           | Description                            |
|---------------------|----------------------------------------|
| <i>&lt;name&gt;</i> | The name of the access-map to display. |

**Mode** User Exec/Privileged Exec

**Example** To display the ACLs in all access-maps, use the command:

```
awplus# show vlan access-map
```

**Output** Figure 15-6: Example output from **show vlan access-map**

```
awplus#show vlan access-map

Vlan access map : deny_all
Hardware MAC access list 4000
 10 deny any any

Vlan access map : ip_range
Hardware IP access list 3000
 10 deny ip 192.168.1.1/24 any
```

**Related commands** [vlan access-map](#)

**Command changes** Version 5.4.6-2.1: command added

# show vlan classifier group

**Overview** Use this command to display information about all configured VLAN classifier groups or a specific group.

**Syntax** show vlan classifier group [<1-16>]

| Parameter | Description                      |
|-----------|----------------------------------|
| <1 - 16>  | VLAN classifier group identifier |

**Mode** User Exec and Privileged Exec

**Usage** If a group ID is not specified, all configured VLAN classifier groups are shown. If a group ID is specified, a specific configured VLAN classifier group is shown.

**Example** To display information about VLAN classifier group 1, enter the command:

```
awplus# show vlan classifier group 1
```

**Related commands** [vlan classifier group](#)

# show vlan classifier group interface

**Overview** Use this command to display information about a single switch port interface for all configured VLAN classifier groups.

**Syntax** show vlan classifier group interface *<switch-port>*

| Parameter                  | Description                                                   |
|----------------------------|---------------------------------------------------------------|
| <i>&lt;switch-port&gt;</i> | Specify the switch port interface classifier group identifier |

**Mode** User Exec and Privileged Exec

**Usage notes** All configured VLAN classifier groups are shown for a single interface.

**Example** To display VLAN classifier group information for switch port interface port1.0.2, enter the command:

```
awplus# show vlan classifier group interface port1.0.2
```

**Output** Figure 15-7: Example output from the **show vlan classifier group interface port1.0.1** command:

```
vlan classifier group 1 interface port1.0.1
```

**Related commands** [vlan classifier group](#)  
[show vlan classifier interface group](#)

# show vlan classifier interface group

**Overview** Use this command to display information about all interfaces configured for a VLAN group or all the groups.

**Syntax** show vlan classifier interface group [<1-16>]

| Parameter | Description                                |
|-----------|--------------------------------------------|
| <1-16>    | VLAN classifier interface group identifier |

**Mode** User Exec and Privileged Exec

**Usage notes** If a group ID is not specified, all interfaces configured for all VLAN classifier groups are shown. If a group ID is specified, the interfaces configured for this VLAN classifier group are shown.

**Example** To display information about all interfaces configured for all VLAN groups, enter the command:

```
awplus# show vlan classifier interface group
```

To display information about all interfaces configured for VLAN group 1, enter the command:

```
awplus# show vlan classifier interface group 1
```

**Output** Figure 15-8: Example output from the **show vlan classifier interface group** command

```
vlan classifier group 1 interface port1.0.1
vlan classifier group 1 interface port1.0.2
vlan classifier group 2 interface port1.0.3
vlan classifier group 2 interface port1.0.4
```

Figure 15-9: Example output from the **show vlan classifier interface group 1** command

```
vlan classifier group 1 interface port1.0.1
vlan classifier group 1 interface port1.0.2
```

**Related commands** [vlan classifier group](#)  
[show vlan classifier group interface](#)

# show vlan classifier rule

**Overview** Use this command to display information about all configured VLAN classifier rules or a specific rule.

**Syntax** show vlan classifier rule [<1-256>]

| Parameter | Description                     |
|-----------|---------------------------------|
| <1 - 256> | VLAN classifier rule identifier |

**Mode** User Exec and Privileged Exec

**Usage** If a rule ID is not specified, all configured VLAN classifier rules are shown. If a rule ID is specified, a specific configured VLAN classifier rule is shown.

**Example** To display information about VLAN classifier rule 1, enter the command:

```
awplus# show vlan classifier rule 1
```

**Output** Figure 15-10: Example output from the **show vlan classifier rule1** command

```
vlan classifier group 1 add rule 1
```

**Related commands**

- [vlan classifier rule proto](#)

# show vlan filter

**Overview** Use this command to display information about the configured VLAN filters. VLAN filters apply access-maps (and therefore ACLs) to VLANs. This enables you to filter traffic ingressing specified VLANs.

**Syntax** `show vlan filter [<access-map-name>]`

| Parameter         | Description                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------|
| <access-map-name> | The name of an access-map. The command output displays only the filters that use that access-map. |

**Mode** User Exec/Privileged Exec

**Example** To display information about the filter that uses the access-map named "deny\_all", use the command:

```
awplus# show vlan filter deny_all
```

**Output** Figure 15-11: Example output from **show vlan filter**

```
awplus#show vlan filter deny_all
Vlan filter : deny_all
 direction : ingress
 vlan list : 48-49
 access map : deny_all
Hardware MAC access list 4000
 10 deny any any
```

**Related commands** [vlan access-map](#)  
[vlan filter](#)

**Command changes** Version 5.4.6-2.1: command added

# show vlan private-vlan

**Overview** Use this command to display the private VLAN configuration and associations.

**Syntax** show vlan private-vlan

**Mode** User Exec and Privileged Exec

**Example** To display the private VLAN configuration and associations, enter the command:

```
awplus# show vlan private-vlan
```

**Output** Figure 15-12: Example output from the **show vlan private-vlan** command

| awplus#show vlan private-vlan |           |           |            |
|-------------------------------|-----------|-----------|------------|
| PRIMARY                       | SECONDARY | TYPE      | INTERFACES |
| -----                         | -----     | -----     | -----      |
| 2                             | 3         | isolated  |            |
| 2                             | 4         | community |            |
|                               | 8         | isolated  |            |

**Related commands** [private-vlan](#)  
[private-vlan association](#)

# show vlan private-vlan ufo

**Overview** Use this command to show the configuration status of a private VLAN UFO-based VLAN(s) and member interfaces.

**Syntax** show vlan private-vlan ufo {all|<vlan-id>}

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| <vlan-id> | A specific VLAN. This must have been configured previously as a private-vlan UFO. |
| all       | All VLANs that have been configured previously as private-vlan UFO.               |

**Mode** User Exec/Privileged Exec.

**Usage notes** Private VLANs can be UFO (Upstream Forwarding Only). Private VLAN port members are either "downstream" or "upstream" which are controlled by a protocol or by static configuration.

**Example** To show all the private-vlan UFO interfaces, use the command:

```
awplus# show vlan private-vlan ufo all
```

**Output** Figure 15-13: Example output from **show vlan private-vlan ufo all**

| awplus#show vlan private-vlan ufo all |            |                    |                  |          |                |
|---------------------------------------|------------|--------------------|------------------|----------|----------------|
| VLAN                                  | INTERFACES | CONFIGURED         | TYPE             | PROTOCOL | MISC           |
| 100                                   | port1.0.1  | primary-upstream   | upstream         | UFO      | -              |
| 100                                   | port1.0.2  | secondary-upstream | downstream       | UFO      | -              |
| 100                                   | port1.0.3  | -                  | downstream       | Static   | -              |
| 200                                   | port1.0.4  | epsr               | downstream       | EPSR     | -              |
| 200                                   | sa1        | epsr               | upstream         | EPSR     | 0030.846e.bac7 |
| 200                                   | port1.0.5  | -                  | downstream       | Static   | -              |
| 300                                   | port1.0.6  | -                  | downstream-fault | Static   | -              |
| 300                                   | port1.0.7  | -                  | downstream-fault | Static   | -              |
| 300                                   | port1.0.8  | -                  | downstream-fault | Static   | -              |
| 400                                   | Port1.0.9  | stp                | upstream         | STP      | 0030.846e.9bf4 |
| 400                                   | Port1.0.10 | stp                | downstream       | STP      | -              |
| 400                                   | Port1.0.11 |                    | downstream       | Static   | -              |

**Command changes** Version 5.4.7-2.1: command added

Version 5.4.8-2.1: added to SBx8100 Series products

Version 5.4.9-0.1: added to x530 Series products

# show vlan statistics

**Overview** Use this command to display the current configuration for either a specific VLAN statistics instance, or (by not specifying an instance) display all VLAN packet counter instances.

**Syntax** `show vlan statistics [name <instance-name>]`

| Parameter       | Description                                                                     |
|-----------------|---------------------------------------------------------------------------------|
| <vid>           | The VID of the VLAN that is associated with <instance-name>.                    |
| <instance-name> | The name of the instance for which incoming frames and their bytes are counted. |

**Mode** User Exec and Privileged Exec

**Examples** To display all packet counters for the packet counter instance "vlan2-data", use the command:

```
awplus# show vlan statistics name vlan2-data
```

To display all packet counters for all packet counter instances, use the command:

```
awplus# show vlan statistics
```

**Table 16:** Example output from the **show vlan statistics** command

|                                           |
|-------------------------------------------|
| VLAN Stats Collection: vlan2-data         |
| VLAN ID: 2                                |
| Port Map: port1.0.1, port1.0.2, port1.0.4 |
| Ingress Packets: total 941, bytes 66185   |

**Related commands** [clear vlan statistics](#)  
[vlan statistics](#)

# switchport access vlan

**Overview** Use this command to change the port-based VLAN of the current port.

Use the **no** variant of this command to change the port-based VLAN of this port to the default VLAN, VLAN 1.

**Syntax** switchport access vlan <vlan-id>  
no switchport access vlan

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| <vlan-id> | <1-4094> The port-based VLAN ID for the port. |

**Default** VLAN 1

**Mode** Interface Configuration

**Usage notes** Any untagged frame received on this port will be associated with the specified VLAN.

**Examples** To change the port-based VLAN to VLAN 3 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport access vlan 3
```

To reset the port-based VLAN to the default VLAN 1 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport access vlan
```

**Related commands** [show interface switchport](#)  
[show vlan](#)

**Command changes** Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

# switchport enable vlan

**Overview** This command enables the VLAN on the port manually once disabled by certain actions, such as QSP (QoS Storm Protection) or EPSR (Ethernet Protection Switching Ring). Note that if the VID is not given, all disabled VLANs are re-enabled.

**Syntax** `switchport enable vlan [<1-4094>]`

| Parameter                   | Description                      |
|-----------------------------|----------------------------------|
| <code>vlan</code>           | Re-enables the VLAN on the port. |
| <code>&lt;1-4094&gt;</code> | VLAN ID.                         |

**Mode** Interface Configuration

**Example** To re-enable port1.0.2 from VLAN 1:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport enable vlan 1
```

**Related commands** [show mls qos interface storm-status](#)  
[storm-window](#)

# switchport mode access

**Overview** Use this command to set the switching characteristics of the port to access mode. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

**Syntax** `switchport mode access [ingress-filter {enable|disable}]`

| Parameter      | Description                                                                               |
|----------------|-------------------------------------------------------------------------------------------|
| ingress-filter | Set the ingress filtering for the received frames.                                        |
| enable         | Turn on ingress filtering for received frames. This is the default.                       |
| disable        | Turn off ingress filtering to accept frames that do not meet the classification criteria. |

**Default** By default, ports are in access mode with ingress filtering on.

**Usage notes** Use access mode to send untagged frames only.

**Mode** Interface Configuration

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access ingress-filter enable
```

**Related Commands** [show interface switchport](#)

**Command changes** Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

# switchport mode private-vlan

**Overview** Use this command to make a Layer 2 port a private VLAN host port or a promiscuous port.

Use the **no** variant of this command to remove the configuration.

**Syntax** `switchport mode private-vlan {host|promiscuous}`  
`no switchport mode private-vlan {host|promiscuous}`

| Parameter   | Description                                                                                                                                                                                                                                                                    |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host        | This port type can communicate with all other host ports assigned to the same community VLAN, but it cannot communicate with the ports in the same isolated VLAN. All communications outside of this VLAN must pass through a promiscuous port in the associated primary VLAN. |
| promiscuous | A promiscuous port can communicate with all interfaces, including the community and isolated ports within a private VLAN.                                                                                                                                                      |

**Mode** Interface Configuration

**Examples** To configure host mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode private-vlan host
```

To configure promiscuous mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# switchport mode private-vlan promiscuous
```

To remove promiscuous mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# no switchport mode private-vlan promiscuous
```

**Related commands** [switchport private-vlan mapping](#)

# switchport mode private-vlan trunk promiscuous

**Overview** Use this command to enable a port in trunk mode to be a promiscuous port for isolated VLANs.

Use the **no** variant of this command to remove a port in trunk mode as a promiscuous port for isolated VLANs. You must first remove the secondary port, or ports, in trunk mode associated with the promiscuous port with the **no switchport mode private-vlan trunk secondary** command.

**Syntax** `switchport mode private-vlan trunk promiscuous group <group-id>`  
`no switchport mode private-vlan trunk promiscuous`

| Parameter                     | Description                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;group-id&gt;</code> | The group ID is a numeric value in the range 1 to 32 that is used to associate the promiscuous port with secondary ports. |

**Default** By default, a port in trunk mode is disabled as a promiscuous port.

**Mode** Interface Configuration

**Usage notes** A port must be put in trunk mode with [switchport mode trunk](#) command before it can be enabled as a promiscuous port.

To add VLANs to be trunked over the promiscuous port, use the [switchport trunk allowed vlan](#) command. These VLANs can be isolated VLANs, or non-private VLANs.

To configure the native VLAN for the promiscuous port, use the [switchport trunk native vlan](#) command. The native VLAN can be an isolated VLAN, or a non-private VLAN.

When you enable a promiscuous port, all of the secondary port VLANs associated with the promiscuous port via the group ID number must be added to the promiscuous port. In other words, the set of VLANs on the promiscuous port must be a superset of all the VLANs on the secondary ports within the group.

**Examples** To create the isolated VLANs 2, 3 and 4 and then enable port1.0.2 in trunk mode as a promiscuous port for these VLANs with the group ID of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 2-4
awplus(config-vlan)# private-vlan 2 isolated
awplus(config-vlan)# private-vlan 3 isolated
awplus(config-vlan)# private-vlan 4 isolated
awplus(config-vlan)# exit
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan add 2-4
awplus(config-if)# switchport mode private-vlan trunk
promiscuous group 3
```

To remove port1.0.2 in trunk mode as a promiscuous port for a private VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport mode private-vlan trunk
promiscuous
```

Note that you must remove the secondary port or ports enabled as trunk ports that are associated with the promiscuous port before removing the promiscuous port.

**Related commands**

- [switchport mode private-vlan trunk secondary](#)
- [switchport mode trunk](#)
- [switchport trunk allowed vlan](#)
- [switchport trunk native vlan](#)
- [show vlan private-vlan](#)

# switchport mode private-vlan trunk secondary

**Overview** Use this command to enable a port in trunk mode to be a secondary port for isolated VLANs.

Use the **no** variant of this command to remove a port in trunk mode as a secondary port for isolated VLANs.

**Syntax** `switchport mode private-vlan trunk secondary group <group-id>`  
`no switchport mode private-vlan trunk secondary`

| Parameter                     | Description                                                                                                                |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;group-id&gt;</code> | The group ID is a numeric value in the range 1 to 32 that is used to associate a secondary port with its promiscuous port. |

**Default** By default, a port in trunk mode is disabled as a secondary port.

When a port in trunk mode is enabled to be a secondary port for isolated VLANs, by default it will have a native VLAN of **none** (no native VLAN specified).

**Mode** Interface Configuration

**Usage notes** A port must be put in trunk mode with `switchport mode trunk` command before the port is enabled as a secondary port in trunk mode.

To add VLANs to be trunked over the secondary port use the `switchport trunk allowed vlan` command. These must be isolated VLANs and must exist on the associated promiscuous port.

To configure the native VLAN for the secondary port, use the `switchport trunk native vlan` command. The native VLAN must be an isolated VLAN and must exist on the associated promiscuous port.

**Examples** To create isolated private VLAN 2 and then enable port1.0.3 in trunk mode as a secondary port for the this VLAN with the group ID of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 2
awplus(config-vlan)# private-vlan 2 isolated
awplus(config-vlan)# exit
awplus(config)# interface port1.0.3
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan add 2
awplus(config-if)# switchport mode private-vlan trunk secondary
group 3
```

To remove port1.0.3 in trunk mode as a secondary port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# no switchport mode private-vlan trunk
secondary
```

# switchport mode private-vlan ufo

- Overview** Use this command to allow private VLAN UFO 802.1q member ports to be configured as upstream or downstream.
- Use the **no** variant of this command to change the role of the private VLAN UFO 802.1q member port to downstream.
- Syntax** `switchport mode private-vlan ufo <vid-list>`  
`{primary-upstream|secondary-upstream|stp|epsr}`  
`no switchport mode private-vlan ufo <vid-list>`

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <vid-list>         | A hyphen-separated range or a comma-separated list of VLAN IDs, all of which must have previously been configured with the private-vlan setting of "ufo".                                                                                                                                                                                                                                                              |
| primary-upstream   | The primary interface port/LAG that this UFO VLAN will attempt to use as the Upstream interface. More than one primary-upstream interface can be configured.                                                                                                                                                                                                                                                           |
| secondary-upstream | The interface that this UFO VLAN will revert to use as the Upstream port if all the primary-upstream ports are unavailable due to being either operationally down (i.e. Link Down) or blocked from forwarding (e.g. STP). More than one secondary-upstream interface can be configured.                                                                                                                                |
| stp                | Let STP determine whether this interface is upstream or downstream. STP will determine if this interface plays the role of an STP Root Port for the CIST, or for the MSTI that this UFO VLAN belongs to. If it is, then UFO will designate this interface as an Upstream interface member for this UFO VLAN. Otherwise it is Downstream.                                                                               |
| epsr               | Let EPSR determine whether this interface is upstream or downstream. If this UFO VLAN is a protected data VLAN in an EPSR instance, and this interface is one of the transit node's interfaces, then this interface will determine if an EPSR Master is reachable from this interface. If it is, then UFO will designate this interface as an Upstream interface member for this UFO VLAN. Otherwise it is Downstream. |

- Default** Downstream.
- Note: The default setting for a private VLAN UFO member interface is downstream, but it is not explicitly configured. Use the **no** variant of this command to make the member interface downstream.
- Mode** Interface Configuration

**Example** To configure a private VLAN UFO trunk port as primary-upstream, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan add 100
awplus(config-if)# switchport mode private-vlan ufo 100
primary-upstream
```

To change the role of the private VLAN UFO 802.1q member port back to the default of downstream, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport mode private-vlan ufo 100
```

**Related commands** [private-vlan](#)  
[show vlan private-vlan ufo](#)

**Command changes** Version 5.4.7-2.1: command added  
Version 5.4.8-2.1: added to SBx8100 Series products  
Version 5.4.9-0.1: added to x530 Series products

# switchport mode trunk

**Overview** Use this command to set the switching characteristics of the port to trunk. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

**Syntax** `switchport mode trunk [ingress-filter {enable|disable}]`

| Parameter      | Description                                                                               |
|----------------|-------------------------------------------------------------------------------------------|
| ingress-filter | Set the ingress filtering for the frames received.                                        |
| enable         | Turn on ingress filtering for received frames. This is the default.                       |
| disable        | Turn off ingress filtering to accept frames that do not meet the classification criteria. |

**Default** By default, ports are in access mode, are untagged members of the default VLAN (VLAN 1), and have ingress filtering on.

**Mode** Interface Configuration

**Usage notes** A port in trunk mode can be a tagged member of multiple VLANs, and an untagged member of one native VLAN.

To configure which VLANs this port will trunk for, use the [switchport trunk allowed vlan](#) command.

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# switchport mode trunk ingress-filter enable
```

**Related Commands** [show interface switchport](#)

**Command changes** Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

# switchport private-vlan host-association

**Overview** Use this command to associate a primary VLAN and a secondary VLAN to a host port. Only one primary and secondary VLAN can be associated to a host port.

Use the **no** variant of this command to remove the association.

**Syntax** `switchport private-vlan host-association <primary-vlan-id> add <secondary-vlan-id>`  
`no switchport private-vlan host-association`

| Parameter           | Description                                                   |
|---------------------|---------------------------------------------------------------|
| <primary-vlan-id>   | VLAN ID of the primary VLAN.                                  |
| <secondary-vlan-id> | VLAN ID of the secondary VLAN (either isolated or community). |

**Mode** Interface Configuration

**Examples** `awplus# configure terminal`  
`awplus(config)# interface port1.0.2`  
`awplus(config-if)# switchport private-vlan host-association 2`  
`add 3`  
`awplus# configure terminal`  
`awplus(config)# interface port1.0.2`  
`awplus(config-if)# no switchport private-vlan host-association`

# switchport private-vlan mapping

**Overview** Use this command to associate a primary VLAN and a set of secondary VLANs to a promiscuous port.

Use the **no** variant of this to remove all the association of secondary VLANs to primary VLANs for a promiscuous port.

**Syntax** `switchport private-vlan mapping <primary-vlan-id> add <secondary-vid-list>`  
`switchport private-vlan mapping <primary-vlan-id> remove <secondary-vid-list>`  
`no switchport private-vlan mapping`

| Parameter                               | Description                                                                                                                       |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;primary-vlan-id&gt;</code>    | VLAN ID of the primary VLAN.                                                                                                      |
| <code>&lt;secondary-vid-list&gt;</code> | VLAN ID of the secondary VLAN (either isolated or community), or a range of VLANs, or a comma-separated list of VLANs and ranges. |

**Mode** Interface Configuration

**Usage notes** This command can be applied to a switch port or a static channel group, but not a dynamic (LACP) channel group. LACP channel groups (dynamic/LACP aggregators) cannot be promiscuous ports in private VLANs.

**Examples** `awplus# configure terminal`  
`awplus(config)# interface port1.0.2`  
`awplus(config-if)# switchport private-vlan mapping 2 add 3-4`  
`awplus(config-if)# switchport private-vlan mapping 2 remove 3-4`  
`awplus(config-if)# no switchport private-vlan mapping`

**Related commands** [switchport mode private-vlan](#)

# switchport trunk allowed vlan

**Overview** Use this command to add VLANs to be trunked over this switch port. Traffic for these VLANs can be sent and received on the port.

Use the **no** variant of this command to reset switching characteristics of a specified interface to negate a trunked configuration specified with **switchport trunk allowed vlan** command.

**Syntax**

```
switchport trunk allowed vlan all
switchport trunk allowed vlan none
switchport trunk allowed vlan add <vid-list>
switchport trunk allowed vlan remove <vid-list>
switchport trunk allowed vlan except <vid-list>
no switchport trunk
```

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| all        | Allow all VLANs to transmit and receive through the port.                                                                                                                                                                                                                                                                                                                                                                                    |
| none       | Allow no VLANs to transmit and receive through the port.                                                                                                                                                                                                                                                                                                                                                                                     |
| add        | Add a VLAN to the list of VLANs that are allowed to transmit and receive through the port. Only use this parameter if a list of VLANs is already configured on a port.                                                                                                                                                                                                                                                                       |
| remove     | Remove a VLAN from the list of VLANs that are allowed to transmit and receive through the port. Only use this parameter if a list of VLANs is already configured on a port.<br>If you are removing VLAN port membership for a large number of switchports and VLANs, note that this command may take a number of minutes to run.                                                                                                             |
| except     | All VLANs, except the VLAN for which the VID is specified, are part of its port member set. Only use this parameter to remove VLANs after either this parameter or the <b>all</b> parameter have added VLANs to a port.                                                                                                                                                                                                                      |
| <vid-list> | <2-4094> The ID of the VLAN or VLANs that will be added to, or removed from, the port. A single VLAN, VLAN range, or comma-separated VLAN list can be set.<br>For a VLAN range, specify two VLAN numbers: lowest, then highest number in the range, separated by a hyphen.<br>For a VLAN list, specify the VLAN numbers separated by commas. Do not enter spaces between hyphens or commas when setting parameters for VLAN ranges or lists. |

**Default** By default, ports are untagged members of the default VLAN (VLAN 1).

**Mode** Interface Configuration

**Usage notes** The **all** parameter sets the port to be a tagged member of all the VLANs configured on the device. The **none** parameter removes all VLANs from the port's tagged member set. The **add** and **remove** parameters will add and remove VLANs to and from the port's member set. The **except** parameter creates an exception to the list.

If you use the **all** parameter, and then you want to remove VLANs from the port's member list, you must use the **except** parameter to remove the unwanted VLANs. Similarly, if you use the **except** parameter to remove a list of VLANs, and you want to change that list, you must use the **except** parameter to make that change (not the **add** and **remove** parameters).

For example, if you want to remove VLAN3-5 from a port and the port's configuration is currently **switchport trunk allowed vlan all**, then you should remove VLAN3-5 by entering the **except** parameter, instead of using the **remove** parameter. This means using the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.6
awplus(config-if)# switchport trunk allowed vlan except 3-5
```

If you do this, then the configuration changes to:

```
awplus#show running-config
interface port1.0.6
switchport
switchport mode trunk
switchport trunk allowed vlan except 3-5
```

For example, if you want to add VLAN4 back in again, and the port configuration is currently **switchport trunk allowed vlan except 3-5**, then you should add VLAN4 by re-entering the **except** parameter with the list of VLANs to remove, instead of using the **add** parameter. This means using the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.6
awplus(config-if)# switchport trunk allowed vlan except 3,5
```

If you do this, then the configuration changes to:

```
awplus#show running-config
interface port1.0.6
switchport
switchport mode trunk
switchport trunk allowed vlan except 3,5
```

**Examples** The following shows adding a single VLAN to a port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk allowed vlan add 2
```

The following shows adding a range of VLANs to a port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk allowed vlan add 2-4
```

The following shows adding a list of VLANs to a port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk allowed vlan add 2,3,4
```

changes**

Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

# switchport trunk native vlan

**Overview** Use this command to configure the native VLAN for this port. The native VLAN is used for classifying the incoming untagged packets. Use the **none** parameter with this command to remove the native VLAN from the port and set the acceptable frame types to VLAN-tagged only.

Use the **no** variant of this command to reset the native VLAN to the default VLAN ID 1 and remove tagged VLANs from the port.

**Syntax** switchport trunk native vlan {<vid>|none}  
no switchport trunk native vlan

| Parameter | Description                                                                                                                                                                                                                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <vid>     | The ID of the VLAN that will be used to classify the incoming untagged packets, in the range 2-2094. The VLAN ID must be a part of the VLAN member set of the port.                                                                                                                                |
| none      | No native VLAN specified. This option removes the native VLAN from the port and sets the acceptable frame types to vlan-tagged only. Note: Use the <b>no</b> variant of this command to revert to the default VLAN 1 as the native VLAN for the specified interface switchport - not <b>none</b> . |

**Default** VLAN 1 (the default VLAN), which is reverted to using the **no** form of this command.

**Mode** Interface Configuration

**Examples** To set the native VLAN on interface port1.0.2 to VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk native vlan 2
```

To remove the native VLAN from interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk native vlan none
```

To reset the native VLAN on interface port1.0.2 to the default VLAN 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport trunk native vlan
```

**Command changes** Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

# switchport vlan translation

- Overview** Use this command to configure a VLAN translation entry on an interface that supports tagged packets. Create an entry to set either:
- VLAN ID translation: This sets the port to translate a packet's VLAN ID between the one seen on the wire and an internal VID.
  - VLAN double-tagging: This enables VLAN double-tagging on the port and specifies the outer-tag VID to be added to packets received on the port. (VLAN double-tagging is also known as VLAN stacking, nested VLANs, or Q-in-Q.)
  - Both VLAN ID translation and VLAN double tagging: This both adds an outer-tag VID and translates the inner-tag VID between the wire-VID and the internal VID.

You can create multiple translation entries for a port.

Use the **no** variant of this command to remove all translation entries or a specific entry.

**Syntax** switchport vlan translation vlan *<wire-vid>* vlan *<vid>*  
switchport vlan translation vlan *<wire-vid>* outer-vlan *<outer-tag-vid>*  
switchport vlan translation vlan *<wire-vid>* vlan *<vid>* outer-vlan *<outer-tag-vid>*  
no switchport vlan translation [*all*|vlan *<wire-vid>*]

| Parameter                               | Description                                                       |
|-----------------------------------------|-------------------------------------------------------------------|
| vlan <i>&lt;wire-vid&gt;</i>            | VLAN-ID of the packet as it is seen on the wire.                  |
| vlan <i>&lt;vid&gt;</i>                 | VLAN-ID of the VLAN as it was assigned when the VLAN was created. |
| outer-vlan <i>&lt;outer-tag-vid&gt;</i> | Enable double-tagging with the specified VID as the outer tag.    |
| all                                     | Delete all translation entries.                                   |

**Default** None (By default, no translation entries exist.)

**Mode** Interface Configuration for a switch port, a static channel group, or a dynamic (LACP) channel group. Switch ports must be trunked.

**Usage notes** This command configures trunked ports only. One or more translation entries can be added to a port. For information on double-tagging on access ports, and for more information about VLAN ID translation and VLAN double-tagging on trunk ports, see the [VLAN Feature Overview and Configuration Guide](#).

**Example** To translate between internal VLAN100 and wire-VID 200 on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport vlan translation vlan 200 vlan 100
```

To add a translation entry to port1.0.1 for wire-VID 200 to add an outer-tag VID of 300 to packets received on the switch port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport vlan translation vlan 200
outer-vlan 300
```

To add a translation entry to port1.0.1 for wire-VID 200 to translate between it and an internal VID of 100 and to add an outer-tag VID of 300, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport vlan translation vlan 200 vlan 100 outer-vlan 300
```

To remove a translation entry from port1.0.1 for wire-VID 200, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no switchport vlan translation vlan 200
```

To remove all translation entries from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no switchport vlan translation all
```

- [switchport mode trunk](#)
- [switchport vlan translation default drop](#)

**Command changes**

- Version 5.4.8-0.2: added to SBx908 GEN2, x930 Series products
- Version 5.4.8-1.1: added to SBx8100 Series products
- Version 5.4.9-0.1: added to x530 Series products
- Version 5.4.9-1.1: added **outer-vlan** parameter for SBx908 GEN2, x950, x930, x510, x510L, IE510-28GSX and IE300 Series switches.
- Version 5.5.0-2.1: added **outer-vlan** parameter for x530 Series switches.

# switchport vlan translation default drop

**Overview** Use this command to drop inbound tagged packets if their VLAN-ID does not match any entries in the VLAN translation table for an interface.

Use the **no** variant of this command to stop dropping non-matching inbound packets and let them be accepted as is for further processing.

**Syntax** switchport vlan translation default drop  
no switchport vlan translation default drop

**Default** Do not drop packets

**Mode** Interface Configuration for a switch port or a static channel group, or a dynamic (LACP) channel group. The interface must be in a mode that supports tagged packets.

**Example** To drop inbound tagged packets arriving at port1.0.1 unless they match a VLAN translation entry, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# interface port1.0.1
```

```
awplus(config-if)# switchport vlan translation default drop
```

To accept inbound tagged packets arriving at port1.0.1 regardless of whether they match a VLAN translation entry, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# interface port1.0.1
```

```
awplus(config-if)# no switchport vlan translation default drop
```

**Related commands** [show interface switchport vlan translation](#)

Version 5.4.9-0.1: added to x530 Series products

# switchport vlan-stacking (double-tagging)

**Overview** Use this command to enable VLAN stacking on a port and set it to be a customer-edge-port or provider-port. This is sometimes referred to as VLAN double-tagging, nested VLANs, or Q in Q.

Use **no** parameter with this command to disable VLAN stacking on an interface. The port must be in access mode.

**Syntax** switchport vlan-stacking {customer-edge-port|provider-port}  
no switchport vlan-stacking

| Parameter          | Description                                                                        |
|--------------------|------------------------------------------------------------------------------------|
| customer-edge-port | Set the port to be a customer edge port. This port must already be in access mode. |
| provider-port      | Set the port to be a provider port. This port must already be in trunk mode.       |

**Default** By default, ports are not VLAN stacking ports.

**Mode** Interface Configuration

**Usage** Use VLAN stacking to separate traffic from different customers so that they can be managed over a provider network.

For more information about how to configure this feature, see the [VLAN Feature Overview and Configuration Guide](#).

Note that you must also enable jumbo frame support on the customer edge port, by using the [platform jumboframe](#) command.

Traffic with an extra VLAN header added by VLAN stacking cannot be routed.

**Example** To apply vlan-stacking to the selected port, configure it to be a customer edge port, and turn on jumbo frames, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport vlan-stacking customer-edge-port
awplus(config-if)# platform jumboframe
```

**Related commands** [platform jumboframe](#)

# switchport voice dscp

**Overview** Use this command for a specific port to configure the Layer 3 DSCP value advertised when the transmission of LLDP-MED Network Policy TLVs for voice devices is enabled. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified DSCP value.

Use the **no** variant of this command to reset the DSCP value to the default, 0.

**Syntax** `switchport voice dscp <0-63>`  
`no switchport voice dscp`

| Parameter | Description                          |
|-----------|--------------------------------------|
| dscp      | Specify a DSCP value for voice data. |
| <0 - 63>  | DSCP value.                          |

**Default** A DSCP value of 0 will be advertised.

**Mode** Interface Configuration

**Usage notes** LLDP-MED advertisements including Network Policy TLVs are transmitted via a port if:

- LLDP is enabled (`lldp run` command)
- Voice VLAN is configured for the port (`switchport voice vlan` command)
- The port is configured to transmit LLDP advertisements—enabled by default (`lldp transmit receive` command)
- The port is configured to transmit Network Policy TLVs—enabled by default (`lldp med-tlv-select` command)
- There is an LLDP-MED device connected to the port

**Example** To tell IP phones connected to port1.0.2 to send voice data with DSCP value 27, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport voice dscp 27
```

**Related commands** `lldp med-tlv-select`  
`show lldp`  
`switchport voice vlan`

# switchport voice vlan

**Overview** Use this command to configure the Voice VLAN tagging advertised when the transmission of LLDP-MED Network Policy TLVs for voice endpoint devices is enabled. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified tagging. This command also sets the ports to be spanning tree edge ports, that is, it enables spanning tree portfast on the ports.

Use the **no** variant of this command to remove LLDP-MED network policy configuration for voice devices connected to these ports. This does not change the spanning tree edge port status.

**Syntax** `switchport voice vlan [<vid>|dot1p|dynamic|untagged]`  
`no switchport voice vlan`

| Parameter | Description                                                                                                                                                                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <vid>     | VLAN identifier, in the range 1 to 4094.                                                                                                                                                                                                      |
| dot1p     | The IP phone should send User Priority tagged packets, that is, packets in which the tag contains a User Priority value, and a VID of 0. (The User Priority tag is also known as the 802.1p priority tag, or the Class of Service (CoS) tag.) |
| dynamic   | The VLAN ID with which the IP phone should send tagged packets will be assigned by RADIUS authentication.                                                                                                                                     |
| untagged  | The IP phone should send untagged packets.                                                                                                                                                                                                    |

**Default** By default, no Voice VLAN is configured, and therefore no network policy is advertised for voice devices.

**Mode** Interface Configuration

**Usage notes** LLDP-MED advertisements including Network Policy TLVs are transmitted via a port if:

- LLDP is enabled (`lldp run` command)
- Voice VLAN is configured for the port using this command (`switchport voice vlan`)
- The port is configured to transmit LLDP advertisements—enabled by default (`lldp transmit receive` command)
- The port is configured to transmit Network Policy TLVs—enabled by default (`lldp med-tlv-select` command)
- There is an LLDP-MED device connected to the port.

To set the priority value to be advertised for tagged frames, use the `switchport voice vlan priority` command.

If the Voice VLAN details are to be assigned by RADIUS, then the RADIUS server must be configured to send the attribute "Egress-VLANID (56)" or "Egress-VLAN-Name (58)" in the RADIUS Accept message when authenticating a phone attached to this port.

To set these attributes on the local RADIUS server, use the [egress-vlan-id](#) command or the [egress-vlan-name](#) command.

For more information about configuring authentication for Voice VLAN, see the [LLDP Feature Overview and Configuration Guide](#).

If the ports have been set to be edge ports by the [switchport voice vlan](#) command, the **no** variant of this command will leave them unchanged as edge ports. To set them back to their default non-edge port configuration, use the [spanning-tree edgeport \(RSTP and MSTP\)](#) command.

**Examples** To tell IP phones connected to port1.0.4 to send voice data tagged for VLAN 10, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# switchport voice vlan 10
```

To tell IP phones connected to port1.0.2-port1.0.8 to send priority tagged packets (802.1p priority tagged with VID 0, so that they will be assigned to the port VLAN) use the following commands. The priority value is 5 by default, but can be configured with the [switchport voice vlan priority](#) command.

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.8
awplus(config-if)# switchport voice vlan dot1p
```

To dynamically configure the VLAN ID advertised to IP phones connected to port1.0.1 based on the VLAN assigned by RADIUS authentication (with RADIUS attribute "Egress-VLANID" or "Egress-VLAN-Name" in the RADIUS accept packet), use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport voice vlan dynamic
```

To remove the Voice VLAN, and therefore disable the transmission of LLDP-MED network policy information for voice devices on port1.0.8, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.8
awplus(config-if)# no switchport voice vlan
```

**Related  
commands**

[egress-vlan-id](#)  
[egress-vlan-name](#)  
[lldp med-tlv-select](#)  
[spanning-tree edgeport \(RSTP and MSTP\)](#)

switchport voice dscp  
switchport voice vlan priority  
show lldp

# switchport voice vlan priority

**Overview** Use this command to configure the Layer 2 user priority advertised when the transmission of LLDP-MED Network Policy TLVs for voice devices is enabled. This is the priority in the User Priority field of the IEEE 802.1Q VLAN tag, also known as the Class of Service (CoS), or 802.1p priority. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified priority.

**Syntax** switchport voice vlan priority <0-7>  
no switchport voice vlan priority

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| priority  | Specify a user priority value for voice data. |
| <0 - 7>   | Priority value.                               |

**Default** By default, the Voice VLAN user priority value is 5.

**Mode** Interface Configuration

**Usage** LLDP-MED advertisements including Network Policy TLVs are transmitted via a port if:

- LLDP is enabled ([lldp run](#) command)
- Voice VLAN is configured for the port ([switchport voice vlan](#) command)
- The port is configured to transmit LLDP advertisements—enabled by default ([lldp transmit receive](#) command)
- The port is configured to transmit Network Policy TLVs—enabled by default ([lldp med-tlv-select](#) command)
- There is an LLDP-MED device connected to the port.

To set the Voice VLAN tagging to be advertised, use the [switchport voice vlan](#) command.

**Example** To remove the Voice VLAN, and therefore disable the transmission of LLDP-MED network policy information for voice devices on port1.0.6, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.6
awplus(config-if)# no switchport voice vlan
```

**Related commands** [lldp med-tlv-select](#)  
[show lldp](#)  
[switchport voice vlan](#)

# vlan

**Overview** This command creates VLANs, assigns names to them, and enables or disables them. Disabling the VLAN causes all forwarding over the specified VLAN ID to cease. Enabling the VLAN allows forwarding of frames on the specified VLAN.

You can create a management-only VLAN that contains only one member port and may be used as a remote management port. Management-only VLANs process packets in the CPU rather than in hardware. See the parameter table below for more detail.

If you need to control ingress and egress traffic to and from management interfaces, you can use software-based ACLs to filter traffic to and from a management-only VLAN.

The **no** variant of this command destroys the specified VLANs or returns their MTU to the default.

**Syntax**

```
vlan <vid> [name <vlan-name>] [state {enable|disable|management-only}]
vlan <vid-range> [state {enable|disable|management-only}]
vlan {<vid>|<vlan-name>} [mtu <mtu-value>]
no vlan {<vid>|<vid-range>} [mtu]
```

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <vid>           | The VID of the VLAN to enable or disable, in the range 1-4094.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <vlan-name>     | The ASCII name of the VLAN. Maximum length: 32 characters.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <vid-range>     | Specifies a range of VLAN identifiers.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <mtu-value>     | Specifies the Maximum Transmission Unit (MTU) size in bytes, in the range 68 to 1500 bytes, for the VLAN.                                                                                                                                                                                                                                                                                                                                                                         |
| enable          | Puts the VLAN into an enabled state.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| disable         | Puts the VLAN into a disabled state.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| management-only | Management-only VLANs are VLANs which: <ul style="list-style-type: none"><li>• have one and only one access port (no aggregators, trunk port etc.)</li><li>• do not route to/from other interfaces.</li><li>• process packets in the CPU, rather than in hardware.</li><li>• cannot be converted to a normal VLAN, nor can a normal VLAN be converted to a management-only VLAN. Delete and re-create the VLAN to convert a normal VLAN to/from a management-only VLAN.</li></ul> |

**Default** By default, VLANs are enabled when they are created.

**Mode** VLAN Configuration

**Examples** To enable VLAN 45, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 45 name accounts state enable
```

To destroy VLAN 45, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no vlan 45
```

To create a management-only VLAN with VID 100, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100 state management-only
```

**Related commands**

- [vlan database](#)
- [show vlan](#)

**Command changes**

- Version 5.4.9-2.1: Parameter **management-only** added
- Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

# vlan access-map

**Overview** Use this command to create a VLAN access-map and enter into VLAN access-map mode, so you can add ACLs to the map. You can use any IPv4 or IPv6 hardware ACLs. VLAN access-maps are used to attach ACLs to VLANs, and therefore to filter traffic as it ingresses VLANs.

See the [ACL Feature Overview and Configuration Guide](#) for more information, including information about the number of rules consumed by per-VLAN ACLs, and ACL processing order.

Use the **no** variant of this command to delete a VLAN access-map.

**Syntax** `vlan access-map <name>`  
`no vlan access-map <name>`

| Parameter | Description                |
|-----------|----------------------------|
| <name>    | A name for the access-map. |

**Default** By default, no VLAN access-maps exist.

**Mode** Global Configuration

**Example** To apply ACL 3001 to VLAN 48, where the ACL drops IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 3001 deny ip any any
awplus(config)# vlan access-map deny_all
awplus(config-vlan-access-map)# match access-group 3001
awplus(config-vlan-access-map)# exit
awplus(config)# vlan filter deny_all vlan-list 48 input
```

**Related commands** [match access-group](#)  
[show vlan access-map](#)  
[vlan filter](#)

**Command changes** Version 5.4.6-2.1: command added

# vlan classifier activate

**Overview** Use this command in Interface Configuration mode to associate a VLAN classifier group with the switch port.

Use the **no** variant of this command to remove the VLAN classifier group from the switch port.

**Syntax** `vlan classifier activate <vlan-class-group-id>`  
`no vlan classifier activate <vlan-class-group-id>`

| Parameter                                | Description                                                     |
|------------------------------------------|-----------------------------------------------------------------|
| <code>&lt;vlan-class-group-id&gt;</code> | Specify a VLAN classifier group identifier in the range <1-16>. |

**Mode** Interface Configuration mode for a switch port or link aggregator.

**Usage notes** See the protocol-based VLAN configuration example in the [VLAN Feature Overview and Configuration Guide](#) for configuration details.

**Example** To associate VLAN classifier group 3 with switch port1.0.3, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# vlan classifier activate 3
```

To remove VLAN classifier group 3 from switch port1.0.3, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# no vlan classifier activate 3
```

**Related commands** [show vlan classifier rule](#)  
[vlan classifier group](#)  
[vlan classifier rule ipv4](#)  
[vlan classifier rule proto](#)

# vlan classifier group

**Overview** Use this command to create a group of VLAN classifier rules. The rules must already have been created.

Use the **no** variant of this command to delete a group of VLAN classifier rules.

**Syntax** `vlan classifier group <1-16> {add|delete} rule  
<vlan-class-rule-id>  
no vlan classifier group <1-16>`

| Parameter            | Description                          |
|----------------------|--------------------------------------|
| <1-16>               | VLAN classifier group identifier     |
| add                  | Add the rule to the group.           |
| delete               | Delete the rule from the group.      |
| <vlan-class-rule-id> | The VLAN classifier rule identifier. |

**Mode** Global Configuration

**Example** `awplus# configure terminal  
awplus(config)# vlan classifier group 3 add rule 5`

**Related commands** [show vlan classifier rule](#)  
[vlan classifier activate](#)  
[vlan classifier rule ipv4](#)  
[vlan classifier rule proto](#)

# vlan classifier rule ipv4

**Overview** Use this command to create an IPv4 subnet-based VLAN classifier rule and map it to a specific VLAN. Use the **no** variant of this command to delete the VLAN classifier rule.

**Syntax** `vlan classifier rule <1-256> ipv4 <ip-addr/prefix-length> vlan <1-4094>`  
`no vlan classifier rule <1-256>`

| Parameter               | Description                                                                    |
|-------------------------|--------------------------------------------------------------------------------|
| <1 - 256>               | Specify the VLAN Classifier Rule identifier.                                   |
| <ip-addr/prefix-length> | Specify the IP address and prefix length.                                      |
| <1 - 4094>              | Specify a VLAN ID to which an untagged packet is mapped in the range <1-4094>. |

**Mode** Global Configuration

**Usage notes** If the source IP address matches the IP subnet specified in the VLAN classifier rule, the received packets are mapped to the specified VLAN.

**NOTE:** The subnet VLAN classifier only matches IPv4 packets. It does not match ARP packets. To ensure ARP traffic is classified into the correct subnet VLAN, you can use a hardware based policy map that sends ARP packets to the CPU, which will then process them appropriately. This means that if you use subnet-based VLANs, you should also configure the following:

**NOTE:** The policy map should be applied to each port that uses a subnet based VLAN using the service-policy input command:

**Example** `awplus# configure terminal`  
`awplus(config)# vlan classifier rule 3 ipv4 3.3.3.3/8 vlan 5`

**Related commands** `show vlan classifier rule`  
`vlan classifier activate`  
`vlan classifier rule proto`

## vlan classifier rule proto

**Overview** Use this command to create a protocol type-based VLAN classifier rule, and map it to a specific VLAN. See the published IANA EtherType IEEE 802 numbers here:

[www.iana.org/assignments/ieee-802-numbers/ieee-802-numbers.txt](http://www.iana.org/assignments/ieee-802-numbers/ieee-802-numbers.txt).

Instead of a protocol name the decimal value of the protocol's EtherType can be entered. The EtherType field is a two-octet field in an Ethernet frame. It is used to show which protocol is encapsulated in the payload of the Ethernet frame. Note that EtherTypes in the IANA 802 numbers are given as hexadecimal values.

The **no** variant of this command removes a previously set rule.

**Syntax** `vlan classifier rule <1-256> proto <protocol> encap {ethv2|nosnapllc|snapllc} vlan <1-4094>`  
`no vlan classifier rule <1-256>`

| Parameter                     | Description                                                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------------|
| <1 - 256>                     | VLAN Classifier identifier                                                                           |
| proto                         | Protocol type                                                                                        |
| <protocol>                    | Specify a protocol either by its decimal number (0-65535) or by one of the following protocol names: |
| [arp   2054]                  | Address Resolution protocol                                                                          |
| [atalkarp   33011]            | Appletalk AARP protocol                                                                              |
| [atalkddp   32923]            | Appletalk DDP protocol                                                                               |
| [atmmulti   34892]            | MultiProtocol Over ATM protocol                                                                      |
| [atmtransport   34948]        | Frame-based ATM Transport protocol                                                                   |

| nosnapllc              | LLC without SNAP encapsulation                                                |
| snapllc                | LLC SNAP encapsulation                                                        |
| <1 - 4094>             | Specify a VLAN ID to which an untagged packet is mapped in the range <1-4094> |

**Mode** Global Configuration

**Usage notes** If the protocol type matches the protocol specified in the VLAN classifier rule, the received packets are mapped to the specified VLAN. Ethernet Frame Numbers may be entered in place of the protocol names listed. For a full list please refer to the IANA list online:  
[www.iana.org/assignments/ieee-802-numbers/ieee-802-numbers.txt](http://www.iana.org/assignments/ieee-802-numbers/ieee-802-numbers.txt)

**Example**   awplus# configure terminal  
awplus(config)# vlan classifier rule 1 proto x25 encaps ethv2  
vlan 2  
awplus(config)# vlan classifier rule 2 proto 512 encaps ethv2  
vlan 2  
awplus(config)# vlan classifier rule 3 proto 2056 encaps ethv2  
vlan 2  
awplus(config)# vlan classifier rule 4 proto 2054 encaps ethv2  
vlan 2

**Validation  
Output**   awplus# show vlan classifier rule

```
vlan classifier rule 16 proto rarp encaps ethv2 vlan 2

vlan classifier rule 8 proto encaps ethv2 vlan 2

vlan classifier rule 4 proto arp encaps ethv2 vlan 2

vlan classifier rule 3 proto xeroxpup encaps ethv2 vlan 2
vlan classifier rule 2 proto ip encaps ethv2 vlan 2
vlan classifier rule 1 proto ipv6 encaps ethv2 vlan 2
```

**Related  
commands**   show vlan classifier rule  
vlan classifier activate  
vlan classifier group

# vlan database

**Overview** Use this command to enter the VLAN Configuration mode. You can then add or delete a VLAN, or modify its values.

**Syntax** `vlan database`

**Mode** Global Configuration

**Example** In the following example, note the change to VLAN Configuration mode from Global Configuration mode:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)#
```

**Related commands** [vlan](#)

**Command changes** Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

# vlan filter

**Overview** Use this command to apply a VLAN access-map to a list of VLANs. The switch uses the ACLs in the access-map to filter traffic ingressing those VLANs.

See the [ACL Feature Overview and Configuration Guide](#) for more information, including information about the number of rules consumed by per-VLAN ACLs, and ACL processing order.

Use the **no** variant of this command to remove the access-map filter from the listed VLANs.

**Syntax** `vlan filter <access-map-name> vlan-list <vid> input`  
`no vlan filter <access-map-name> vlan-list <vid> input`

| Parameter                            | Description                                                                                                                                                                                     |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;access-map-name&gt;</code> | The name of the VLAN access-map to apply to the specified list of VLANs                                                                                                                         |
| <code>vlan-list &lt;vid&gt;</code>   | The list of VLANs to filter. You can specify a single VLAN (e.g. 49), a comma-separated list of VLANs (e.g. 49, 51), a hyphenated range of VLANs (e.g. 49-51), or a combination (e.g. 49,51-53) |
| <code>input</code>                   | Apply the filter to ingress traffic                                                                                                                                                             |

**Default** By default, no VLAN filters exist.

**Mode** Global Configuration

**Example** To apply ACL 3001 to VLAN 48, where the ACL drops IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 3001 deny ip any any
awplus(config)# vlan access-map deny_all
awplus(config-vlan-access-map)# match access-group 3001
awplus(config-vlan-access-map)# exit
awplus(config)# vlan filter deny_all vlan-list 48 input
```

**Related commands** [match access-group](#)  
[show vlan filter](#)  
[vlan access-map](#)

**Command changes** Version 5.4.6-2.1: command added

## vlan mode stack-local-vlan

**Overview** This command enables you to create stack-local-VLANs and use ICMP to monitor and diagnose issues within specific members of the stack. When a VLAN is added using this method, all its traffic will be trapped to and processed by the CPU of the specific local stack member, rather than the CPU of the stack master.

The **no** variant of this command destroys the specified VLAN.

**Syntax** `vlan <vid> mode stack-local-vlan <member-id>`  
`no vlan <vid>`

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <vid>                 | The VID of the VLAN to be created in the range 2-4094. We recommend that the first stack-local-vlan be assigned the number 4001 for the first stack member, then incremented by one for each stack member. For example, a stack of four members would be assigned the following VID numbers: <ul style="list-style-type: none"><li>• stack member one: VID 4001</li><li>• stack member two: VID 4002</li><li>• stack member three: VID 4003</li><li>• stack member four: VID 4004</li></ul> |
| mode stack-local-vlan | Specifies that the new VLAN will function as a stack-local-VLAN.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <member-id>           | Specifies the stack member ID. Enter a decimal number in the range 1-8.                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Default** By default, VLANs are automatically enabled as they are added.

**Mode** VLAN Configuration

**Usage notes** If IGMP snooping is operating on a stack-local-VLAN, the device will try to process some multicast traffic via that VLAN, if it is connected to a Microsoft Windows PC. To avoid this, we recommend disabling IGMP snooping on stack-local-VLANs, by using the command **no ip igmp snooping**.

**Examples** To add a stack-local-VLAN with the VID of 4002 and assign it to stack member 2, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 4002 mode stack-local-vlan 2
awplus(config-vlan)# exit
awplus(config)# interface vlan4002
awplus(config-if)# no ip igmp snooping
```

To remove VLAN 4002, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no vlan 4002
```

**Related  
commands**

[vlan database](#)

# vlan statistics

**Overview** This command creates a VLAN packet counter instance, and enables you to add one or more ports to a defined counter instance. This command can only be applied to switch ports. You cannot apply it to aggregated links or eth ports.

The **no** variant of this command enables the deletion of VLAN packet counter instances, or for removing one or more ports that are currently mapped to a counter instance. Note that the selected range of ports must all be switch ports.

**NOTE:** In describing this command, the terms *frame* and *packet* are used interchangeably.

**Syntax** `vlan <vid> statistics name <instance-name>`  
`no vlan statistics name <instance-name>`

| Parameter       | Description                                                                     |
|-----------------|---------------------------------------------------------------------------------|
| <vid>           | The VID of the VLAN that is associated with <instance-name>.                    |
| <instance-name> | The name of the instance for which incoming frames and their bytes are counted. |

**Mode** Interface Configuration

**Usage notes** A maximum of 128 packet counter instances can be created. When the first instance is configured, the switch will reserve sufficient resources to support 128 packet counter instances. These resources are also shared with other features such as QoS and ACLs. Where the remaining resources are insufficient to support the VLAN Statistics feature the feature will not be enabled, and an error message will display.

**Examples** To create a VLAN packet counter instance named "vlan2-data", and apply this to count incoming vlan2 tagged frames on port1.0.3 and port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3,port1.0.4
awplus(config-if)# vlan 2 statistics name vlan2-data
```

To extend the previous example by adding port1.0.1 and port1.0.2 to the VLAN packet counter instance, use the following commands. The vlan2-data instance will now count all incoming vlan2 tagged frames on ports within the range port1.0.1 to port1.0.4

```
awplus(config)# interface port1.0.1-port1.0.2
awplus(config-if)# vlan 2 statistics name vlan2-data
```

To remove port1.0.4 from the packet counter instance named vlan2-data, use the commands:

```
awplus(config)# interface port1.0.4
```

```
awplus(config-if)# no vlan statistics name vlan2-data
```

To remove the remaining ports port1.0.1 to port1.0.3 from the packet counter instance named vlan2-data, use the following commands. Note that because there will then be no ports associated with the vlan2-data, this instance will be removed.

```
awplus(config)# interface port1.0.1-port1.0.3
```

```
awplus(config-if)# no vlan statistics name vlan2-data
```

# clear spanning-tree statistics

**Overview** Use this command to clear all the STP BPDU (Bridge Protocol Data Unit) statistics.

**Syntax** `clear spanning-tree statistics`  
`clear spanning-tree statistics [instance <mstp-instance>]`  
`clear spanning-tree statistics [interface <port> [instance <mstp-instance>]]`

| Parameter       | Description                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port>          | The port to clear STP BPDU statistics for. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |
| <mstp-instance> | The MSTP instance (MSTI - Multiple Spanning Tree Instance) to clear MSTP BPDU statistics.                                                                                   |

**Mode** User Exec and Privileged Exec

**Usage notes** Use this command with the **instance** parameter in MSTP mode. Specifying this command with the **interface** parameter only not the instance parameter will work in STP and RSTP mode.

**Examples** `awplus# clear spanning-tree statistics`  
`awplus# clear spanning-tree statistics instance 1`  
`awplus# clear spanning-tree statistics interface port1.0.2`  
`awplus# clear spanning-tree statistics interface port1.0.2 instance 1`

# clear spanning-tree detected protocols (RSTP and MSTP)

**Overview** Use this command to clear the detected protocols for a specific port, or all ports.  
Use this command in RSTP or MSTP mode only.

**Syntax** `clear spanning-tree detected protocols [interface <port>]`

| Parameter | Description                                                                                                                                                                |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port>    | The port to clear detected protocols for. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |

**Mode** Privileged Exec

**Example** `awplus# clear spanning-tree detected protocols`

## debug mstp (RSTP and STP)

**Overview** Use this command to enable debugging for the configured spanning tree mode, and echo data to the console, at various levels. Note that although this command uses the keyword **mstp** it displays debugging output for RSTP and STP protocols as well the MSTP protocol.

Use the **no** variant of this command to disable spanning tree debugging.

**Syntax**

```
debug mstp {all|cli|protocol [detail]|timer [detail]}
debug mstp {packet {rx|tx} [decode] [interface <interface>]}
debug mstp {topology-change [interface <interface>]}
no debug mstp {all|cli|protocol [detail]|timer [detail]}
no debug mstp {packet {rx|tx} [decode] [interface <interface>]}
no debug mstp {topology-change [interface <interface>]}
```

| Parameter       | Description                                                             |
|-----------------|-------------------------------------------------------------------------|
| all             | Echoes all spanning tree debugging levels to the console.               |
| cli             | Echoes spanning tree commands to the console.                           |
| packet          | Echoes spanning tree packets to the console.                            |
| rx              | Received packets.                                                       |
| tx              | Transmitted packets.                                                    |
| protocol        | Echoes protocol changes to the console.                                 |
| timer           | Echoes timer information to the console.                                |
| detail          | Detailed output.                                                        |
| decode          | Interprets packet contents                                              |
| topology-change | Interprets topology change messages                                     |
| interface       | Keyword before <interface> placeholder to specify an interface to debug |
| <interface>     | Placeholder used to specify the name of the interface to debug.         |

**Mode** Privileged Exec and Global Configuration mode

**Usage 1** Use the **debug mstp topology-change interface** command to generate debugging messages when the device receives an indication of a topology change in a BPDU from another device. The debugging can be activated on a per-port basis. Although this command uses the keyword **mstp**, it displays debugging output for RSTP and STP protocols as well as the MSTP protocol.

Due to the likely volume of output, these debug messages are best viewed using the [terminal monitor](#) command before issuing the relevant **debug mstp**

command. The default terminal monitor filter will select and display these messages. Alternatively, the messages can be directed to any of the other log outputs by adding a filter for the MSTP application using [log buffered \(filter\)](#) command:

```
awplus# configure terminal
awplus(config)# log buffered program mstp
```

### Output 1

```
awplus#terminal monitor
awplus#debug mstp topology-change interface port1.0.4
10:09:09 awplus MSTP[1409]: Topology change rcvd on port1.0.4 (internal)
10:09:09 awplus MSTP[1409]: Topology change rcvd on MSTI 1 port1.0.4
awplus#debug mstp topology-change interface port1.0.6
10:09:29 awplus MSTP[1409]: Topology change rcvd on port1.0.6 (external)
10:09:29 awplus MSTP[1409]: Topology change rcvd on MSTI 1 port1.0.6
```

**Usage 2** Use the **debug mstp packet rx|tx decode interface** command to generate debugging messages containing the entire contents of a BPDU displayed in readable text for transmitted and received xSTP BPDUs. The debugging can be activated on a per-port basis and transmit and receive debugging is controlled independently. Although this command uses the keyword **mstp**, it displays debugging output for RSTP and STP protocols as well as the MSTP protocol.

Due to the likely volume of output, these debug messages are best viewed using the [terminal monitor](#) command before issuing the relevant **debug mstp** command. The default terminal monitor filter will select and display these messages. Alternatively, the messages can be directed to any of the other log outputs by adding a filter for the MSTP application using the [log buffered \(filter\)](#) command:

```
awplus(config)# log buffered program mstp
```

**Output 2** In MSTP mode - an MSTP BPDU with 1 MSTI:

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.0.4
17:23:42 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - start
17:23:42 awplus MSTP[1417]: Protocol version: MSTP, BPDU type: RST
17:23:42 awplus MSTP[1417]: CIST Flags: Agree Forward Learn role=Desig
17:23:42 awplus MSTP[1417]: CIST root id : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST ext pathcost : 0
17:23:42 awplus MSTP[1417]: CIST reg root id : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST port id : 8001 (128:1)
17:23:42 awplus MSTP[1417]: msg age: 0 max age: 20 hellotime: 2 fwd delay: 15
17:23:42 awplus MSTP[1417]: Version 3 length : 80
17:23:42 awplus MSTP[1417]: Format id : 0
17:23:42 awplus MSTP[1417]: Config name : test
17:23:42 awplus MSTP[1417]: Revision level : 0
17:23:42 awplus MSTP[1417]: Config digest : 3ab68794d602fdf43b21c0b37ac3bca8
17:23:42 awplus MSTP[1417]: CIST int pathcost : 0
17:23:42 awplus MSTP[1417]: CIST bridge id : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST hops remaining : 20
17:23:42 awplus MSTP[1417]: MSTI flags : Agree Forward Learn role=Desig
17:23:42 awplus MSTP[1417]: MSTI reg root id : 8001:0000cd1000fe
17:23:42 awplus MSTP[1417]: MSTI pathcost : 0
17:23:42 awplus MSTP[1417]: MSTI bridge priority : 32768 port priority : 128
17:23:42 awplus MSTP[1417]: MSTI hops remaining : 20
17:23:42 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - finish
```

In STP mode transmitting a TCN BPDU:

```
awplus#terminal monitor
awplus#debug mstp packet tx decode interface port1.0.4
17:28:09 awplus MSTP[1417]: port1.0.4 xSTP BPDU tx - start
17:28:09 awplus MSTP[1417]: Protocol version: STP, BPDU type: TCN
17:28:09 awplus MSTP[1417]: port1.0.4 xSTP BPDU tx - finish
```

In STP mode receiving an STP BPDU:

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.0.4
17:31:36 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - start
17:31:36 awplus MSTP[1417]: Protocol version: STP, BPDU type: Config
17:31:36 awplus MSTP[1417]: Flags: role=none
17:31:36 awplus MSTP[1417]: Root id : 8000:0000cd1000fe
17:31:36 awplus MSTP[1417]: Root pathcost : 0
17:31:36 awplus MSTP[1417]: Bridge id : 8000:0000cd1000fe
17:31:36 awplus MSTP[1417]: Port id : 8001 (128:1)
17:31:36 awplus MSTP[1417]: msg age: 0 max age: 20 hellotime: 2 fwd delay: 15
17:31:36 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - finish
```

In RSTP mode receiving an RSTP BPDU:

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.0.4
awplus#17:30:17 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - start
17:30:17 awplus MSTP[1417]: Protocol version: RSTP, BPDU type: RST
17:30:17 awplus MSTP[1417]: CIST Flags: Forward Learn role=Desig
17:30:17 awplus MSTP[1417]: CIST root id : 8000:0000cd1000fe
17:30:17 awplus MSTP[1417]: CIST ext pathcost : 0
17:30:17 awplus MSTP[1417]: CIST reg root id : 8000:0000cd1000fe
17:30:17 awplus MSTP[1417]: CIST port id : 8001 (128:1)
17:30:17 awplus MSTP[1417]: msg age: 0 max age: 20 hellotime: 2 fwd delay: 15
17:30:17 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - finish
```

**Examples**

```
awplus# debug mstp all
awplus# debug mstp cli
awplus# debug mstp packet rx
awplus# debug mstp protocol detail
awplus# debug mstp timer
awplus# debug mstp packet rx decode interface port1.0.2

# instance priority (MSTP)

**Overview** Use this command to set the priority for this device to become the root bridge for the specified MSTI (Multiple Spanning Tree Instance).

Use this command for MSTP only.

Use the **no** variant of this command to restore the root bridge priority of the device for the instance to the default.

**Syntax** `instance <instance-id> priority <priority>`  
`no instance <instance-id> priority`

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;instance-id&gt;</code> | Specify an MSTP instance in the range 1-15.                                                                                                                                                                                                                                                                                                                                |
| <code>&lt;priority&gt;</code>    | Specify the root bridge priority for the device for the MSTI in the range <0 - 61440>. Note that a lower priority number indicates a greater likelihood of the device becoming the root bridge. The priority values can be set only in increments of 4096. If you specify a number that is not a multiple of 4096, it will be rounded down. The default priority is 32768. |

**Default** The default priority value for all instances is 32768.

**Mode** MST Configuration

**Usage notes** MSTP lets you distribute traffic more efficiently across a network by blocking different links for different VLANs. You do this by making different devices into the root bridge for each MSTP instance, so that each instance blocks a different link.

If all devices have the same root bridge priority for the instance, MSTP selects the device with the lowest MAC address to be the root bridge. Give the device a higher priority for becoming the root bridge for a particular instance by assigning it a lower priority number, or vice versa.

**Examples** To set the root bridge priority for MSTP instance 2 to be the highest (0), so that it will be the root bridge for this instance when available, use the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# instance 2 priority 0
```

To reset the root bridge priority for instance 2 to the default (32768), use the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# no instance 2 priority
```

**Related commands**

- region (MSTP)
- revision (MSTP)
- show spanning-tree mst config
- spanning-tree mst instance
- spanning-tree mst instance priority

# instance vlan (MSTP)

**Overview** Use this command to create an MST Instance (MSTI), and associate the specified VLANs with it. An MSTI is a spanning tree instance that exists within an MST region (MSTR).

When a VLAN is associated with an MSTI the member ports of the VLAN are automatically configured to send and receive spanning-tree information for the associated MSTI. You can disable this automatic configuration of member ports of the VLAN to the associated MSTI by using a **no spanning-tree mst instance** command to remove the member port from the MSTI.

Use the **instance vlan** command for MSTP only.

Use the **no** variant of this command to remove the specified VLANs from the MSTI.

**Syntax** `instance <instance-id> vlan <vid-list>`  
`no instance <instance-id> vlan <vid-list>`

| Parameter     | Description                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <instance-id> | Specify an MSTP instance in the range 1-15.                                                                                                                                                           |
| <vid-list>    | Specify one or more VLAN identifiers (VID) to be associated with the MSTI specified. This can be a single VID in the range 1-4094, or a hyphen-separated range or a comma-separated list of VLAN IDs. |

**Mode** MST Configuration

**Usage notes** The VLANs must be created before being associated with an MST instance (MSTI). If the VLAN range is not specified, the MSTI will not be created.

This command removes the specified VLANs from the CIST and adds them to the specified MSTI. If you use the **no** variant of this command to remove the VLAN from the MSTI, it returns it to the CIST. To move a VLAN from one MSTI to another, you must first use the **no** variant of this command to return it to the CIST.

Ports in these VLANs will remain in the control of the CIST until you associate the ports with the MSTI using the [spanning-tree mst instance](#) command.

**Example** To associate VLAN 30 with MSTI 2, use the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mode mstp
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# instance 2 vlan 30
```

**Related commands**

- revision (MSTP)
- show spanning-tree mst config
- spanning-tree mst instance
- vlan

## region (MSTP)

**Overview** Use this command to assign a name to the device's MST Region. MST Instances (MSTI) of a region form different spanning trees for different VLANs.

Use this command for MSTP only.

Use the **no** variant of this command to remove this region name and reset it to the default.

**Syntax** `region <region-name>`  
`no region`

| Parameter                        | Description                                                                                                           |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <code>&lt;region-name&gt;</code> | Specify the name of the region, up to 32 characters. Valid characters are upper-case, lower-case, digits, underscore. |

**Default** By default, the region name is My Name.

**Mode** MST Configuration

**Usage** The region name, the revision number, and the digest of the VLAN to MSTI configuration table must be the same on all devices that are intended to be in the same MST region.

**Example** `awplus# configure terminal`  
`awplus(config)# spanning-tree mst configuration`  
`awplus(config-mst)# region ATL`

**Related commands** [revision \(MSTP\)](#)  
[show spanning-tree mst config](#)

## revision (MSTP)

**Overview** Use this command to specify the MST revision number to be used in the configuration identifier.

Use this command for MSTP only.

**Syntax** `revision <revision-number>`

| Parameter                            | Description                                   |
|--------------------------------------|-----------------------------------------------|
| <code>&lt;revision-number&gt;</code> | <code>&lt;0-65535&gt;</code> Revision number. |

**Default** The default of revision number is 0.

**Mode** MST Configuration

**Usage** The region name, the revision number, and the digest of the VLAN to MSTI configuration table must be the same on all devices that are intended to be in the same MST region.

**Example**

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# revision 25
```

# show debugging mstp

**Overview** Use this command to see what debugging is turned on for MSTP.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show debugging mstp

**Mode** User Exec and Privileged Exec

**Example** To display the MSTP debugging options set, enter the command:

```
awplus# show debugging mstp
```

**Output** Figure 16-1: Example output from **show debugging mstp**

```
MSTP debugging status:
MSTP receiving packet debugging is on
```

**Related commands** [debug mstp \(RSTP and STP\)](#)

# show spanning-tree

**Overview** Use this command to display detailed spanning tree information on the specified port or on all ports. Use this command for RSTP, MSTP or STP.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show spanning-tree [interface <port-list>]

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface   | Display information about the following port only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <port-list> | The ports to display information about. A port-list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.0.6) a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-1.0.4, or sa1-2, or po1-2</li><li>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.4-1.0.6. Do not mix switch ports, static channel groups, and dynamic (LACP) channel groups in the same list</li></ul> |

**Mode** User Exec and Privileged Exec

**Usage notes** Note that any list of interfaces specified must not span any interfaces that are not installed.

A topology change counter has been included for RSTP and MSTP. You can see the topology change counter for RSTP by using the **show spanning-tree** command. You can see the topology change counter for MSTP by using the **show spanning-tree mst instance** command.

**Example** To display spanning tree information about port1.0.3, use the command:

```
awplus# show spanning-tree interface port1.0.3
```

**Output** Figure 16-2: Example output from **show spanning-tree** in RSTP mode

```

# show spanning-tree brief

**Overview** Use this command to display a summary of spanning tree status information on all ports. Use this command for RSTP, MSTP or STP.

**Syntax** show spanning-tree brief

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| brief     | A brief summary of spanning tree information. |

**Mode** User Exec and Privileged Exec

**Usage notes** Note that any list of interfaces specified must not span any interfaces that are not installed.

A topology change counter has been included for RSTP and MSTP. You can see the topology change counter for RSTP by using the **show spanning-tree** command. You can see the topology change counter for MSTP by using the **show spanning-tree mst instance** command.

**Example** To display a summary of spanning tree status information, use the command:

```
awplus# show spanning-tree brief
```

**Output** Figure 16-4: Example output from **show spanning-tree brief**

|                                                                        |                   |         |            |            |
|------------------------------------------------------------------------|-------------------|---------|------------|------------|
| Default: Bridge up - Spanning Tree Enabled                             |                   |         |            |            |
| Default: Root Path Cost 40000 - Root Port 4501 - Bridge Priority 32768 |                   |         |            |            |

**Related commands** [show spanning-tree mst interface](#)

# show spanning-tree mst config

**Overview** Use this command to display MSTP configuration identifier for the device.

**Syntax** show spanning-tree mst config

**Mode** User Exec, Privileged Exec and Interface Configuration

**Usage notes** The region name, the revision number, and the digest of the VLAN to MSTI configuration table must be the same on all devices that are intended to be in the same MST region.

**Example** To display MSTP configuration identifier information, enter the command:

```
awplus# show spanning-tree mst config
```

**Output** Figure 16-6: Example output from **show spanning-tree mst config**

```
awplus#show spanning-tree mst config
%
% MSTP Configuration Information:
%-----
% Format Id : 0
% Name : My Name
% Revision Level : 0
% Digest : 0x80DEE46DA92A98CF21C603291B22880A
%-----
```

# show spanning-tree mst detail interface

**Overview** This command displays detailed information about the specified switch port, and the MST instances associated with it.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show spanning-tree mst detail interface <port>

| Parameter | Description                                                                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port>    | The port to display information about. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |

**Mode** User Exec, Privileged Exec and Interface Configuration

**Example** To display detailed information about port1.0.3 and the instances associated with it, enter the command:

```
awplus# show spanning-tree mst detail interface port1.0.3
```

**Output** Figure 16-8: Example output from **show spanning-tree mst detail interface**

# show spanning-tree mst instance

**Overview** This command displays detailed information for the specified instance, and all switch ports associated with that instance.

A topology change counter has been included for RSTP and MSTP. You can see the topology change counter for RSTP by using the [show spanning-tree](#) command. You can see the topology change counter for MSTP by using the **show spanning-tree mst instance** command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show spanning-tree mst instance <instance-id>

| Parameter     | Description                                 |
|---------------|---------------------------------------------|
| <instance-id> | Specify an MSTP instance in the range 1-15. |

**Mode** User Exec, Privileged Exec, and Interface Configuration

**Example** To display detailed information for **instance 2**, and all switch ports associated with that instance, use the command:

```
awplus# show spanning-tree mst instance 2
```

**Output** Figure 16-9: Example output from **show spanning-tree mst instance**

```
% 1: MSTI Root Path Cost 0 - MSTI Root Port 0 - MSTI Bridge Priority 32768
% 1: MSTI Root Id 80020000cd24ff2d

# show spanning-tree statistics instance

**Overview** This command displays BPDU (Bridge Protocol Data Unit) statistics for the specified MST (Multiple Spanning Tree) instance, and all switch ports associated with that MST instance.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show spanning-tree statistics instance *<instance-id>*

| Parameter                  | Description                                 |
|----------------------------|---------------------------------------------|
| <i>&lt;instance-id&gt;</i> | Specify an MSTP instance in the range 1-15. |

**Mode** Privileged Exec

**Example** To display BPDU statistics information for MST instance 2, and all switch ports associated with that MST instance, use the command:

```
awplus# show spanning-tree statistics instance 2
```

**Output** Figure 16-13: Example output from **show spanning-tree statistics instance**

| Parameter                  | Description                                                                                                                                                             |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;instance-id&gt;</i> | Specify an MSTP instance in the range 1-15.                                                                                                                             |
| <i>&lt;port&gt;</i>        | The port to display information about. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |

**Mode** Privileged Exec

**Example** To display BPDU statistics for MST instance 2, interface port1.0.2, use the command:

```
awplus# show spanning-tree statistics instance 2 interface port1.0.2
```

**Output** Figure 16-14: Example output from **show spanning-tree statistics instance interface**

```
awplus#sh spanning-tree statistics interface port1.0.2 instance 1
Spanning Tree Enabled for Instance : 1

**Related commands** [show spanning-tree statistics](#)

# show spanning-tree statistics interface

**Overview** This command displays BPDU (Bridge Protocol Data Unit) statistics for the specified switch port, and all MST instances associated with that switch port.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show spanning-tree statistics interface <port>

| Parameter | Description                                                                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port>    | The port to display information about. The port may be a switch port (e.g. port1.0.2), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |

**Mode** Privileged Exec

**Example** To display BPDU statistics about each MST instance for port1.0.2, use the command:

```
awplus# show spanning-tree statistics interface port1.0.2
```

**Output** Figure 16-15: Example output from **show spanning-tree statistics interface**

```
awplus#show spanning-tree statistics interface port1.0.2

**Related commands** [show spanning-tree statistics](#)

# show spanning-tree vlan range-index

**Overview** Use this command to display information about MST (Multiple Spanning Tree) instances and the VLANs associated with them including the VLAN range-index value for the device.

**Syntax** show spanning-tree vlan range-index

**Mode** Privileged Exec

**Example** To display information about MST instances and the VLANs associated with them for the device, including the VLAN range-index value, use the following command:

```
awplus# show spanning-tree vlan range-index
```

**Output** Figure 16-16: Example output from **show spanning-tree vlan range-index**

|                                            |              |      |          |
|--------------------------------------------|--------------|------|----------|
| awplus#show spanning-tree vlan range-index |              |      |          |
| %                                          | MST Instance | VLAN | RangeIdx |
| %                                          | 1            | 1    | 1%       |

**Related commands** [show spanning-tree statistics](#)

# spanning-tree autoedge (RSTP and MSTP)

**Overview** Use this command to enable the autoedge feature on the port.

The autoedge feature allows the port to automatically detect that it is an edge port. If it does not receive any BPDUs in the first three seconds after linkup, enabling, or entering RSTP or MSTP mode, it sets itself to be an edgeport and enters the forwarding state.

Use this command for RSTP or MSTP.

Use the **no** variant of this command to disable this feature.

**Syntax** spanning-tree autoedge  
no spanning-tree autoedge

**Default** Disabled

**Mode** Interface Configuration

**Example** awplus# configure terminal  
awplus(config)# interface port1.0.3  
awplus(config-if)# spanning-tree autoedge

**Related commands** [spanning-tree edgeport \(RSTP and MSTP\)](#)

## spanning-tree bpdu

**Overview** Use this command to configure BPDU (Bridge Protocol Data Unit) discarding or forwarding, when STP is disabled on the switch. This may be needed for correct STP operation in complex networks.

There is no **no** variant for this command. Instead, apply the **discard** parameter to reset it back to the default then re-enable STP with the command [spanning-tree enable](#).

**Syntax** `spanning-tree bpdu  
{discard|forward|forward-untagged-vlan|forward-vlan}`

| Parameter             | Description                                                                                                                                                                               |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bpdu                  | A port that has BPDU filtering enabled will not transmit any BPDUs and will ignore any BPDUs received. This port type has one of the following parameters (in Global Configuration mode): |
| discard               | Discards all ingress STP BPDU frames.                                                                                                                                                     |
| forward               | Forwards any ingress STP BPDU packets to all ports, regardless of any VLAN membership.                                                                                                    |
| forward-untagged-vlan | Forwards any ingress STP BPDU frames to all ports that are untagged members of the ingress port's native VLAN.                                                                            |
| forward-vlan          | Forwards any ingress STP BPDU frames to all ports that are tagged members of the ingress port's native VLAN.                                                                              |

**Default** The discard parameter is enabled by default.

**Mode** Global Configuration

**Usage notes** This command enables the switch to forward unsupported BPDUs with an unsupported Spanning Tree Protocol, such as proprietary STP protocols with unsupported BPDUs, by forwarding BPDU (Bridge Protocol Data Unit) frames unchanged through the switch.

You must disable RSTP with the **no spanning-tree rstp enable** command before you can use this command.

When you want to revert to default behavior on the switch, issue a **spanning-tree bdpdu discard** command and re-enable Spanning Tree with a **spanning-tree rstp enable** command.

**Examples** To enable STP BPDU discard in Global Configuration mode with STP disabled, which discards all ingress STP BPDU frames, enter the commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree rstp enable
awplus(config)# spanning-tree bpdu discard
```

To enable STP BPDU forward in Global Configuration mode with STP disabled, which forwards any ingress STP BPDU frames to all ports regardless of any VLAN membership, enter the commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree rstp enable
awplus(config)# spanning-tree bpdu forward
```

To enable STP BPDU forwarding for untagged frames in Global Configuration mode with STP disabled, which forwards any ingress STP BPDU frames to all ports that are untagged members of the ingress port's native VLAN, enter the commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree rstp enable
awplus(config)# spanning-tree bpdu forward-untagged-vlan
```

To enable STP BPDU forwarding for tagged frames in Global Configuration mode with STP disabled, which forwards any ingress STP BPDU frames to all ports that are tagged members of the ingress port's native VLAN, enter the commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree rstp enable
awplus(config)# spanning-tree bpdu forward-vlan
```

To reset STP BPDU back to the default discard parameter and re-enable RSTP on the switch, enter the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree bpdu discard
awplus(config)# spanning-tree rstp enable
```

**Related commands** [show spanning-tree](#)  
[spanning-tree enable](#)

# spanning-tree cisco-interoperability (MSTP)

**Overview** Use this command to enable/disable Cisco-interoperability for MSTP.  
Use this command for MSTP only.

**Syntax** spanning-tree cisco-interoperability {enable|disable}

| Parameter | Description                              |
|-----------|------------------------------------------|
| enable    | Enable Cisco interoperability for MSTP.  |
| disable   | Disable Cisco interoperability for MSTP. |

**Default** If this command is not used, Cisco interoperability is disabled.

**Mode** Global Configuration

**Usage** For compatibility with certain Cisco devices, all devices in the switched LAN running the AlliedWare Plus™ Operating System must have Cisco-interoperability enabled. When the AlliedWare Plus Operating System is interoperating with Cisco, the only criteria used to classify a region are the region name and revision level. VLAN to instance mapping is not used to classify regions when interoperating with Cisco.

**Examples** To enable Cisco interoperability on a Layer 2 device:

```
awplus# configure terminal
```

```
awplus(config)# spanning-tree cisco-interoperability enable
```

To disable Cisco interoperability on a Layer 2 device:

```
awplus# configure terminal
```

```
awplus(config)# spanning-tree cisco-interoperability disable
```

# spanning-tree edgeport (RSTP and MSTP)

**Overview** Use this command to set a port as an edge-port.

Use this command for RSTP or MSTP.

This command has the same effect as the [spanning-tree portfast \(STP\)](#) command, but the configuration displays differently in the output of some show commands.

Use the **no** variant of this command to set a port to its default state (not an edge-port).

**Syntax** spanning-tree edgeport  
no spanning-tree edgeport

**Default** Not an edge port.

**Mode** Interface Configuration

**Usage notes** Use this command on a switch port connected to a LAN that has no other bridges attached. If a BPDU is received on the port that indicates that another bridge is connected to the LAN, then the port is no longer treated as an edge port.

**Example** awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# spanning-tree edgeport

**Related commands** [spanning-tree autoedge \(RSTP and MSTP\)](#)

# spanning-tree enable

**Overview** Use this command in Global Configuration mode to enable the specified spanning tree protocol for all switch ports. Note that this must be the spanning tree protocol that is configured on the device by the [spanning-tree mode](#) command.

Use the **no** variant of this command to disable the configured spanning tree protocol. This places all switch ports in the forwarding state.

**Syntax** spanning-tree {mstp|rstp|stp} enable  
no spanning-tree {mstp|rstp|stp} enable

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| mstp      | Enables or disables MSTP (Multiple Spanning Tree Protocol). |
| rstp      | Enables or disables RSTP (Rapid Spanning Tree Protocol).    |
| stp       | Enables or disables STP (Spanning Tree Protocol).           |

**Default** RSTP is enabled by default for all switch ports.

**Mode** Global Configuration

**Usage** With no configuration, spanning tree is enabled, and the spanning tree mode is set to RSTP. To change the mode, see [spanning-tree mode](#) command.

**Examples** To enable STP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree stp enable
```

To disable STP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree stp enable
```

To enable MSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mstp enable
```

To disable MSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree mstp enable
```

To enable RSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree rstp enable
```

To disable RSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
```

```
awplus(config)# no spanning-tree rstp enable
```

**Related  
commands**

[spanning-tree bpdu](#)

[spanning-tree mode](#)

# spanning-tree errdisable-timeout enable

**Overview** Use this command to enable the errdisable-timeout facility, which sets a timeout for ports that are disabled due to the BPDU guard feature.

Use this command for RSTP or MSTP.

Use the **no** variant of this command to disable the errdisable-timeout facility.

**Syntax** spanning-tree errdisable-timeout enable  
no spanning-tree errdisable-timeout enable

**Default** By default, the errdisable-timeout is disabled.

**Mode** Global Configuration

**Usage** The BPDU guard feature shuts down the port on receiving a BPDU on a BPDU-guard enabled port. This command associates a timer with the feature such that the port is re-enabled without manual intervention after a set interval. This interval can be configured by the user using the [spanning-tree errdisable-timeout interval](#) command.

**Example** awplus# configure terminal  
awplus(config)# spanning-tree errdisable-timeout enable

**Related commands** [show spanning-tree](#)  
[spanning-tree errdisable-timeout interval](#)  
[spanning-tree portfast bpdu-guard](#)

# spanning-tree errdisable-timeout interval

**Overview** Use this command to specify the time interval after which a port is brought back up when it has been disabled by the BPDU guard feature.

Use this command for RSTP or MSTP.

**Syntax** spanning-tree errdisable-timeout interval `<10-1000000>`  
no spanning-tree errdisable-timeout interval

| Parameter                       | Description                                         |
|---------------------------------|-----------------------------------------------------|
| <code>&lt;10-1000000&gt;</code> | Specify the errdisable-timeout interval in seconds. |

**Default** By default, the port is re-enabled after 300 seconds.

**Mode** Global Configuration

**Example** awplus# configure terminal  
awplus(config)# spanning-tree errdisable-timeout interval 34

**Related commands** [show spanning-tree](#)  
[spanning-tree errdisable-timeout enable](#)  
[spanning-tree portfast bpdu-guard](#)

# spanning-tree force-version

**Overview** Use this command in Interface Configuration mode for a switch port interface only to force the protocol version for the switch port. Use this command for RSTP or MSTP only.

**Syntax** spanning-tree force-version *<version>*  
no spanning-tree force-version

| Parameter              | Description                                                                                                                                                                            |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;version&gt;</i> | <i>&lt;0 - 3&gt;</i> Version identifier.                                                                                                                                               |
| 0                      | Forces the port to operate in STP mode.                                                                                                                                                |
| 1                      | Not supported.                                                                                                                                                                         |
| 2                      | Forces the port to operate in RSTP mode. If it receives STP BPDUs, it can automatically revert to STP mode.                                                                            |
| 3                      | Forces the port to operate in MSTP mode (this option is only available if MSTP mode is configured). If it receives RSTP or STP BPDUs, it can automatically revert to RSTP or STP mode. |

**Default** By default, no version is forced for the port. The port is in the spanning tree mode configured for the device, or a lower version if it automatically detects one.

**Mode** Interface Configuration mode for a switch port interface only.

**Examples** Set the value to enforce the spanning tree protocol (STP):

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree force-version 0
```

Set the default protocol version:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree force-version
```

**Related commands** [show spanning-tree](#)

# spanning-tree forward-time

**Overview** Use this command to set the forward delay value. Use the **no** variant of this command to reset the forward delay value to the default setting of 15 seconds.

The **forward delay** sets the time (in seconds) to control how fast a port changes its spanning tree state when moving towards the forwarding state. If the mode is set to STP, the value determines how long the port stays in each of the listening and learning states which precede the forwarding state. If the mode is set to RSTP or MSTP, this value determines the maximum time taken to transition from discarding to learning and from learning to forwarding.

This value is used only when the device is acting as the root bridge. Devices not acting as the Root Bridge use a dynamic value for the **forward delay** set by the root bridge. The **forward delay**, **max-age**, and **hello time** parameters are interrelated.

**Syntax** spanning-tree forward-time <forward-delay>  
no spanning-tree forward-time

| Parameter       | Description                                  |
|-----------------|----------------------------------------------|
| <forward-delay> | <4-30> The forwarding time delay in seconds. |

**Default** The default is 15 seconds.

**Mode** Global Configuration

**Usage notes** The allowable range for forward-time is 4-30 seconds.

The **forward delay**, **max-age**, and **hello time** parameters should be set according to the following formula, as specified in IEEE Standard 802.1d:

$2 \times (\text{forward delay} - 1.0 \text{ seconds}) \geq \text{max-age}$

$\text{max-age} \geq 2 \times (\text{hello time} + 1.0 \text{ seconds})$

**Example** awplus# configure terminal  
awplus(config)# spanning-tree forward-time 6

**Related commands** show spanning-tree  
spanning-tree forward-time  
spanning-tree hello-time  
spanning-tree mode

# spanning-tree guard root

**Overview** Use this command in Interface Configuration mode for a switch port only to enable the Root Guard feature for the switch port. The root guard feature disables reception of superior BPDUs. You can use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to disable the root guard feature for the port.

**Syntax** spanning-tree guard root  
no spanning-tree guard root

**Mode** Interface Configuration mode for a switch port interface only.

**Usage notes** The Root Guard feature makes sure that the port on which it is enabled is a designated port. If the Root Guard enabled port receives a superior BPDU, it goes to a Listening state (for STP) or discarding state (for RSTP and MSTP).

**Example** awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# spanning-tree guard root

# spanning-tree hello-time

**Overview** Use this command to set the hello-time. This sets the time in seconds between the transmission of device spanning tree configuration information when the device is the Root Bridge of the spanning tree or is trying to become the Root Bridge.

Use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to restore the default of the hello time.

**Syntax** spanning-tree hello-time *<hello-time>*  
no spanning-tree hello-time

| Parameter                 | Description                                |
|---------------------------|--------------------------------------------|
| <i>&lt;hello-time&gt;</i> | <1-10> The hello BPDU interval in seconds. |

**Default** Default is 2 seconds.

**Mode** Global Configuration and Interface Configuration for switch ports.

**Usage notes** The allowable range of values is 1-10 seconds.  
The forward delay, max-age, and hello time parameters should be set according to the following formula, as specified in IEEE Standard 802.1d:

$2 \times (\text{forward delay} - 1.0 \text{ seconds}) \geq \text{max-age}$

$\text{max-age} \geq 2 \times (\text{hello time} + 1.0 \text{ seconds})$

**Example** awplus# configure terminal  
awplus(config)# spanning-tree hello-time 3

**Related commands** spanning-tree forward-time  
spanning-tree max-age  
show spanning-tree

# spanning-tree link-type

**Overview** Use this command in Interface Configuration mode for a switch port interface only to enable or disable point-to-point or shared link types on the switch port.

Use this command for RSTP or MSTP only.

Use the **no** variant of this command to return the port to the default link type.

**Syntax** spanning-tree link-type {point-to-point|shared}  
no spanning-tree link-type

| Parameter      | Description               |
|----------------|---------------------------|
| shared         | Disable rapid transition. |
| point-to-point | Enable rapid transition.  |

**Default** The default link type is point-to-point.

**Mode** Interface Configuration mode for a switch port interface only.

**Usage notes** You may want to set link type to shared if the port is connected to a hub with multiple devices connected to it.

**Examples** awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# spanning-tree link-type point-to-point

# spanning-tree max-age

**Overview** Use this command to set the max-age. This sets the maximum age, in seconds, that dynamic spanning tree configuration information is stored in the device before it is discarded.

Use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to restore the default of max-age.

**Syntax** spanning-tree max-age <max-age>  
no spanning-tree max-age

| Parameter | Description                          |
|-----------|--------------------------------------|
| <max-age> | <6-40> The maximum time, in seconds. |

**Default** The default of spanning-tree max-age is 20 seconds.

**Mode** Global Configuration

**Usage** Max-age is the maximum time in seconds for which a message is considered valid. Configure this value sufficiently high, so that a frame generated by the root bridge can be propagated to the leaf nodes without exceeding the max-age.

The **forward delay**, **max-age**, and **hello time** parameters should be set according to the following formula, as specified in IEEE Standard 802.1d:

$2 \times (\text{forward delay} - 1.0 \text{ seconds}) \geq \text{max-age}$

$\text{max-age} \geq 2 \times (\text{hello time} + 1.0 \text{ seconds})$

**Example** awplus# configure terminal  
awplus(config)# spanning-tree max-age 12

**Related commands** show spanning-tree  
spanning-tree forward-time  
spanning-tree hello-time

# spanning-tree max-hops (MSTP)

**Overview** Use this command to specify the maximum allowed hops for a BPDU in an MST region. This parameter is used by all the instances of the MST region.

Use the **no** variant of this command to restore the default.

Use this command for MSTP only.

**Syntax** spanning-tree max-hops *<hop-count>*  
no spanning-tree max-hops *<hop-count>*

| Parameter                | Description                                                              |
|--------------------------|--------------------------------------------------------------------------|
| <i>&lt;hop-count&gt;</i> | Specify the maximum hops the BPDU will be valid for in the range <1-40>. |

**Default** The default max-hops in a MST region is 20.

**Mode** Global Configuration

**Usage** Specifying the max hops for a BPDU prevents the messages from looping indefinitely in the network. The hop count is decremented by each receiving port. When a device receives an MST BPDU that has a hop count of zero, it discards the BPDU.

**Examples** awplus# configure terminal  
awplus(config)# spanning-tree max-hops 25  
awplus# configure terminal  
awplus(config)# no spanning-tree max-hops

# spanning-tree mode

**Overview** Use this command to change the spanning tree protocol mode on the device. The spanning tree protocol mode on the device can be configured to either STP, RSTP or MSTP.

**Syntax** `spanning-tree mode {stp|rstp|mstp}`

**Default** The default spanning tree protocol mode on the device is RSTP.

**Mode** Global Configuration

**Usage** With no configuration, the device will have spanning tree enabled, and the spanning tree mode will be set to RSTP. Use this command to change the spanning tree protocol mode on the device. MSTP is VLAN aware, but RSTP and STP are not VLAN aware. To enable or disable spanning tree operation, see the [spanning-tree enable](#) command.

**Examples** To change the spanning tree mode from the default of RSTP to MSTP, use the following commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mode mstp
```

**Related commands** [spanning-tree enable](#)

# spanning-tree mst configuration

**Overview** Use this command to enter the MST Configuration mode to configure the Multiple Spanning-Tree Protocol.

**Syntax** spanning-tree mst configuration

**Mode** Global Configuration

**Examples** The following example uses this command to enter MST Configuration mode. Note the change in the command prompt.

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)#
```

# spanning-tree mst instance

**Overview** Use this command to assign a Multiple Spanning Tree instance (MSTI) to a switch port or channel group.

Note that ports are automatically configured to send and receive spanning-tree information for the associated MSTI when VLANs are assigned to MSTIs using the [instance vlan \(MSTP\)](#) command.

Use the **no** variant of this command in Interface Configuration mode to remove the MSTI from the specified switch port or channel group.

**Syntax** spanning-tree mst instance *<instance-id>*  
no spanning-tree mst instance *<instance-id>*

| Parameter                  | Description                                                                                                                                         |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;instance-id&gt;</i> | Specify an MSTP instance in the range 1-15. The MST instance must have already been created using the <a href="#">instance vlan (MSTP)</a> command. |

**Default** A port automatically becomes a member of an MSTI when it is assigned to a VLAN.

**Mode** Interface Configuration mode for a switch port or channel group.

**Usage notes** You can disable automatic configuration of member ports of a VLAN to an associated MSTI by using a **no spanning-tree mst instance** command to remove the member port from the MSTI. Use the **spanning-tree mst instance** command to add a VLAN member port back to the MSTI.

**Examples** To assign instance 3 to a switch port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3
```

To remove instance 3 from a switch port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3
```

**Related commands** [instance vlan \(MSTP\)](#)  
[spanning-tree mst instance path-cost](#)  
[spanning-tree mst instance priority](#)  
[spanning-tree mst instance restricted-role](#)  
[spanning-tree mst instance restricted-tcn](#)

# spanning-tree mst instance path-cost

**Overview** Use this command to set the cost of a path associated with a switch port, for the specified MSTI.

This specifies the switch port's contribution to the cost of a path to the MSTI regional root via that port. This applies when the port is the root port for the MSTI.

Use the **no** variant of this command to restore the default cost value of the path.

**Syntax** spanning-tree mst instance *<instance-id>* path-cost *<path-cost>*  
no spanning-tree mst instance *<instance-id>* path-cost

| Parameter                  | Description                                                                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;instance-id&gt;</i> | Specify an MSTP instance in the range 1-15.                                                                                                                  |
| <i>&lt;path-cost&gt;</i>   | Specify the cost of path in the range of <1 - 2000000000>, where a lower path-cost indicates a greater likelihood of the specific interface becoming a root. |

**Default** The default path cost values and the range of recommended path cost values depend on the port speed, as shown in the following table from the IEEE 802.1q-2003 standard.

| Port speed         | Default path cost | Recommended path cost range |
|--------------------|-------------------|-----------------------------|
| Less than 100 Kb/s | 200,000,000       | 20,000,000-200,000,000      |
| 1Mbps              | 20,000,000        | 2,000,000-20,000,000        |
| 10Mbps             | 2,000,000         | 200,000-2,000,000           |
| 100 Mbps           | 200,000           | 20,000-200,000              |
| 1 Gbps             | 20,000            | 2,000-20,000                |
| 10 Gbps            | 2,000             | 200-2,000                   |
| 100 Gbps           | 200               | 20-200                      |
| 1Tbps              | 20                | 2-200                       |
| 10 Tbps            | 2                 | 2-20                        |

**Mode** Interface Configuration mode for a switch port interface only.

**Usage notes** Before you can use this command to set a path-cost in a VLAN configuration, you must explicitly add an MST instance to a port using the [spanning-tree mst instance](#) command.

**Examples** To set a path cost of 1000 on instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 path-cost 1000
```

To return the path cost to its default value on instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3 path-cost
```

**Related  
commands**

[instance vlan \(MSTP\)](#)  
[spanning-tree mst instance](#)  
[spanning-tree mst instance priority](#)  
[spanning-tree mst instance restricted-role](#)  
[spanning-tree mst instance restricted-tcn](#)

# spanning-tree mst instance priority

**Overview** Use this command in Interface Configuration mode for a switch port interface only to set the port priority for an MST instance (MSTI).

Use the **no** variant of this command to restore the default priority value (128).

**Syntax** `spanning-tree mst instance <instance-id> priority <priority>`  
`no spanning-tree mst instance <instance-id> [priority]`

| Parameter                        | Description                                                                                                                                   |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;instance-id&gt;</code> | Specify an MSTP instance in the range 1-15.                                                                                                   |
| <code>&lt;priority&gt;</code>    | This must be a multiple of 16 and within the range <0-240>. A lower priority indicates greater likelihood of the port becoming the root port. |

**Default** The default is 128.

**Mode** Interface Configuration mode for a switch port interface.

**Usage notes** This command sets the value of the priority field contained in the port identifier. The MST algorithm uses the port priority when determining the root port for the switch in the MSTI. The port with the lowest value has the highest priority, so it will be chosen as root port over a port that is equivalent in all other aspects but with a higher priority value.

**Examples** To set the priority to 112 on instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 priority 112
```

To return the priority to its default value of 128 on instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3 priority
```

**Related commands**

- [instance vlan \(MSTP\)](#)
- [spanning-tree priority \(port priority\)](#)
- [spanning-tree mst instance](#)
- [spanning-tree mst instance path-cost](#)
- [spanning-tree mst instance restricted-role](#)
- [spanning-tree mst instance restricted-tcn](#)

# spanning-tree mst instance restricted-role

**Overview** Use this command in Interface Configuration mode for a switch port interface only to enable the restricted role for an MSTI (Multiple Spanning Tree Instance) on a switch port. Configuring the restricted role for an MSTI on a switch port prevents the switch port from becoming the root port in a spanning tree topology.

Use the **no** variant of this command to disable the restricted role for an MSTI on a switch port. Removing the restricted role for an MSTI on a switch port allows the switch port to become the root port in a spanning tree topology.

**Syntax** spanning-tree mst instance <instance-id> restricted-role  
no spanning-tree mst instance <instance-id> restricted-role

| Parameter     | Description                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <instance-id> | Specify an MSTP instance in the range 1-15. The MST instance must have already been created using the <a href="#">instance vlan (MSTP)</a> command. |

**Default** The restricted role for an MSTI instance on a switch port is disabled by default.

**Mode** Interface Configuration mode for a switch port interface only.

**Usage notes** The root port is the port providing the best path from the bridge to the root bridge. Use this command to disable a port from becoming a root port. Use the **no** variant of this command to enable a port to become a root port. See the [STP Feature Overview and Configuration Guide](#) for root port information.

**Examples** To prevent a switch port from becoming the root port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 restricted-role
```

To stop preventing the switch port from becoming the root port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3
restricted-role
```

**Related commands**

- instance vlan (MSTP)
- spanning-tree priority (port priority)
- spanning-tree mst instance
- spanning-tree mst instance path-cost
- spanning-tree mst instance restricted-tcn

# spanning-tree mst instance restricted-tcn

**Overview** Use this command to prevent a switch port from propagating received topology change notifications and topology changes to other switch ports. This is named restricted TCN (Topology Change Notification). A TCN is a simple Bridge Protocol Data Unit (BPDU) that a bridge sends out to its root port to signal a topology change.

Use the **no** variant of this command to stop preventing the switch port from propagating received topology change notifications and topology changes to other switch ports for the specified MSTI (Multiple Spanning Tree Instance).

The restricted TCN setting applies only to the specified MSTI (Multiple Spanning Tree Instance).

**Syntax** spanning-tree mst instance *<instance-id>* restricted-tcn  
no spanning-tree mst instance *<instance-id>* restricted-tcn

| Parameter                  | Description                                                                                                                                         |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;instance-id&gt;</i> | Specify an MSTP instance in the range 1-15. The MST instance must have already been created using the <a href="#">instance vlan (MSTP)</a> command. |

**Default** Disabled. By default, switch ports propagate TCNs.

**Mode** Interface Configuration mode for a switch port interface only.

**Examples** To prevent a switch port from propagating received topology change notifications and topology changes to other switch ports, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 restricted-tcn
```

To stop preventing a switch port from propagating received topology change notifications and topology changes to other switch ports, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3
restricted-tcn
```

**Related commands** [instance vlan \(MSTP\)](#)  
[spanning-tree priority \(port priority\)](#)  
[spanning-tree mst instance](#)  
[spanning-tree mst instance path-cost](#)  
[spanning-tree mst instance restricted-role](#)

## spanning-tree path-cost

**Overview** Use this command in Interface Configuration mode for a switch port interface only to set the cost of a path for the specified port. This value then combines with others along the path to the root bridge in order to determine the total cost path value from the particular port, to the root bridge. The lower the numeric value, the higher the priority of the path. This applies when the port is the root port.

Use this command for RSTP, STP or MSTP. When MSTP mode is configured, this will apply to the port's path cost for the CIST.

**Syntax** spanning-tree path-cost *<pathcost>*  
no spanning-tree path-cost

| Parameter               | Description                                                     |
|-------------------------|-----------------------------------------------------------------|
| <i>&lt;pathcost&gt;</i> | <i>&lt;1-200000000&gt;</i> The cost to be assigned to the port. |

**Default** The default path cost values and the range of recommended path cost values depend on the port speed, as shown in the following table from the IEEE 802.1q-2003 and IEEE 802.1d-2004 standards.

| Port speed         | Default path cost | Recommended path cost range |
|--------------------|-------------------|-----------------------------|
| Less than 100 Kb/s | 200,000,000       | 20,000,000-200,000,000      |
| 1Mbps              | 20,000,000        | 2,000,000-20,000,000        |
| 10Mbps             | 2,000,000         | 200,000-2,000,000           |
| 100 Mbps           | 200,000           | 20,000-200,000              |
| 1 Gbps             | 20,000            | 2,000-20,000                |
| 10 Gbps            | 2,000             | 200-2,000                   |
| 100 Gbps           | 200               | 20-200                      |
| 1Tbps              | 20                | 2-200                       |
| 10 Tbps            | 2                 | 2-20                        |

**Mode** Interface Configuration mode for switch port interface only.

**Example** awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# spanning-tree path-cost 123

# spanning-tree portfast (STP)

**Overview** Use this command in Interface Configuration mode for a switch port interface only to set a port as an edge-port. The portfast feature enables a port to rapidly move to the forwarding state, without having first to pass through the intermediate spanning tree states. This command has the same effect as the [spanning-tree edgeport \(RSTP and MSTP\)](#) command, but the configuration displays differently in the output of some show commands.

**NOTE:** You can run either of two additional parameters with this command. To simplify the syntax these are documented as separate commands. See the following additional portfast commands:

- [spanning-tree portfast bpdu-filter](#) command
- [spanning-tree portfast bpdu-guard](#) command.

You can obtain the same effect by running the [spanning-tree edgeport \(RSTP and MSTP\)](#) command. However, the configuration output may display differently in some show commands.

Use the **no** variant of this command to set a port to its default state (not an edge-port).

**Syntax** spanning-tree portfast  
no spanning-tree portfast

**Default** Not an edge port.

**Mode** Interface Configuration mode for a switch port interface only.

**Usage notes** Portfast makes a port move from a blocking state to a forwarding state, bypassing both listening and learning states. The portfast feature is meant to be used for ports connected to end-user devices. Enabling portfast on ports that are connected to a workstation or server allows devices to connect to the network without waiting for spanning-tree to converge.

For example, you may need hosts to receive a DHCP address quickly and waiting for STP to converge would cause the DHCP request to time out. Ensure you do not use portfast on any ports connected to another device to avoid creating a spanning-tree loop on the network.

Use this command on a switch port that connects to a LAN with no other bridges attached. An edge port should never receive BPDUs. Therefore if an edge port receives a BPDU, the portfast feature takes one of three actions.

- Cease to act as an edge port and pass BPDUs as a member of a spanning tree network ([spanning-tree portfast \(STP\)](#) command disabled).
- Filter out the BPDUs and pass only the data and continue to act as a edge port ([spanning-tree portfast bpdu-filter](#) command enabled).
- Block the port to all BPDUs and data ([spanning-tree portfast bpdu-guard](#) command enabled).

**Example**   awplus# configure terminal  
              awplus(config)# interface port1.0.2  
              awplus(config-if)# spanning-tree portfast

**Related commands**   spanning-tree edgeport (RSTP and MSTP)  
                      show spanning-tree  
                      spanning-tree portfast bpdu-filter  
                      spanning-tree portfast bpdu-guard

# spanning-tree portfast bpdu-filter

**Overview** This command sets the bpdu-filter feature and applies a filter to any BPDUs (Bridge Protocol Data Units) received. Enabling this feature ensures that configured ports will not transmit any BPDUs and will ignore (filter out) any BPDUs received. BPDU Filter is not enabled on a port by default.

Using the **no** variant of this command to turn off the bpdu-filter, but retain the port's status as an enabled port. If the port then receives a BPDU it will change its role from an **edge-port** to a **non edge-port**.

**Syntax (Global Configuration)** spanning-tree portfast bpdu-filter  
no spanning-tree portfast bpdu-filter

**Syntax (Interface Configuration)** spanning-tree portfast bpdu-filter  
{default|disable|enable}  
no spanning-tree portfast bpdu-filter

| Parameter   | Description                                                                                                                                                                               |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bpdu-filter | A port that has bpdu-filter enabled will not transmit any BPDUs and will ignore any BPDUs received. This port type has one of the following parameters (in Interface Configuration mode): |
| default     | Takes the setting that has been configured for the whole device, i.e. the setting made from the Global configuration mode.                                                                |
| disable     | Turns off BPDU filter.                                                                                                                                                                    |
| enable      | Turns on BPDU filter.                                                                                                                                                                     |

**Default** BPDU Filter is not enabled on any ports by default.

**Mode** Global Configuration and Interface Configuration

**Usage notes** This command filters the BPDUs and passes only data to continue to act as an edge port. Using this command in Global Configuration mode applies the portfast bpdu-filter feature to all ports on the device. Using it in Interface mode applies the feature to a specific port, or range of ports. The command will operate in both RSTP and MSTP networks.

Use the [show spanning-tree](#) command to display status of the bpdu-filter parameter for the switch ports.

**Example** To enable STP BPDU filtering in Global Configuration mode, enter the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree portfast bpdu-filter
```

To enable STP BPDU filtering in Interface Configuration mode, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree portfast bpdu-filter enable
```

**Related  
commands**

[show spanning-tree](#)  
[spanning-tree portfast \(STP\)](#)  
[spanning-tree portfast bpdu-guard](#)

# spanning-tree portfast bpdu-guard

**Overview** This command applies a BPDU (Bridge Protocol Data Unit) guard to the port. A port with the bpdu-guard feature enabled will block all traffic (BPDUs and user data), if it starts receiving BPDUs.

Use this command in Global Configuration mode to apply BPDU guard to all ports on the device. Use this command in Interface mode for an individual interface or a range of interfaces specified. BPDU Guard is not enabled on a port by default.

Use the **no** variant of this command to disable the BPDU Guard feature on a device in Global Configuration mode or to disable the BPDU Guard feature on a port in Interface mode.

**Syntax (Global Configuration)** spanning-tree portfast bpdu-guard  
no spanning-tree portfast bpdu-guard

**Syntax (Interface Configuration)** spanning-tree portfast bpdu-guard  
{default|disable|enable}  
no spanning-tree portfast bpdu-guard

| Parameter  | Description                                                                                                                                                                         |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bpdu-guard | A port that has bpdu-guard turned on will enter the STP blocking state if it receives a BPDU. This port type has one of the following parameters (in Interface Configuration mode): |
| default    | Takes the setting that has been configured for the whole device, i.e. the setting made from the Global configuration mode.                                                          |
| disable    | Turns off BPDU guard.                                                                                                                                                               |
| enable     | Turns on BPDU guard and will also set the port as an edge port.                                                                                                                     |

**Default** BPDU Guard is not enabled on any ports by default.

**Mode** Global Configuration or Interface Configuration

**Usage notes** This command blocks the port(s) to all devices and data when enabled. BPDU Guard is a port-security feature that changes how a portfast-enabled port behaves if it receives a BPDU. When **bpdu-guard** is set, then the port shuts down if it receives a BPDU. It does not process the BPDU as it is considered suspicious. When **bpdu-guard** is not set, then the port will negotiate spanning-tree with the device sending the BPDUs. By default, bpdu-guard is not enabled on a port.

You can configure a port disabled by the bpdu-guard to re-enable itself after a specific time interval. This interval is set with the [spanning-tree errdisable-timeout interval](#) command. If you do not use the **errdisable-timeout** feature, then you will need to manually re-enable the port by using the **no shutdown** command.

Use the [show spanning-tree](#) command to display the device and port configurations for the BPDU Guard feature. It shows both the administratively configured and currently running values of bpdu-guard.

**Example** To enable STP BPDU guard in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
```

```
awplus(config)# spanning-tree portfast bpdu-guard
```

To enable STP BPDU guard in Interface Configuration mode, enter the below commands:

```
awplus# configure terminal
```

```
awplus(config)# interface port1.0.2
```

```
awplus(config-if)# spanning-tree portfast bpdu-guard enable
```

# spanning-tree priority (bridge priority)

- Overview** Use this command to set the bridge priority for the device. A lower priority value indicates a greater likelihood of the device becoming the root bridge.
- Use this command for RSTP, STP or MSTP. When MSTP mode is configured, this will apply to the CIST.
- Use the **no** variant of this command to reset it to the default.

**Syntax** spanning-tree priority *<priority>*  
no spanning-tree priority

| Parameter               | Description                                                                              |
|-------------------------|------------------------------------------------------------------------------------------|
| <i>&lt;priority&gt;</i> | <i>&lt;0-61440&gt;</i> The bridge priority, which will be rounded to a multiple of 4096. |

**Default** The default priority is 32678.

**Mode** Global Configuration

**Usage** To force a particular device to become the root bridge use a lower value than other devices in the spanning tree.

**Example** awplus# configure terminal  
awplus(config)# spanning-tree priority 4096

**Related commands** spanning-tree mst instance priority  
show spanning-tree

# spanning-tree priority (port priority)

**Overview** Use this command in Interface Configuration mode for a switch port interface only to set the port priority for port. A lower priority value indicates a greater likelihood of the port becoming part of the active topology.

Use this command for RSTP, STP, or MSTP. When the device is in MSTP mode, this will apply to the CIST.

Use the **no** variant of this command to reset it to the default.

**Syntax** spanning-tree priority *<priority>*  
no spanning-tree priority

| Parameter               | Description                                                                                      |
|-------------------------|--------------------------------------------------------------------------------------------------|
| <i>&lt;priority&gt;</i> | <0-240>, in increments of 16. The port priority, which will be rounded down to a multiple of 16. |

**Default** The default priority is 128.

**Mode** Interface Configuration mode for a switch port interface only.

**Usage notes** To force a port to be part of the active topology (for instance, become the root port or a designated port) use a lower value than other ports on the device. (This behavior is subject to network topology, and more significant factors, such as bridge ID.)

**Example** awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# spanning-tree priority 16

**Related commands** [spanning-tree mst instance priority](#)  
[spanning-tree priority \(bridge priority\)](#)  
[show spanning-tree](#)

# spanning-tree restricted-role

**Overview** Use this command in Interface Configuration mode for a switch port interface only to restrict the port from becoming a root port.

Use the **no** variant of this command to disable the restricted role functionality.

**Syntax** spanning-tree restricted-role  
no spanning-tree restricted-role

**Default** The restricted role is disabled.

**Mode** Interface Configuration mode for a switch port interface only.

**Example** awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# spanning-tree restricted-role

## spanning-tree restricted-tcn

**Overview** Use this command in Interface Configuration mode for a switch port interface only to prevent TCN (Topology Change Notification) BPDUs (Bridge Protocol Data Units) from being sent on a port. If this command is enabled, after a topology change a bridge is prevented from sending a TCN to its designated bridge.

Use the **no** variant of this command to disable the restricted TCN functionality.

**Syntax** spanning-tree restricted-tcn  
no spanning-tree restricted-tcn

**Default** The restricted TCN is disabled.

**Mode** Interface Configuration mode for a switch port interface only.

**Example** awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# spanning-tree restricted-tcn

# spanning-tree transmit-holdcount

**Overview** Use this command to set the maximum number of BPDU transmissions that are held back.

Use the **no** variant of this command to restore the default transmit hold-count value.

**Syntax** spanning-tree transmit-holdcount  
no spanning-tree transmit-holdcount

**Default** Transmit hold-count default is 3.

**Mode** Global Configuration

**Example** awplus# configure terminal  
awplus(config)# spanning-tree transmit-holdcount

# undebbug mstp

**Overview** This command applies the functionality of the no `debug mstp` (RSTP and STP) command.

# 17

# Unidirectional Link Detection (UDLD) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure the Unidirectional Link Detection (UDLD) protocol.

UDLD is a data link protocol which monitors network cables and detects broken bidirectional links. It complements the spanning tree protocol (STP), which is used to eliminate Layer 2 loops.

A license is required to use this feature. Please contact your authorized Allied Telesis representative for more information.

# debug udld

**Overview** Use this command to enable UDLD debugging.  
Use the **no** variant of this command to disable UDLD debugging.

**Syntax** debug udld [info|pkt|state|nsm|all]  
no debug udld [info|pkt|state|nsm|all]

| Parameter | Description                                                                |
|-----------|----------------------------------------------------------------------------|
| info      | Enable or disable general UDLD debugging information.                      |
| pkt       | Enable or disable debugging of UDLD packets.                               |
| state     | Enable or disable UDLD state transition debugging.                         |
| nsm       | Enable or disable UDLD Network Service Module (NSM) debugging information. |
| all       | Enable or disable the all UDLD debugging.                                  |

**Default** Debugging is disabled for **all** by default.

**Mode** Global Configuration  
Privileged Exec

**Example** To enable UDLD packet debugging, use the commands:

```
awplus# configure terminal
awplus(config)# debug udld pkt
```

**Related commands** [show debugging udld](#)  
[undebug udld](#)

# show debugging udld

**Overview** Use this command to show which UDLD debugging options are set.

**Syntax** show debugging udld

**Mode** Privileged Exec

**Example** To show which UDLD debugging options are set, use the command:

```
awplus# show debugging udld
```

**Output** Figure 17-1: Example output from **show debugging udld**

```
awplus# show debugging udld
UDLD debugging status:
 Info debugging : off
 Packet debugging : off
 State debugging : on
 NSM debugging : off
```

**Related commands** [debug udld](#)

# show udld

**Overview** Use this command to display global UDLD status and configuration settings.

**Syntax** show udld

**Mode** Privileged Exec

**Example** To show global UDLD information, use the command:

```
awplus# show udld
```

**Output** Figure 17-2: Example output from **show udld**

```
awplus#show udld
Status : Enabled
Mode : Normal
Message-Interval: 7 seconds
Timeout-Interval: 5 seconds
Disable-Period : 15 seconds

[Fiber-Ports]

port1.0.1 Enabled Aggressive Bidirectional
port1.0.2 Disabled Normal -
```

**Related commands**

- [udld port](#)
- [udld port disable](#)
- [udld enable](#)

# show udld neighbors

**Overview** Use this command to display UDLD neighbor status.

**Syntax** show udld neighbors [<interface-name>] [detail]

| Parameter        | Description                                               |
|------------------|-----------------------------------------------------------|
| <interface-name> | Show UDLD neighbor information for a specified interface. |
| detail           | This option provides a greater level of detail.           |

**Mode** Privileged Exec

**Example** To show UDLD information for all neighbors, use the command:

```
awplus# show udld neighbors
```

To show detailed UDLD neighbor information for port1.0.1, use the command:

```
awplus# show udld neighbours port1.0.1 detail
```

**Output** Figure 17-3: Example output from **show udld neighbors**

| Port      | Device-ID    | Port-ID    | Device-Name | Neighbor-State |
|-----------|--------------|------------|-------------|----------------|
| port1.0.1 | 0000F4272DA2 | port2.0.1  | X930        | Bidirectional  |
| port1.0.2 | 0000F5572632 | port1.0.15 | X610        | Bidirectional  |

Figure 17-4: Example output from **show udld neighbor port1.0.1 detail**

|                                             |                 |
|---------------------------------------------|-----------------|
| awplus# show udld neighbor port1.0.1 detail |                 |
| [port1.0.1]                                 |                 |

- [udld port disable](#)
- [udld enable](#)

# show udld port

**Overview** Use this command to display UDLD port status and configuration settings.

**Syntax** show udld port [*<interface-name>*] [detail]

| Parameter                     | Description                                      |
|-------------------------------|--------------------------------------------------|
| <i>&lt;interface-name&gt;</i> | Show UDLD information for a specified interface. |
| detail                        | This option provides a greater level of detail.  |

**Mode** Privileged Exec

**Example** To show UDLD information for all ports, use the command:

```
awplus# show udld port
```

To show detailed UDLD information for port1.0.1, use the command:

```
awplus# show udld port port1.0.1 detail
```

**Output** Figure 17-5: Example output from **show udld port**

```
awplus#show udld port
```

| Port      | Status   | Mode       | Directional-State |
|-----------|----------|------------|-------------------|
| -----     | -----    | -----      | -----             |
| port1.0.1 | Enabled  | Aggressive | Bidirectional     |
| port1.0.2 | Disabled | Normal     | -                 |

Figure 17-6: Example output from **show udld port port1.0.1 detail**

```
awplus#show udld port port1.0.1 detail
```

|                   |           |                                          |                   |
|-------------------|-----------|------------------------------------------|-------------------|
| [port1.0.1]       |           |                                          |                   |
| Status            | :         | Enabled                                  |                   |
| Mode              | :         | Aggressive                               |                   |
| Directional-State | :         | Bidirectional                            |                   |
| Operational-State | :         | Advertisement - single neighbor detected |                   |
| Neighbors:        |           |                                          |                   |
| Device-ID         | Port-ID   | Device-Name                              | Directional-State |
| -----             | -----     | -----                                    | -----             |
| 0000F4272DA2      | port2.0.1 | awplus                                   | Bidirectional     |

**Related commands**

- [udld port](#)
- [udld port disable](#)
- [udld enable](#)

# udld aggressive-mode

**Overview** Use this command to set UDLD to aggressive mode on all interfaces.

In **normal mode**, when the UDLD information times out:

- No action is taken by UDLD.
- The UDLD port state is set to undetermined.
- The port behaves according to its STP state.

In **aggressive mode**, when the UDLD information times out:

- UDLD tries to re-establish the state of the port.
- If not successful, after 8 retries, the port is disabled.

**NOTE:** *If stacking is configured with UDLD then only configure aggressive-mode on the ports that require it. If it is configured on all ports, it will be disabled on all but the resilience link when a stack member reboots.*

Use the **no** variant of this command to disable aggressive mode on all interfaces.

**Syntax** `udld aggressive-mode`  
`no udld aggressive-mode`

**Default** Aggressive mode is disabled by default.

**Mode** Global Configuration

**Example** To enable aggressive mode on interfaces, use the commands:

```
awplus# configure terminal
awplus(config)# udld aggressive-mode
```

To disable aggressive mode, use the commands:

```
awplus# configure terminal
awplus(config)# no udld aggressive-mode
```

**Related commands** [udld port aggressive-mode](#)  
[show udld](#)

# udld enable

**Overview** Use this command to enable UDLD on all of a device's fiber-optic ports. It has no effect on copper ports. Use the [udld port](#) command to enable UDLD on copper ports.

Use the **no** variant of this command to disable the UDLD feature on all of a device's fiber interfaces.

**Syntax** `udld enable`  
`no udld enable`

**Default** UDLD is disabled by default.

**Mode** Global Configuration

**Example** To enable the UDLD feature on all fiber interfaces, use the command:

```
awplus# configure terminal
awplus(config)# udld enable
```

**Related commands**

- [show udld](#)
- [show udld neighbors](#)
- [udld aggressive-mode](#)
- [udld port](#)
- [udld port disable](#)
- [udld reset](#)
- [udld time disable-period](#)
- [udld time message-interval](#)

# udld port

**Overview** Use this command to enable UDLD on an interface. This command enables UDLD on both copper and fiber ports.

Use the **no** variant of this command to disable UDLD on an interface.

**Syntax** `udld port`  
`no udld port`

**Default** UDLD is disabled on an interface by default.

**Mode** Interface Configuration

- Usage notes**
- This command always enables the UDLD feature on a port.
  - The `udld port disable` command overwrites this command and disables UDLD on an interface.
  - If UDLD has been set globally, using the `udld enable` command, then AlliedWare Plus ignores the **no udld port** command on a fiber interface.

**Example** To enable UDLD on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# udld port
```

To disable UDLD on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no udld port
```

**Related commands**

- `show udld port`
- `show udld neighbors`
- `udld enable`
- `udld port disable`
- `udld reset`
- `udld time disable-period`
- `udld time message-interval`

# udld port aggressive-mode

**Overview** Use this command to enable UDLD aggressive mode on an interface.

In **normal mode**, when the UDLD information times out:

- No action is taken by UDLD.
- The UDLD port state is set to undetermined.
- The port behaves according to its STP state.

In **aggressive mode**, when the UDLD information times out:

- UDLD tries to re-establish the state of the port.
- If not successful, after 8 retries, the port is disabled.

Use the **no** variant of this command to disable aggressive mode on an interface.

**Syntax** `udld port aggressive-mode`  
`no udld port aggressive-mode`

**Default** Aggressive mode is disabled on an interface by default.

**Mode** Interface Configuration

**Example** To change the UDLD mode to aggressive on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# udld port aggressive-mode
```

To disable aggressive mode on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no port aggressive-mode
```

**Related commands** [udld aggressive-mode](#)  
[show udld port](#)

# udld port disable

**Overview** Use this command to disable UDLD on an interface. This command disables UDLD on both copper and fiber ports

Use the **no** variant of this command to allow UDLD on a fiber port.

**Syntax** `udld port disable`  
`no udld port disable`

**Default** UDLD disable is not set by default.

- Usage notes**
- This command always disables the UDLD feature on a port.
  - The `udld port` command overwrites this command and enables UDLD on an interface.
  - If UDLD has been set globally, using the `udld enable` command, then AlliedWare Plus ignores the **no udld port** command on a fiber interface.

**Mode** Interface Configuration

**Example** To disable UDLD on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# udld port disable
```

To enable UDLD on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no udld port disable
```

**Related commands** `udld enable`  
`udld port`  
`show udld port`

# udld reset

**Overview** Use this command to reset the status of any interface disabled by UDLD.

**Syntax** `udld reset`

**Mode** Global Configuration

**Example** To reset an interface that has been disabled by UDLD, use the commands:

```
awplus# configure terminal
awplus(config)# udld reset
```

**Output** Figure 17-7: Example output from **udld reset**, when 2 ports are disabled

```
awplus#udld reset
2 ports disabled by udld reset
```

Figure 17-8: Example output from **udld reset**, when no ports are disabled

```
awplus#udld reset
No ports are disabled by udld reset
```

**Related commands** [show udld](#)  
[udld enable](#)

# udld time disable-period

**Overview** Use this command to set the UDLD disable period on all interfaces. The disable period is the time (in seconds) that a port is marked disabled before UDLD attempts to recheck it.

Manually reset the UDLD status of a port using the [udld reset](#) command.

Use the **no** variant of this command to reset the disable period to infinite.

**Syntax** `udld time disable-period <seconds>`  
`no udld time disable-period`

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| <seconds> | 30-86400<br>Specify the disable period in seconds. |

**Default** The default time disable period is infinite.

**Mode** Global Configuration

**Example** To change the UDLD disable period to 60 sec on all interfaces, use the commands:

```
awplus# configure terminal
awplus(config)# udld time disable-period 60
```

To reset the disable period to infinite, use the commands:

```
awplus# configure terminal
awplus(config)# no udld time disable-period
```

**Related commands** [udld enable](#)  
[udld port](#)  
[show udld](#)

# udld time message-interval

**Overview** Use this command to set the UDLD message send interval on all interfaces. This is the time, in seconds, between UDLD probe messages. Use the **no** variant of this command to reset the message send interval to 15 seconds.

**Syntax** `udld time message-interval <seconds>`  
`no udld time message-interval`

| Parameter | Description                                           |
|-----------|-------------------------------------------------------|
| <seconds> | 7-90<br>Specify the message send interval in seconds. |

**Default** The default message send interval is 15 seconds.

**Mode** Global Configuration

**Example** To change UDLD message sending interval to 30 sec on all interfaces, use the commands:

```
awplus# configure terminal
awplus(config)# udld time message-interval 30
```

To reset the message sending interval to 15 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no udld time message-interval
```

**Related commands** [udld enable](#)  
[udld port](#)  
[show udld](#)

# undebbug udld

**Overview** This command applies the functionality of the **no debug udld** command.

# 18

# Link Aggregation Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure a static channel group (static aggregator) and dynamic channel group (LACP channel group, etherchannel or LACP aggregator). Link aggregation is also sometimes referred to as channeling.

**NOTE:** *AlliedWare Plus™ supports IEEE 802.3ad link aggregation and uses the Link Aggregation Control Protocol (LACP). LACP does not interoperate with devices that use Port Aggregation Protocol (PAgP).*

*Link aggregation does not necessarily achieve exact load balancing across the links. The load sharing algorithm is designed to ensure that any given data flow always goes down the same link. It also aims to spread data flows across the links as evenly as possible.*

*For example, for a 2 Gbps LAG that is a combination of two 1 Gbps ports, any one flow of traffic can only ever reach a maximum throughput of 1 Gbps. However, the hashing algorithm should spread the flows across the links so that when many flows are operating, the full 2 Gbps can be utilized.*

*For information about load balancing see the [platform load-balancing](#) command.*

For a description of static and dynamic link aggregation (LACP), and configuration examples, see the [Link Aggregation Feature Overview and Configuration Guide](#).

# channel-group

**Overview** Use this command to create a dynamic channel group, or to add a port to an existing dynamic channel group.

You can create up to 124 channel groups, in any combination of static and dynamic (LACP) groups. This means you can create up to 124 dynamic channel groups, if you have no static channel groups.

Use the **no** variant of this command to turn off link aggregation on the device port. You will be returned to Global Configuration mode from Interface Configuration mode.

**Syntax** `channel-group <dynamic-channel-group-number> mode {active|passive}`  
`no channel-group`

| Parameter                                         | Description                                                                                                                                                                                |
|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;dynamic-channel-group-number&gt;</code> | <1-248> Dynamic channel group number for an LACP link. You can create up to 124 dynamic channel groups, numbered in the range 1-248.                                                       |
| <code>active</code>                               | Enables initiation of LACP negotiation on a port. The port will transmit LACP dialogue messages whether or not it receives them from the partner device.                                   |
| <code>passive</code>                              | Disables initiation of LACP negotiation on a port. The port will only transmit LACP dialogue messages if the partner device is transmitting them, i.e., the partner is in the active mode. |

**Mode** Interface Configuration

**Usage notes** All the device ports in a channel-group must belong to the same VLANs, have the same tagging status, and can only be operated on as a group. All device ports within a channel group must have the same port speed and be in full duplex mode.

Once the LACP channel group has been created, it is treated as a device port. You can specify it in other commands. If you are specifying it in:

- an LACP command, then use the channel-group number on its own. For example, use the command **show etherchannel 2** to show details about channel group 2.
- a non-LACP command, then use **po** followed by the channel-group number. For example, use the command **show interface po2** to show details about channel group 2's interface.

For more information about LACP, see the [Link Aggregation Feature Overview and Configuration Guide](#) which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Examples** To add device port1.0.2 to a newly created LACP channel group 2, in active mode, use the commands below:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# channel-group 2 mode active
```

To remove device port1.0.2 from any created LACP channel groups, use the command below:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no channel-group
```

To reference channel group 2 as an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface po2
awplus(config-if)#
```

**Related commands**

- [show etherchannel](#)
- [show etherchannel detail](#)
- [show etherchannel summary](#)
- [show port etherchannel](#)

**Command changes** Version 5.4.9-0.1: Ability added to create up to 124 groups as any combination of static and dynamic channel groups. Also, numbering changed to 1-248.

# clear lacp counters

**Overview** Use this command to clear all counters of all present LACP aggregators (channel groups) or a given LACP aggregator.

**Syntax** `clear lacp [<1-248>] counters`

| Parameter | Description           |
|-----------|-----------------------|
| <1 - 248> | Channel-group number. |

**Mode** Privileged Exec

**Example** `awplus# clear lacp 2 counters`

# debug lacp

**Overview** Use this command to enable all LACP troubleshooting functions.

Use the **no** variant of this command to disable this function.

**Syntax** `debug lacp {all|cli|event|ha|packet|sync|timer[detail]}`  
`no debug lacp {all|cli|event|ha|packet|sync|timer[detail]}`

| Parameter | Description                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------|
| all       | Turn on all debugging for LACP.                                                                           |
| cli       | Specifies debugging for CLI messages.<br>Echoes commands to the console.                                  |
| event     | Specifies debugging for LACP events.<br>Echoes events to the console.                                     |
| ha        | Specifies debugging for HA (High Availability) events.<br>Echoes High Availability events to the console. |
| packet    | Specifies debugging for LACP packets.<br>Echoes packet contents to the console.                           |
| sync      | Specified debugging for LACP synchronization.<br>Echoes synchronization to the console.                   |
| timer     | Specifies debugging for LACP timer.<br>Echoes timer expiry to the console.                                |
| detail    | Optional parameter for LACP timer-detail.<br>Echoes timer start/stop details to the console.              |

**Mode** Privileged Exec and Global Configuration

**Examples** `awplus# debug lacp timer detail`  
`awplus# debug lacp all`

**Related commands** [show debugging lacp](#)  
[undebug lacp](#)

# lacp global-passive-mode enable

**Overview** Use this command to enable LACP channel-groups to dynamically self-configure when they are connected to another device that has LACP channel-groups configured with Active Mode.

**Syntax** lacp global-passive-mode enable  
no lacp global-passive-mode enable

**Default** Enabled

**Mode** Global Configuration

**Usage notes** Do not mix LACP configurations (manual and dynamic). When LACP global passive mode is turned on (by using the **lacp global-passive-mode enable** command), we do not recommend using a mixed configuration in a LACP channel-group; i.e. some links are manually configured (by the **channel-group** command) and others are dynamically learned in the same channel-group.

**Example** To enable global passive mode for LACP channel groups, use the command:

```
awplus(config)# lacp global-passive-mode enable
```

To disable global passive mode for LACP channel groups, use the command:

```
awplus(config)# no lacp global-passive-mode enable
```

**Related commands** [show etherchannel](#)  
[show etherchannel detail](#)

# lacp port-priority

**Overview** Use this command to set the priority of a device port. Ports are selected for aggregation based on their priority, with the higher priority (numerically lower) ports selected first.

Use the **no** variant of this command to reset the priority of port to the default.

**Syntax** lacp port-priority <1-65535>  
no lacp port-priority

| Parameter   | Description                     |
|-------------|---------------------------------|
| <1 - 65535> | Specify the LACP port priority. |

**Default** The default is 32768.

**Mode** Interface Configuration

**Example** awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# lacp port-priority 34

# lacp system-priority

**Overview** Use this command to set the system priority of a local system. This is used in determining the system responsible for resolving conflicts in the choice of aggregation groups.

Use the **no** variant of this command to reset the system priority of the local system to the default.

**Syntax** lacp system-priority <1-65535>  
no lacp system-priority

| Parameter   | Description                                                          |
|-------------|----------------------------------------------------------------------|
| <1 - 65535> | LACP system priority. Lower numerical values have higher priorities. |

**Default** The default is 32768.

**Mode** Global Configuration

**Example** awplus# configure terminal  
awplus(config)# lacp system-priority 6700

# lacp timeout

**Overview** Use this command to set the short or long timeout on a port. Ports will time out of the aggregation if three consecutive updates are lost.

**Syntax** lacp timeout {short|long}

| Parameter | Description                                                            |
|-----------|------------------------------------------------------------------------|
| timeout   | Number of seconds before invalidating a received LACP data unit (DU).  |
| short     | LACP short timeout. The <b>short</b> timeout value is <b>1</b> second. |
| long      | LACP long timeout. The <b>long</b> timeout value is <b>30</b> seconds. |

**Default** The default is **long** timeout (30 seconds).

**Mode** Interface Configuration

**Usage notes** This command enables the device to indicate the rate at which it expects to receive LACPDU's from its neighbor.

If the timeout is set to **long**, then the device expects to receive an update every **30** seconds, and this will time a port out of the aggregation if no updates are seen for 90 seconds (i.e. 3 consecutive updates are lost).

If the timeout is set to **short**, then the device expects to receive an update every second, and this will time a port a port out of the aggregation if no updates are seen for 3 seconds (i.e. 3 consecutive updates are lost).

The device indicates its preference by means of the Timeout field in the Actor section of its LACPDUs. If the Timeout field is set to 1, then the device has set the **short** timeout. If the Timeout field is set to 0, then the device has set the **long** timeout.

Setting the **short** timeout enables the device to be more responsive to communication failure on a link, and does not add too much processing overhead to the device (1 packet per second).

**NOTE:** It is not possible to configure the rate that the device sends LACPDUs; the device must send at the rate which the neighbor indicates it expects to receive LACPDUs.

**Examples** The following commands set the LACP long timeout period for 30 seconds on port1.0.2.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# lacp timeout long
```

The following commands set the LACP short timeout for 1 second on port1.0.2.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# lacp timeout short
```

# platform load-balancing

**Overview** This command determines which address fields are used as inputs into the load balancing algorithm for aggregated links. The output from this algorithm is used to select which individual path a given packet will traverse within an aggregated link.

The **no** variant of this command removes the specified packet type from the calculation.

**Syntax** platform load-balancing [src-dst-mac] [src-dst-ip]  
[src-dst-port]  
no platform load-balancing [src-dst-mac] [src-dst-ip]  
[src-dst-port]

| Parameter    | Description                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------|
| src-dst-mac  | The source and destination MAC addresses (Layer 2)                                                                                     |
| src-dst-ip   | The source and destination IP addresses (Layer 3)                                                                                      |
| src-dst-port | The source and destination TCP/UDP port data (Layer 4). If you include this option, make sure that <b>src-dst-ip</b> is also selected. |

**Default** Includes the **src-dst-mac** and **src-dst-ip** addresses as inputs into the platform load balancing algorithm.

**Mode** Global configuration

**Usage notes** Useful combinations of inputs are:

- MAC address and IP address (the default)
- MAC address only
- MAC address, IP address and Layer 4 port number
- IP address and Layer 4 port number
- IP address only

The following examples show how to configure each of these combinations.

Note the following restrictions:

- you can only stop using MAC addresses (**src-dst-mac**) if you still have IP addresses (**src-dst-ip**) selected
- if you specify Layer 4 ports (**src-dst-port**), you should also specify IP addresses (**src-dst-ip**)

Use the [show platform](#) command to verify this command's setting.

**Examples** To use MAC addresses and IP addresses, you do not have to enter any commands, because this is the default. Note that this setting is not displayed in the **show running-config** output. Use the [show platform](#) command to verify this setting.

To use MAC addresses only, remove IP addresses by using the commands:

```
awplus# configure terminal
```

```
awplus(config)# no platform load-balancing src-dst-ip
```

To use MAC addresses, IP addresses and Layer 4 port numbers, add Layer 4 port numbers by using the commands:

```
awplus# configure terminal
```

```
awplus(config)# platform load-balancing src-dst-port
```

To use IP addresses and Layer 4 port numbers, remove MAC addresses and add Layer 4 port numbers by using the commands:

```
awplus# configure terminal
```

```
awplus(config)# no platform load-balancing src-dst-mac
```

```
awplus(config)# platform load-balancing src-dst-port
```

To use IP addresses only, remove MAC addresses by using the commands:

```
awplus# configure terminal
```

```
awplus(config)# no platform load-balancing src-dst-mac
```

**Related commands** [show platform](#)

# show debugging lacp

**Overview** Use this command to see what debugging is turned on for LACP management.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show debugging lacp

**Mode** User Exec and Privileged Exec

**Example** awplus# show debugging lacp

**Output** Figure 18-1: Example output from the **show debugging lacp** command

```
LACP debugging status:
LACP timer debugging is on
LACP timer-detail debugging is on
LACP cli debugging is on
LACP packet debugging is on
LACP event debugging is on
LACP sync debugging is on
```

**Related commands** [debug lacp](#)

# show diagnostic channel-group

**Overview** This command displays dynamic and static channel group interface status information. The output of this command is useful for Allied Telesis authorized service personnel for diagnostic purposes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show diagnostic channel-group

**Mode** User Exec and Privileged Exec

**Example** awplus# show diagnostic channel-group

**Output** Figure 18-2: Example output from the **show diagnostic channel-group** command

```
awplus#show diagnostic channel-group

Channel Group Info based on NSM:
Note: Pos - position in hardware table

Dev Interface IfIndex Member port IfIndex Active Pos

 sa3 4503 port1.0.15 5015 No
 sa3 4503 port1.0.18 5018 No
 po1 4601 port1.0.7 5007 No
 po1 4601 port1.0.8 5008 No
 po1 4601 port1.0.9 5009 No

Channel Group Info based on HSL:
Note: Pos - position in hardware table

Dev Interface IfIndex Member port IfIndex Active Pos

 sa3 4503 N/a
 po1 4601 N/a

Channel Group Info based on IPIFWD:
Note: Pos - position in hardware table

Dev Interface IfIndex Member port IfIndex Active Pos

 sa3 4503 N/a
 po1 4601 N/a
```

Channel Group Info based on HW:

Note: Pos - position in hardware table

Only entries from first device are displayed.

| Dev | Interface | IfIndex | Member port | IfIndex | Active | Pos |
|-----|-----------|---------|-------------|---------|--------|-----|
|     | sa3       | 4503    |             |         | N/a    |     |
|     | po1       | 4601    |             |         | N/a    |     |

No error found

**Related commands** [show tech-support](#)

# show etherchannel

**Overview** Use this command to display information about an LACP channel specified by the channel group number.

The command output also shows the thrash limiting status. If thrash limiting is detected and the **action** parameter of the [thrash-limiting](#) command is set to **vlan-disable**, the output will also show the VLANs on which thrashing is detected.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#), which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** show etherchannel [<1-248>]

| Parameter | Description           |
|-----------|-----------------------|
| <1-248>   | Channel-group number. |

**Mode** User Exec and Privileged Exec

**Example** awplus# show etherchannel

**Output** Figure 18-3: Example output from **show etherchannel**

```
awplus#show etherchannel
LAG Maximum : 124
LAG Static Count : 0
LAG Dynamic Count : 1
LAG Total Count : 1
Lacp Aggregator: po1
Member:
 port1.0.1
 port1.0.2
```

**Example** awplus# show etherchannel 1

**Output** Figure 18-4: Example output from **show etherchannel** for a particular channel

```
awplus#show etherchannel 1
Aggregator po1 (4601)
Mac address: 00:00:00:00:00:00
Admin Key: 0001 - Oper Key 0000
Receive link count: 0 - Transmit link count: 0
Individual: 0 - Ready: 0
Partner LAG: 0x0000,00-00-00-00-00-00
Link: port1.0.1 (5001) disabled
Link: port1.0.2 (5002) disabled
```

# show etherchannel detail

**Overview** Use this command to display detailed information about all LACP channels.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#), which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** show etherchannel detail

**Mode** User Exec and Privileged Exec

**Example** awplus# show etherchannel detail

**Output** Example output from **show etherchannel detail**

```
awplus#show etherchannel detail
Aggregator po1 (IfIndex: 4601)
 Mac address: 00:00:cd:37:05:17
 Admin Key: 0001 - Oper Key 0001
 Receive link count: 2 - Transmit link count: 2
 Individual: 0 - Ready: 1
 Partner LAG: 0x8000,00-00-cd-37-02-9a,0x0001
 Link: port1.0.1 (IfIndex: 8002) synchronized
 Link: port1.0.2 (IfIndex: 20002) synchronized
Aggregator po2 (IfIndex: 4602)
 Mac address: 00:00:cd:37:05:17
 Admin Key: 0002 - Oper Key 0002
 Receive link count: 2 - Transmit link count: 2
 Individual: 0 - Ready: 1

# show etherchannel summary

**Overview** Use this command to display a summary of all LACP channels.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#), which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** show etherchannel summary

**Mode** User Exec and Privileged Exec

**Example** awplus# show etherchannel summary

**Output** Example output from **show etherchannel summary**

```
awplus#show etherchannel summary
Aggregator po10 (IfIndex: 4610)
Admin Key: 0010 - Oper Key 0010
Link: port1.0.1 (IfIndex: 7007) synchronized
Link: port1.0.2 (IfIndex: 8007) synchronized
Link: port1.0.3 (IfIndex: 11007) synchronized
```

# show lacp sys-id

**Overview** Use this command to display the LACP system ID and priority.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#), which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** show lacp sys-id

**Mode** User Exec and Privileged Exec

**Example** awplus# show lacp sys-id

**Output** Example output from **show lacp sys-id**

```
System Priority: 0x8000 (32768)
MAC Address: 0200.0034.5684
```

# show lacp-counter

**Overview** Use this command to display the packet traffic on all ports of all present LACP aggregators, or a given LACP aggregator.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#), which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** show lacp-counter [<1-248>]

| Parameter | Description           |
|-----------|-----------------------|
| <1-248>   | Channel-group number. |

**Mode** User Exec and Privileged Exec

**Example** awplus# show lacp-counter 2

**Output** Example output from **show lacp-counter**

|                                  |         |      |        |      |          |      |
|----------------------------------|---------|------|--------|------|----------|------|
| % Traffic statistics             |         |      |        |      |          |      |
| Port                             | LACPDUs |      | Marker |      | Pckt err |      |

| % Aggregator po2 (IfIndex: 4604) |         |      |        |      |          |      |
| port1.0.2                        | 0       | 0    | 0      | 0    | 0        | 0    |

# show port etherchannel

**Overview** Use this command to show LACP details of the device port specified.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#), which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** show port etherchannel <port>

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| <port>    | Name of the device port to display LACP information about. |

**Mode** User Exec and Privileged Exec

**Example** awplus# show port etherchannel port1.0.2

**Output** Example output from **show port etherchannel**

```
awplus#show port etherchannel port1.0.2
LACP link info: port1.0.2 - 7007
Link: port1.0.2 (IfIndex: 7007)
Aggregator: po10 (IfIndex: 4610)
Receive machine state: Current

Distributing Yes
Defaulted No
Expired No
```

# show static-channel-group

**Overview** Use this command to display all configured static channel groups and their corresponding member ports. Note that a static channel group is the same as a static aggregator.

The command output also shows the thrash limiting status. If thrash limiting is detected and the **action** parameter of the [thrash-limiting](#) command is set to **vlan-disable**, the output will also show the VLANs on which thrashing is detected.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#), which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** show static-channel-group

**Mode** User Exec and Privileged Exec

**Example** awplus# show static-channel-group

**Output** Example output from **show static-channel-group**

```
% LAG Maximum : 124
% LAG Static Count : 2
% LAG Dynamic Count : 0
% LAG Total Count : 2
% Static Aggregator: sa2
% Member:
 port1.0.1
 port1.0.2
% Static Aggregator: sa3
% Member:
 port1.0.3
 port1.0.4
```

**Related commands** [static-channel-group](#)

# static-channel-group

**Overview** Use this command to create a static channel group, or to add a port to an existing static channel group. Static channel groups are also known as static aggregators.

You can create up to 124 channel groups, in any combination of static and dynamic (LACP) groups. This means you can create up to 124 static channel groups, if you have no dynamic channel groups.

Use the **no** variant of this command to remove the device port from the static channel group.

**Syntax** `static-channel-group <static-channel-group-number>`  
`[member-filters]`  
`no static-channel-group`

| Parameter                                        | Description                                                                                                                                                                                                       |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;static-channel-group-number&gt;</code> | <1-248> Static channel group number. You can create up to 124 static channel groups, numbered in the range 1-248.                                                                                                 |
| <code>member-filters</code>                      | Allow QoS and ACL settings to be configured on the aggregator's individual member ports, instead of the aggregator itself. This configuration is required when using QoS Storm Protection on a static aggregator. |

**Mode** Interface Configuration

**Usage notes** This command adds the device port to the static channel group with the specified channel group number. If the channel group does not exist, it is created, and the port is added to it. The **no** prefix detaches the port from the static channel group. If the port is the last member to be removed, the static channel group is deleted.

All the ports in a channel group must have the same VLAN configuration: they must belong to the same VLANs and have the same tagging status, and can only be operated on as a group.

Once the static channel group has been created, it is treated as a device port. You can specify it in other commands by using **sa** followed by the channel-group number. For example, use the command **show interface sa2** to show details about channel group 2's interface:

**Examples** To define static channel group 2 on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# static-channel-group 2
```

To reference static channel group 2 as an interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface sa2
awplus(config-if)#
```

To make it possible to use QoS Storm Protection on static channel group 2 on port1.0.2, with an ACL named "test-acl", use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# static-channel-group 2 member-filters
awplus(config-if)# access-group test-acl
```

**Related commands** [show static-channel-group](#)

**Command changes** Version 5.4.9-0.1: Ability added to create up to 124 groups as any combination of static and dynamic channel groups. Also, numbering changed to 1-248.

# undebbug lacp

**Overview** This command applies the functionality of the no `debug lacp` command.

# 19

# Power over Ethernet Commands

## Introduction

**Overview** This chapter contains an alphabetical list of commands used to configure Power over Ethernet (PoE). Each command contains a functional description and shows examples of configuration and output screens for show commands. These commands are only supported on PoE capable ports. An error message will display on the console if you enter a PoE command on a port that does not support PoE. The following documents offer further information for configuring PoE on AlliedWare Plus switches.

- the [PoE Feature Overview and Configuration\\_Guide](#).
- the [Support for Allied Telesis Enterprise\\_MIBs\\_in AlliedWare Plus](#), for information about which PoE MIB objects are supported.
- the [SNMP Feature Overview and Configuration\\_Guide](#), for information about SNMP traps.

Power over Ethernet (PoE) is a technology allowing devices such as security cameras to receive power over LAN cabling.

The Powered Device (PD) referred to throughout this chapter is a PoE or PoE+ powered device, such as an IP phone or a Wireless Access Point (WAP).

# clear power-inline counters interface

**Overview** This command will clear the counters from a specified port, a range of ports, or all ports on the switch. If no ports are entered then PoE counters for all ports are cleared. It will also clear all Power over Ethernet (PoE) counters supported by the Power Ethernet MIB (RFC 3621).

**Syntax** `clear power-inline counters interface [<port-list>]`

| Parameter   | Description                                                 |
|-------------|-------------------------------------------------------------|
| <port-list> | Selects the port or ports whose counters are to be cleared. |

**Mode** Privileged Exec

**Usage notes** The PoE counters are displayed with the [show power-inline counters](#) command.

**Examples** To clear the PoE counters for port1.0.2 only, use the following command:

```
awplus# clear power-inline counters interface port1.0.2
```

To clear the PoE counters for port1.0.5 through port1.0.8, use the following command:

```
awplus# clear power-inline counters interface
port1.0.5-port1.0.8
```

To clear the PoE counters for all ports, use the following command:

```
awplus# clear power-inline counters interface
```

**Related commands** [show power-inline counters](#)

**Command changes** Version 5.4.8-0.2: added to x550 series products

# debug power-inline

**Overview** This command enables debugging display for messages that are specific to Power over Ethernet (PoE).

Use the **no** variant of this command to disable the specified PoE debugging messages.

**Syntax** debug power-inline [all|event|info|power]  
no debug power-inline [all|event|info|power]

| Parameter | Description                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------|
| all       | Displays all (event, info, nsm, power) debug messages.                                                                           |
| event     | Displays event debug information, showing any error conditions that may occur during PoE operation.                              |
| info      | Displays informational level debug information, showing high-level essential debugging, such as information about message types. |
| power     | Displays power management debug information.                                                                                     |

**Default** No debug messages are enabled by default.

**Mode** Privileged Exec

**Usage notes** Use the [terminal monitor](#) command to display PoE debug messages on the console.

Use the [show debugging power-inline](#) command to show the PoE debug configuration.

**Examples** To enable PoE debugging and start the display of PoE event and info debug messages on the console, use the following commands:

```
awplus# terminal monitor
awplus# debug power-inline event info
```

To enable PoE debugging and start the display of all PoE debugging messages on the console, use the following commands:

```
awplus# terminal monitor
awplus# debug power-inline all
```

To stop the display of PoE info debug messages on the console, use the following command:

```
awplus# no debug power-inline info
```

To disable all PoE debugging and stop the display of any PoE debugging messages on the console, use the following command:

```
awplus# no debug power-inline all
```

**Related commands** [show debugging power-inline](#)  
[terminal monitor](#)

**Command changes** Version 5.4.8-0.2: added to x550 series products

# power-inline allow-legacy

**Overview** This command enables detection of pre-IEEE 802.3af Power Ethernet standard legacy Powered Devices (PDs).

The **no** variant of this command disables detection of pre-IEEE 802.3af Power Ethernet standard legacy Powered Devices (PDs).

**Syntax** power-inline allow-legacy  
no power-inline allow-legacy

**Default** Detection of legacy PDs is disabled on all ports

**Mode** Global Configuration

**Examples** To enable detection of legacy PDs, use the following commands:

```
awplus# configure terminal
awplus(config)# power-inline allow-legacy
```

To disable detection of legacy PDs, use the following commands:

```
awplus# configure terminal
awplus(config)# no power-inline allow-legacy
```

**Validation Commands** show power-inline  
show running-config power-inline

**Command changes** Version 5.4.8-0.2: added to x550 series products  
Version 5.4.9-0.1: default changed to “disabled”

# power-inline description

**Overview** This command adds a description for a Powered Device (PD) connected to a PoE port.

The **no** variant of this command clears a previously entered description for a connected PD, resetting the PD description to the default (null).

**Syntax** `power-inline description <pd-description>`  
`no power-inline description`

| Parameter                           | Description                                                                                                             |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;pd-description&gt;</code> | Description of the PD connected to the PoE capable port (with a maximum 256 character string limit per PD description). |

**Default** No description for a connected PD is set by default.

**Mode** Interface Configuration

**Usage notes** Select a PoE port, a list of PoE ports, or a range of PoE ports with the preceding [interface \(to configure\)](#) command. If you specify a range or list of ports they must all be PoE capable ports.

In a VCS stack of switches this command is supported on all PoE capable ports.

To configure the same description on a port on more than one stack member you specify the interface range and apply the description. Note the command will only be successfully applied to PoE capable ports.

To give ports different descriptions, select the ports separately, then configure the desired description on each.

**Examples** To add the description "Desk Phone" for a connected PD on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# power-inline description Desk Phone
```

To clear the description for the connected PD on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no power-inline description
```

**Related commands** [show power-inline interface](#)  
[show running-config <power-inline>](#)

**Command changes** Version 5.4.8-0.2: added to x550 series products

# power-inline enable

**Overview** This command enables Power over Ethernet (PoE) to detect a connected Powered Device (PD) and supply power.

The **no** variant of this command disables PoE functionality on the selected PoE port(s). No power is supplied to a connected PD after PoE is disabled on the selected PoE port(s).

Ports still provide Ethernet connectivity after PoE is disabled.

**Syntax** `power-inline enable`  
`no power-inline enable`

**Default** PoE is enabled by default on all ports

**Mode** Interface Configuration for one or more PoE switchports.

**Usage notes** No PoE log messages are generated for ports on which PoE is disabled.

**Examples** To disable PoE on port1.0.1 to port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# no power-inline enable
```

To enable PoE on port1.0.1 to port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# power-inline enable
```

**Related commands** [show power-inline](#)  
[show power-inline interface](#)  
[show power-inline interface detail](#)  
[show running-config power-inline](#)

**Command changes** Version 5.4.8-0.2: added to x550 series products

# power-inline hanp

**Overview** Use this command to enable High Availability Network Power (HANP), also known as Continuous PoE. Continuous PoE enables the switches to perform actions such as software upgrades without forcing the Powered Devices to power cycle. This means, for example, if you are rebooting a switch connected to a PD such as a camera, Continuous PoE allows the camera to buffer while the switch is rebooted. You can configure it on a global or per port level. Enabling it globally enables it on all PoE ports.

Use the **no** variant of this command to disable Continuous PoE globally or on the specified ports.

**Syntax** `power-inline hanp`  
`no power-inline hanp`

**Default** Continuous PoE is disabled globally by default. If you enable it globally, that enables it on all ports.

**Mode** User Exec/Privileged Exec or Interface Configuration for a PoE port

**Example** To enable Continuous PoE on all ports, use the commands:

```
awplus# configure terminal
awplus(config)# power-inline hanp
```

To enable Continuous PoE on all ports except port 1.0.5, use the commands:

```
awplus# configure terminal
awplus(config)# power-inline hanp
awplus(config)# interface port1.0.5
awplus(config-if)# no power-inline hanp
```

**Related commands** [show power-inline](#)  
[show power-inline interface](#)  
[show power-inline interface detail](#)

**Command changes** Version 5.4.6-2.1: command added  
Version 5.4.7-0.1: added to x930 series products  
Version 5.4.8-0.2: added to x550 series products  
Version 5.4.8-2.1: added to x220 series products

# power-inline max

**Overview** This command sets the maximum power allocated to a Power over an Ethernet (PoE and PoE+) port. The amount of power actually supplied to the port depends on the power requirements of the connected PD. It is also a function of the total PoE power loading on the switch and the PoE priority set for the port by the [power-inline priority](#) command. However this command (power-inline max) does apply a maximum value to the power that the port is able to supply.

This switch allocates power dynamically, so you do not need to use this command to set it statically. If you do use this command, the values specified in this command will override the dynamic allocation and will control the power output for each port.

Note that the value set by this command will be the figure the switch will use when apportioning the power budget for its ports. For example, if 15.4 W is assigned to a port whose PD only consumes 5 W, the switch will reserve the full 15.4 W for this port when determining its total power PoE power requirement.

The **no** variant of this command sets the maximum power supplied to a PoE port to the default, which is set to the maximum power limit for the class of the connected Powered Device (PD).

**Syntax** power-inline max <4000-30000>  
no power-inline max

| Parameter    | Description                                                  |
|--------------|--------------------------------------------------------------|
| <4000-30000> | The maximum power supplied to a PoE port in milliwatts (mW). |

**Default** By default, the switch dynamically determines the power used by the PD connected to the port.

**Mode** Interface Configuration for one or more ports. If you specify a range or list of ports, they must all be PoE capable ports.

**Usage notes** If you select a range of PoE ports in Interface Configuration mode before issuing this command, then each port in the range selected will have the same maximum power value configured.

If a PoE port attempts to draw more than the maximum power, this is logged and all power is removed.

Note that the value entered is rounded up to the next value supported by the hardware. The actual value used is displayed after you enter the command, such as in the following sample console output:

```
awplus#configure terminal
awplus(config)#interface port1.0.1
awplus(config-if)#power-line max 5300
% The maximum power has been rounded to 5450mW in hardware.
```

See the [LLDP Feature Overview and Configuration Guide](#) for information about power monitoring at the PD.

Note the difference in power supplied from the PSE to the power available at the PD due to line loss.

See the [PoE Feature Overview and Configuration Guide](#) for further information about the difference between the power supplied from the PSE and the power available at the PD.

**Examples** To set the maximum power supplied to ports in the range port1.0.1 to port1.0.4 to 6450mW per port, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.4
awplus(config-if)# power-inline max 6450
```

To clear the user-configured maximum power supplied to port1.0.1, and revert to using the default maximum power, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no power-inline max
```

**Related commands** [show power-inline interface](#)  
[show running-config power-inline](#)

**Command changes** Version 5.4.8-0.2: added to x550 series products

# power-inline priority

**Overview** This command sets the Power over Ethernet (PoE) priority level of a PoE port to one of three available priority levels:

- low
- high
- critical

The **no** variant of this command restores the PoE port priority to the default (low).

**Syntax** power-inline priority {low|high|critical}  
no power-inline priority

| Parameter | Description                                                                                                                                                                                                                                                              |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| low       | The lowest priority for a PoE enabled port (default). PoE ports set to <b>low</b> only receive power if all the PoE ports assigned to the other two levels are already receiving power.                                                                                  |
| high      | The second highest priority for a PoE enabled port. PoE ports set to <b>high</b> receive power only if all the ports set to <b>critical</b> are already receiving power.                                                                                                 |
| critical  | The highest priority for a PoE enabled port. PoE ports set to <b>critical</b> are guaranteed power before any ports assigned to the other two priority levels. Ports assigned to the other priority levels receive power only if all critical ports are receiving power. |

**Default** The default priority is **low** for all PoE ports

**Mode** Interface Configuration

**Usage notes** This command is supported on all PoE capable ports, whether operating as a stand-alone switch, or within a VCStack.

Select a PoE port, a list of PoE ports, or a range of PoE ports with the preceding [interface \(to configure\)](#) command. If you specify a range or list of ports they must all be PoE capable ports.

PoE ports with higher priorities are given power before PoE ports with lower priorities. If the priorities for two PoE ports are the same then the lower numbered PoE port is given power before the higher numbered PoE port.

See the [PoE Feature Overview and Configuration Guide](#) for further information about PoE priority.

**Examples** To set the priority level to high on port1.0.1 to port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# power-inline priority high
```

To reset the priority level to the default of low on port1.0.1 to port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# no power-inline priority
```

**Command changes** Version 5.4.8-0.2: added to x550 series products

# power-inline usage-threshold

**Overview** This command sets the level at which the switch will issue a message that the power supplied to all Powered Devices (PDs) has reached a critical level of the nominal power rating for the switch. The level is set as a percentage of total available power.

The **no** variant of this command resets the notification usage-threshold to the default (80% of the nominal power rating).

**Syntax** power-inline usage-threshold <1-99>  
no power-inline usage-threshold

| Parameter | Description                                                  |
|-----------|--------------------------------------------------------------|
| <1-99>    | The usage-threshold percentage configured with this command. |

**Default** The default power usage threshold is 80% of the nominal power rating

**Mode** Global Configuration

**Usage notes** Use the [snmp-server enable trap](#) command to configure SNMP notification. An SNMP notification is sent when the usage-threshold, as configured in the example, is exceeded.

**Examples** To generate SNMP notifications when power supplied exceeds 70% of the nominal power rating, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap power-inline
awplus(config)# power-inline usage-threshold 70
```

To reset the notification threshold to the default (80% of the nominal power rating), use the following commands:

```
awplus# configure terminal
awplus(config)# no power-inline usage-threshold
```

**Related commands** [snmp-server enable trap](#)

[show running-config power-inline](#)

**Command changes** Version 5.4.8-0.2: added to x550 series products

# service power-inline

**Overview** This command enables Power over Ethernet (PoE) globally on the switch, for all PoE ports.

**Syntax** `service power-inline`  
`no service power-inline`

**Default** PoE functionality is enabled by default

**Mode** Global Configuration

**Usage notes** In a stack, issuing this command enables PoE globally for all PoE ports.  
In a stack configuration, only stack members containing PoE hardware will have PoE enabled by default in software.

**Examples** To disable PoE, use the following commands:

```
awplus# configure terminal
awplus(config)# no service power-inline
```

To re-enable PoE, if PoE has been disabled, use the following commands:

```
awplus# configure terminal
awplus(config)# service power-inline
```

# show debugging power-inline

**Overview** This command displays Power over Ethernet (PoE) debug settings.

**Syntax** show debugging power-inline

**Mode** User Exec and Privileged Exec

**Example** To display PoE debug settings, use the following command:

```
awplus# show debugging power-inline
```

**Output** Figure 19-1: Example output from the **show debugging power-inline** command

```
awplus#show debugging power-inline
PoE Debugging status:
PoE Informational debugging is disabled
PoE Event debugging is disabled
PoE Power Management debugging is disabled

PoE NSM debugging is enabled
```

**Command changes** Version 5.4.8-0.2: added to x550 series products

# show power-inline

**Overview** This command displays the Power over Ethernet (PoE) status for all ports. For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show power-inline

**Mode** User Exec and Privileged Exec

**Example** To display the PoE status for all ports, use the following command:

```
awplus# show power-inline
```

**Output** Figure 19-2: Example output from **show power-inline**.

```
awplus#show power-inline
PoE Status:
Stack member 1
Nominal Power: 740W
Power Allocated: 66W
Power Requested: 66W
Actual Power Consumption: 58W
Operational Status: On
Power Usage Threshold: 80% (592W)
Detection of legacy devices is disabled
Allow power to pre-802.3bt devices is disabled
Power Source: AC
High Availability Network Power: Disabled
Power management mode: Dynamic

**Table 1:** Parameters in the **show power-inline** command output

| Parameter       | Description                                                                                                                                     |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Nominal Power   | The nominal power available on the switch in watts (W).                                                                                         |
| Power Allocated | The current power allocated in watts (W) that is available to be drawn by any connected Powered Devices (PDs). This is updated every 5 seconds. |

**Table 1:** Parameters in the **show power-inline** command output (cont.)

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Actual Power Consumption        | The current power consumption in watts (W) drawn by all connected Powered Devices (PDs). This is updated every 5 seconds.                                                                                                                                                                                                                                                                                                                                                       |
| Operational Status              | The operational status of the PSU hardware when this command was issued: <ul style="list-style-type: none"> <li>• <b>On</b> if the PSU is installed and switched on.</li> <li>• <b>Off</b> when the PSU is switched off (an RPS may be connected to the switch to power PoE instead of the PSU).</li> <li>• <b>Fault</b> when there is an issue with the PSU hardware.</li> </ul>                                                                                               |
| Power Usage Threshold (%)       | The configured SNMP trap / log threshold, as configured from a <a href="#">power-inline usage-threshold</a> command.                                                                                                                                                                                                                                                                                                                                                            |
| Power management mode: Dynamic  | Indicates that PoE power is allocated dynamically, based on the current usage of each PD attached to the switch's ports. When you connect a new PD to the switch, the switch determines whether it can power that device by measuring the power the existing PDs are currently using. If there is sufficient power available, the switch will allocate it to the new device.                                                                                                    |
| High Availability Network Power | Whether High Availability Network Power is enabled or disabled globally. HANP is also known as Continuous PoE. Continuous PoE enables the switch to perform actions such as software upgrades without forcing the Powered Devices to power cycle. This allows, for example, IP cameras to buffer data instead of losing it.                                                                                                                                                     |
| Interface                       | The PoE port(s) in the format portx.y.z, where x is the device number, y is the module number within the device, and z is the PoE port number within the module.                                                                                                                                                                                                                                                                                                                |
| Admin                           | The administrative state of PoE on a PoE port, either <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                                                                                                                                                                                                                       |
| Pri                             | The current PoE priorities for PoE ports, as configured using the <a href="#">power-inline priority</a> command: <ul style="list-style-type: none"> <li>• <b>Low</b> is the lowest priority (this is the default).</li> <li>• <b>High</b> is the second highest priority.</li> <li>• <b>Crit</b> (critical) is the highest priority.</li> </ul> <p>If the switch cannot supply all ports, it will supply critical ports, then high-priority ports, then low-priority ports.</p> |

**Table 1:** Parameters in the **show power-inline** command output (cont.)

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Oper      | <p>The current PoE port state when this command was issued:</p> <ul style="list-style-type: none"> <li>• <b>Powered</b> displays if there is a PD connected and power is being supplied.</li> <li>• <b>Denied</b> displays if supplying power would make the switch go over the power budget.</li> <li>• <b>Off</b> displays if the port is not supplying power but has not been denied power by the switch. This is the default state for ports that are not connected to a PD.</li> <li>• <b>Disabled</b> displays if the PoE port is administratively disabled.</li> <li>• <b>Syncing</b> displays if PoE is still initializing the port when you issue the command.</li> <li>• <b>Fault</b> displays if there is a problem with PoE on the port.</li> <li>• <b>Unknown</b> displays if PoE cannot determine the state of the port.</li> </ul> |
| Power     | The power consumption in milliwatts (mW) for the PoE port when this command was entered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Device    | The description of the connected PD device if a description has been added with the <a href="#">power-inline description</a> command. No description is shown for PDs not configured with the <a href="#">power-inline description</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Class     | The class of the connected PD, if power is being supplied to the PD.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Max (mW)  | <p>The power in milliwatts (mW) allocated for the PoE port. Additionally, note the following as displayed per PoE port:</p> <ul style="list-style-type: none"> <li>• <b>[U]</b> if the power limit for a port was user configured (with the <a href="#">power-inline max</a> command).</li> <li>• <b>[L]</b> if the power limit for a port was supplied by LLDP.</li> <li>• <b>[C]</b> if the power limit for a port was supplied by the PD class.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                     |
| HANP      | Whether High Availability Network Power is enabled (on) or not (off) on the port. HANP is also known as Continuous PoE. Continuous PoE enables the switch to perform actions such as software upgrades without forcing the Powered Devices to power cycle. This allows, for example, IP cameras to buffer data instead of losing it. This column only displays if Continuous PoE has been enabled globally on the switch.                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Related commands** [show power-inline counters](#)  
[show power-inline interface](#)

**Command changes** Version 5.4.8-0.2: added to x550 series products

# show power-inline counters

**Overview** This command displays Power over Ethernet (PoE) event counters for ports on the Power Sourcing Equipment (PSE). The PoE event counters displayed can also be accessed by objects in the PoE MIB (RFC 3621). See [the MIB Objects Feature Overview and Configuration Guide](#) for information about which PoE MIB objects are supported.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show power-inline counters [*<port-list>*]

| Parameter                | Description                                                   |
|--------------------------|---------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | Enter the PoE port(s) to display PoE event counters for them. |

**Mode** User Exec and Privileged Exec

**Examples** To display all PoE event counters for all PoE ports, use the command:

```
awplus# show power-inline counters
```

To display the PoE event counters for port1.0.1, use the command:

```
awplus# show power-inline counters port1.0.1
```

**Output** Figure 19-3: Example output from the **show power-inline counters** command

**Table 2:** Parameters in the **show power-inline counters** command output

| Parameter | Description                                                                                                                                                                                                              |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | The PoE port(s) in the format portx.y.z, where x is the device number, y is the module number within the device, and z is the PoE port number within the module.                                                         |
| MPSAbsent | The number of instances when the PoE MPS (Maintain Power Signature) signal has been lost. The PoE MPS signal is lost when a PD is disconnected from the PSE. Also increments pethPsePortMPSAbsentCounter in the PoE MIB. |

**Table 2:** Parameters in the **show power-inline counters** command output

| Parameter | Description                                                                                                                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Over load | The number of instances when a PD exceeds its configured power limit (as configured by the <a href="#">power-inline max</a> command). Also increments <code>pethPsePortOverLoadCounter</code> in the PoE MIB. |
| Short     | The number of short circuits that have happened with a PD. Also increments <code>pethPsePortShortCounter</code> in the PoE MIB.                                                                               |
| Invalid   | The number of times a PD with an Invalid Signature (where the PD has an open or short circuit, or is a legacy PD) is detected. Also increments <code>pethPseInvalidSignatureCounter</code> in the PoE MIB.    |
| Denied    | The number of times a PD has been refused power due to power budget limitations for the PSE. Also increments <code>pethPsePortPowerDeniedCounter</code> in the PoE MIB.                                       |

**Command changes**    Version 5.4.8-0.2: added to x550 series products

# show power-inline interface

**Overview** This command displays a summary of Power over Ethernet (PoE) information for specified ports. If no ports are specified then PoE information is displayed for all ports.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show power-inline interface [<port-list>]

| Parameter   | Description                                                                   |
|-------------|-------------------------------------------------------------------------------|
| <port-list> | Enter the PoE port(s) to display PoE specific information in the show output. |

**Mode** User Exec and Privileged Exec

**Example** To display the PoE port-specific information for all PoE ports on the switch, use the following command:

```
awplus# show power-inline interface
```

To display the PoE port specific information for port1.0.1 to port1.0.3, use the following command:

```
awplus# show power-inline interface port1.0.1-port1.0.3
```

**Output** Figure 19-4: Example output from **show power-inline interface**

|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pri       | <p>The current PoE priorities for PoE ports on the PSE, as configured from a <a href="#">power-inline priority</a> command:</p> <ul style="list-style-type: none"> <li>• <b>Low</b> displays when the low parameter is issued. The lowest priority for a PoE enabled port (default).</li> <li>• <b>High</b> displays when the high parameter is issued. The second highest priority for a PoE enabled port.</li> <li>• <b>Crit</b> displays when the critical parameter is issued. The highest priority for a PoE enabled port.</li> </ul>                                                                                                                                                                                                                                                                                                        |
| Oper      | <p>The current PoE port state when this command was issued:</p> <ul style="list-style-type: none"> <li>• <b>Powered</b> displays if there is a PD connected and power is being supplied.</li> <li>• <b>Denied</b> displays if supplying power would make the switch go over the power budget.</li> <li>• <b>Off</b> displays if the port is not supplying power but has not been denied power by the switch. This is the default state for ports that are not connected to a PD.</li> <li>• <b>Disabled</b> displays if the PoE port is administratively disabled.</li> <li>• <b>Syncing</b> displays if PoE is still initializing the port when you issue the command.</li> <li>• <b>Fault</b> displays if there is a problem with PoE on the port.</li> <li>• <b>Unknown</b> displays if PoE cannot determine the state of the port.</li> </ul> |
| Power     | The power consumption in milliwatts (mW) for the PoE port when this command was entered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Device    | The description of the connected PD device if a description has been added with the <a href="#">power-inline description</a> command. No description is shown for PDs not configured with the <a href="#">power-inline description</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Class     | <p>The class of the connected PD, if power is being supplied to the PD from the PSE.</p> <p>See the <a href="#">PoE Feature Overview and Configuration Guide</a> for further information about power classes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 3:** Parameters in **show power-inline interface** output (cont.)

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max (mW)  | The power in milliwatts (mW) allocated for the PoE port. Additionally, note the following is displayed per PoE port: <ul style="list-style-type: none"><li>• <b>[U]</b> if the power limit for a port was user configured (with the <a href="#">power-inline max</a> command).</li><li>• <b>[L]</b> if the power limit for a port was supplied by LLDP.</li><li>• <b>[C]</b> if the power limit for a port was supplied by the PD class.</li></ul> |
| HANP      | Whether High Availability Network Power is enabled (on) or not (off) on the port. HANP is also known as Continuous PoE. It enables the switch to perform actions such as software upgrades without forcing the Powered Devices to power cycle. This allows, for example, IP cameras to buffer data instead of losing it. This column only displays if Continuous PoE has been enabled globally on the switch.                                      |

**Related commands** [show power-inline](#)  
[show power-inline interface detail](#)

**Command changes** Version 5.4.8-0.2: added to x550 series products

# show power-inline interface detail

**Overview** This command displays detailed information for one or more Power over Ethernet (PoE) ports.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show power-inline interface [<port-list>] detail

| Parameter   | Description                                                                          |
|-------------|--------------------------------------------------------------------------------------|
| <port-list> | Enter the PoE port(s) to display information about only the specified port or ports. |

**Mode** User Exec and Privileged Exec

**Usage notes** The power allocated to each port is listed in the **Power allocated** row, and is limited by the maximum power per Powered Device (PD) class, or a user configured power limit.

**Examples** To display detailed PoE port specific information for the port range port1.0.1 to port1.0.2, use the command:

```
awplus# show power-inline interface port1.0.1-port1.0.2 detail
```

**Output** Figure 19-5: Example output from **show power-inline interface detail**

```
awplus#show power-inline interface port1.0.1 detail
Interface port1.0.1
 Powered device type: IP-Phone
 PoE admin: on
 Configured Priority: Low
 Actual Priority: Low
 Detection status: Powered
 High Availability Network Power: On
 Last negotiated time: mon Sep 2 21:01:24 2019
 Current power consumption: 23000 mW
 Powered device class: 4
 Power allocated: 30000 mW (from powered device class)
 Powered pairs: Data
```

**Table 4:** Parameters in **show power-inline interface detail** output

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                        | The PoE port(s) in the format portx.y.z, where x is the device number, y is the module number within the device, and z is the PoE port number within the module.                                                                                                                                                                                                                                                                                                                                                                                            |
| Powered device type:             | The name of the PD, if connected and if power is being supplied to the PD from the PSE, configured with the <a href="#">power-inline description</a> command. <b>n/a</b> displays if a description has not been configured for the PD.                                                                                                                                                                                                                                                                                                                      |
| PoE admin                        | The administrative state of PoE on a PoE capable port, either <b>Enabled</b> or <b>Disabled</b> as configured from the <a href="#">power-inline enable</a> command or the <b>no power-inline enable</b> command respectively.                                                                                                                                                                                                                                                                                                                               |
| Priority                         | The PoE priority of a port, which is either <b>Low</b> , or <b>High</b> , or <b>Critical</b> , as configured by the <a href="#">power-inline priority</a> command.                                                                                                                                                                                                                                                                                                                                                                                          |
| Detection status:                | The current PSE PoE port state when this command was issued: <ul style="list-style-type: none"> <li>• <b>Powered</b> displays when there is a PD connected and power is being supplied from the PSE.</li> <li>• <b>Denied</b> displays when supplying power would make the PSE go over the power budget.</li> <li>• <b>Disabled</b> displays when the PoE port is administratively disabled.</li> <li>• <b>Off</b> displays when PoE has been disabled for the port.</li> <li>• <b>Fault</b> displays when a PSE goes over its power allocation.</li> </ul> |
| High Availability Network Power: | Whether HANP is enabled or disabled on the port. HANP is also known as Continuous PoE. It enables the switch to perform actions such as software upgrades without forcing the Powered Devices to power cycle. This allows, for example, IP cameras to buffer data instead of losing it. Note that this information is only displayed if Continuous PoE is enabled globally on the switch.                                                                                                                                                                   |
| Current power consumption:       | The power consumption for the PoE port when this command was entered. Note that the power consumption may have changed since the command was entered and the power is displayed.                                                                                                                                                                                                                                                                                                                                                                            |
| Powered device class:            | The class of the connected PD if connected, and if power is being supplied to the PD from the PSE.<br>See the <a href="#">PoE Feature Overview and Configuration Guide</a> for further information about power classes.                                                                                                                                                                                                                                                                                                                                     |
| Power allocated                  | The power in milliwatts (mW) allocated for the PoE port. Additionally, note the following as displayed per PoE port: <ul style="list-style-type: none"> <li>• <b>[U]</b> if the power limit for a port was user configured (with the <b>power-inline max</b> command).</li> <li>• <b>[L]</b> if the power limit for a port was supplied by LLDP.</li> <li>• <b>[C]</b> if the power limit for a port was supplied by the PD class.</li> </ul>                                                                                                               |

**Table 4:** Parameters in **show power-inline interface detail** output (cont.)

| Parameter                      | Description                                                                                                                                                                                                                                                                    |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Detection of legacy devices is | The status of legacy PoE detection on the PoE port (enabled or disabled), as configured for the PoE port with the <a href="#">power-inline allow-legacy</a> command. Legacy detection involves measuring for a large capacitance value to confirm the presence of a legacy PD. |
| Powered pairs                  | The IEEE 802.3af and IEEE 802.3at standards allow for either <b>data</b> or <b>spare</b> twisted pairs to be used to transfer power to a PD.                                                                                                                                   |

# IP Addressing and Protocol Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure various IP features, including the following protocols:

- Address Resolution Protocol (ARP)
- ICMP Router Discovery Advertisements (IRDP)

For more information, see the [IP Feature Overview and Configuration Guide](#).

- Command List**

# arp-aging-timeout

**Overview** This command sets a timeout period on dynamic ARP entries associated with a specific interface. If your device stops receiving traffic for the host specified in a dynamic ARP entry, it deletes the ARP entry from the ARP cache after this timeout is reached.

Your device times out dynamic ARP entries to ensure that the cache does not fill with entries for hosts that are no longer active. Static ARP entries are not aged or automatically deleted.

By default the time limit for dynamic ARP entries is 300 seconds on all interfaces.

The **no** variant of this command sets the time limit to the default of 300 seconds.

**Syntax** arp-aging-timeout <0-432000>  
no arp-aging timeout

| Parameter  | Description                    |
|------------|--------------------------------|
| <0-432000> | The timeout period in seconds. |

**Default** 300 seconds (5 minutes)

**Mode** Interface Configuration for VLAN interfaces.

**Example** To set the ARP entries on interface vlan2 to time out after two minutes, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# arp-aging-timeout 120
```

**Related commands** [clear arp-cache](#)  
[show arp](#)

# arp-mac-disparity

**Overview** Use this command to enable the switch to support services like Microsoft Network Load Balancing (MS-NLB).

Such services use ARP with disparate MAC addresses to ensure that packets destined for a server cluster virtual address are sent to all servers in the cluster. Disparate MAC addresses mean that the MAC address in the "sender hardware address" field of an ARP reply is different to the MAC address in the "Source MAC address" field of the Ethernet header that the ARP packet is encapsulated in.

The **no** variant of this command reverts to the default behavior. See the Default section below for more information.

**Syntax** `arp-mac-disparity {multicast|multicast-igmp|unicast}`  
`no arp-mac-disparity {multicast|multicast-igmp|unicast}`

| Parameter      | Description                                                                                                                                                                                   |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| multicast      | Enables support of server clusters operating in multicast mode. Packets destined for the server cluster are flooded to all ports in the VLAN.                                                 |
| multicast-igmp | Enables support of server clusters operating in multicast/IGMP mode. In multicast/IGMP mode, the MS-NLB server cluster uses IGMP reports to forward server traffic to a limited set of ports. |
| unicast        | Enables support of server clusters operating in unicast mode. Packets destined for the server cluster are flooded to all ports in the VLAN.                                                   |

**Default** The default behavior upon receiving a Disparate ARP response depends on whether **arp-mac-disparity multicast** or **arp-mac-disparity multicast-igmp** has been configured on an interface.

- If one of these has been configured, then the default action is to flood the packets.
- If neither of these has been configured, then the default action is to drop the packets.
- The command **platform multicast-address-mismatch-action {drop|bridge}** overrides the default behavior regardless of the arp-mac-disparity configuration. An action of **bridge** will cause disparate ARPs to be flooded.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** **Disabling L2 load balancing**

You cannot use the command **arp-mac-disparity** if L2 load balancing is enabled, due to a hashing incompatibility. Use the command **no platform load-balancing src-dst-mac** to turn off L2 load balancing.

### Multicast mode

When you are using **multicast** mode, you can limit the number of ports that packets are flooded to, instead of flooding to all ports in the VLAN. To do this, specify the list of ports when creating the ARP entry.

For example, to flood only port1.0.1 to port1.0.3, use the commands:

```
awplus# configure terminal
awplus(config)# no platform load-balancing src-dst-mac
awplus(config)# interface vlan2
awplus(config-if)# arp-mac-disparity multicast
awplus(config-if)# arp 10.10.1.100 010e.11ff.2222
port1.0.1-port1.0.3
```

### Multicast IGMP mode

You can enable Multicast-IGMP mode by using the command **arp-mac-disparity multicast-igmp**.

In this mode, the only difference to standard multicast mode is that the reception of IGMP reports now controls the ports to which the L3 switch floods traffic. That is, rather than simply flooding each packet destined for the NLB cluster IP address to all ports on the egress VLAN, those packets are only sent to the switchports in the VLAN that have received IGMP reports for the multicast group corresponding to the NLB cluster MAC address.

Like **arp-mac-disparity multicast**, the command **arp-mac-disparity multicast-igmp** puts the switch into a mode where it will accept Disparate ARP responses. Similarly, upon receiving a Disparate ARP response, an ARP entry is created for the IP/MAC in the content of the ARP packet. The difference with the **arp-mac-disparity multicast-igmp** command is that the egress port is set to the subset of ports in the VLAN that have received IGMP reports for the NLB cluster MAC address.

Note that the ARP entry is updated as ports join/leave the IGMP group. If no ports have received IGMP reports for the NLB cluster MAC address then the ARP entry will have no egress ports and will simply drop packets destined for the NLB cluster IP address.

Again, no FDB entry is created in response to receiving the ARP packet. However, since the NLB server is operating in multicast mode with the IGMP option set and is sending IGMP reports, an FDB entry will already exist for the IGMP group (and, as a result, the NLB cluster MAC address).

When the **arp-mac-disparity multicast-igmp** command is configured on the VLAN, ARP entries appear in the output of the command **show arp** like this:

```
awplus#show arp
IP Address MAC Address Interface Port Type
10.100.0.56 0100.5e7f.0038 vlan200 igmp-group dynamic
```

**Examples** To enable support for MS-NLB in unicast mode on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# no platform load-balancing src-dst-mac
awplus(config)# interface vlan2
awplus(config-if)# arp-mac-disparity unicast
```

To disable support for MS-NLB in unicast mode on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no arp-mac-disparity unicast
```

**Related  
commands**

[arp](#)  
[clear arp-cache](#)  
[platform load-balancing](#)  
[platform multicast-address-mismatch-action](#)  
[show arp](#)

# arp

**Overview** This command adds a static ARP entry to the ARP cache. This is typically used to add entries for hosts that do not support ARP or to speed up the address resolution function for a host. The ARP entry must not already exist. Use the **alias** parameter to allow your device to respond to ARP requests for this IP address.

If VRF-lite is configured, you can add ARP entries to either the global cache or for a specific VRF instance.

The **no** variant of this command removes the static ARP entry. Use the [clear arp-cache](#) command to remove the dynamic ARP entries in the ARP cache.

**Syntax** `arp <ip-addr> <mac-address> [<port-number>] [alias]`  
`arp <ip-addr> <multicast-mac-address> [<port-list>]`  
`no arp <ip-addr>`

**Syntax (VRF-lite)** `arp [vrf <vrf-name>] <ip-addr> <mac-address> [<port-number>] [alias]`  
`arp [vrf <vrf-name>] <ip-addr> <multicast-mac-address> [<port-list>]`  
`no arp [vrf <vrf-name>] <ip-addr>`

| Parameter                                  | Description                                                                                                                                          |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-addr&gt;</code>               | The IPv4 address of the device you are adding as a static ARP entry.                                                                                 |
| <code>&lt;mac-address&gt;</code>           | The MAC address of the device you are adding as a static ARP entry, in hexadecimal notation with the format HHHH.HHHH.HHHH.                          |
| <code>&lt;port-number&gt;</code>           | The port number associated with the IP address. Specify this when the IP address is part of a VLAN.                                                  |
| <code>&lt;multicast-mac-address&gt;</code> | The multicast MAC address for which you are adding a static ARP entry, in hexadecimal notation with the format HHHH.HHHH.HHHH.                       |
| <code>&lt;port-list&gt;</code>             | The list of port numbers associated with the IP address. You can only specify multiple egress ports when the MAC address is a multicast MAC address. |
| <code>alias</code>                         | Allows your device to respond to ARP requests for the IP address. Proxy ARP must be enabled on the interface before using this parameter.            |
| <code>vrf</code>                           | Apply this command to a VRF instance.                                                                                                                |
| <code>&lt;vrf-name&gt;</code>              | The name of the VRF instance.                                                                                                                        |

**Mode** Global Configuration

**Usage notes** One use of this command is to limit packet flooding when using services like Microsoft Network Load Balancing (MS-NLB). With such services, packets destined for server cluster virtual address must be sent to all servers in the cluster. The server cluster can operate in multicast mode, in which it uses a multicast MAC address. To support this, this command allows you to create a static ARP entry with a multicast MAC address, and specify which ports the packets will be forwarded out.

Creating a static ARP entry enables the switch to correctly forward server cluster traffic. If you want the switch to also respond to pings from the server cluster, you need to also enable server cluster support, using the [arp-mac-disparity](#) command.

**Examples** To add the IP address 10.10.10.9 with the MAC address 0010.2533.4655 into the ARP cache, and have your device respond to ARP requests for this address, use the commands:

```
awplus# configure terminal
awplus(config)# arp 10.10.10.9 0010.2355.4566 alias
```

**Example (VRF-lite)** To apply the above example within a VRF instance called red use the following commands:

```
awplus# configure terminal
awplus(config)# arp vrf red 10.10.10.9 0010.2355.4566 alias
```

# arp log

**Overview** This command enables the logging of dynamic and static ARP entries in the ARP cache. The ARP cache contains mappings of device ports, VLAN IDs, and IP addresses to physical MAC addresses for hosts.

This command can display the MAC addresses in the ARP log either using the notation HHHH.HHHH.HHHH, or using the IEEE standard hexadecimal notation (HH-HH-HH-HH-HH-HH).

Use the **no** variant of this command to disable the logging of ARP entries.

**Syntax** `arp log [mac-address-format ieee]`  
`no arp log [mac-address-format ieee]`

| Parameter               | Description                                                                                                                                    |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| mac-address-format ieee | Display the MAC address in the standard IEEE format (HH-HH-HH-HH-HH-HH), instead of displaying the MAC address with the format HHHH.HHHH.HHHH. |

**Default** The ARP logging feature is disabled by default.

**Mode** Global Configuration

**Usage notes** You have the option to change how the MAC address is displayed in the ARP log message. The output can either use the notation HHHH.HHHH.HHHH or HH-HH-HH-HH-HH-HH.

Enter **arp log** to use HHHH.HHHH.HHHH notation.

Enter **arp log mac-address-format ieee** to use HH-HH-HH-HH-HH-HH notation.

Enter **no arp log mac-address-format ieee** to revert from HH-HH-HH-HH-HH-HH to HHHH.HHHH.HHHH.

Enter **no arp log** to disable ARP logging.

To display ARP log messages use the command **show log | include ARP\_LOG**.

**Examples** To enable ARP logging and specify that the MAC address in the log message is displayed in HHHH.HHHH.HHHH notation, use the following commands:

```
awplus# configure terminal
awplus(config)# arp log
```

To disable ARP logging on the device, use the following commands:

```
awplus# configure terminal
awplus(config)# no arp log
```

To enable ARP logging and specify that the MAC address in the log message is displayed in the standard IEEE format hexadecimal notation (HH-HH-HH-HH-HH-HH), use the following commands:

```
awplus# configure terminal
awplus(config)# arp log mac-address-format ieee
```

To leave ARP logging enabled, but stop using HH-HH-HH-HH-HH-HH format and use HHHH.HHHH.HHHH format instead, use the following commands:

```
awplus# configure terminal
awplus(config)# no arp log mac-address-format ieee
```

To display ARP log messages, use the following command:

```
awplus# show log | include ARP_LOG
```

**Output** Figure 20-1: Output from **show log | include ARP\_LOG** after enabling ARP logging using **arp log**. Note that this output uses HHHH.HHHH.HHHH format.

```
awplus#configure terminal
awplus(config)#arp log

*<date> <time> <severity> <hostname> <program-name>  
ARP\_LOG <port-number> <vid> <operation> <MAC> <IP>*

Table 20-1: Parameters in the output from **show log | include ARP\_LOG**

| Parameter                  | Description                                                                                                                                                                                                                                                                      |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ARP_LOG                    | Indicates that ARP log entry information follows.                                                                                                                                                                                                                                |
| <i>&lt;port-number&gt;</i> | Indicates device port number for the ARP log entry.                                                                                                                                                                                                                              |
| <i>&lt;vid&gt;</i>         | Indicates the VLAN ID for the ARP log entry.                                                                                                                                                                                                                                     |
| <i>&lt;operation&gt;</i>   | Indicates “add” if the ARP log entry displays an ARP addition. Indicates “del” if the ARP log entry displays an ARP deletion.                                                                                                                                                    |
| <i>&lt;MAC&gt;</i>         | Indicates the MAC address for the ARP log entry, either in the default hexadecimal notation (HHHH.HHHH.HHHH) or in the IEEE standard format hexadecimal notation (HH-HH-HH-HH-HH-HH) as specified with the <b>arp log</b> or the <b>arp log mac-address-format ieee</b> command. |
| <i>&lt;IP&gt;</i>          | Indicates the IP address for the ARP log entry.                                                                                                                                                                                                                                  |

**Related commands**    [show log](#)  
                              [show running-config](#)

# arp opportunistic-nd

**Overview** Use this command to enable opportunistic neighbor discovery for the global ARP cache. This command changes the behavior for unsolicited ARP packet forwarding on the device.

When using VRF-lite, you can use this command to enable opportunistic neighbor discovery for a named VRF instance.

Use the **no** variant of this command to disable opportunistic neighbor discovery for the global ARP cache.

**Syntax** arp opportunistic-nd  
no arp opportunistic-nd

**Syntax (VRF-lite)** arp opportunistic-nd [vrf <vrf-name>]  
no arp opportunistic-nd [vrf <vrf-name>]

| Parameter  | Description                           |
|------------|---------------------------------------|
| vrf        | Apply this command to a VRF instance. |
| <vrf-name> | The name of the VRF instance.         |

**Default** Opportunistic neighbor discovery is disabled by default.

**Mode** Global Configuration

**Usage notes** When opportunistic neighbor discovery is enabled, the device will reply to any received unsolicited ARP packets (but not gratuitous ARP packets). The source MAC address for the unsolicited ARP packet is added to the ARP cache, so the device forwards the ARP packet. When opportunistic neighbor discovery is disabled, the source MAC address for the ARP packet is not added to the ARP cache, so the ARP packet is not forwarded by the device.

Note this command enables or disables opportunistic neighbor discovery for a VRF instance if the **vrf** parameter and an instance name are applied. If a VRF instance is not specified, then opportunistic neighbor discovery is enabled or disabled for device ports configured for IPv4.

**Examples** To enable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# arp opportunistic-nd
```

To disable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# no arp opportunistic-nd
```

**Example (VRF-lite)** To enable opportunistic neighbor discovery for the VRF instance 'blue', enter:

```
awplus# configure terminal
awplus(config)# arp opportunistic-nd vrf blue
```

To disable opportunistic neighbor discovery for the VRF instance 'blue', enter:

```
awplus# configure terminal
awplus(config)# no arp opportunistic-nd vrf blue
```

# arp-reply-bc-dmac

**Overview** Use this command to allow processing of ARP replies that arrive with a broadcast destination MAC (ffff.ffff.ffff). This makes neighbors reachable if they send ARP responses that contain a broadcast destination MAC.

Use the **no** variant of this command to turn off processing of ARP replies that arrive with a broadcast destination MAC.

**Syntax** arp-reply-bc-dmac  
no arp-reply-bc-dmac

**Default** By default, this functionality is disabled.

**Mode** Interface Configuration for VLAN interfaces.

**Example** To allow processing of ARP replies that arrive on vlan2 with a broadcast destination MAC, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# arp-reply-bc-dmac
```

**Related commands** clear arp-cache  
show arp

# clear arp-cache

**Overview** This command deletes dynamic ARP entries from the ARP cache. You can optionally specify the IPv4 address of an ARP entry to be cleared from the ARP cache.

When running VRF-lite, this command deletes dynamic ARP entries either from the ARP cache of a specific VRF instance, or from the ARP cache of the Global VRF instance. To delete all ARP entries from both the Global VRF instance and all VRF instances, use the command with no parameters. You can optionally specify the IPv4 address for the VRF instance to clear an ARP entry from the ARP cache.

**Syntax** `clear arp-cache [<ip-address>]`

**Syntax (VRF-lite)** `clear arp-cache [vrf <vrf-name>|global] [<ip-address>]`

| Parameter    | Description                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------|
| <ip-address> | Specifies a specific IPv4 address for a VRF instance whose entries are to be cleared from the ARP cache. |
| global       | When VRF-lite is configured, apply this command to the global routing and forwarding table.              |
| vrf          | Apply this command to the specified VRF instance.                                                        |
| <vrf-name>   | The VRF instance name                                                                                    |

**Mode** Privileged Exec

**Usage notes** To display the entries in the ARP cache, use the [show arp](#) command. To remove static ARP entries, use the no variant of the [arp](#) command.

**Example** To clear all dynamic ARP entries, use the command:

```
awplus# clear arp-cache
```

To clear all dynamic ARP entries associated with the IPv4 address 192.168.1.1, use the command:

```
awplus# clear arp-cache 192.168.1.1
```

**Example (VRF-lite)** To clear the dynamic ARP entries from the VRF instance named blue, use the commands:

```
awplus# clear arp-cache vrf blue
```

To clear the dynamic ARP entries from the VRF instance named blue with the IPv4 address 192.168.1.1, use the commands:

```
awplus# clear arp-cache vrf blue 192.168.1.1
```

When running VRF-lite, to clear the dynamic ARP entries from the global VRF-lite and all VRF instances, use the command:

```
awplus# clear arp-cache
```

# debug ip packet interface

**Overview** The **debug ip packet interface** command enables IP packet debug and is controlled by the **terminal monitor** command.

If the optional **icmp** keyword is specified then ICMP packets are shown in the output.

The **no** variant of this command disables the **debug ip interface** command.

**Syntax** debug ip packet interface {<interface-name>|all} [address <ip-address>|verbose|hex|arp|udp|tcp|icmp]  
no debug ip packet interface [<interface-name>]

| Parameter    | Description                                                                                                                                                                                                            |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface>  | Specify a single Layer 3 interface name (not a range of interfaces)<br>This keyword can be specified as either all or as a single Layer 3 interface to show debugging for either all interfaces or a single interface. |
| all          | Specify all Layer 3 interfaces on the device.                                                                                                                                                                          |
| <ip-address> | Specify an IPv4 address.<br>If this keyword is specified, then only packets with the specified IP address as specified in the ip-address placeholder are shown in the output.                                          |
| verbose      | Specify <b>verbose</b> to output more of the IP packet.<br>If this keyword is specified then more of the packet is shown in the output.                                                                                |
| hex          | Specify <b>hex</b> to output the IP packet in hexadecimal.<br>If this keyword is specified, then the output for the packet is shown in hex.                                                                            |
| arp          | Specify <b>arp</b> to output ARP protocol packets.<br>If this keyword is specified, then ARP packets are shown in the output.                                                                                          |
| udp          | Specify <b>udp</b> to output UDP protocol packets.<br>If this keyword is specified then UDP packets are shown in the output.                                                                                           |
| tcp          | Specify <b>tcp</b> to output TCP protocol packets.<br>If this keyword is specified, then TCP packets are shown in the output.                                                                                          |
| icmp         | Specify <b>icmp</b> to output ICMP protocol packets.<br>If this keyword is specified, then ICMP packets are shown in the output.                                                                                       |

**Mode** Privileged Exec and Global Configuration

**Examples** To turn on ARP packet debugging on vlan2, use the command:

```
awplus# debug ip packet interface vlan2 arp
```

To turn off IP packet interface debugging on interface vlan2, use the command:

```
awplus# no debug ip packet interface vlan2
```

To turn on all packet debugging on all interfaces on the device, use the command:

```
awplus# debug ip packet interface all
```

To turn off IP packet interface debugging on all interfaces, use the command:

```
awplus# no debug ip packet interface
```

To turn on TCP packet debugging on vlan2 and IP address 192.168.2.4, use the command:

```
awplus# debug ip packet interface vlan2 address 192.168.2.4 tcp
```

# debug ip irdp

**Overview** This command enables debugging of ICMP Router Discovery Protocol (IRDP) events and messages on your device. IRDP debugging is disabled by default.

The **no** variant of this command disables IRDP debugging. Negating any packet debug mode will switch detail off.

**Syntax** `debug ip irdp {event|nsm|receive|send|both|detail|all}`  
`no debug ip irdp {event|nsm|receive|send|both|detail|all}`

| Parameter | Description                                                                                                                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| event     | Enables debugging of IRDP events.                                                                                                                                                                                                                              |
| nsm       | Enables debugging of IRDP processing of NSM messages.                                                                                                                                                                                                          |
| receive   | Enables debugging of IRDP input packet processing.                                                                                                                                                                                                             |
| send      | Enables debugging of IRDP output packet processing.                                                                                                                                                                                                            |
| both      | Enables debugging of both IRDP input and output packet processing.                                                                                                                                                                                             |
| detail    | Enables detailed debugging of both IRDP input and output packet processing. Note that setting detail also sets both, so if you set <b>detail</b> , the output will show “packet debugging mode is all”. Negating any packet debug mode will switch detail off. |
| all       | Enables all IRDP debugging types.                                                                                                                                                                                                                              |

**Default** IRDP protocol debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Examples** To enable IRDP input packet process debugging, use the following command:

```
awplus# debug ip irdp receive
```

To disable all IRDP debugging, use the following command:

```
awplus# no debug ip irdp all
```

**Related commands**

- [show ip irdp](#)
- [undebug ip irdp](#)

# ip address (IP Addressing and Protocol)

**Overview** This command sets a static IP address on an interface.

The **no** variant of this command removes the IP address from the interface.

You cannot remove the primary address when a secondary address is present.

**Syntax** `ip address <ip-addr/prefix-length> [secondary] [label <label>]`  
`no ip address [<ip-addr/prefix-length>] [secondary]`

| Parameter               | Description                                                                                                      |
|-------------------------|------------------------------------------------------------------------------------------------------------------|
| <ip-addr/prefix-length> | The IPv4 address and prefix length you are assigning to the interface.                                           |
| secondary               | Secondary IP address.                                                                                            |
| label                   | Adds a user-defined description of the secondary IP address.                                                     |
| <label>                 | A user-defined description of the secondary IP address. Valid characters are any printable character and spaces. |

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** To set the primary IP address on the interface, specify only **ip address** <ip-addr/prefix-length>. This overwrites any configured primary IP address. To add additional IP addresses on this interface, use the **secondary** parameter. You must configure a primary address on the interface before configuring a secondary address.

**NOTE:** Use **show running-config interface**, instead of **show ip interface brief**, when you need to view a secondary address configured on an interface. **show ip interface brief** will only show the primary address, not a secondary address for an interface.

**Examples** To add the IP address 10.10.10.50/24 to the interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip address 10.10.10.50/24
```

To add the secondary IP address 10.10.11.50/24 to the same interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip address 10.10.11.50/24 secondary
```

To add the IP address 10.10.11.50/24 to the local loopback interface lo, use the following commands:

```
awplus# configure terminal
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.11.50/24
```

**Related commands**

- interface (to configure)
- show ip interface
- show running-config interface

# ip directed-broadcast

**Overview** Use this command to enable flooding of directed broadcast packets into a directly connected subnet. If this command is configured on a VLAN interface, then directed broadcasts received on other VLAN interfaces, destined for the subnet on this VLAN, will be flooded to the subnet broadcast address of this VLAN.

Use the **no** variant of this command to disable **ip directed-broadcast**. When this feature is disabled using the **no** variant of this command, directed broadcasts are not forwarded.

**Syntax** ip directed-broadcast  
no ip directed-broadcast

**Default** The **ip directed-broadcast** command is disabled by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** IP directed-broadcast is enabled and disabled per VLAN interface. When enabled a directed broadcast packet is forwarded to an enabled VLAN interface if received on another subnet.

An IP directed broadcast is an IP packet whose destination address is a broadcast address for some IP subnet, but originates from a node that is not itself part of that destination subnet. When a directed broadcast packet reaches a device that is directly connected to its destination subnet, that packet is flooded as a broadcast on the destination subnet.

The **ip directed-broadcast** command controls the flooding of directed broadcasts when they reach target subnets. The command affects the final transmission of the directed broadcast on its destination subnet. It does not affect the transit unicast routing of IP directed broadcasts. If directed broadcast is enabled for an interface, incoming directed broadcast IP packets intended for the subnet assigned to the interface will be flooded as broadcasts on that subnet.

If the **no ip directed-broadcast** command is configured for an interface, directed broadcasts destined for the subnet where the interface is attached will be dropped instead of broadcast.

**Examples** To enable the flooding of broadcast packets out via vlan2, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip directed-broadcast
```

To disable the flooding of broadcast packets via vlan2, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip directed-broadcast
```

**Related  
commands**    [ip forward-protocol udp](#)  
                  [ip helper-address](#)  
                  [show running-config](#)

# ip forwarding

**Overview** This command enables IP forwarding on your device. When enabled, your device routes IP packets.

The **no** variant of this command disables IP forwarding on your device. Even when IP forwarding is not enabled, the device can still work as an IP host; in particular, it can be managed by IP-based applications, such as SNMP, Telnet and SSH.

**Syntax** `ip forwarding`  
`no ip forwarding`

**Default** IP forwarding is enabled by default.

**Mode** Global Configuration

**Examples** To enable your device to route IP packets, use the commands:

```
awplus# configure terminal
awplus(config)# ip forwarding
```

To stop your device from routing IP packets, use the commands

```
awplus# configure terminal
awplus(config)# no ip forwarding
```

**Related commands** [show ip forwarding](#)

# ip forward-protocol udp

**Overview** This command enables you to control which UDP broadcasts will be forwarded to the helper address(es). A UDP broadcast will only be forwarded if the destination UDP port number in the packet matches one of the port numbers specified using this command.

Refer to the IANA site ([www.iana.org](http://www.iana.org)) for a list of assigned UDP port numbers for protocols to forward using **ip forward-protocol udp**.

Use the **no** variant of this command to remove a port number from the list of destination port numbers that are used as the criterion for deciding if a given UDP broadcast should be forwarded to the IP helper address(es).

**Syntax** `ip forward-protocol udp <port>`  
`no ip forward-protocol udp <port>`

| Parameter | Description      |
|-----------|------------------|
| <port>    | UDP Port Number. |

**Default** The **ip forward-protocol udp** command is not enabled by default.

**Mode** Global Configuration

**Usage notes** Combined with the [ip helper-address](#) command in interface mode, the **ip forward-protocol udp** command in Global Configuration mode allows control of which protocols (destination port numbers) are forwarded. The **ip forward-protocol udp** command configures protocols for forwarding, and the **ip helper-address** command configures the destination address(es).

**NOTE:**

*The types of UDP broadcast packets that the device will forward are ONLY those specified by the **ip forward-protocol** command(s). There are no other UDP packet types that the IP helper process forwards by default.*

**NOTE:**

*The **ip forward-protocol udp** command does not support BOOTP / DHCP Relay. The **ip dhcp-relay** command must be used instead. For this reason, you may not configure UDP ports 67 and 68 with the **ip forward-protocol udp** command.*

See the [IP Feature Overview and Configuration Guide](#) for more information about DNS Relay.

**Examples** To configure forwarding of packets on a UDP port, use the following commands:

```
awplus# configure terminal
awplus(config)# ip forward-protocol udp <port>
```

To delete a UDP port from the UDP ports that the device forwards, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no ip forward-protocol udp <port>
```

**Related  
commands**

[ip helper-address](#)

[ip directed-broadcast](#)

[show running-config](#)

# ip gratuitous-arp-link

**Overview** This command sets the Gratuitous ARP time limit for all interfaces. The time limit restricts the sending of Gratuitous ARP packets to one Gratuitous ARP packet within the time in seconds.

The **no** variant of the command sets the Gratuitous ARP time limit to the default.

**NOTE:** This command specifies time between sequences of Gratuitous ARP packets, and time between individual Gratuitous ARP packets occurring in a sequence, to allow legacy support for older devices and inter-operation between other devices that are not ready to receive and forward data until several seconds after linkup.

Additionally, jitter has been applied to the delay following linkup, so Gratuitous ARP packets applicable to a given port are spread over a period of 1 second so are not all sent at once. Remaining Gratuitous ARP packets in the sequence occur after a fixed delay from the first one.

**Syntax** ip gratuitous-arp-link <0-300>  
no ip gratuitous-arp-link

| Parameter | Description                                                                                                                                                                                                                     |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-300>   | Specify the minimum time between sequences of Gratuitous ARPs and the fixed time between Gratuitous ARPs occurring in a sequence, in seconds.<br>0 disables the sending of Gratuitous ARP packets.<br>The default is 8 seconds. |

**Default** The default Gratuitous ARP time limit for all interfaces is 8 seconds.

**Mode** Global Configuration

**Usage** Every switchport will send a sequence of 3 Gratuitous ARP packets to each VLAN that the switchport is a member of, whenever the switchport moves to the forwarding state. The first Gratuitous ARP packet is sent 1 second after the switchport becomes a forwarding switchport. The second and third Gratuitous ARP packets are each sent after the time period specified by the Gratuitous ARP time limit.

Additionally, the Gratuitous ARP time limit specifies the minimum time between the end of one Gratuitous ARP sequence and the start of another Gratuitous ARP sequence. When a link is flapping, the switchport's state is set to forwarding several times. The Gratuitous ARP time limit is imposed to prevent Gratuitous ARP packets from being sent undesirably often.

**Examples** To disable the sending of Gratuitous ARP packets, use the commands :

```
awplus# configure terminal
awplus(config)# ip gratuitous-arp-link 0
```

To restrict the sending of Gratuitous ARP packets to one every 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip gratuitous-arp-link 20
```

**Related  
Commands**   [show running-config](#)

# ip helper-address

**Overview** Use this command to add a forwarding destination address for IP Helper to enable forwarding of User Datagram Protocol (UDP) broadcasts on an interface.

Use the **no** variant of this command to disable the forwarding of broadcast packets to specific addresses.

**Syntax** `ip helper-address <ip-addr>`  
`no ip helper-address <ip-addr>`

| Parameter | Description                                      |
|-----------|--------------------------------------------------|
| <ip-addr> | Forwarding destination IP address for IP Helper. |

**Default** The destination address for the **ip helper-address** command is not configured by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** Combined with the [ip forward-protocol udp](#) command in global configuration mode, the **ip helper-address** command in interface mode allows control of which protocols (destination port numbers) are forwarded. The **ip forward-protocol udp** command configures protocols for forwarding, and the **ip helper-address** command configures the destination address(es).

The destination address can be a unicast address or a subnet broadcast address. The UDP destination port is configured separately with the **ip forward-protocol udp** command. If multiple destination addresses are registered then UDP packets are forwarded to each IP address added to an IP Helper. Up to 32 destination addresses may be added using IP Helper.

The device will only forward the types of UDP broadcast packets that are specified by the **ip forward-protocol** command(s). The device does not forward any other UDP packet types by default.

The **ip helper-address** command does not support BOOTP / DHCP Relay. The [service dhcp-relay](#) command must be used instead. For this reason, you may not configure UDP ports 67 and 68 with the **ip forward-protocol** command.

See the [IP Feature Overview and Configuration Guide](#) for more information about DHCP Relay.

**Examples** The following example defines IPv4 address 192.168.1.100 as an IP Helper destination address to which to forward UDP broadcasts received on vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip helper-address 192.168.1.100
```

The following example removes IPv4 address 192.168.1.100 as an IP Helper destination address to which to forward UDP broadcasts received on vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip helper-address 192.168.1.100
```

**Related commands**

- [ip directed-broadcast](#)
- [show running-config](#)

# ip irdp

**Overview** This command enables ICMP Router Discovery advertising on an interface. However, the interface does not send or process Router Discovery messages until at least one IP address is configured on the interface with the [ip address \(IP Addressing and Protocol\)](#) command.

The **no** variant of this command disables ICMP Router Discovery advertisements on an IP interface. All transmitting and processing of Router Discovery messages ceases immediately on the interface.

**Syntax** ip irdp  
no ip irdp

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To enable Router Discovery advertisements on v l a n 4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip irdp
```

To disable Router Discovery advertisements on v l a n 4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ip irdp
```

**Related commands** [ip address \(IP Addressing and Protocol\)](#)  
[show ip irdp](#)  
[show ip irdp interface](#)

# ip icmp error-interval

**Overview** Use this command to limit how often IPv4 ICMP error messages are sent. The maximum frequency of messages is specified in milliseconds.

Use the **no** variant of this command to reset the frequency to the default.

**Syntax** `ip icmp error-interval <interval>`  
`no ip icmp error-interval`

| Parameter  | Description                             |
|------------|-----------------------------------------|
| <interval> | 0-2147483647, interval in milliseconds. |

**Default** 1000

**Mode** Global Configuration

**Example** To configure the rate to be at most one packet every 10 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip icmp error-interval 10000
```

To reset the rate to the default of one packet every second, use the commands:

```
awplus# configure terminal
awplus(config)# no ip icmp error-interval
```

**Related commands** [ipv6 icmp error-interval](#)

# ip irdp address preference

**Overview** When multiple routers connected to a LAN are all sending Router Discovery advertisements, hosts need to be able to choose the best router to use. Therefore the IRDP defines a preference value to place in the Router Discovery advertisements. Hosts choose the router with the highest preference value.

This command sets the preference value to include in Router Discovery advertisements sent for the specified IP address.

The **no** variant of this command sets the preference for a specific address to the default of **0**.

**Syntax** `ip irdp address <ip-address> preference <0-2147483647>`  
`no ip irdp address <ip-address> preference`

| Parameter      | Description                                                                                       |
|----------------|---------------------------------------------------------------------------------------------------|
| <ip-address>   | The IP address to be advertised with the specified preference value.                              |
| <0-2147483647> | The preference value advertised. A higher number increases the preference level for this address. |

**Default** The default preference value is 0.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the preference value to 3000 for the address 192 . 168 . 1 . 1 advertised on v lan5, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ip irdp address 192.168.1.1 preference 3000
```

To set the preference value to the default of 0 for the address 192 . 168 . 1 . 1 advertised on v lan5, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# no ip irdp address 192.168.1.1 preference
```

**Related commands** [ip irdp](#)  
[ip irdp preference](#)  
[show ip irdp interface](#)

# ip irdp broadcast

**Overview** This command configures broadcast Router Discovery advertisements on an interface. The interface sends IRDP advertisements with the broadcast address (255.255.255.255) as the IP destination address.

The **no** variant of this command configures multicast Router Discovery advertisements on an interface. The interface sends IRDP advertisements with the all-system multicast address (224.0.0.1) as the IP destination address.

**Syntax** ip irdp broadcast  
no ip irdp broadcast

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To enable broadcast Router Discovery advertisements on v l an13, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan13
awplus(config-if)# ip irdp broadcast
```

To enable multicast Router Discovery advertisements on v l an13, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan13
awplus(config-if)# no ip irdp broadcast
```

**Related commands** ip irdp  
ip irdp multicast  
show ip irdp interface

# ip irdp holdtime

**Overview** This command sets the maximum length of time that the advertised addresses are to be considered as valid router addresses by hosts.

The **no** variant of this command resets the holdtime back to the default of 1800 seconds.

**Syntax** `ip irdp holdtime <0-9000>`  
`no ip irdp holdtime`

| Parameter | Description                                            |
|-----------|--------------------------------------------------------|
| <0-9000>  | The holdtime value in seconds of addresses advertised. |

**Default** The IRDP holdtime is set to 1800 seconds (30 minutes) by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the holdtime value of addresses advertised on `vlan2` to 4000 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip irdp holdtime 4000
```

To set the holdtime value of addresses advertised on `vlan2` back to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip irdp holdtime
```

**Related commands** [show ip irdp interface](#)

# ip irdp lifetime

**Overview** This command sets the maximum length of time that hosts should consider the Router Discovery advertised addresses as valid router addresses. If you change the lifetime value, also change the **maxadvertisementinterval** and the **minadvertisementinterval** to maintain the following ratios:

This command is synonymous with the **ip irdp hostname**<0-9000> command.

The **no** variant of this command sets the lifetime back to the default of 1800 seconds.

**Syntax** ip irdp lifetime <0-9000>  
no ip irdp lifetime

| Parameter | Description                                            |
|-----------|--------------------------------------------------------|
| <0-9000>  | Lifetime value in seconds of the advertised addresses. |

**Default** The lifetime value is 1800 seconds.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the lifetime value to 4000 seconds for addresses advertised on `vlan6`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan6
awplus(config-if)# ip irdp lifetime 4000
```

To set the lifetime value to the default of 1800 seconds for addresses advertised on `vlan6`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan6
awplus(config-if)# no ip irdp lifetime
```

**Related commands** [ip irdp](#)  
[ip irdp maxadvertinterval](#)  
[ip irdp minadvertinterval](#)  
[show ip irdp interface](#)

# ip irdp maxadvertinterval

**Overview** This command sets the maximum time allowed between sending router advertisements from the interface. If you change the **maxadvertisementinterval** value, also change the **lifetime** and the **minadvertisementinterval** to maintain the following ratios:

```
lifetime=3 x maxadvertisementinterval
minadvertisementinterval=0.75 x maxadvertisementinterval
```

You cannot set the maximum advertisement interval below the minimum interval. If you are lowering the maximum interval to a value below the current minimum interval, you must change the minimum value first.

The **no** variant of this command sets the **maxadvertinterval** back to the default of 600 seconds.

**Syntax** `ip irdp maxadvertinterval <4-1800>`  
`no ip irdp maxadvertinterval`

| Parameter | Description                                                            |
|-----------|------------------------------------------------------------------------|
| <4-1800>  | The maximum time, in seconds, between Router Discovery advertisements. |

**Default** The IRDP maximum advertisement interval is set to 600 seconds (10 minutes) by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the maximum interval between Router Discovery advertisements on `vlan7` to 950 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan7
awplus(config-if)# ip irdp maxadvertinterval 950
```

To set the maximum interval between advertisements on `vlan7` back to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan7
awplus(config-if)# no ip irdp maxadvertinterval
```

**Related  
commands**

- `ip irdp`
- `ip irdp lifetime`
- `ip irdp minadvertinterval`
- `show ip irdp interface`

# ip irdp minadvertinterval

**Overview** This command sets the minimum time allowed between sending router advertisements from the interface. If you change the **minadvertisementinterval** value, also change the **lifetime** and the **maxadvertisementinterval** to maintain the following ratios:

```
lifetime=3 x maxadvertisementinterval
minadvertisementinterval=0.75 x maxadvertisementinterval
```

You cannot set the minimum advertisement interval above the maximum interval. If you are raising the minimum interval to a value above the current maximum interval, you must change the maximum value first.

The **no** variant of this command sets the **minadvertinterval** back to the default of 450 seconds.

**Syntax** `ip irdp minadvertinterval <3-1800>`  
`no ip irdp minadvertinterval`

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| <3-1800>  | The minimum time between advertisements in seconds. |

**Default** The IRDP minimum advertisement interval is set to 450 seconds (7.5 minutes) by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the minimum interval between advertisements on `vlan4` to 900 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip irdp minadvertinterval 900
```

To set the minimum interval between advertisements on `vlan4` back to the default of 450 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ip irdp minadvertinterval
```

**Related  
commands**

- `ip irdp`
- `ip irdp lifetime`
- `ip irdp maxadvertinterval`
- `show ip irdp interface`

# ip irdp multicast

**Overview** This command configures multicast Router Discovery advertisements on an interface. The interface sends IRDP advertisements with the all-system multicast address (224.0.0.1) as the IP destination address.

The **no** variant of this command configures broadcast Router Discovery advertisements on an interface. The interface sends IRDP advertisements with the broadcast address (255.255.255.255) as the IP destination address.

The multicast address is the default IP destination address for Router Discovery advertisements.

**Syntax** ip irdp multicast  
no ip irdp multicast

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To enable multicast Router Discovery advertisements on v lan5, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ip irdp multicast
```

To enable broadcast Router Discovery advertisements on v lan5, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# no ip irdp multicast
```

**Related commands** ip irdp  
ip irdp broadcast  
show ip irdp interface

# ip irdp preference

**Overview** When multiple routers connected to a LAN are all sending Router Discovery advertisements, hosts need to be able to choose the best router to use. Therefore the IRDP defines a preference value to place in the Router Discovery advertisements. Hosts choose the router with the highest preference value.

This command sets the preference value to include in Router Discovery advertisements sent for the specified interface.

When this command is used, all IP addresses on the interface are assigned the same preference value, except the addresses that have specific preference value assignment using the command [ip irdp address preference](#).

The **no** variant of this command sets the preference value to the default of 0.

**Syntax** `ip irdp preference <0-2147483647>`  
`no ip irdp preference`

| Parameter      | Description                                                                                                                     |
|----------------|---------------------------------------------------------------------------------------------------------------------------------|
| <0-2147483647> | The preference value for the interface. A higher number increases the preference level for addresses on the specific interface. |

**Default** The default preference value is 0.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the preference of addresses advertised on `vlan6` to 500, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan6
awplus(config-if)# ip irdp preference 500
```

To set the preference value for addresses on `vlan6` back to the default of 0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan6
awplus(config-if)# no ip irdp preference
```

**Related commands** [ip irdp](#)  
[ip irdp address preference](#)  
[show ip irdp interface](#)

# ip limited-local-proxy-arp

**Overview** Use this command to enable local proxy ARP, but only for a specified set of IP addresses. This makes the device respond to ARP requests for those IP addresses when the addresses are reachable via the interface you are configuring.

To specify the IP addresses, use the command [local-proxy-arp](#).

Use the **no** variant of this command to disable limited local proxy ARP. This stops your device from intercepting and responding to ARP requests for the specified hosts. This allows the hosts to use MAC address resolution to communicate directly with one another.

**Syntax** `ip limited-local-proxy-arp`  
`no ip limited-local-proxy-arp`

**Default** Limited local proxy ARP is disabled by default.

**Mode** Interface Configuration

**Usage** This command allows you to stop MAC address resolution for specified hosts. Limited local proxy ARP works by intercepting ARP requests for the specified hosts and responding with your device's own MAC address details instead of the destination host's details. This stops hosts from learning the MAC address of the other hosts through ARP requests.

Limited local proxy ARP ensures that the specified devices cannot send traffic that bypasses Layer 3 routing on your device. This gives you control over which hosts may communicate with one another.

**Example** To enable limited local proxy ARP, so that the device makes ARP responses to ARP requests for specified addresses, when the ARP requests are received on VLAN2 and the addresses are routed out VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip limited-local-proxy-arp
```

**Related commands** [ip local-proxy-arp](#)  
[local-proxy-arp](#)

# ip local-proxy-arp

**Overview** This command allows you to stop MAC address resolution between hosts within a private VLAN edge interface. Local Proxy ARP works by intercepting ARP requests between hosts within a subnet and responding with your device's own MAC address details instead of the destination host's details. This stops hosts from learning the MAC address of other hosts within its subnet through ARP requests.

Local Proxy ARP ensures that devices within a subnet cannot send traffic that bypasses Layer 3 routing on your device. This lets you monitor and filter traffic between hosts in the same subnet, and enables you to have control over which hosts may communicate with one another.

When Local Proxy ARP is operating on an interface, your device does not generate or forward any ICMP-Redirect messages on that interface. This command does not enable proxy ARP on the interface; see the [ip proxy-arp](#) command for more information on enabling proxy ARP.

The **no** variant of this command disables Local Proxy ARP to stop your device from intercepting and responding to ARP requests between hosts within a subnet. This allows the hosts to use MAC address resolution to communicate directly with one another. Local Proxy ARP is disabled by default.

**Syntax** `ip local-proxy-arp`  
`no ip local-proxy-arp`

**Default** Local proxy ARP is disabled by default

**Mode** Interface Configuration for VLAN interfaces.

**Examples** To enable your device to apply Local Proxy ARP on the interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip local-proxy-arp
```

To disable your device to apply Local Proxy ARP on the interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip local-proxy-arp
```

**Related commands** [ip proxy-arp](#)  
[show arp](#)  
[show running-config](#)

# ip proxy-arp

**Overview** This command enables Proxy ARP responses to ARP requests on an interface. When enabled, your device intercepts ARP broadcast packets and substitutes its own physical address for that of the remote host. By responding to the ARP request, your device ensures that subsequent packets from the local host are directed to its physical address, and it can then forward these to the remote host.

Your device responds only when it has a specific route to the address being requested, excluding the interface route that the ARP request arrived from. It ignores all other ARP requests. See the [ip local-proxy-arp](#) command about enabling your device to respond to other ARP messages.

The **no** variant of this command disables Proxy ARP responses on an interface. Proxy ARP is disabled by default.

**Syntax** `ip proxy-arp`  
`no ip proxy-arp`

**Default** Proxy ARP is disabled by default.

**Mode** Interface Configuration for VLAN interfaces.

**Examples** To enable your device to Proxy ARP on the interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip proxy-arp
```

To disable your device to Proxy ARP on the interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip proxy-arp
```

**Related commands** [arp](#)  
[ip local-proxy-arp](#)  
[show arp](#)  
[show running-config](#)

# ip redirects

**Overview** This command enables the device to send ICMP redirects on one or more interfaces.

Use the **no** variant of this command to stop the device from sending ICMP redirects on one or more interfaces.

**Syntax** `ip redirects`  
`no ip redirects`

**Default** ICMP redirects are disabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** ICMP redirect messages are used to notify hosts that a better route is available to a destination.

ICMP redirects are used when a packet is routed into the device on the same interface that the packet is routed out of the device. ICMP redirects are only sent to packet sources that are directly connected to the device.

**Examples** To enable the device to send ICMP redirects on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip redirects
```

To stop the device from sending ICMP redirects on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip redirects
```

## ip tcp synack-retries

**Overview** Use this command to specify how many times the switch will retry sending a SYN ACK for a TCP connection for which it has received a SYN but not an ACK. Such connections are called half-open TCP connections. This command allows you to influence how long half-open TCP connections take to time out.

Use the **no** variant of this command to return to the default setting of 5 retries.

**Syntax** `ip tcp synack-retries <0-255>`  
`no ip tcp synack-retries`

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| <0-255>   | Number of times to retry sending the SYN ACK |

**Default** 5 retries

**Mode** Global Configuration

**Usage notes** The following table shows the approximate correlation between the number of retries and the time half-open TCP connections take to time out.

| Number of retries | Approximate lower bound for the timeout |
|-------------------|-----------------------------------------|
| 0 retries         | 1 second                                |
| 1 retry           | 3 seconds                               |
| 2 retries         | 7 seconds                               |
| 3 retries         | 15 seconds                              |
| 4 retries         | 31 seconds                              |
| 5 retries         | 63 seconds                              |

**Example** To retry twice, which leads to a timeout of approximately 7 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip tcp synack-retries 2
```

**Related commands** [show running-config](#)

**Command changes** Version 5.4.7-0.2: command added

# ip unreachables

**Overview** Use this command to enable ICMP (Internet Control Message Protocol) type 3, destination unreachable, messages.

Use the **no** variant of this command to disable destination unreachable messages. This prevents an attacker from using these messages to discover the topology of a network.

**Syntax** ip unreachables  
no ip unreachables

**Default** Destination unreachable messages are enabled by default.

**Mode** Global Configuration

**Usage notes** When a device receives a packet for a destination that is unreachable it returns an ICMP type 3 message, this message includes a reason code, as per the table below. An attacker can use these messages to obtain information regarding the topology of a network. Disabling destination unreachable messages, using the **no ip unreachables** command, secures your network against this type of probing.

**NOTE:** Disabling ICMP destination unreachable messages breaks applications such as traceroute and Path MTU Discovery (PMTUD), which depend on these messages to operate correctly.

Table 20-2: ICMP type 3 reason codes and description

| Code | Description [RFC]                                  |
|------|----------------------------------------------------|
| 0    | Network unreachable [RFC792]                       |
| 1    | Host unreachable [RFC792]                          |
| 2    | Protocol unreachable [RFC792]                      |
| 3    | Port unreachable [RFC792]                          |
| 4    | Fragmentation required, and DF flag set [RFC792]   |
| 5    | Source route failed [RFC792]                       |
| 6    | Destination network unknown [RFC1122]              |
| 7    | Destination host unknown [RFC1122]                 |
| 8    | Source host isolated [RFC1122]                     |
| 9    | Network administratively prohibited [RFC768]       |
| 10   | Host administratively prohibited [RFC869]          |
| 11   | Network unreachable for Type of Service [RFC908]   |
| 12   | Host unreachable for Type of Service [RFC938]      |
| 13   | Communication administratively prohibited [RFC905] |

Table 20-2: ICMP type 3 reason codes and description (cont.)

| Code | Description [RFC]                     |
|------|---------------------------------------|
| 14   | Host Precedence Violation [RFC1812]   |
| 15   | Precedence cutoff in effect [RFC1812] |

**Example** To disable destination unreachable messages, use the commands

```
awplus# configure terminal
awplus(config)# no ip unreachable
```

To enable destination unreachable messages, use the commands

```
awplus# configure terminal
awplus(config)# ip unreachable
```

# local-proxy-arp

**Overview** Use this command to specify an IP subnet for use with limited local proxy ARP. When limited local proxy ARP is enabled with the command [ip limited-local-proxy-arp](#), the device will respond to ARP requests for addresses in that subnet.

Use the **no** variant of this command to stop specifying a subnet for use with limited local proxy ARP.

**Syntax** `local-proxy-arp [<ip-add/mask>]`  
`no local-proxy-arp [<ip-add/mask>]`

| Parameter                        | Description                                                                                                                                 |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-add/mask&gt;</code> | The IP subnet to use with limited local proxy ARP, in dotted decimal format (A.B.C.D/M). To specify a single IP address, use a 32-bit mask. |

**Default** No subnets are specified for use with limited local proxy ARP.

**Mode** Global Configuration

**Example** To specify limited local proxy ARP for the address 172.22.0.3, use the following commands:

```
awplus# configure terminal
awplus(config)# local-proxy-arp 172.22.0.3/32
```

**Related commands** [ip limited-local-proxy-arp](#)

# optimistic-nd

**Overview** Use this command to enable the optimistic neighbor discovery feature for both IPv4 and IPv6.

Use the **no** variant of this command to disable the optimistic neighbor discovery feature.

**Syntax** optimistic-nd  
no optimistic-nd

**Default** The optimistic neighbor discovery feature is enabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** The optimistic neighbor discovery feature allows the device, after learning an IPv4 or IPv6 neighbor, to refresh the neighbor before the neighbor is deleted from the hardware L3 switching table. The device puts the neighbor entry into the 'stale' state in the software switching table if it is not refreshed, then the 'stale' neighbors are deleted from the hardware L3 switching table.

The optimistic neighbor discovery feature enables the device to sustain L3 traffic switching to a neighbor without interruption. Without the optimistic neighbor discovery feature enabled L3 traffic is interrupted when a neighbor is 'stale' and is then deleted from the L3 switching table.

If a neighbor receiving optimistic neighbor solicitations does not answer optimistic neighbor solicitations with neighbor advertisements, then the neighbor will be put into the 'stale' state, and subsequently deleted from both the software and the hardware L3 switching tables.

**Examples** To enable the optimistic neighbor discovery feature on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# optimistic-nd
```

To disable the optimistic neighbor discovery feature on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no optimistic-nd
```

**Related commands** [show running-config](#)

# ping

**Overview** This command sends a query to another IPv4 host (send Echo Request messages).

**Syntax** ping [ip] <host> [broadcast] [df-bit {yes|no}] [interval <0-128>] [pattern <hex-data-pattern>] [repeat {<1-2147483647>|continuous}] [size <36-18024>] [source <ip-addr>] [timeout <1-65535>] [tos <0-255>]

**Syntax (VRF-lite)** ping [vrf <vrf-name>] [ip] <host> [broadcast] [df-bit {yes|no}] [interval <0-128>] [pattern <hex-data-pattern>] [repeat {<1-2147483647>|continuous}] [size <36-18024>] [source <ip-addr>] [timeout <1-65535>] [tos <0-255>]

| Parameter                  | Description                                                                                                                                                                                                          |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <host>                     | The destination IP address or hostname.                                                                                                                                                                              |
| broadcast                  | Allow pinging of a broadcast address.                                                                                                                                                                                |
| df-bit                     | Enable or disable the do-not-fragment bit in the IP header.                                                                                                                                                          |
| interval <0-128>           | Specify the time interval in seconds between sending ping packets. The default is 1. You can use decimal places to specify fractions of a second. For example, to ping every millisecond, set the interval to 0.001. |
| pattern <hex-data-pattern> | Specify the hex data pattern.                                                                                                                                                                                        |
| repeat                     | Specify the number of ping packets to send.                                                                                                                                                                          |
| <1-2147483647>             | Specify repeat count. The default is 5.                                                                                                                                                                              |
| continuous                 | Continuous ping                                                                                                                                                                                                      |
| size <36-18024>            | The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes).                                                                                                          |
| source <ip-addr>           | The IP address of a configured IP interface to use as the source in the IP header of the ping packet.                                                                                                                |
| timeout <1-65535>          | The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait.                                                 |
| tos <0-255>                | The value of the type of service in the IP header.                                                                                                                                                                   |
| vrf                        | Apply the command to the specified VRF instance.                                                                                                                                                                     |
| <vrf-name>                 | The name of the VRF instance.                                                                                                                                                                                        |

**Mode** User Exec and Privileged Exec

**Example** To ping the IP address 10.10.0.5 use the following command:

```
awplus# ping 10.10.0.5
```

**Example (VRF-lite)** To ping the IP address 10.10.0.5 from VRF instance 'red', use the following command:

```
awplus# ping vrf red 10.10.0.5
```

**NOTE:** Unless a cross-domain static or leaked route exists to the destination IP address, you must run this command from within the same routing domain as the address being pinged.

# platform multicast-address-mismatch-action

**Overview** Use this command to change the action taken by the switch when it receives IP multicast packets that have mismatched destination MAC address and destination IP address. Such packets are used by services like Microsoft Network Load Balancing (MS-NLB), in which case they need to be flooded across the switch.

Use the **no** variant of this command to return to the default action.

**Syntax** `platform multicast-address-mismatch-action {bridge|drop}`  
`no platform multicast-address-mismatch-action`

| Parameter | Description                                                                 |
|-----------|-----------------------------------------------------------------------------|
| drop      | Drop IP multicast packets with mismatched destination addresses on ingress. |
| bridge    | Flood IP multicast packets with mismatched destination addresses.           |

**Default** The default behavior depends on whether **arp-mac-disparity multicast** or **arp-mac-disparity multicast-igmp** has been configured on an interface:

- If one of these has been configured, then the default action is to flood the packets.
- If neither of these has been configured, then the default action is to drop the packets.

**Mode** Global Configuration

**Usage notes** You must also turn on L3 multicast, using the [ip multicast-routing](#) command. Otherwise, L2 flooding will occur, because no L3 processing is being done.

**Example** To ensure that the switch floods packets it receives that have IP multicast packets with mismatched L2/L3 destination addresses, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast-routing
awplus(config)# platform multicast-address-mismatch-action
bridge
```

To return to the default, where the behavior depends on the [arp-mac-disparity](#) command setting, use the commands:

```
awplus# configure terminal
awplus(config)# no platform multicast-address-mismatch-action
```

Version 5.4.8-2.1: command added

## router ip irdp

**Overview** This command globally enables ICMP Router Discovery (IRDP) advertisements on your device. However, your device does not send or process IRDP messages until at least one interface is configured to use IP and has had IRDP enabled on the interface with the [ip irdp](#) command.

The **no** variant of this command globally disables IRDP advertisements on the device. All interfaces immediately stop transmitting and processing Router Discovery messages.

**Syntax** router ip irdp  
no router ip irdp

**Mode** Global Configuration

**Examples** To enable Router Discovery advertisements on your device, use the following commands:

```
awplus# configure terminal
awplus(config)# router ip irdp
```

To disable Router Discovery advertisements on your device, use the following commands:

```
awplus# configure terminal
awplus(config)# no router ip irdp
```

**Related commands** [ip irdp](#)  
[show ip irdp](#)

# show arp

**Overview** Use this command to display entries in the ARP routing and forwarding table—the ARP cache contains mappings of IP addresses to physical addresses for hosts. To have a dynamic entry in the ARP cache, a host must have used the ARP protocol to access another host.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show arp

**Syntax (VRF-lite)** show arp [global|security|vrf <vrf-name>]

| Parameter  | Description                                                                                |
|------------|--------------------------------------------------------------------------------------------|
| global     | When VRF-lite is configured, apply this command to the global routing and forwarding table |
| vrf        | Apply this command to the specified VRF instance.                                          |
| <vrf-name> | The VRF instance name                                                                      |

**Mode** User Exec and Privileged Exec

**Usage notes** Running this command with no additional parameters will display all entries in the ARP routing and forwarding table.

With VRF-lite configured, and no additional parameters entered, the command output displays all entries, listed by their VRF instance. By adding either a specific VRF instance or global parameter entry, you can selectively list ARP entries by their membership of a specific VRF instance.

**Example** To display all ARP entries in the ARP cache, use the following command:

```
awplus# show arp
```

**Output** Figure 20-3: Example output from the **show arp** command

|                 |                |           |           |         |  |
|-----------------|----------------|-----------|-----------|---------|--|
| awplus#show arp |                |           |           |         |  |
| IP Address      | LL Address     | Interface | Port      | Type    |  |
| 192.168.27.10   | 192.168.4.1    | vlan1     | port1.0.1 | dynamic |  |
| 192.168.27.100  | 0000.daaf.cd24 | vlan1     | port1.0.2 | dynamic |  |
| 192.168.1.100   | 192.168.20.1   | vlan2     | port1.0.3 | static  |  |

**Example (VRF-lite)** To display the dynamic ARP entries in the global routing instance, use the command:

```
awplus# show arp global
```

**Output** Figure 20-4: Example output from the **show arp global** command

| awplus#show arp global |                |           |           |         |  |
|------------------------|----------------|-----------|-----------|---------|--|
| IP Address             | LL Address     | Interface | Port      | Type    |  |
| 192.168.10.2           | 0015.77ad.fad8 | vlan1     | port1.0.1 | dynamic |  |
| 192.168.20.2           | 0015.77ad.fa48 | vlan2     | port1.0.2 | dynamic |  |
| 192.168.1.100          | 00d0.6b04.2a42 | vlan2     | port1.0.3 | static  |  |

**Example (VRF-lite)** To display the dynamic ARP entries for a VRF instance 'red', use the command:  
awplus# show arp vrf red

**Output** Figure 20-5: Example output from the **show arp vrf red** command

| awplus# show arp vrf red |                |           |           |         |  |
|--------------------------|----------------|-----------|-----------|---------|--|
| [VRF: red]               |                |           |           |         |  |
| IP Address               | LL Address     | Interface | Port      | Type    |  |
| 192.168.10.2             | 0015.77ad.fad8 | vlan1     | port1.0.1 | dynamic |  |

**Table 21:** Parameters in the output of the **show arp** command

| Parameter  | Meaning                                                                                                                                                                               |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address | IP address of the network device this entry maps to.                                                                                                                                  |
| LL Address | Hardware address of the network device.                                                                                                                                               |
| Interface  | Interface over which the network device is accessed.                                                                                                                                  |
| Port       | Physical port that the network device is attached to.                                                                                                                                 |
| Type       | Whether the entry is a static or dynamic entry. Static entries are added using the <a href="#">arp</a> command. Dynamic entries are learned from ARP request/reply message exchanges. |
| VRF        | The name of the VRF instance. The VRF-lite components only display when VRF-lite is configured.                                                                                       |

**Related commands** [arp](#)  
[clear arp-cache](#)  
[ip vrf](#)

**Command changes** Version 5.4.9-0.1: Link layer addresses now shown as the hardware address (MAC Address output parameter has been renamed to LL Address).

# show debugging ip packet

**Overview** Use this command to see what debugging is turned on for IP interfaces. IP interface debugging is set using the **debug ip packet interface** command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show debugging ip packet

**Mode** User Exec and Privileged Exec

**Example** To display the IP interface debugging status when the terminal monitor is off, use the commands:

```
awplus# terminal no monitor
awplus# show debugging ip packet
```

**Output** Figure 20-6: Example output from the **show debugging ip packet** command with **terminal monitor** off

```
awplus#terminal no monitor
awplus#show debugging ip packet
IP debugging status:
interface all tcp (stopped)
interface vlan1 arp verbose (stopped)
```

**Example** To display the IP interface debugging status when the terminal monitor is on, use the commands:

```
awplus# terminal monitor
awplus# show debugging ip packet
```

**Output** Figure 20-7: Example output from the **show debugging ip packet** command with **terminal monitor** on

```
awplus#terminal monitor
awplus#show debugging ip packet
IP debugging status:
interface all tcp (running)
interface vlan1 arp verbose (running)
```

**Related commands** [debug ip packet interface](#)  
[terminal monitor](#)

# show ip flooding-nexthops

**Overview** Use this command to display the static and dynamic ARP entries in the ARP cache that flood packets to multiple ports.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ip flooding-nexthops`

**Syntax (VRF-lite)** `show ip flooding-nexthops [vrf <vrf-name>|global]`

| Parameter                         | Description                     |
|-----------------------------------|---------------------------------|
| <code>vrf &lt;vrf-name&gt;</code> | VRF instance                    |
| <code>global</code>               | Global Routing/Forwarding table |

**Mode** User Exec and Privileged Exec

**Usage notes** To display the flooding nexthop entries associated with a VRF instance, use the **show ip flooding-nexthops vrf** command in User Exec and Privileged Exec mode.

To display the entries in the global ARP table only, use the **show ip flooding-nexthop global** command.

**Example** To display all of the flooding nexthop entries in the ARP cache, use the command:

```
awplus# show ip flooding-nexthops
```

**Output** Figure 20-8: Example output from **show ip flooding-nexthops**

|                                  |                |           |               |        |
|----------------------------------|----------------|-----------|---------------|--------|
| awplus#show ip flooding-nexthops |                |           |               |        |
| IP Address                       | MAC Address    | Interface | Flooding Mode | Type   |
| 11.11.11.10                      | 0300.0000.0011 | vlan1     | port-group    | static |
| [VRF: test]                      |                |           |               |        |
| IP Address                       | MAC Address    | Interface | Flooding Mode | Type   |

**Command changes** Version 5.4.8-2.1: command added

# show ip forwarding

**Overview** Use this command to display the IP forwarding status.

**Syntax** show ip forwarding

**Mode** User Exec and Privileged Exec

**Example** awplus# show ip forwarding

**Output** Figure 20-9: Example output from the **show ip forwarding** command

```
awplus#show ip forwarding
IP forwarding is on
```

**Related commands** [ip forwarding](#)

# show ip interface

**Overview** Use this command to display information about interfaces and the IP addresses assigned to them. To display information about a specific interface, specify the interface name with the command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip interface [<interface-list>] [brief]

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface-list> | The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• the loopback interface (lo)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. vlan10-20)</li><li>• a comma-separated list (e.g. vlan1,vlan10-20). Do not mix interface types in a list.</li></ul> The specified interfaces must exist. |

**Mode** User Exec and Privileged Exec

**Examples** To show brief information for the assigned IP address for interface vlan2 use the command:

```
awplus# show ip interface vlan2 brief
```

**Output** Figure 20-10: Example output from the **show ip interface brief** command

| Interface | IP-Address  | Status   | Protocol |
|-----------|-------------|----------|----------|
| port1.0.1 | unassigned  | admin up | down     |
| ...       |             |          |          |
| vlan1     | 192.168.1.1 | admin up | running  |
| ...       |             |          |          |

# show ip irdp

**Overview** This command displays whether IRDP is globally enabled on your device, and the status of the debugging modes.

If the **debug ip irdp** command has been set with the **detail** parameter then the **both** parameter is also set and the output will show “packet debugging mode is all”.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip irdp

**Mode** User Exec and Privileged Exec

**Example** To display global IRDP configuration, use the command:

```
awplus# show ip irdp
```

**Output** Figure 20-11: Example output from the **show ip irdp** command

```
IRDP is enabled
event debugging is disabled
nsm debugging is disabled
packet debugging mode is disabled
```

Figure 20-12: Example output from the **show ip irdp** command with **debug ip irdp detail** set

```
IRDP is enabled
event debugging is disabled
nsm debugging is disabled
packet debugging mode is all
```

Figure 20-13: Example output from the **show ip irdp** command with **debug ip irdp both** set

```
IRDP is enabled
event debugging is disabled
nsm debugging is disabled
packet debugging mode is both
```

# show ip irdp interface

**Overview** This command displays the configuration of IRDP on all interfaces, or for a specified interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip irdp interface [*<interface-name>*]

| Parameter                     | Description                                                                         |
|-------------------------------|-------------------------------------------------------------------------------------|
| <i>&lt;interface-name&gt;</i> | Displays the interface status and configuration details of the specified interface. |

**Mode** User Exec and Privileged Exec

**Example** To display the IRDP configuration for v lan4, use the command:

```
awplus# show ip irdp interface vlan4
```

**Output** Figure 20-14: Example output from the **show ip irdp interface** command

```
vlan13 is up, line protocol is up
ICMP Router Discovery Protocol
 Sending mode multicast
 Router Lifetime 1350 seconds
 Default Preference 0
 Min Adv Interval 450 seconds
 Max Adv Interval 600 seconds
 Next advertisement in 551 seconds
 Non default prefix preferences
 192.168.1.1 preference 25000

 In packets 0 Out packets 3
 In bad packets 0 Out bad packets 0
 In good packets 0 Out good packets 3
 In ignored packets 0
```

**Table 22:** Parameters in the output of the **show ip irdp interface** command

| Parameter                      | Description                                                                                                                                                                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sending mode                   | Whether this interface is sending broadcast or multicast router advertisements. This means the destination IP address of router advertisements will be either the multicast address 224.0.0.1, or the broadcast address 255.255.255.255.                                    |
| Router Lifetime                | The lifetime value set for router advertisements sent from this interface. This is the maximum time that other devices should treat the advertised address as valid.                                                                                                        |
| Default Preference             | The preference value for IP addresses as default router addresses, relative to other router addresses on the same subnet. This preference value is used for all IP addresses on this interface, except for those listed under the heading "non default prefix preferences". |
| Min Adv Interval               | Minimum time allowed between sending router advertisements from this interface.                                                                                                                                                                                             |
| Max Adv Interval               | Maximum time allowed between sending router advertisements from this interface.                                                                                                                                                                                             |
| Non default prefix preferences | List of the IP addresses on this interface that have been set with a specific router preference value. These addresses use the preference value listed beside them, rather than the interface's default preference value.                                                   |
| In packets                     | The total number of packets received by IRDP on this interface. IRDP processes all ICMP packets received on this interface.                                                                                                                                                 |
| Out packets                    | The number of packets sent by IRDP on this interface.                                                                                                                                                                                                                       |
| In bad packets                 | The number of packets received by IRDP that it has discarded because they do not conform or corrupted.                                                                                                                                                                      |
| Out bad packets                | The number of packets that IRDP generated but failed to send to the network layer.                                                                                                                                                                                          |
| In good packets                | The number of packets received and processed by IRDP.                                                                                                                                                                                                                       |
| Out good packets               | The number of packets generated and successfully sent by IRDP.                                                                                                                                                                                                              |
| In ignored packets             | The number of incoming packets ignored, like ICMP packets other than IRDP.                                                                                                                                                                                                  |

**Related commands** [ip irdp](#)  
[show ip irdp](#)

# show ip sockets

**Overview** Use this command to display information about the IP or TCP sockets that are present on the device. It includes TCP and UDP listen sockets, and displays the associated IP address and port.

The information displayed for established TCP sessions includes the remote IP address, port, and session state. Raw IP protocol listen socket information is also displayed for protocols such as VRRP and ICMP6, which are configured to receive IP packets with the associated protocol number.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip sockets

**Mode** Privileged Exec

**Usage notes** Use this command to verify that the socket being used is opening correctly. If there is a local and remote endpoint, a connection is established with the ports indicated.

Note that this command does not display sockets that are used internally for exchanging data between the various processes that exist on the device and are involved in its operation and management. It only displays sockets that are present for the purposes of communicating with other external devices.

**Example** To display IP sockets currently present on the device, use the command:

```
awplus# show ip sockets
```

**Output** Figure 20-15: Example output from **show ip sockets**

| Not showing<br><number><br>local<br>connections        | This field refers to established sessions between processes internal to the device, that are used in its operation and management. These sessions are not displayed as they are not useful to the user. <number> is some positive integer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Not showing<br><number><br>local<br>listening<br>ports | This field refers to listening sockets belonging to processes internal to the device, that are used in its operation and management. They are not available to receive data from other devices. These sessions are not displayed as they are not useful to the user. <number> is some positive integer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Typ                                                    | This column displays the type of the socket. Possible values for this column are:<br>tcp : IP Protocol 6<br>udp : IP Protocol 17<br>raw : Indicates that socket is for a non port-orientated protocol (i.e. a protocol other than TCP or UDP) where all packets of a specified IP protocol type are accepted. For raw socket entries the protocol type is indicated in subsequent columns.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Local<br>Address                                       | For TCP and UDP listening sockets this shows the destination IP address (either IPv4 or IPv6) and destination TCP or UDP port number for which the socket will receive packets. The address and port are separated by ':'. If the socket will accept packets addressed to any of the device's IP addresses, the IP address will be 0.0.0.0 for IPv4 or :: for IPv6. For active TCP sessions the IP address will display which of the devices addresses the session was established with. For raw sockets this displays the IP address and IP protocol for which the socket will accept IP packets. The address and protocol are separated by ':'. If the socket will accept packets addressed to any of the device's IP addresses, the IP address will be 0.0.0.0 for IPv4 and :: for IPv6. IP Protocol assignments are described at: <a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a> |

Table 20-1: Parameters in the output from **show ip sockets** (cont.)

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Address | For TCP and UDP listening sockets this shows the source IP address (either IPv4 or IPv6) and source TCP or UDP port number for which the socket will accept packets. The address and port are separated by ':'. If the socket will accept packets addressed from any IP address, the IP address will be 0.0.0.0 for IPv4 or :: for IPv6. This is the usual case for a listening socket. Normally for a listen socket any source port will be accepted. This is indicated by '. For active TCP sessions the IP address will display the remote address and port the session was established with. For raw sockets the entry in this column will be 0.0.0.0: or ::: for IPv4 and IPv6, respectively. |
| State          | This column shows the state of the socket. For TCP sockets this shows the state of the TCP state machine. For UDP sockets this column is blank. For raw sockets it contains the IP protocol number. The possible TCP states are:<br>LISTEN<br>SYN - SENT<br>SYN - RECEIVED<br>ESTABLISHED<br>FIN - WAIT - 1<br>FIN - WAIT - 2<br>CLOSE - WAIT<br>CLOSING<br>LAST - ACK<br>TIME - WAIT<br>CLOSED<br>RFC793 contains the TCP state machine diagram with Section 3.2 describing each of the states.                                                                                                                                                                                                   |

# show ip traffic

**Overview** Use this command to display statistics regarding IP traffic sent and received by all interfaces on the device, showing totals for IP and IPv6 and then broken down into sub-categories such as TCP, UDP, ICMP and their IPv6 equivalents when appropriate.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip traffic

**Mode** Privileged Exec

**Example** To display IP traffic statistics, use the command:

```
awplus# show ip traffic
```

**Output** Figure 20-16: Example output from the **show ip traffic** command

```
awplus#show ip traffic
IP:
 168475 packets received
 168475 delivered
 208099 sent
 35 dropped due to missing route
 22646409 bytes received
 126783216 bytes sent
 InCsumErrors 0
 InNoECTPkts 168475
 InECT1Pkts 0
 InECT0Pkts 0
 InCEPkts 0
 In107 Destination Unreachable
 Out11 Destination Unreachable
IPv6:
 14 packets received
 14 received packets delivered
 18 packets transmitted
...
ICMP6:
 4 messages sent
...
UDP6:
 Udp6RcvbufErrors 0
...
UDPLite6:
 UdpLite6RcvbufErrors 0
...
```

```
TCP:
 8 remote connections established
...
UDP:
 79797 datagrams received
...
UDPLite:
 InCsumErrors 0
...
```

# tcpdump

**Overview** Use this command to start a tcpdump, which gives the same output as the Unix-like **tcpdump** command to display TCP/IP traffic. Press <ctrl> + c to stop a running tcpdump.

**Syntax** tcpdump <line>

**Syntax (VRF-lite)** tcpdump [vrf <vrf-name>] <line>

| Parameter  | Description                                                                                                                                                                          |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <line>     | Specify the dump options. For more information on the options for this placeholder see <a href="http://www.tcpdump.org/tcpdump_man.html">http://www.tcpdump.org/tcpdump_man.html</a> |
| vrf        | Apply the command to the specified VRF instance.                                                                                                                                     |
| <vrf-name> | The name of the VRF instance.                                                                                                                                                        |

**Mode** Privileged Exec

**Example** To start a tcpdump running to capture IP packets, enter the command:

```
awplus# tcpdump ip
```

**Example (VRF-lite)** To start a tcpdump on interface vlan2 associated with a VRF instance red, enter the command:

```
awplus# tcpdump vrf red vlan2
```

**Output** Figure 20-17: Example output from the **tcpdump** command

```
03:40:33.221337 IP 192.168.1.1 > 224.0.0.13: PIMv2, Hello,
length: 34
1 packets captured
2 packets received by filter
0 packets dropped by kernel
```

**Related commands** [debug ip packet interface](#)

# traceroute

**Overview** Use this command to trace the route to the specified IPv4 host.

**Syntax** `traceroute {<ip-addr>|<hostname>}`

**Syntax (VRF-lite)** `traceroute [vrf <vrf-name>] {<ip-addr>|<hostname>}`

| Parameter  | Description                                                             |
|------------|-------------------------------------------------------------------------|
| <ip-addr>  | The destination IPv4 address. The IPv4 address uses the format A.B.C.D. |
| <hostname> | The destination hostname.                                               |
| vrf        | Apply the command to the specified VRF instance.                        |
| <vrf-name> | The name of the VRF instance.                                           |

**Mode** User Exec and Privileged Exec

**Example** `awplus# traceroute 10.10.0.5`

**Example (VRF-lite)** `awplus# traceroute vrf red 192.168.0.1`

# undebug ip packet interface

**Overview** This command applies the functionality of the no [debug ip packet interface](#) command.

# undebbug ip irdp

**Overview** This command applies the functionality of the no `debug ip irdp` command.

# 21

# Domain Name Service (DNS) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Domain Name Service (DNS) features, including the following:

- DNS client
- DNS forwarding (DNS relay)

For more information about DNS for Switches, see the [Domain Name System \(DNS\) for AlliedWare Plus Switches Feature Overview and Configuration Guide](#)

- Command List**
- “clear ip dns forwarding cache” on page 914
  - “debug ip dns forwarding” on page 915
  - “ip dns forwarding” on page 916
  - “ip dns forwarding cache” on page 917
  - “ip dns forwarding dead-time” on page 919
  - “ip dns forwarding retry” on page 920
  - “ip dns forwarding source-interface” on page 921
  - “ip dns forwarding timeout” on page 922

# clear ip dns forwarding cache

**Overview** Use this command to clear the DNS Relay name resolver cache.

When using VRF-lite, use this command to clear the DNS Relay name resolver cache for either the whole device or for a specific VRF instance.

**Syntax** `clear ip dns forwarding cache`

**Syntax (VRF-lite)** `clear ip dns [vrf <name>|global] forwarding cache`

| Parameter | Description                                                                                 |
|-----------|---------------------------------------------------------------------------------------------|
| vrf       | Apply this command to the specified VRF instance.                                           |
| <name>    | The name of the specific VRF instance                                                       |
| global    | When VRF-lite is configured, apply this command to the global routing and forwarding table. |

**Mode** Privileged Exec

**Examples** To clear all cached data, use the command:

```
awplus# clear ip dns forwarding cache
```

**Example (VRF-lite)** To clear the cached data for VRF instance red, use the command:

```
awplus# clear ip dns vrf red forwarding cache
```

To clear the cached data for the default global VRF instance only, use the command:

```
awplus# clear ip dns global forwarding cache
```

**Related commands** [ip dns forwarding cache](#)

# debug ip dns forwarding

**Overview** Use this command to enable DNS Relay debugging.  
Use the **no** variant of this command to disable DNS Relay debugging.

**Syntax** debug ip dns forwarding  
no debug ip dns forwarding

**Default** DNS Relay debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable DNS forwarding debugging, use the commands:

```
awplus# debug ip dns forwarding
```

To disable DNS forwarding debugging, use the commands:

```
awplus# no debug ip dns forwarding
```

**Related commands** [ip dns forwarding](#)  
[show debugging ip dns forwarding](#)

# ip dns forwarding

**Overview** Use this command to enable DNS Relay, the forwarding of incoming DNS queries for IP hostname-to-address translation.

Use the **no** variant of this command to disable the forwarding of incoming DNS queries for IP hostname-to-address translation.

**Syntax** `ip dns forwarding`  
`no ip dns forwarding`

**Default** The forwarding of incoming DNS query packets is disabled by default.

**Mode** Global Configuration

**Usage notes** DNS Relay is independent of the configuration of `ip domain-lookup` (which is enabled by default). If `ip domain-lookup` is disabled, but DNS Relay is enabled, the router will continue to forward DNS queries by hosts in the network to its configured name-servers.

See the `ip dns forwarding dead-time` command used with this command.

**NOTE:** When running VRF-lite, the DNS Relay functions will apply separately within each VRF instance.

**Examples** To enable the forwarding of incoming DNS query packets, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding
```

To disable the forwarding of incoming DNS query packets, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding
```

**Related commands**

- `clear ip dns forwarding cache`
- `debug ip dns forwarding`
- `ip dns forwarding cache`

- `ip dns forwarding retry`
- `ip dns forwarding source-interface`
- `ip dns forwarding timeout`
- `ip domain-lookup`
- `ip name-server`
- `show ip dns forwarding`
- `show ip dns forwarding cache`
- `show ip dns forwarding server`

# ip dns forwarding cache

**Overview** Use this command to set the DNS Relay name resolver cache size and cache entry lifetime period. The DNS Relay name resolver cache stores the mappings between domain names and IP addresses.

Use the **no** variant of this command to set the default DNS Relay name resolver cache size and cache entry lifetime period.

Note that the lifetime period of the cache entry can be overwritten by the time-out period of the DNS reply from the DNS server if the time-out period of the DNS reply from the DNS server is smaller than the configured time-out period. The time-out period of the cache entry will only be used when the time-out period of the DNS reply from the DNS server is bigger than the time-out period configured on the device.

**Syntax** `ip dns forwarding cache [size <0-10000>] [timeout <60-3600>]`  
`no ip dns forwarding cache [size|timeout]`

| Parameter | Description                                                                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-10000> | Number of entries in the DNS Relay name resolver cache. Note that when running VRF-lite the number of entries configured will apply to each VRF instance. |
| <60-3600> | Timeout value in seconds. Note that when running VRF-lite the number of entries configured will apply to each VRF instance.                               |

**Default** The default cache size is 0 (no entries) and the default lifetime is 1800 seconds.

**Mode** Global Configuration

**Examples** To set the cache size to 10 entries and the lifetime to 500 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding cache size 10 time 500
```

To set the cache size to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding cache size
```

**Related commands**

- [clear ip dns forwarding cache](#)
- [debug ip dns forwarding](#)
- [ip dns forwarding](#)
- [show ip dns forwarding](#)
- [show ip dns forwarding cache](#)

**Command changes** Version 5.4.8-1.1: maximum cache limit increased to 10000

# ip dns forwarding dead-time

**Overview** Use this command to set the time period in seconds when the device stops sending any DNS requests to an unresponsive server and all retries set using [ip dns forwarding retry](#) are used. This time period is the DNS forwarding dead-time. The device stops sending DNS requests at the DNS forwarding dead-time configured and when all of the retries are used.

Use the **no** variant of this command to restore the default DNS forwarding dead-time value of 3600 seconds.

**Syntax** `ip dns forwarding dead-time <60-43200>`  
`no ip dns forwarding retry`

| Parameter  | Description                                                                                                                         |
|------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <60-43200> | Set the DNS forwarding dead-time in seconds. At the dead-time set, the switch stops sending DNS requests to an unresponsive server. |

**Default** The default time to stop sending DNS requests to an unresponsive server is 3600 seconds.

**Mode** Global Configuration

**Usage notes** See the [ip dns forwarding retry](#) command used with this command.

**Examples** To set the DNS forwarding retry count to 50 and to set the DNS forwarding dead-time to 1800 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding dead-time 1800
awplus(config)# ip dns forwarding retry 50
```

To reset the DNS retry count to the default of 2 and the DNS forwarding dead-time to the default of 3600, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding dead-time
awplus(config)# no ip dns forwarding retry
```

**Related commands**

- [ip dns forwarding](#)
- [ip dns forwarding retry](#)
- [show ip dns forwarding](#)
- [show ip dns forwarding server](#)

# ip dns forwarding retry

**Overview** Use this command to set the number of times DNS Relay will retry to forward DNS queries. The device stops sending DNS requests to an unresponsive server at the time set using the [ip dns forwarding dead-time](#) command and when all of the retries are used.

Use the **no** variant of this command to set the number of retries to the default of 2.

**Syntax** `ip dns forwarding retry <0-100>`  
`no ip dns forwarding retry`

| Parameter | Description                                                          |
|-----------|----------------------------------------------------------------------|
| <0-100>   | Set the number of times DNS Relay will retry to forward a DNS query. |

**Default** The default number of retries is 2 DNS requests to an unresponsive server.

**Mode** Global Configuration

**Usage notes** See the [ip dns forwarding dead-time](#) command used with this command.

**Examples** To set the DNS forwarding retry count to 50 and to set the DNS forwarding dead-time to 1800 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding retry 50
awplus(config)# ip dns forwarding dead-time 1800
```

To reset the DNS retry count to the default of 2 and the DNS forwarding dead-time to the default of 3600 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding retry
awplus(config)# no ip dns forwarding dead-time
```

**Related commands**

- [debug ip dns forwarding](#)
- [ip dns forwarding](#)
- [ip dns forwarding dead-time](#)
- [show ip dns forwarding](#)

# ip dns forwarding source-interface

**Overview** Use this command to set the interface to use for forwarding and receiving DNS queries.

Use the **no** variant of this command to unset the interface used for forwarding and receiving DNS queries.

**Syntax** `ip dns forwarding source-interface <interface-name>`  
`no ip dns forwarding source-interface`

| Parameter        | Description                                        |
|------------------|----------------------------------------------------|
| <interface-name> | An alphanumeric string that is the interface name. |

**Default** The default is that no interface is set and the device selects the appropriate source IP address automatically.

**Mode** Global Configuration

**Examples** To set `vlan1` as the source interface for relayed DNS queries, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding source-interface vlan1
```

To clear the source interface for relayed DNS queries, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding source-interface
```

**Related commands** [debug ip dns forwarding](#)  
[ip dns forwarding](#)  
[show ip dns forwarding](#)

# ip dns forwarding timeout

**Overview** Use this command to set the time period for the DNS Relay to wait for a DNS response.

Use the **no** variant of this command to set the time period to wait for a DNS response to the default of 3 seconds.

**Syntax** `ip dns forwarding timeout <0-3600>`  
`no ip dns forwarding timeout`

| Parameter | Description               |
|-----------|---------------------------|
| <0-3600>  | Timeout value in seconds. |

**Default** The default timeout value is 3 seconds.

**Mode** Global Configuration

**Examples** To set the timeout value to 12 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding timeout 12
```

To set the timeout value to the default of 3 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding timeout
```

**Related commands** [debug ip dns forwarding](#)  
[ip dns forwarding](#)  
[show ip dns forwarding](#)

# ip domain-list

**Overview** This command adds a domain to the DNS list. Domains are appended to incomplete host names in DNS requests. Each domain in this list is tried in turn in DNS lookups. This list is ordered so that the first entry you create is checked first.

The **no** variant of this command deletes a domain from the list.

**Syntax** `ip domain-list <domain-name>`  
`no ip domain-list <domain-name>`

| Parameter                        | Description                               |
|----------------------------------|-------------------------------------------|
| <code>&lt;domain-name&gt;</code> | Domain string, for example "company.com". |

**Mode** Global Configuration

**Usage notes** If there are no domains in the DNS list, then your device uses the domain specified with the `ip domain-name` command. If any domain exists in the DNS list, then the device does not use the domain set using the **ip domain-name** command.

**Example** To add the domain `example.net` to the DNS list, use the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-list example.net
```

**Related commands** `ip domain-lookup`  
`ip domain-name`  
`show ip domain-list`

# ip domain-lookup

**Overview** This command enables the DNS client on your device. This allows you to use domain names instead of IP addresses in commands. The DNS client resolves the domain name into an IP address by sending a DNS inquiry to a DNS server, specified with the [ip name-server](#) command.

It is possible to configure the DNS client to use the DNS relay to resolve domain lookups originating from the device itself. This configuration may be preferred, as the DNS relay provides additional functionality that is not available in the DNS client, such as caching, a configurable timeout length, and other options.

The **no** variant of this command disables the DNS client. The client will not attempt to resolve domain names. You must use IP addresses to specify hosts in commands.

**Syntax** `ip domain-lookup [via-relay]`  
`no ip domain-lookup`

| Parameter | Description                      |
|-----------|----------------------------------|
| via-relay | Perform resolution via DNS relay |

**Mode** Global Configuration

**Usage notes** The client is enabled by default. However, it does not attempt DNS inquiries unless there is a DNS server configured.

**Examples** To enable the DNS client on your device, use the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-lookup
```

To configure the DNS client to perform resolution via the DNS relay, use the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-lookup via-relay
awplus(config)# ip dns forwarding
```

To disable the DNS client on your device, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip domain-lookup
```

**Related commands**

- [ip domain-list](#)
- [ip domain-name](#)
- [ip name-server](#)
- [show hosts](#)
- [show ip name-server](#)

**Command changes**    Version 5.4.8-1.1: via-relay parameter added

# ip domain-name

**Overview** This command sets a default domain for the DNS. The DNS client appends this domain to incomplete host-names in DNS requests.

The **no** variant of this command removes the domain-name previously set by this command.

**Syntax** `ip domain-name <domain-name>`  
`no ip domain-name <domain-name>`

| Parameter                        | Description                               |
|----------------------------------|-------------------------------------------|
| <code>&lt;domain-name&gt;</code> | Domain string, for example "company.com". |

**Mode** Global Configuration

**Usage notes** If there are no domains in the DNS list (created using the [ip domain-list](#) command) then your device uses the domain specified with this command. If any domain exists in the DNS list, then the device does not use the domain configured with this command.

When your device is using its DHCP client for an interface, it can receive Option 15 from the DHCP server. This option replaces the domain name set with this command.

**Example** To configure the domain name, enter the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-name company.com
```

**Related commands** [ip domain-list](#)  
[show ip domain-list](#)  
[show ip domain-name](#)

# ip name-server

**Overview** Use this command to add IPv4 or IPv6 DNS server addresses. The DNS client on your device sends DNS queries to IP addresses in this list when trying to resolve a host name. Host names cannot be resolved until you have added at least one server to this list. A maximum of three name servers can be added to this list.

If you are running VRF-lite, you can add IPv4 or IPv6 DNS server addresses for either the global VRF instance or for a specific VRF instance. Host names cannot be resolved from within a VRF instance until you have added at least one name-server to that VRF instance.

The **no** variant of this command removes the specified DNS name-server address.

**Syntax** `ip name-server <ip-addr>`  
`no ip name-server <ip-addr>`

**Syntax (VRF-lite)** `ip name-server [vrf <name>] <ip-addr>`  
`no ip name-server [vrf <name>] <ip-addr>`

| Parameter | Description                                                                                                                                                                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-addr> | The IP address of the DNS server that is being added to the name server list. The address is entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X:X for an IPv6 address. The order that you enter the servers in, is the order in which they will be used. |
| vrf       | Apply this command to the specified VRF instance.                                                                                                                                                                                                                            |
| <name>    | The name of the specific VRF instance                                                                                                                                                                                                                                        |

**Mode** Global Configuration

**Usage notes** To allow the device to operate as a DNS proxy, your device must have learned about a DNS name-server to forward requests to. Name-servers can be learned through the following means:

- Manual configuration, using the **ip name-server** command
- Learned from DHCP server with Option 6

Use this command to statically configure a DNS name-server for the device to use.

The order that you enter the servers in, is the order in which they will be used.

**Examples** To allow a device to send DNS queries to a DNS server with the IPv4 address 10.10.10.5, use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server 10.10.10.5
```

To enable your device to send DNS queries to a DNS server with the IPv6 address 2001:0db8:010d::1, use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server 2001:0db8:010d::1
```

**Example (VRF-lite)** To enable your switch to send DNS queries (on VRF instance RED) to a DNS server with the IPv4 address 10.10.10.5 use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server vrf RED 10.10.10.5
```

**Command changes**

Version 5.4.6-2.1: VRF-lite support added to AR-series devices.

# ip name-server preferred-order

**Overview** Use this command to choose between using statically-configured DNS servers or dynamically-learned DNS servers.

Use the **no** variant of this command to set the DNS servers back to the default setting of dynamic.

**Syntax** ip name-server preferred-order {dynamic|static}  
no ip name-server preferred-order

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| dynamic   | Use dynamically learned DNS servers first.   |
| static    | Use statically configured DNS servers first. |

**Default** dynamic

**Mode** Global Configuration

**Usage notes** This command is used to choose which DNS server set to use first. Select either the **dynamic** or **static** parameter.

**Examples** To configure the preference to use static servers first, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# ip name-server preferred-order static
```

To configure the preference to use dynamically-learned servers first, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# ip name-server preferred-order dynamic
```

or

```
awplus# configure terminal
```

```
awplus(config)# no ip name-server preferred-order
```

**Command changes** Version 5.4.9-0.1: command added

# show debugging ip dns forwarding

**Overview** Use this command to see what debugging is turned on for DNS Relay. DNS Relay debugging is set using the **debug ip dns forwarding** command.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** show debugging ip dns forwarding

**Mode** User Exec and Privileged Exec

**Example** To display the DNS Relay debugging status, use the command:

```
awplus# show debugging ip dns forwarding
```

**Output** Figure 21-1: Example output from the **show debugging ip dns forwarding** command:

```
awplus#show debugging ip dns forwarding

DNS Relay debugging status:
 debugging is on
```

**Related commands** [debug ip dns forwarding](#)

# show hosts

**Overview** This command shows the default domain, domain list, and name servers configured on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show hosts

**Mode** User Exec and Privileged Exec

**Example** To display the default domain, use the command:

```
awplus# show hosts
```

**Output** Figure 21-2: Example output from the **show hosts** command when **no ip domain-lookup** is configured

```
awplus#show hosts

Default domain is not set
Name/address lookup is disabled
```

Figure 21-3: Example output from the **show hosts** command when **ip domain-lookup** is configured

```
awplus#show hosts

Default domain is mycompany.com
Domain list: company.com
Name/address lookup uses domain service
Name servers are 10.10.0.2 10.10.0.88
```

Figure 21-4: Example output from the **show hosts** command when **ip domain-lookup via-relay** is configured

```
awplus#show hosts

Default domain is mycompany.com
Domain list: company.com
Name/address lookup uses domain relay service
Name servers are 10.10.0.2 10.10.0.88
```

# show ip dns forwarding

**Overview** Use this command to display the DNS Relay status.

**Syntax** show ip dns forwarding

**Mode** User Exec and Privileged Exec

**Examples** To display the DNS Relay status, use the command:

```
awplus# show ip dns forwarding
```

**Output** Figure 21-5: Example output from the **show ip dns forwarding** command

```
awplus#show ip dns forwarding

Max-Retry : 2
Timeout : 3 second(s)
Dead-Time : 3600 second(s)
Source-Interface: not specified
DNS Cache : disabled
```

**Related commands** [ip dns forwarding](#)

# show ip dns forwarding cache

**Overview** Use this command to display the DNS Relay name resolver cache.

**Syntax** show ip dns forwarding cache

**Syntax (VRF-lite)** show ip dns [vrf <name>|global] forwarding cache

| Parameter | Description                                                                                 |
|-----------|---------------------------------------------------------------------------------------------|
| vrf       | Apply this command to the specified VRF instance.                                           |
| <name>    | The name of the specific VRF instance                                                       |
| global    | When VRF-lite is configured, apply this command to the global routing and forwarding table. |

**Mode** User Exec and Privileged Exec

**Example** To display the DNS Relay name resolver cache, use the command:

```
awplus# show ip dns forwarding cache
```

**Output** Figure 21-6: Example output from the **show ip dns forwarding cache** command

|                                     |                 |         |         |
|-------------------------------------|-----------------|---------|---------|
| awplus#show ip dns forwarding cache |                 |         |         |
| IPv4 addresses in cache: 3          |                 |         |         |
| IPv6 addresses in cache: 0          |                 |         |         |
| Cache size: 1000                    |                 |         |         |
| Host                                | Address         | Expires | Flags   |
| www.example.com                     | 172.16.1.1.     | 180     |         |
| mail.example.com                    | www.example.com | 180     | CNAME   |
| www.example.com                     | 172.16.1.1.     | 180     | REVERSE |
| mail.example.com                    | 172.16.1.5.     | 180     |         |

**Example (VRF-lite)** To display the DNS Relay name resolver cache with output for VRF instance RED, use the command:

```
awplus# show ip dns vrf RED forwarding cache
```

**Output** Figure 21-7: Example output from the **show ip dns forwarding cache** command that includes output for VRF instance RED.

```
awplus#show ip dns vrf RED forwarding cache
IPv4 addresses in cache: 3
IPv6 addresses in cache: 0
Cache size: 1000
Host Address Expires Flags
www.example.com 172.16.1.1. 180
mail.example.com www.example.com 180 CNAME
www.example.com 172.16.1.1. 180 REVERSE
mail.example.com 172.16.1.5. 180

www.example2.com 10.25.1.1. 180
mail.example2.com www.example2.com 180 CNAME
www.example2.com 10.25.1.1. 180 REVERSE
mail.example2.com 10.25.1.6. 180
```

**Related commands** [ip dns forwarding cache](#)  
[ip name-server](#)

# show ip dns forwarding server

**Overview** Use this command to display the status of DNS forwarding name servers.  
If you are running VRF, you can also use this command to display the status for DNS forwarding name servers operating on a specific VRF instance.

**Syntax** show ip dns forwarding server

**Syntax (VRF-lite)** show ip dns [vrf <name>|global] forwarding server

| Parameter         | Description                                                                                                                                                     |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vrf               | Apply this command to the specified VRF instance.                                                                                                               |
| <name>            | The name of the specific VRF instance                                                                                                                           |
| global            | When VRF-lite is configured, apply this command to the global routing and forwarding table.                                                                     |
| forwarding server | Display information about the DNS forwarding name servers for either the switch (when not using VRF-lite) or for a specific VRF instance (when using VRF-lite). |

**Mode** User Exec and Privileged Exec

**Examples** To display the status of DNS Relay name servers, use the command:

```
awplus# show ip dns forwarding server
```

**Output** Figure 21-8: Example output from the **show ip dns forwarding server** command

```
awplus#show ip dns forwarding server
```

| Servers    | Forwards | Fails | Dead-Time |
|------------|----------|-------|-----------|
| 172.16.1.1 | 12       | 0     | active    |
| 172.16.1.2 | 6        | 3     | 3900      |

**Example (VRF-lite)** To display the status of DNS Relay name-servers for VRF-lite instance red, use the command:

```
awplus# show ip dns vrf red forwarding server
```

**Output** Figure 21-9: Example output from the **show ip dns forwarding server** command

```
awplus#show ip dns forwarding server
```

| [VRF: red] |          |       |           |
|------------|----------|-------|-----------|
| Servers    | Forwards | Fails | Dead-Time |
| 172.16.1.1 | 12       | 0     | active    |
| 172.16.1.2 | 6        | 3     | 3900      |

**Related commands** [ip dns forwarding](#)  
[ip dns forwarding dead-time](#)

# show ip domain-list

**Overview** This command shows the domains configured in the domain list. The DNS client uses the domains in this list to append incomplete hostnames when sending a DNS inquiry to a DNS server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip domain-list

**Mode** User Exec and Privileged Exec

**Example** To display the list of domains in the domain list, use the command:

```
awplus# show ip domain-list
```

**Output** Figure 21-10: Example output from the **show ip domain-list** command

```
awplus#show ip domain-list
alliedtelesis.com
mycompany.com
```

**Related commands** [ip domain-list](#)  
[ip domain-lookup](#)

# show ip domain-name

**Overview** This command shows the default domain configured on your device. When there are no entries in the DNS list, the DNS client appends this domain to incomplete hostnames when sending a DNS inquiry to a DNS server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip domain-name

**Mode** User Exec and Privileged Exec

**Example** To display the default domain configured on your device, use the command:

```
awplus# show ip domain-name
```

**Output** Figure 21-11: Example output from the **show ip domain-name** command

```
awplus#show ip domain-name
alliedtelesis.com
```

**Related commands** [ip domain-name](#)  
[ip domain-lookup](#)

# show ip name-server

**Overview** This command displays a list of IPv4 and IPv6 DNS server addresses that your device will send DNS requests to. This is a static list configured using the [ip name-server](#) command.

When running VRF-lite, this command displays a list of IPv4 and IPv6 addresses of DNS servers that your device will send DNS requests to for either the global VRF instance or a selected VRF instance.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip name-server

**Syntax (VRF-lite)** show ip name-server [vrf <name>|global]

| Parameter | Description                           |
|-----------|---------------------------------------|
| vrf       | A VRF instance                        |
| <name>    | The name of the specific VRF instance |
| global    | The global VRF instance               |

**Mode** User Exec and Privileged Exec

**Example** To display the list of DNS servers that your device sends DNS requests to, use the command:

```
awplus# show ip name-server
```

**Output** Figure 21-12: Example output from the **show ip name-server** command

```
awplus# show ip name-server
10.10.0.123
10.10.0.124
2001:0db8:010d::1
```

**Output (VRF-lite)** Figure 21-13: Example output from the **show ip name-server** command for the VRF instance “red”

```
awplus# show ip name-server vrf red

[VRF: red]
10.10.0.123
10.10.0.124
2001:0db8:010d::1
```

# IPv6 Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure IPv6. For more information, see the [IPv6 Feature Overview and Configuration Guide](#).

- Command List**
- “clear ipv6 neighbors” on page 942
  - “ipv6 address” on page 943
  - “ipv6 address autoconfig” on page 945
  - “ipv6 address suffix” on page 947
  - “ipv6 enable” on page 948
  - “ipv6 eui64-linklocal” on page 950
  - “ipv6 forwarding” on page 951
  - “ipv6 icmp error-interval” on page 952
  - “ipv6 multicast forward-slow-path-packet” on page 953
  - “ipv6 nd accept-ra-default-routes” on page 954
  - “ipv6 nd accept-ra-pinfo” on page 955
  - “ipv6 nd current-hoplimit” on page 956
  - “ipv6 nd managed-config-flag” on page 957
  - “ipv6 nd minimum-ra-interval” on page 958
  - “ipv6 nd other-config-flag” on page 959
  - “ipv6 nd prefix” on page 960
  - “ipv6 nd ra-interval” on page 962
  - “ipv6 nd ra-lifetime” on page 963
  - “ipv6 nd rguard” on page 964

- ["ipv6 nd reachable-time"](#) on page 966
- ["ipv6 nd retransmission-time"](#) on page 967
- ["ipv6 nd suppress-ra"](#) on page 968
- ["ipv6 neighbor"](#) on page 969
- ["ipv6 opportunistic-nd"](#) on page 970
- ["ipv6 route"](#) on page 971
- ["ipv6 unreachable"](#) on page 972
- ["optimistic-nd"](#) on page 973
- ["ping ipv6"](#) on page 974
- ["show ipv6 forwarding"](#) on page 976
- ["show ipv6 interface"](#) on page 977
- ["show ipv6 neighbors"](#) on page 978
- ["show ipv6 route"](#) on page 979
- ["show ipv6 route summary"](#) on page 981
- ["traceroute ipv6"](#) on page 982

# clear ipv6 neighbors

**Overview** Use this command to clear all dynamic IPv6 neighbor entries.

**Syntax** clear ipv6 neighbors

**Mode** Privileged Exec

**Example** awplus# clear ipv6 neighbors

**Related commands** [ipv6 neighbor](#)  
[show ipv6 neighbors](#)

# ipv6 address

**Overview** Use this command to set the IPv6 address of an interface. The command also enables IPv6 on the interface, which creates an EUI-64 link-local address as well as enabling RA processing and SLAAC.

To stop the device from processing prefix information (routes and addresses from the received Router Advertisements) use the command **no ipv6 nd accept-ra-pinfo**.

To remove the EUI-64 link-local address, use the command **no ipv6 eui64-linklocal**.

Use the **no** variant of this command to remove the IPv6 address assigned and disable IPv6. Note that if no global addresses are left after removing the IPv6 address then IPv6 is disabled.

**Syntax** `ipv6 address <ipv6-addr/prefix-length>`  
`no ipv6 address <ipv6-addr/prefix-length>`

| Parameter                                    | Description                                                                                                                                                                                                             |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-addr/prefix-length&gt;</code> | Specifies the IPv6 address to be set. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. Note that your switch will not accept prefix lengths greater than 64. |

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** Note that the device keeps link-local addresses until you remove them with the **no** variant of the command that established them. See the [ipv6 enable](#) command for more information.

Also note that the device keeps the link-local address if the global address is removed using a command other than the command that was used to establish the link-local address. For example, if a link local address is established with the [ipv6 enable](#) command then it will not be removed using a **no ipv6 address** command.

**Examples** To assign the IPv6 address 2001:0db8::a2/64 to the VLAN interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::a2/64
```

To remove the IPv6 address 2001:0db8::a2/64 from the VLAN interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::a2/64
```

**Related  
commands**

- [ipv6 address autoconfig](#)
- [ipv6 address dhcp](#)
- [ipv6 dhcp server](#)
- [ipv6 enable](#)
- [ipv6 eui64-linklocal](#)
- [show running-config](#)
- [show ipv6 interface](#)
- [show ipv6 route](#)

# ipv6 address autoconfig

**Overview** Use this command to enable IPv6 stateless address autoconfiguration (SLAAC) for an interface. This configures an IPv6 address on an interface derived from the MAC address on the interface.

Use the **no** variant of this command to disable IPv6 SLAAC on an interface. Note that if no global addresses are left after removing all IPv6 autoconfigured addresses then IPv6 is disabled.

**Syntax** `ipv6 address autoconfig`  
`no ipv6 address autoconfig`

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** Use this command to enable automatic configuration of IPv6 addresses using stateless autoconfiguration on an interface, and enable IPv6.

IPv6 hosts can configure themselves when connected to an IPv6 network using ICMPv6 (Internet Control Message Protocol version 6) router discovery messages. Configured routers respond with a Router Advertisement (RA) containing configuration parameters for IPv6 hosts.

The SLAAC process derives the interface identifier of the IPv6 address from the MAC address of the interface. When applying SLAAC to an interface, note that the MAC address of the default VLAN is applied to the interface if the interface does not have its own MAC address.

If SLAAC is not suitable then a network can use stateful configuration with DHCPv6 (Dynamic Host Configuration Protocol version 6) Relay, or hosts can be configured statically. See [ip dhcp-relay server-address](#) for the DHCPv6 Relay server command description and examples. See the [IP Feature Overview and Configuration Guide](#) for more information about DNS Relay.

Note that the device keeps link-local addresses until you remove them with the **no** variant of the command that established them. See the [ipv6 enable](#) command for more information.

Also note that the device keeps the link-local address if the global address is removed using a command other than the command that was used to establish the link-local address. For example, if a link local address is established with the [ipv6 enable](#) command then it will not be removed using a **no ipv6 address** command.

**Examples** To enable SLAAC on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address autoconfig
```

To disable SLAAC on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address autoconfig
```

**Related  
commands**

[ipv6 address](#)  
[ipv6 enable](#)  
[show ipv6 interface](#)  
[show running-config](#)

# ipv6 address suffix

**Overview** Use this command to configure the suffix to use when generating an address from prefix information. Any addresses that were created with the EUI-64 suffix will be removed, and new addresses will be added after the next Router Advertisement.

Use the **no** variant of this command to set it back to the default of disabled or set to :: for the same result as the **no** variant.

**Syntax** `ipv6 address suffix <ipv6-addr-suffix>`  
`no ipv6 address suffix`

| Parameter                             | Description                                         |
|---------------------------------------|-----------------------------------------------------|
| <code>&lt;ipv6-addr-suffix&gt;</code> | In the format of ::X:X:X:X, for example ::a2d8:0fd8 |

**Default** Disabled

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Example** To configure the suffix to use when generating an address from prefix information on vlan2, use the command:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address suffix ::a2d8:0fd8
```

**Related commands** [ipv6 nd accept-ra-pinfo](#)  
[show running-config interface](#)

**Command changes** Version 5.4.8-2.1: command added

# ipv6 enable

**Overview** Use this command to enable automatic configuration of a link-local IPv6 address on an interface using Stateless Automatic Address Configuration (SLAAC). By default, the EUI-64 method is used to generate the link-local address.

Use the **no** variant of this command to disable IPv6 on an interface without a global address. Note, to stop EUI-64 from generating the automatic link-local address, use the command **no ipv6 eui64-linklocal**.

**Syntax** `ipv6 enable`  
`no ipv6 enable`

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** The **ipv6 enable** command automatically configures an IPv6 link-local address on the interface and enables the interface for IPv6 processing.

A link-local address is an IP (Internet Protocol) address that is only used for communications in the local network, or for a point-to-point connection. Routing does not forward packets with link-local addresses. IPv6 requires that a link-local address is assigned to each interface that has the IPv6 protocol enabled, and when addresses are assigned to interfaces for routing IPv6 packets.

Note that the device keeps link-local addresses until you remove them with the **no** variant of the command that established them.

Also note that the device keeps the link-local address if the global address is removed using a command other than the command that was used to establish the link-local address. For example, if a link local address is established with the **ipv6 enable** command then it will not be removed using a **no ipv6 address** command.

**Default** All interfaces default to IPv6-down with no address.

**Examples** To enable IPv6 with only a link-local IPv6 address on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
```

To disable IPv6 with only a link-local IPv6 address on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 enable
```

**Related  
commands**

ipv6 address  
ipv6 address autoconfig  
ipv6 address dhcp  
ipv6 address (DHCPv6 PD)  
ipv6 dhcp client pd  
ipv6 nd prefix  
show ipv6 interface  
show ipv6 route  
show running-config

# ipv6 eui64-linklocal

**Overview** When IPv6 is enabled on an interface, an EUI link-local address is generated and installed on the interface. In other words, **ipv6 eui64-linklocal** is enabled by default on any IPv6 enabled interface.

Use the **no** variant of this command to disallow the automatic generation of the EUI-64 link-local address on an IPv6 enabled interface.

**Syntax** `ipv6 eui64-linklocal`  
`no ipv6 eui64-linklocal`

**Default** The command **ipv6 eui64-linklocal** is enabled by default on any IPv6 enabled interface.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Example** To enable IPv6 on the interface vlan1, and use the link-local address of fe80::1/10 instead of the EUI-64 link-local that is automatically generated, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# no ipv6 eui64-linklocal
awplus(config-if)# ipv6 address fe80::1/10
```

**Related commands** [ipv6 address](#)  
[ipv6 address autoconfig](#)  
[ipv6 enable](#)

**Command changes** Version 5.4.7-0.1: command added

# ipv6 forwarding

**Overview** Use this command to turn on IPv6 unicast routing for IPv6 packet forwarding.

Use this command globally on your device before using the [ipv6 enable](#) command on individual interfaces.

Use the **no** variant of this command to turn off IPv6 unicast routing. Note IPv6 unicast routing is disabled by default.

**NOTE:** Use this command to enable IPv6 unicast routing before configuring either RIPng or OSPFv3 IPv6 routing protocols and static or multicast IPv6 routing.

Before using PIM-SMv6 commands, IPv6 must be enabled on an interface with the [ipv6 enable](#) command, IPv6 forwarding must be enabled globally for routing IPv6 with the [ipv6 forwarding](#) command, and IPv6 multicasting must be enabled globally with the [ipv6 multicast-routing](#) command.

**Syntax** `ipv6 forwarding`  
`no ipv6 forwarding`

**Mode** Global Configuration

**Default** IPv6 unicast forwarding is disabled by default.

**Usage notes** Enable IPv6 unicast forwarding globally for all interfaces on your device with this command. Use the **no** variant of this command to disable IPv6 unicast forwarding globally for all interfaces on your device.

IPv6 unicast forwarding allows devices to communicate with devices that are more than one hop away, providing that there is a route to the destination address. If IPv6 forwarding is not enabled then pings to addresses on devices that are more than one hop away will fail, even if there is a route to the destination address.

**Examples** To enable IPv6 unicast routing, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
```

To disable IPv6 unicast routing, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 forwarding
```

**Related commands** [ipv6 enable](#)  
[ipv6 multicast-routing](#)

# ipv6 icmp error-interval

**Overview** Use this command to limit how often IPv6 ICMP error messages are sent. The maximum frequency of messages is specified in milliseconds.

Use the **no** variant of this command to reset the frequency to the default

**Syntax** `ipv6 icmp error-interval <interval>`  
`no ipv6 icmp error-interval`

| Parameter  | Description                             |
|------------|-----------------------------------------|
| <interval> | 0-2147483647, interval in milliseconds. |

**Default** 1000

**Mode** Global Configuration

**Example** To configure the rate to be at most one packet every 10 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 icmp error-interval 10000
```

To reset the rate to the default of one packet every second, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 icmp error-interval
```

**Related commands** [ip icmp error-interval](#)

# ipv6 multicast forward-slow-path-packet

**Overview** Use this command to enable multicast packets to be forwarded to the CPU. Enabling this command will ensure that the layer L3 MTU is set correctly for each IP multicast group and will apply the value of the smallest MTU among the outgoing interfaces for the multicast group.

It will also ensure that a received packet that is larger than the MTU value will result in the generation of an ICMP Too Big message.

Use the **no** variant of this command to disable the above functionality.

**Syntax** `ipv6 multicast forward-slow-path-packet`  
`no ipv6 multicast forward-slow-path-packet`

**Default** Disabled.

**Mode** Privileged Exec

**Example** To enable the ipv6 multicast forward-slow-path-packet function, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast forward-slow-path-packet
```

**Related commands** [show ipv6 forwarding](#)

# ipv6 nd accept-ra-default-routes

**Overview** Use this command to allow accepting and installing of default routes based on a received RA (Router Advertisement). The default route's destination is set to the source address of the received RA.

Use the **no** variant of this command to disable accepting RA-based default routes.

**Syntax** `ipv6 nd accept-ra-default-routes`  
`no ipv6 nd accept-ra-default-routes`

**Default** RA-based default routes are accepted by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Example** To enable RA-based default routes on vlan1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# no ipv6 nd accept-ra-pinfo
```

**Related commands** [ipv6 address](#)  
[ipv6 address autoconfig](#)  
[ipv6 enable](#)

# ipv6 nd accept-ra-pinfo

**Overview** Use this command to allow the processing of the prefix information included in a received RA (Router Advertisement) on an IPv6 enabled interface.

Use the **no** variant of this command to disable an IPv6 interface from using the prefix information within a received RA.

**Syntax** `ipv6 nd accept-ra-pinfo`  
`no ipv6 nd accept-ra-pinfo`

**Default** The command **ipv6 nd accept-ra-pinfo** is enabled by default on any IPv6 interface.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** By default, when IPv6 is enabled on an interface, SLAAC is also enabled. SLAAC addressing along with the EUI-64 process, uses the prefix information included in a received RA to generate an automatic link-local address on the IPv6 interface.

Note: an AlliedWare Plus device will, by default, add a prefix for the connected interface IPv6 address(es) to the RA it transmits. However, this behavior can be changed by using the command **no ipv6 nd prefix auto-advertise**, so there is no guarantee that an RA will contain a prefix.

**Example** To enable IPv6 on vlan1 without installing a SLAAC address on the interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# no ipv6 nd accept-ra-pinfo
```

**Related commands** [ipv6 address](#)  
[ipv6 address autoconfig](#)  
[ipv6 enable](#)

**Command changes** Version 5.4.7-0.1: command added

# ipv6 nd current-hoplimit

**Overview** Use this command to specify the advertised current hop limit used between IPv6 Routers.

Use the **no** variant of this command to reset the current advertised hop limit to the default of 0.

**Syntax** `ipv6 nd current-hoplimit <hoplimit>`  
`no ipv6 nd current-hoplimit`

| Parameter  | Description                                                                               |
|------------|-------------------------------------------------------------------------------------------|
| <hoplimit> | Specifies the advertised current hop limit value.<br>Valid values are from 0 to 255 hops. |

**Default** 0 (No advertised current hop limit specified)

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the advertised current hop limit to 2 between IPv6 Routers on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd current-hoplimit 2
```

To reset the advertised current hop limit to the default 0 on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd current-hoplimit
```

**Related commands** [ipv6 nd managed-config-flag](#)  
[ipv6 nd prefix](#)  
[ipv6 nd suppress-ra](#)

# ipv6 nd managed-config-flag

**Overview** Use this command to set the managed address configuration flag, contained within the router advertisement field.

Setting this flag indicates the operation of a stateful autoconfiguration protocol such as DHCPv6 for address autoconfiguration, and that address information (i.e. the network prefix) and other (non-address) information can be requested from the device.

An unset flag enables hosts receiving the advertisements to use a stateless autoconfiguration mechanism to establish their IPv6 addresses. The default is flag unset.

Use the **no** variant of this command to reset this command to its default of having the flag unset.

**Syntax** `ipv6 nd managed-config-flag`  
`no ipv6 nd managed-config-flag`

**Default** Unset

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** Advertisement flags will not be transmitted unless you have applied the [ipv6 nd suppress-ra](#) command. This step is included in the example below.

**Example** To set the managed address configuration flag on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd managed-config-flag
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related commands** [ipv6 nd suppress-ra](#)  
[ipv6 nd prefix](#)  
[ipv6 nd other-config-flag](#)

# ipv6 nd minimum-ra-interval

**Overview** Use this command in Interface Configuration mode to set a minimum Router Advertisement (RA) interval for an interface.

Use the **no** variant of this command in Interface Configuration mode to remove the minimum RA interval for an interface.

**Syntax** `ipv6 nd minimum-ra-interval <seconds>`  
`no ipv6 nd minimum-ra-interval`

| Parameter                    | Description                                                                                                        |
|------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <code>&lt;seconds&gt;</code> | Specifies the number of seconds between IPv6 Router Advertisements (RAs). Valid values are from 3 to 1350 seconds. |

**Default** The RA interval for an interface is unset by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the minimum RA interval for the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd minimum-ra-interval 60
```

To remove the minimum RA interval for the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd minimum-ra-interval
```

**Related commands**

- [ipv6 nd ra-interval](#)
- [ipv6 nd suppress-ra](#)
- [ipv6 nd prefix](#)
- [ipv6 nd other-config-flag](#)

# ipv6 nd other-config-flag

**Overview** Use this command to set the **other** stateful configuration flag (contained within the router advertisement field) to be used for IPv6 address auto-configuration. This flag is used to request the router to provide information in addition to providing addresses.

Setting the [ipv6 nd managed-config-flag](#) command implies that the [ipv6 nd other-config-flag](#) will also be set.

Use **no** variant of this command to reset the value to the default.

**Syntax** `ipv6 nd other-config-flag`  
`no ipv6 nd other-config-flag`

**Default** Unset

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** Advertisement flags will not be transmitted unless you have applied the [ipv6 nd suppress-ra](#) command. This step is included in the example below.

**Example** To set the IPv6 other-config-flag on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd other-config-flag
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related commands** [ipv6 nd suppress-ra](#)  
[ipv6 nd prefix](#)  
[ipv6 nd managed-config-flag](#)

# ipv6 nd prefix

**Overview** Use this command in Interface Configuration mode to specify the IPv6 prefix information that is advertised by the router advertisement for IPv6 address auto-configuration.

Use the **no** parameter with this command to reset the IPv6 prefix for an interface in Interface Configuration mode.

**Syntax** `ipv6 nd prefix <ipv6-prefix/length>`  
`ipv6 nd prefix <ipv6-prefix/length> [<valid-lifetime>]`  
`ipv6 nd prefix <ipv6-prefix/length>`  
`<valid-lifetime><preferred-lifetime> [no-autoconfig]`  
`ipv6 nd prefix <ipv6-prefix/length>`  
`<valid-lifetime><preferred-lifetime> off-link [no-autoconfig]`  
`no ipv6 nd prefix [<ipv6-addr/prefix-length>|all]`

| Parameter                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-prefix/length&gt;</code> | The prefix to be advertised by the router advertisement message.<br>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64. The default is X:X::/64.                                                                                                                                                                                                                              |
| <code>&lt;valid-lifetime&gt;</code>     | The the period during which the specified IPv6 address prefix is valid. This can be set to a value between 0 and 4294967295 seconds. The default is 2592000 (30 days). Note that this period should be set to a value greater than that set for the prefix preferred-lifetime.                                                                                                                                                            |
| <code>&lt;preferred-lifetime&gt;</code> | Specifies the IPv6 prefix preferred lifetime. This is the period during which the IPv6 address prefix is considered a current (undeprecated) value. After this period, the command is still valid but should not be used in new communications. Set to a value between 0 and 4294967295 seconds. The default is 604800 seconds (7 days). Note that this period should be set to a value less than that set for the prefix valid-lifetime. |
| <code>off-link</code>                   | Specify the IPv6 prefix off-link flag. The default is flag set.                                                                                                                                                                                                                                                                                                                                                                           |
| <code>no-autoconfig</code>              | Specify the IPv6 prefix no autoconfiguration flag. Setting this flag indicates that the prefix is not to be used for autoconfiguration. The default is flag set.                                                                                                                                                                                                                                                                          |
| <code>all</code>                        | Specify all IPv6 prefixes associated with the VLAN interface.                                                                                                                                                                                                                                                                                                                                                                             |

**Default** Valid-lifetime default is 2592000 seconds (30 days). Preferred-lifetime default is 604800 seconds (7 days).

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** This command specifies the IPv6 prefix flags that are advertised by the router advertisement message.

**Examples** To configure the device to issue router advertisements on vlan2, and advertise the address prefix of 2001:0db8::/64, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64
```

To configure the device to issue router advertisements on vlan2, and advertise the address prefix of 2001:0db8::/64 with a valid lifetime of 10 days and a preferred lifetime of 5 days, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64 864000 432000
```

To configure the device to issue router advertisements on vlan2 and advertise the address prefix of 2001:0db8::/64 with a valid lifetime of 10 days, a preferred lifetime of 5 days, and no prefix used for autoconfiguration, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64 864000 432000
no-autoconfig
```

To reset router advertisements on vlan2, so the address prefix of 2001:0db8::/64 is not advertised from the device, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd prefix 2001:0db8::/64
```

To reset all router advertisements on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd prefix all
```

**Related commands** [ipv6 nd suppress-ra](#)

# ipv6 nd ra-interval

**Overview** Use this command to specify the interval between IPv6 Router Advertisements (RA) transmissions.

Use **no** parameter with this command to reset the value to the default value (600 seconds).

**Syntax** `ipv6 nd ra-interval <seconds>`  
`no ipv6 nd ra-interval`

| Parameter | Description                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------|
| <seconds> | Specifies the number of seconds between IPv6 Router Advertisements (RAs). Valid values are from 4 to 1800 seconds. |

**Default** 600 seconds.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** Advertisement flags will not be transmitted unless you have applied the **no ipv6 nd suppress-ra** command as shown in the example below.

**Example** To set the advertisements interval on vlan2 to be 60 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd ra-interval 60
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related commands** [ipv6 nd minimum-ra-interval](#)  
[ipv6 nd suppress-ra](#)  
[ipv6 nd prefix](#)

# ipv6 nd ra-lifetime

**Overview** Use this command to specify the time period that this router can usefully act as a default gateway for the network. Each router advertisement resets this time period.

Use **no** parameter with this command to reset the value to default.

**Syntax** `ipv6 nd ra-lifetime <seconds>`  
`no ipv6 nd ra-lifetime`

| Parameter | Description                                                                                                                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <seconds> | Time period in seconds. Valid values are from 0 to 9000. Note that you should set this time period to a value greater than the value you have set using the <a href="#">ipv6 nd ra-interval</a> command. |

**Default** 1800 seconds

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** This command specifies the lifetime of the current router to be announced in IPv6 Router Advertisements.

Advertisement flags will not be transmitted unless you have applied the **no ipv6 nd suppress-ra** command. This instruction is included in the example shown below.

**Examples** To set the advertisement lifetime of 8000 seconds on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd ra-lifetime 8000
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related commands** [ipv6 nd suppress-ra](#)  
[ipv6 nd prefix](#)

# ipv6 nd raguard

**Overview** Use this command to apply the Router Advertisements (RA) Guard feature from the Interface Configuration mode for a device port. This blocks all RA messages received on a device port.

For more information about RA Guard, see the [IPv6 Feature Overview and Configuration Guide](#).

Use the **no** parameter with this command to disable RA Guard for a specified device port.

**Syntax** `ipv6 nd raguard`  
`no ipv6 nd raguard`

**Default** RA Guard is not disabled by default.

**Mode** Interface Configuration for a port.

**Usage notes** Router Advertisements (RAs) are used by Routers to announce themselves on the link. Applying RA Guard to a device port disallows Router Advertisements and redirect messages. RA Guard blocks RAs from untrusted hosts. Blocking RAs stops untrusted hosts from flooding malicious RAs and stops any misconfigured hosts from disrupting traffic on the local network.

Enabling RA Guard on a port blocks RAs from a connected host and indicates the port and host are untrusted. Disabling RA Guard on a port allows RAs from a connected host and indicates the port and host are trusted. Ports and hosts are trusted by default to allow RAs.

**Example** To enable RA Guard on port1.0.1-port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# ipv6 nd raguard
```

To verify RA Guard is enabled on port1.0.1, use the command:

```
awplus# show running-config interface port1.0.1
```

To disable RA Guard on port1.0.1-port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# no ipv6 nd raguard
```

When RA Guard is disabled on a port it is not displayed in **show running-config** output.

**Output** Example output from using **show running-config interface port1.0.1** to verify RA Guard:

```
!
interface port1.0.1
 switchport mode access

 ipv6 nd raguard
!
```

**Related commands** [show running-config interface](#)

# ipv6 nd reachable-time

**Overview** Use this command to specify the reachable time in the router advertisement to be used for detecting reachability of the IPv6 neighbor.

Use the **no** variant of this command to reset the value to default.

**Syntax** `ipv6 nd reachable-time <milliseconds>`  
`no ipv6 nd reachable-time`

| Parameter      | Description                                                                                                                             |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <milliseconds> | Time period in milliseconds. Valid values are from 1000 to 3600000.<br>Setting this value to 0 indicates an unspecified reachable-time. |

**Default** 0 milliseconds

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** This command specifies the reachable time of the current router to be announced in IPv6 Router Advertisements.

Advertisement flags will not be transmitted unless you have applied the **no ipv6 nd suppress-ra** command. This instruction is included in the example shown below.

**Example** To set the reachable-time in router advertisements on the VLAN interface vlan2 to be 1800000 milliseconds, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd reachable-time 1800000
awplus(config-if)# no ipv6 nd suppress-ra
```

To reset the reachable-time in router advertisements on the VLAN interface vlan2 to an unspecified reachable-time (0 milliseconds), enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd reachable-time
```

**Related commands** [ipv6 nd suppress-ra](#)  
[ipv6 nd prefix](#)

# ipv6 nd retransmission-time

**Overview** Use this command to specify the advertised retransmission interval for Neighbor Solicitation in milliseconds between IPv6 Routers.

Use the **no** variant of this command to reset the retransmission time to the default (1 second).

**Syntax** `ipv6 nd retransmission-time <milliseconds>`  
`no ipv6 nd retransmission-time`

| Parameter      | Description                                                         |
|----------------|---------------------------------------------------------------------|
| <milliseconds> | Time period in milliseconds. Valid values are from 1000 to 3600000. |

**Default** 1000 milliseconds (1 second)

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the retransmission-time of Neighbor Solicitation on the VLAN interface vlan2 to be 800000 milliseconds, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd retransmission-time 800000
```

To reset the retransmission-time of Neighbor Solicitation on the VLAN interface vlan2 to the default 1000 milliseconds (1 second), enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd retransmission-time
```

**Related commands** [ipv6 nd suppress-ra](#)  
[ipv6 nd prefix](#)

# ipv6 nd suppress-ra

**Overview** Use this command to inhibit IPv6 Router Advertisement (RA) transmission for the current interface. Router advertisements are used when applying IPv6 stateless auto-configuration.

Use **no** parameter with this command to enable Router Advertisement transmission.

**Syntax** `ipv6 nd suppress-ra`  
`no ipv6 nd suppress-ra`

**Default** Router Advertisement (RA) transmission is suppressed by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Example** To enable the transmission of router advertisements from vlan2 on the device, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related commands** [ipv6 nd ra-interval](#)  
[ipv6 nd prefix](#)

# ipv6 neighbor

**Overview** Use this command to add a static IPv6 neighbor entry.  
Use the **no** variant of this command to remove a specific IPv6 neighbor entry.

**Syntax** `ipv6 neighbor <ipv6-address> <vlan-name> <mac-address>  
<port-list>`  
`no ipv6 neighbor <ipv6-address> <vlan-name> <port-list>`

| Parameter      | Description                                                                            |
|----------------|----------------------------------------------------------------------------------------|
| <ipv6-address> | Specify the neighbor's IPv6 address in the format X:X::X:X.                            |
| <vlan-name>    | Specify the neighbor's VLAN name.                                                      |
| <mac-address>  | Specify the MAC hardware address in hexadecimal notation in the format HHHH.HHHH.HHHH. |
| <port-list>    | Specify the port number, or port range.                                                |

**Mode** Global Configuration

**Usage notes** Use this command to clear a specific IPv6 neighbor entry. To clear all dynamic address entries, use the [clear ipv6 neighbors](#) command.

**Example** To create a static neighbor entry for IPv6 address 2001:0db8::a2, on vlan2, with MAC address 0000.cd28.0880, on port1.0.1, use the command:

```
awplus# configure terminal
awplus(config)# ipv6 neighbor 2001:0db8::a2 vlan2
0000.cd28.0880 port1.0.1
```

**Related commands** [clear ipv6 neighbors](#)  
[show ipv6 neighbors](#)

# ipv6 opportunistic-nd

**Overview** Use this command to enable opportunistic neighbor discovery for the global IPv6 ND cache. Opportunistic neighbor discovery changes the behavior for unsolicited ICMPv6 ND packet forwarding on the device.

Use the **no** variant of this command to disable opportunistic neighbor discovery for the global IPv6 ND cache.

**Syntax** `ipv6 opportunistic-nd`  
`no ipv6 opportunistic-nd`

**Default** Opportunistic neighbor discovery is disabled by default.

**Mode** Global Configuration

**Usage notes** When opportunistic neighbor discovery is enabled, the device will reply to any received unsolicited ICMPv6 ND packets. The source MAC address for the unsolicited ICMPv6 ND packet is added to the IPv6 ND cache, so the device forwards the ICMPv6 ND packet. When opportunistic neighbor discovery is disabled, the source MAC address for the ICMPv6 packet is not added to the IPv6 ND cache, so the ICMPv6 ND packet is not forwarded by the device.

**Examples** To enable opportunistic neighbor discovery for the IPv6 ND cache, enter:

```
awplus# configure terminal
awplus(config)# ipv6 opportunistic-nd
```

To disable opportunistic neighbor discovery for the IPv6 ND cache, enter:

```
awplus# configure terminal
awplus(config)# no ipv6 opportunistic-nd
```

**Related commands** [arp opportunistic-nd](#)  
[show ipv6 neighbors](#)  
[show running-config interface](#)

# ipv6 route

**Overview** This command adds a static IPv6 route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to advertise routes to neighbors and forward packets.

The **no** variant of this command removes the static route.

**Syntax** `ipv6 route <dest-prefix> <dest-prefix/length>  
[<src-prefix/length>] {<gateway-ip>|<gateway-name>}  
[<distvalue>]`  
`no ipv6 route <dest-prefix> <dest-prefix/length>  
[<src-prefix/length>] {<gateway-ip>|<gateway-name>}  
[<distvalue>]`

| Parameter                                | Description                                                                                                                                                 |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;dest-prefix/ length&gt;</code> | Specifies the IP destination prefix. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.        |
| <code>&lt;src-prefix/length&gt;</code>   | Specifies the IP source prefix. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.             |
| <code>&lt;gateway-ip&gt;</code>          | Specifies the IP gateway (or next hop) address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |
| <code>&lt;gateway-name&gt;</code>        | Specifies the name of the gateway (or next hop) interface.                                                                                                  |
| <code>&lt;distvalue&gt;</code>           | Specifies the administrative distance for the route. Valid values are from 1 to 255.                                                                        |

**Mode** Global Configuration

**Usage notes** You can use administrative distance to determine which routes take priority over other routes.

**Example** `awplus# configure terminal`  
`awplus(config)# ipv6 route 2001:0db8::1/128 vlan2 32`

**Validation Commands** `show running-config`  
`show ipv6 route`

**Command changes** Version 5.5.0-0.3: parameter **src-prefix** added

# ipv6 unreachable

**Overview** Use this command to enable ICMPv6 (Internet Control Message Protocol version 6) type 1, destination unreachable, messages.

Use the **no** variant of this command to disable destination unreachable messages. This prevents an attacker from using these messages to discover the topology of a network.

**Syntax** `ipv6 unreachable`  
`no ipv6 unreachable`

**Default** Destination unreachable messages are enabled by default.

**Mode** Global Configuration

**Usage notes** When a device receives a packet for a destination that is unreachable it returns an ICMPv6 type 1 message. This message includes a reason code, as per the table below. An attacker can use these messages to obtain information regarding the topology of a network. Disabling destination unreachable messages, using the **no ipv6 unreachable** command, secures your network against this type of probing.

**NOTE:** *Disabling ICMPv6 destination unreachable messages breaks applications such as traceroute, which depend on these messages to operate correctly.*

Table 22-1: ICMPv6 type 1 reason codes and description

| Code | Description [RFC]                                                    |
|------|----------------------------------------------------------------------|
| 0    | No route to destination [RFC4443]                                    |
| 1    | Communication with destination administratively prohibited [RFC4443] |
| 2    | Beyond scope of source address [RFC4443]                             |
| 3    | Address unreachable [RFC4443]                                        |
| 4    | Port unreachable [RFC4443]                                           |
| 5    | Source address failed ingress/egress policy [RFC4443]                |
| 6    | Reject route to destination [RFC4443]                                |
| 7    | Error in Source Routing Header [RFC6554]                             |

**Example** To disable destination unreachable messages, use the commands

```
awplus# configure terminal
awplus(config)# no ipv6 unreachable
```

To enable destination unreachable messages, use the commands

```
awplus# configure terminal
awplus(config)# ipv6 unreachable
```

# optimistic-nd

**Overview** Use this command to enable the optimistic neighbor discovery feature for both IPv4 and IPv6.

Use the **no** variant of this command to disable the optimistic neighbor discovery feature.

**Syntax** optimistic-nd  
no optimistic-nd

**Default** The optimistic neighbor discovery feature is enabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** The optimistic neighbor discovery feature allows the device, after learning an IPv4 or IPv6 neighbor, to refresh the neighbor before the neighbor is deleted from the hardware L3 switching table. The device puts the neighbor entry into the 'stale' state in the software switching table if it is not refreshed, then the 'stale' neighbors are deleted from the hardware L3 switching table.

The optimistic neighbor discovery feature enables the device to sustain L3 traffic switching to a neighbor without interruption. Without the optimistic neighbor discovery feature enabled L3 traffic is interrupted when a neighbor is 'stale' and is then deleted from the L3 switching table.

If a neighbor receiving optimistic neighbor solicitations does not answer optimistic neighbor solicitations with neighbor advertisements, then the neighbor will be put into the 'stale' state, and subsequently deleted from both the software and the hardware L3 switching tables.

**Examples** To enable the optimistic neighbor discovery feature on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# optimistic-nd
```

To disable the optimistic neighbor discovery feature on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no optimistic-nd
```

**Related commands** [show running-config](#)

# ping ipv6

**Overview** This command sends a query to another IPv6 host (send Echo Request messages).

**Syntax** ping ipv6 {<host>|<ipv6-address>} [repeat {<1-2147483647>|continuous}] [size <10-1452>] [interface <interface-list>] [timeout <1-65535>]

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipv6-addr>                   | The destination IPv6 address. The IPv6 address uses the format X:X::X:X.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <hostname>                    | The destination hostname.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| repeat                        | Specify the number of ping packets to send.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <1-2147483647>                | Specify repeat count. The default is 5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| size <10-1452>                | The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes).                                                                                                                                                                                                                                                                                                                                                                                               |
| interface<br><interface-list> | The interface or range of configured IP interfaces to use as the source in the IP header of the ping packet. The interface can be one of: <ul style="list-style-type: none"> <li>a VLAN (e.g. vlan2)</li> <li>the loopback interface (lo)</li> <li>a continuous range of interfaces separated by a hyphen (e.g. vlan10-20)</li> <li>a comma-separated list (e.g. vlan1,vlan10-20). Do not mix interface types in a list.</li> </ul> You can only specify the interface when pinging a link local address. |
| timeout<br><1-65535>          | The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait.                                                                                                                                                                                                                                                                                                                                      |
| repeat                        | Specify the number of ping packets to send.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <1-2147483647>                | Specify repeat count. The default is 5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| continuous                    | Continuous ping.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| size <10-1452>                | The number of data bytes to send, excluding the 8 byte ICMP header. **Mode** User Exec and Privileged Exec

**Example** awplus# ping ipv6 2001:0db8::a2

**Related  
commands** [traceroute ipv6](#)

# show ipv6 forwarding

**Overview** Use this command to display IPv6 forwarding status.

**Syntax** show ipv6 forwarding

**Mode** User Exec and Privileged Exec

**Example** awplus# show ipv6 forwarding

**Output** Figure 22-1: Example output from the **show ipv6 forwarding** command

```
awplus#show ipv6 forwarding
ipv6 forwarding is on
```

# show ipv6 interface

**Overview** Use this command to display brief information about interfaces and the IPv6 address assigned to them.

**Syntax** `show ipv6 interface [brief|<interface-list>] [nd]`

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| brief            | Specify this optional parameter to display brief IPv6 interface information.                                                                                                                                                                                                                                                                                                                             |
| <interface-list> | The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• the loopback interface (lo)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. vlan10-20)</li><li>• a comma-separated list (e.g. vlan1,vlan10-20). Do not mix interface types in a list.</li></ul> The specified interfaces must exist. |
| nd               | Specify this optional parameter for Neighbor Discovery configurations.                                                                                                                                                                                                                                                                                                                                   |

**Mode** User Exec and Privileged Exec

**Examples** To display a brief list of all interfaces on a device, use the following command:

```
awplus# show ipv6 interface brief
```

**Output** Figure 22-2: Example output from the **show ipv6 interface brief** command

|                                  |                             |          |          |

# show ipv6 neighbors

**Overview** Use this command to display all IPv6 neighbors.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** show ipv6 neighbors

**Mode** User Exec and Privileged Exec

**Example** To display a devices IPv6 neighbors, use the following command:

```
awplus# show ipv6 neighbors
```

**Output** Figure 22-3: Example output of the **show ipv6 neighbors** command

| IPv6 Address            | MAC Address    | Interface | Port | Type    |
|-------------------------|----------------|-----------|------|---------|
| fe80::290:bff:fe3e:44dc | 0090.0b3e.44dc | vlan1     | po3  | dynamic |
| fd32:b1f0:ddf7:ab03::1  | 0090.0b3e.44dc | vlan1     | po3  | dynamic |
| fe80::2                 | eccd.6ddf.6d41 | vlan2     | po4  | static  |

**Related commands** [clear ipv6 neighbors](#)  
[ipv6 neighbor](#)

# show ipv6 route

**Overview** Use this command to display the IPv6 routing table for a protocol or from a particular table.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 route`  
`[bgp|connected|database|ospf|rip|static|summary|<ipv6-address>`  
`|<ipv6-prefix/prefix-length>]`

| Parameter                     | Description                                                              |
|-------------------------------|--------------------------------------------------------------------------|
| bgp                           | Displays only the routes learned from BGP.                               |
| connected                     | Displays only the routes learned from connected interfaces.              |
| database                      | Displays only the IPv6 routing information extracted from the database.  |
| ospf                          | Displays only the routes learned from OSPFv3.                            |
| rip                           | Displays only the routes learned from RIPng.                             |
| static                        | Displays only the IPv6 static routes you have configured.                |
| summary                       | Displays summary information from the IPv6 routing table.                |
| <ipv6-address>                | Displays the routes for the specified address in the IPv6 routing table. |
| <ipv6-prefix>/<prefix-length> | Displays only the routes for the specified IPv6 prefix.                  |

**Mode** User Exec and Privileged Exec

**Example** To display all IPv6 routes with all parameters turned on, use the following command:

```
awplus# show ipv6 route
```

To display all database entries for all IPv6 routes, use the following command:

```
awplus# show ipv6 route database
```

**Output** Figure 22-4: Example output of the **show ipv6 route** command

```
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP
S ::/0 [1/0] via 2001::a:0:0:c0a8:a6, vlan10

```

# show ipv6 route summary

**Overview** Use this command to display the summary of the current NSM RIB entries.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ipv6 route summary

**Mode** User Exec and Privileged Exec

**Example** To display IP route summary, use the following command:

```
awplus# show ipv6 route summary
```

**Output** Figure 22-6: Example output from the **show ipv6 route summary** command

|                                                          |          |
|----------------------------------------------------------|----------|
| IPv6 routing table name is Default-IPv6-Routing-Table(0) |          |
| IPv6 routing table maximum-paths is 4                    |          |
| RouteSource                                              | Networks |
| connected                                                | 4        |
| rip                                                      | 5        |
| Total                                                    | 9        |
| FIB                                                      | 5        |

**Related commands** [show ip route database](#)

# traceroute ipv6

**Overview** Use this command to trace the route to the specified IPv6 host.

**Syntax** `traceroute ipv6 {<ipv6-addr>|<hostname>}`

| Parameter                      | Description                                                              |
|--------------------------------|--------------------------------------------------------------------------|
| <code>&lt;ipv6-addr&gt;</code> | The destination IPv6 address. The IPv6 address uses the format X:X::X:X. |
| <code>&lt;hostname&gt;</code>  | The destination hostname.                                                |

**Mode** User Exec and Privileged Exec

**Example** To run a traceroute for the IPv6 address 2001:0db8::a2, use the following command:

```
awplus# traceroute ipv6 2001:0db8::a2
```

**Related commands** [ping ipv6](#)

# IPv6 over IPv4 Tunneling Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure IPv6 over IPv4 tunneling.

IPv6 over IPv4 tunnels are point-to-point tunnels made by encapsulating IPv6 packets within IPv4 headers to carry them over IPv4 routing infrastructures. This allows isolated IPv6 end systems and devices to communicate without the need to upgrade the IPv4 infrastructure that exists between them.

When moving a network from IPv4 addressing to IPv6 addressing, the transition necessarily proceeds in stages, with islands of IPv6 developing within the IPv4 network, and gradually growing until they cover the whole network. During early transition, IPv4 networks are widely deployed and IPv6 networks are isolated sites. An IPv6 over IPv4 tunnel allows IPv6 packets to be transmitted on an IPv4 network and connects all IPv6 sites.

For more information, see the [IPv6 over IPv4 Tunneling Feature Overview and Configuration Guide](#).

- Command List**
- “[interface tunnel \(ipv6ip\)](#)” on page 984
  - “[show platform mem tunnel](#)” on page 985
  - “[tunnel destination \(ipv6ip\)](#)” on page 986
  - “[tunnel mode \(ipv6ip\)](#)” on page 988
  - “[tunnel source \(ipv6ip\)](#)” on page 989

# interface tunnel (ipv6ip)

**Overview** Use this command to create a tunnel interface or to enter Interface mode to configure an existing tunnel. Tunnel interfaces are identified by an index identifier that is an integer in the range from 0 to 65535.

Use the **no** variant of this command to remove a previously created tunnel interface.

**Syntax** `interface tunnel< tunnel-index>`  
`no interface tunnel< tunnel-index>`

| Parameter       | Description                                                               |
|-----------------|---------------------------------------------------------------------------|
| < tunnel-index> | Specify a tunnel interface index identifier in the range from 0 to 65535. |

**Default** Tunnel interfaces do not exist.

**Mode** Global Configuration

**Usage notes** After you have created the tunnel interface, use the **tunnel mode** command to enable the tunnel.

**Examples** To configure a tunnel interface with index 30 and enable IPv6 over IPv4 tunneling, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel30
awplus(config-if)# tunnel mode ipv6ip
```

To remove the IPv6 over IPv4 tunnel interface tunnel30, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel30
awplus(config-if)# no tunnel mode ipv6ip
```

**Related commands** [tunnel source \(ipv6ip\)](#)  
[tunnel destination \(ipv6ip\)](#)  
[tunnel mode \(ipv6ip\)](#)

**Command changes** Version 5.5.0-0.1: command added

# show platform mem tunnel

**Overview** Use this command to debug an IPv6 over IPv4 tunnel.

**Syntax** show platform mem tunnel [decode]

| Parameter | Description                                                                         |
|-----------|-------------------------------------------------------------------------------------|
| decode    | Displays the output of memory for all tunnels on a device in a human readable form. |

**Mode** Privileged Exec

**Usage notes** The output of this command shows the source, destination, egress VLAN and TTL of an IPv6 over IPv4 tunnel.

**Example** To display the details of an IPv6 over IPv4 tunnel, use the command:

```
awplus# show platform mem tunnel decode
```

**Output** Figure 23-1: Example output from **show platform mem tunnel decode**

```
awplus#show platform mem tunnel decode
Table Tunnel on device 0 at 0x0f400000
8192 entries in this table, 192 bits in each entry.

```

**Related commands** [tunnel mode \(ipv6ip\)](#)

**Command changes** Version 5.5.0-0.1: command added

# tunnel destination (ipv6ip)

**Overview** Use this command to specify a tunnel destination for the remote end of the tunnel. Tunnel destination can be specified by using a destination network name or an IPv6 address.

Use the **no** variant of this command to remove a configured tunnel destination.

**Syntax** tunnel destination {<ipv6-addr>|<destination-network-name>}  
no tunnel destination

| Parameter                  | Description                                                                                                                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipv6-addr>                | Specify the tunnel destination IPv6 address in the format x:x::x:x. The endpoints of the tunnel must be configured by mirroring IP addresses, that is, the tunnel source on one endpoint must be specified as the tunnel destination on the other endpoint. |
| <destination-network-name> | Specify the destination network name. If the destination network name cannot be resolved, then the IPv6 tunnel remains inactive.                                                                                                                            |

**Mode** Interface Configuration

**Examples** To configure an IPv6 over IPv4 tunnel destination by using an IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# tunnel mode ipv6ip
awplus(config-if)# tunnel destination 2001:db8::1:1
```

To configure an IPv6 over IPv4 tunnel destination by using a destination network name, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# tunnel mode ipv6ip
awplus(config-if)# tunnel destination
corporate_lan.example.com
```

To remove an IPv6 over IPv4 tunnel destination, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# no tunnel destination
```

**Related commands** [interface tunnel \(ipv6ip\)](#)  
[tunnel source \(ipv6ip\)](#)

tunnel mode (ipv6ip)

**Command changes**    Version 5.5.0-0.1: command added

## tunnel mode (ipv6ip)

**Overview** Use this command to set the tunnel encapsulation mode for IPv6 over IPv4 (ipv6ip) tunneling. In AlliedWare Plus, manual IPv6 over IPv4 tunneling is the only tunnel mode supported. You must set the ipv6ip tunnel mode to enable the tunnel operation.

Use the **no** variant of this command to return the mode of the IPv6 transition tunnel to an undefined state.

**Syntax** tunnel mode ipv6ip  
no tunnel mode

**Default** Not set.

**Mode** Interface Configuration

**Example** To configure an IPv6 over IPv4 tunnel mode for tunnel8, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel8
awplus(config-if)# tunnel source 192.0.2.1
awplus(config-if)# tunnel destination 192.0.2.2
awplus(config-if)# tunnel mode ipv6ip
```

To remove the configured IPv6 over IPv4 tunnel mode for tunnel8, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel8
awplus(config-if)# no tunnel source 192.0.2.1
awplus(config-if)# no tunnel destination 192.0.2.2
awplus(config-if)# no tunnel mode
```

**Related commands** [interface tunnel \(ipv6ip\)](#)  
[tunnel source \(ipv6ip\)](#)  
[tunnel destination \(ipv6ip\)](#)

**Command changes** Version 5.5.0-0.1: command added

## tunnel source (ipv6ip)

**Overview** Use this command to specify a tunnel source for the tunnel interface. Tunnel source can be specified by using an interface name or an IPv6 address. The source address must be an existing IPv6 address configured for an interface.

Use the **no** variant of this command to remove a tunnel source for a tunnel interface.

**Syntax** tunnel source {<ipv6-addr>|<interface-name>}  
no tunnel source

| Parameter        | Description                                                                                                                                                                                                                                                                             |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipv6-addr>      | Specify the tunnel source IPv6 address for the IPv6 tunnel interface in the format x:x::x:x.<br>The endpoints of the tunnel must be configured by mirroring IP addresses, that is, the tunnel source on one endpoint must be specified as the tunnel destination on the other endpoint. |
| <interface-name> | Available interface name. Any AlliedWare Plus interface type (eth, vlan, ppp, tunnel, lo and so on).<br>Using interface name can minimize the number of user-configured IP addresses and allow the tunnel source IP address to be dynamically issued via, for example, DHCP.            |

**Mode** Interface Configuration

**Examples** To configure an IPv6 over IPv4 tunnel's source IPv6 address, use the commands:

```
awplus# configure terminal
awplus# interface eth1
awplus(config-if)# ip address 2001:db8::1:1/48
awplus(config-if)# interface tunnel2
awplus(config-if)# tunnel mode ipv6ip
awplus(config-if)# tunnel source 2001:db8::1:1
```

To use an interface name as the tunnel source, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel mode ipv6ip
awplus(config-if)# tunnel source eth1
```

To remove an IPv6 over IPv4 tunnel source, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel source
```

**Related commands**    [interface tunnel \(ipv6ip\)](#)  
                          [tunnel destination \(ipv6ip\)](#)  
                          [tunnel mode \(ipv6ip\)](#)

**Command changes**    Version 5.5.0-0.1: command added

# Routing Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of routing commands that are common across the routing IP protocols. For more information, see the [Route Selection Feature Overview and Configuration Guide](#).

- Command List**
- ["ip route"](#) on page 992
  - ["ipv6 route"](#) on page 995
  - ["max-fib-routes"](#) on page 996
  - ["max-static-routes"](#) on page 998
  - ["maximum-paths"](#) on page 999
  - ["show ip route"](#) on page 1000
  - ["show ip route database"](#) on page 1003
  - ["show ip route summary"](#) on page 1006
  - ["show ipv6 route"](#) on page 1008
  - ["show ipv6 route summary"](#) on page 1010

# ip route

**Overview** This command adds a static route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to advertise routes to neighbors and forward packets.

When using VRF (Virtual Routing and Forwarding), you can use this command to configure a static inter-VRF route to a destination network that is reachable by a remote gateway located in a different VRF instance. Note that to apply the command in this way, the [ip route static inter-vrf](#) command must be in enabled (its default condition). For more information about VRF, see the [VRF Feature Overview and Configuration Guide](#) and the [VRF-lite Commands](#) chapter.

The **no** variant of this command removes the static route from the RIB and FIB.

**Syntax** `ip route <subnet&mask> {<gateway-ip>|<interface>} [<distance>]`  
`no ip route <subnet&mask> {<gateway-ip>|<interface>} [<distance>]`

**Syntax (VRF-lite)** `ip route [vrf <vrf-name>] <subnet&mask> [<gateway-ip>] [<interface>] [<distance>]`  
`no ip route [vrf <vrf-name>] <subnet&mask> [<gateway-ip>] [<interface>] [<distance>]`

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <subnet&mask> | The IPv4 address of the destination subnet defined using either a prefix length or a separate mask specified in one of the following formats: <ul style="list-style-type: none"><li>The IPv4 subnet address in dotted decimal notation followed by the subnet mask, also in dotted decimal notation.</li><li>The IPv4 subnet address in dotted decimal notation, followed by a forward slash, then the prefix length.</li></ul>                                                                                                                       |
| <gateway-ip>  | The IPv4 address of the gateway device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <interface>   | The interface that connects your device to the network. Enter the name of the VLAN or its VID. You can also enter 'null' as an interface. Specify a 'null' interface to add a null or blackhole route to the switch.<br>The gateway IP address or the interface is required if VRF-lite is not configured.<br>If VRF-lite is configured: When adding a static intra-VRF route, you must specify either the gateway IP address or the interface. When adding a static inter-VRF route, you must specify both the gateway IP address and the interface. |
| <distance>    | The administrative distance for the static route in the range 1 to 255. Static routes by default have an administrative distance of 1, which gives them the highest priority possible.                                                                                                                                                                                                                                                                                                                                                                |

| Parameter  | Description                                                         |
|------------|---------------------------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance.                  |
| <vrf-name> | The name of the VRF instance to enter IPv4 Address-Family mode for. |

**Mode** Global Configuration

**Default** The default administrative distance for a static route is 1.

**Usage notes** You can use administrative distance to determine which routes take priority over other routes.

Specify a 'Null' interface to add a null or blackhole route to the switch. A null or blackhole route is a routing table entry that does not forward packets, so any packets sent to it are dropped.

**Examples** To add the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at 10.10.0.2 with the default administrative distance, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# ip route 192.168.3.0 255.255.255.0 10.10.0.2
```

To remove the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at 10.10.0.2 with the default administrative distance, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ip route 192.168.3.0 255.255.255.0 10.10.0.2
```

To specify a null or blackhole route 192.168.4.0/24, so packets forwarded to this route are dropped, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# ip route 192.168.4.0/24 null
```

To add the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at 10.10.0.2 with an administrative distance of 128, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# ip route 192.168.3.0 255.255.255.0 10.10.0.2
128
```

**Examples (VRF-lite)** To create a static route from source VRF instance red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6, use the following commands for static intra-VRF routing configuration:

```
awplus# configure terminal
```

```
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
```

To remove a static route from source VRF red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6, use the following commands for static intra-VRF routing configuration:

```
awplus# configure terminal
awplus(config)# no ip route vrf red 192.168.50.0/24
192.168.20.6
```

To create a static route from source VRF red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6 via vlan10, use the following commands for static inter-VRF routing configuration:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
vlan10
```

**Related commands**   [show ip route](#)  
                          [show ip route database](#)

# ipv6 route

**Overview** This command adds a static IPv6 route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to advertise routes to neighbors and forward packets.

The **no** variant of this command removes the static route.

**Syntax** `ipv6 route <dest-prefix> <dest-prefix/length>  
[<src-prefix/length>] {<gateway-ip>|<gateway-name>}  
[<distvalue>]`  
`no ipv6 route <dest-prefix> <dest-prefix/length>  
[<src-prefix/length>] {<gateway-ip>|<gateway-name>}  
[<distvalue>]`

| Parameter                                | Description                                                                                                                                                 |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;dest-prefix/ length&gt;</code> | Specifies the IP destination prefix. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.        |
| <code>&lt;src-prefix/length&gt;</code>   | Specifies the IP source prefix. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.             |
| <code>&lt;gateway-ip&gt;</code>          | Specifies the IP gateway (or next hop) address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |
| <code>&lt;gateway-name&gt;</code>        | Specifies the name of the gateway (or next hop) interface.                                                                                                  |
| <code>&lt;distvalue&gt;</code>           | Specifies the administrative distance for the route. Valid values are from 1 to 255.                                                                        |

**Mode** Global Configuration

**Usage notes** You can use administrative distance to determine which routes take priority over other routes.

**Example** `awplus# configure terminal`  
`awplus(config)# ipv6 route 2001:0db8::1/128 vlan2 32`

**Validation  
Commands** `show running-config`  
`show ipv6 route`

**Command  
changes** Version 5.5.0-0.3: parameter **src-prefix** added

# max-fib-routes

**Overview** This command enables you to control the maximum number of FIB routes configured. It operates by providing parameters that enable you to configure preset maximums and warning message thresholds.

**NOTE:** When using VRF-lite, this command applies to the Global VRF instance; to set the max-fib-routes for a user-defined VRF instance use the [max-fib-routes \(VRF\)](#) command. For static routes use the [max-static-routes](#) command for the Global VRF instance and the [max-static-routes \(VRF\)](#) command for a user-defined VRF instance.

Use the **no** variant of this command to set the maximum number of FIB routes to the default of 4294967294 FIB routes.

**Syntax** max-fib-routes <1-4294967294> [<1-100>|warning-only]  
no max-fib-routes

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| max-fib-routes | This is the maximum number of routes that can be stored in the device's Forwarding Information dataBase. In practice, other practical system limits would prevent this maximum being reached.                                                                                                                                                |
| <1-4294967294> | The allowable configurable range for setting the maximum number of FIB-routes.                                                                                                                                                                                                                                                               |
| <1-100>        | This parameter enables you to optionally apply a percentage value. This percentage will be based on the maximum number of FIB routes you have specified. This will cause a warning message to appear when your routes reach your specified percentage value. Routes can continue to be added until your configured maximum value is reached. |
| warning-only   | This parameter enables you to optionally apply a warning message. If you set this option a warning message will appear if your maximum configured value is reached. Routes can continue to be added until your device reaches either the maximum capacity value of 4294967294, or a practical system limit.                                  |

**Default** The default number of FIB routes is the maximum number of FIB routes (4294967294).

**Mode** Global Configuration

**Examples** To set the maximum number of dynamic routes to 2000 and warning threshold of 75%, use the following commands:

```
awplus# config terminal
awplus(config)# max-fib-routes 2000 75
```

**Related  
commands** [max-fib-routes \(VRF\)](#)

# max-static-routes

**Overview** Use this command to set the maximum number of static routes, excluding FIB (Forwarding Information Base) routes.

**NOTE:** For FIB routes use the [max-fib-routes](#) command.

Use the **no** variant of this command to set the maximum number of static routes to the default of 1000 static routes.

**Syntax** max-static-routes <1-1000>  
no max-static-routes

**Default** The default number of static routes is the maximum number of static routes (1000).

**Mode** Global Configuration

**Example** To reset the maximum number of static routes to the default maximum, use the command:

```
awplus# configure terminal
awplus(config)# no max-static-routes
```

**NOTE:** Static routes are applied before adding routes to the RIB (Routing Information Base). Therefore, rejected static routes will not appear in the running config.

**Related commands** [max-fib-routes](#)

# maximum-paths

**Overview** This command enables ECMP on your device, and sets the maximum number of paths that each route has in the Forwarding Information Base (FIB). ECMP is enabled by default.

The **no** variant of this command sets the maximum paths to the default of 4.

**Syntax** `maximum-paths <1-8>`  
`no maximum-paths`

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| <1-8>     | The maximum number of paths that a route can have in the FIB. |

**Default** By default the maximum number of paths is 4.

**Mode** Global Configuration

**Examples** To set the maximum number of paths for each route in the FIB to 5, use the command:

```
awplus# configure terminal
awplus(config)# maximum-paths 5
```

To set the maximum paths for a route to the default of 4, use the command:

```
awplus# configure terminal
awplus(config)# no maximum-paths
```

# show ip route

**Overview** Use this command to display routing entries in the FIB (Forwarding Information Base). The FIB contains the best routes to a destination, and your device uses these routes when forwarding traffic. You can display a subset of the entries in the FIB based on protocol.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

**VRF-lite** If VRF-lite is configured, you can display routing entries in the FIB associated with either the global routing domain or a named VRF.

**Syntax** `show ip route [bgp|connected|ospf|rip|static|  
<ip-addr>|<ip-addr/prefix-length>]`

**Syntax (VRF-lite)** `show ip route {vrf <vrf-name>|global}  
[bgp|connected|ospf|rip|static]`

| Parameter               | Description                                                                              |
|-------------------------|------------------------------------------------------------------------------------------|
| global                  | If VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf                     | Apply the command to the specified VRF instance.                                         |
| <vrf-name>              | The name of the VRF instance.                                                            |
| bgp                     | Displays only the routes learned from BGP.                                               |
| connected               | Displays only the routes learned from connected interfaces.                              |
| ospf                    | Displays only the routes learned from OSPF.                                              |
| rip                     | Displays only the routes learned from RIP.                                               |
| static                  | Displays only the static routes you have configured.                                     |
| <ip-addr>               | Displays the routes for the specified address. Enter an IPv4 address.                    |
| <ip-addr/prefix-length> | Displays the routes for the specified network. Enter an IPv4 address and prefix length.  |

**Mode** User Exec and Privileged Exec

**Examples** To display the static routes in the FIB, use the command:

```
awplus# show ip route static
```

To display the OSPF routes in the FIB, use the command:

```
awplus# show ip route ospf
```

**Example (VRF-lite)** To display all routing entries in the FIB associated with a VRF instance `red`, use the command:

```
awplus# show ip route vrf red
```

**Output** Each entry in the output from this command has a code preceding it, indicating the source of the routing entry. For example, O indicates OSPF as the origin of the route. The first few lines of the output list the possible codes that may be seen with the route entries.

Typically, route entries are composed of the following elements:

- code
- a second label indicating the sub-type of the route
- network or host IP address
- administrative distance and metric
- next hop IP address
- outgoing interface name
- time since route entry was added

Figure 24-1: Example output from the **show ip route** command

```
Codes: C - connected, S - static, R - RIP, B - BGP
 O - OSPF, IA - OSPF inter area
 N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
 E1 - OSPF external type 1, E2 - OSPF external type 2
 * - candidate default

O 10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:20:54
C 3.3.3.0/24 is directly connected, vlan1
C 10.10.31.0/24 is directly connected, vlan2
C 10.70.0.0/24 is directly connected, vlan4
O E2 14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:18:56
C 33.33.33.33/32 is directly connected, lo
```

**Connected Route** The connected route entry consists of:

```
C 10.10.31.0/24 is directly connected, vlan2
```

This route entry denotes:

- Route entries for network 10.10.31.0/24 are derived from the IP address of local interface vlan2.
- These routes are marked as Connected routes (C) and always preferred over routes for the same network learned from other routing protocols.

**OSPF Route** The OSPF route entry consists of:

```
O 10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:20:54
```

This route entry denotes:

- This route in the network 10.10.37.0/24 was added by OSPF.
- This route has an administrative distance of 110 and metric/cost of 11.
- This route is reachable via next hop 10.10.31.16.
- The outgoing local interface for this route is vlan2.
- This route was added 20 minutes and 54 seconds ago.

### **OSPF External Route**

The OSPF external route entry consists of:

```
0 E2 14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:18:56
```

This route entry denotes that this route is the same as the other OSPF route explained above; the main difference is that it is a Type 2 External OSPF route.

### **Related commands**

[ip route](#)

[maximum-paths](#)

[show ip route database](#)

# show ip route database

**Overview** This command displays the routing entries in the RIB (Routing Information Base).

When multiple entries are available for the same prefix, RIB uses the routes' administrative distances to choose the best route. All best routes are entered into the FIB (Forwarding Information Base). To view the routes in the FIB, use the [show ip route](#) command.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

**Syntax** show ip route database [bgp|connected|ospf|rip|static]

**Syntax (VRF-lite)** show ip route [vrf <vrf-name>|global] database [bgp|connected|ospf|rip|static]

| Parameter  | Description                                                                              |
|------------|------------------------------------------------------------------------------------------|
| global     | If VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf        | Apply the command to the specified VRF instance.                                         |
| <vrf-name> | The name of the VRF instance.                                                            |
| bgp        | Displays only the routes learned from BGP.                                               |
| connected  | Displays only the routes learned from connected interfaces.                              |
| ospf       | Displays only the routes learned from OSPF.                                              |
| rip        | Displays only the routes learned from RIP.                                               |
| static     | Displays only the static routes you have configured.                                     |

**Mode** User Exec and Privileged Exec

**Example** To display the static routes in the RIB, use the command:

```
awplus# show ip route database static
```

**Output** Figure 24-2: Example output from the **show ip route database** command

```
Codes: C - connected, S - static, R - RIP, B - BGP
 O - OSPF, IA - OSPF inter area

```

**Example (VRF-lite)** To display all routing entries in the RIB associated with a VRF instance **red**, use the command:

```
awplus# show ip route vrf red database
```

**Output** Figure 24-3: Example output from the **show ip route vrf red database** command

```
[VRF: red]
Codes: C - connected, S - static, R - RIP, B - BGP
 O - OSPF, IA - OSPF inter area
 N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
 E1 - OSPF external type 1, E2 - OSPF external type 2
 > - selected route, * - FIB route, p - stale info

O 192.168.10.0/24 [110/1] is directly connected, vlan1, 06:45:51
C *> 192.168.10.0/24 is directly connected, vlan1
B > 192.168.33.0/24 [20/0] via 192.168.30.3, 06:45:52
O E2 *> 192.168.110.0/24 [110/20] via 192.168.10.2, vlan1, 06:45:00
O E2 *> 192.168.111.0/24 [110/20] via 192.168.10.2, vlan1, 06:45:00
```

The routes added to the FIB are marked with a \*. When multiple routes are available for the same prefix, the best route is indicated with the > symbol. All unselected routes have neither the \* nor the > symbol.

```
S *> 10.10.34.0/24 [1/0] via 10.10.31.16, vlan2
O 10.10.34.0/24 [110/31] via 10.10.31.16, vlan2, 00:21:19
```

These route entries denote:

- The same prefix was learned from OSPF and from static route configuration.

- Since this static route has a lower administrative distance than the OSPF route (110), the static route (1) is selected and installed in the FIB.

If the static route becomes unavailable, then the device automatically selects the OSPF route and installs it in the FIB.

**Related  
commands** [maximum-paths](#)  
[show ip route](#)

# show ip route summary

**Overview** This command displays a summary of the current RIB (Routing Information Base) entries.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

**Syntax** show ip route summary

**Syntax (VRF-lite)** show ip route summary [vrf <vrf-name>|global]

| Parameter  | Description                              |
|------------|------------------------------------------|
| vrf        | Specific VRF instance.                   |
| <vrf-name> | The name of the VRF instance.            |
| global     | The global routing and forwarding table. |

**Mode** User Exec and Privileged Exec

**Example** To display a summary of the current RIB entries, use the command:

```
awplus# show ip route summary
```

**Output** Figure 24-4: Example output from the **show ip route summary** command

|                                                      |          |

[show ip route database](#)

# show ipv6 route

**Overview** Use this command to display the IPv6 routing table for a protocol or from a particular table.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 route`  
`[bgp|connected|database|ospf|rip|static|summary|<ipv6-address>`  
`|<ipv6-prefix/prefix-length>]`

| Parameter                     | Description                                                              |
|-------------------------------|--------------------------------------------------------------------------|
| bgp                           | Displays only the routes learned from BGP.                               |
| connected                     | Displays only the routes learned from connected interfaces.              |
| database                      | Displays only the IPv6 routing information extracted from the database.  |
| ospf                          | Displays only the routes learned from OSPFv3.                            |
| rip                           | Displays only the routes learned from RIPng.                             |
| static                        | Displays only the IPv6 static routes you have configured.                |
| summary                       | Displays summary information from the IPv6 routing table.                |
| <ipv6-address>                | Displays the routes for the specified address in the IPv6 routing table. |
| <ipv6-prefix>/<prefix-length> | Displays only the routes for the specified IPv6 prefix.                  |

**Mode** User Exec and Privileged Exec

**Example** To display all IPv6 routes with all parameters turned on, use the following command:

```
awplus# show ipv6 route
```

To display all database entries for all IPv6 routes, use the following command:

```
awplus# show ipv6 route database
```

**Output** Figure 24-6: Example output of the **show ipv6 route** command

```

# accept-lifetime

**Overview** Use this command to specify the time period during which the authentication key on a key chain is received as valid.

Use the **no** variant of this command to remove a specified time period for an authentication key on a key chain as set previously with the **accept-lifetime** command.

**Syntax** `accept-lifetime <start-date> {<end-date>|  
duration <seconds>|infinite}  
no accept-lifetime`

| Parameter    | Description                                                                                                                       |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <start-date> | Specifies the start time and date in the format:<br><hh:mm:ss> <day> <month> <year> or<br><hh:mm:ss> <month> <day> <year>, where: |
|              | <hh:mm:ss> The time of the day, in hours, minutes and seconds                                                                     |
|              | <day> <1 - 31> The day of the month                                                                                               |
|              | <month> The month of the year (the first three letters of the month, for example, Jan)                                            |
|              | <year> <1993 - 2035> The year                                                                                                     |
| <end-date>   | Specifies the end time and date in the format:<br><hh:mm:ss> <day> <month> <year> or<br><hh:mm:ss> <month> <day> <year>, where:   |
|              | <hh:mm:ss> The time of the day, in hours, minutes and seconds                                                                     |
|              | <day> <1 - 31> The day of the month                                                                                               |
|              | <month> The month of the year (the first three letters of the month, for example, Jan)                                            |
|              | <year> <1993 - 2035> The year                                                                                                     |
| <seconds>    | <1 - 2147483646> Duration of the key in seconds.                                                                                  |
| infinite     | Never expires.                                                                                                                    |

**Mode** Keychain-key Configuration

**Examples** The following examples show the setting of accept-lifetime for key 1 on the key chain named "mychain".

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# accept-lifetime 03:03:01 Sep 3
2016 04:04:02 Oct 6 2016
```

or:

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# accept-lifetime 03:03:01 3 Sep
2016 04:04:02 6 Oct 2016
```

[send-lifetime](#)

# alliedware-behavior

**Overview** This command configures your device to exhibit AlliedWare behavior when sending RIPv1 response/update messages. Configuring for this behavior may be necessary if you are replacing an AlliedWare device with an AlliedWare Plus device and wish to ensure consistent RIPv1 behavior.

Use the **no** variant of this command to implement AlliedWare Plus behavior.

This command has no impact on devices running RIPv2. Reception and transmission can be independently altered to conform to AlliedWare standard.

**Syntax** `alliedware-behavior {rip1-send|rip1-recv}`  
`no alliedware-behavior {rip1-send|rip1-recv}`

| Parameter              | Description                                                                               |
|------------------------|-------------------------------------------------------------------------------------------|
| <code>rip1-send</code> | Configures the router to behave in AlliedWare mode when <b>sending</b> update messages.   |
| <code>rip1-recv</code> | Configures the router to behave in AlliedWare mode when <b>receiving</b> update messages. |

**Default** By default when sending out RIPv1 updates on an interface, if the prefix (learned through RIPv2 or otherwise redistributed into RIP) being advertised does not match the subnetting used on the outgoing RIPv1 interface it will be filtered. The **alliedware-behavior** command returns your router's RIPv1 behavior to the AlliedWare format, where the prefix will be advertised as-is.

For example, if a RIPv1 update is being sent over interface 192.168.1.4/26, by default the prefix 192.168.1.64/26 will be advertised, but the prefix 192.168.1.144/28 will be filtered because the mask /28 does not match the interface's mask of /26. If **alliedware-behavior rip1-send** is configured, 192.168.1.144 would be sent as-is.

**Mode** Router Configuration

**Examples** To configure your device for **AlliedWare**-like behavior when sending and receiving RIPv1 update messages, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# alliedware-behavior rip1-send
awplus(config-router)# alliedware-behavior rip1-recv
```

To return your device to **AlliedWare Plus**-like behavior when sending and receiving RIPv1 update messages, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no alliedware-behavior rip1-send
awplus(config-router)# no alliedware-behavior rip1-recv
```

**Validation  
Commands**    [show ip protocols rip](#)  
                  [show running-config](#)

**Related  
commands**    [fullupdate \(RIP\)](#)

# cisco-metric-behavior (RIP)

**Overview** Use this command to enable or disable the RIP routing metric update to conform to Cisco's implementation. This command is provided to allow inter-operation with older Cisco devices that do not conform to the RFC standard for RIP route metrics.

Use the **no** variant of this command to disable this feature.

**Syntax** `cisco-metric-behavior {enable|disable}`  
`no cisco-metric-behavior`

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| enable    | Enables updating the metric consistent with Cisco.  |
| disable   | Disables updating the metric consistent with Cisco. |

**Default** By default, the Cisco metric-behavior is disabled.

**Mode** Router Configuration

**Examples** To enable the routing metric update to behave as per the Cisco implementation, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# cisco-metric-behavior enable
```

To disable the routing metric update to behave as per the default setting, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no cisco-metric-behavior
```

**Validation Commands** `show running-config`

# clear ip rip route

**Overview** Use this command to clear specific data from the RIP routing table.

**Syntax** `clear ip rip route <ip-dest-network/prefix-length>`  
`clear ip rip route`  
`{static|connected|rip|ospf|bgp|invalid-routes|all}`

**Syntax (VRF-lite)** `clear ip rip [vrf <vrf-name>] route`  
`<ip-dest-network/prefix-length>`  
`clear ip rip [vrf <vrf-name>] route`  
`{static|connected|rip|ospf|bgp|invalid-routes|all}`

| Parameter                       | Description                                                                                                                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| vrf                             | Apply this command to a VRF instance.                                                                                                                   |
| <vrf-name>                      | The name of the VRF instance.                                                                                                                           |
| <ip-dest-network/prefix-length> | Removes entries which exactly match this destination address from RIP routing table. Enter the IP address and prefix length of the destination network. |
| static                          | Removes static entries from the RIP routing table.                                                                                                      |
| connected                       | Removes entries for connected routes from the RIP routing table.                                                                                        |
| rip                             | Removes only RIP routes from the RIP routing table.                                                                                                     |
| ospf                            | Removes only OSPF routes from the RIP routing table.                                                                                                    |
| bgp                             | Removes only BGP routes from the RIP routing table.                                                                                                     |
| invalid-routes                  | Removes routes with metric 16 immediately. Otherwise, these routes are not removed until RIP times out the route after 2 minutes.                       |
| all                             | Clears the entire RIP routing table.                                                                                                                    |

**Mode** Privileged Exec

**Usage notes** Using this command with the **all** parameter clears the RIP table of all the routes.

**Examples** To clear the route 10.0.0.0/8 from the RIP routing table, use the following command:

```
awplus# clear ip rip route 10.0.0.0/8
```

**Examples (VRF-lite)** To clear RIP routes associated with the VRF instance 'red' for OSPF routes, use the following command:

```
awplus# clear ip rip vrf red route ospf
```

To clear the route 10.0.0.0/8 from the RIP routing table for the VRF instance 'red', use the following command:

```
awplus# clear ip rip vrf red route 10.0.0.0/8
```

# debug rip

**Overview** Use this command to specify the options for the displayed debugging information for RIP events and RIP packets.

Use the **no** variant of this command to disable the specified debug option.

**Syntax** debug rip {events|nsm|<packet>|all}  
no debug rip {events|nsm|<packet>|all}

| Parameter | Description                                                    |
|-----------|----------------------------------------------------------------|
| events    | RIP events debug information is displayed.                     |
| nsm       | RIP and NSM communication is displayed.                        |
| <packet>  | packet [recv send] [detail] Specifies RIP packets only.        |
| recv      | Specifies that information for received packets be displayed.  |
| send      | Specifies that information for sent packets be displayed.      |
| detail    | Displays detailed information for the sent or received packet. |
| all       | Displays all RIP debug information.                            |

**Default** Disabled

**Mode** Privileged Exec and Global Configuration

**Example** The following example displays information about the RIP packets that are received and sent out from the device.

```
awplus# debug rip packet
```

**Related commands** [undebug rip](#)

# default-information originate (RIP)

**Overview** Use this command to generate a default route into the Routing Information Protocol (RIP).

Use the **no** variant of this command to disable this feature.

**Syntax** default-information originate  
no default-information originate

**Default** Disabled

**Mode** Router Configuration

**Usage** If routes are being redistributed into RIP and the router's route table contains a default route, within one of the route categories that are being redistributed, the RIP protocol will advertise this default route, irrespective of whether the **default-information originate** command has been configured or not. However, if the router has not redistributed any default route into RIP, but you want RIP to advertise a default route anyway, then use this command.

This will cause RIP to create a default route entry in the RIP database. The entry will be of type RS (Rip Static). Unless actively filtered out, this default route will be advertised out every interface that is sending RIP. Split horizon does not apply to this route, as it is internally generated. This operates quite similarly to the OSPF **default-information originate always** command.

**Example** awplus# configure terminal  
awplus(config)# router rip  
awplus(config-router)# default-information originate

# default-metric (RIP)

**Overview** Use this command to specify the metrics to be assigned to redistributed RIP routes. Use the **no** variant of this command to reset the RIP metric back to its default (1).

**Syntax** `default-metric <metric>`  
`no default-metric [<metric>]`

| Parameter | Description                                       |
|-----------|---------------------------------------------------|
| <metric>  | <1-16> Specifies the value of the default metric. |

**Default** By default, the RIP metric value is set to 1.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** This command is used with the [redistribute \(RIP\)](#) command to make the routing protocol use the specified metric value for all redistributed routes, regardless of the original protocol that the route has been redistributed from.

**Examples** This example assigns the cost of 10 to the routes that are redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# default-metric 10
awplus(config-router)# redistribute ospf
awplus(config-router)# redistribute connected
```

**Example (VRF-lite)** This example assigns the cost of 10 to the routes which are redistributed into RIP for the VRF instance blue.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address family ipv4 vrf blue
awplus(config-router-af)# default-metric 10
awplus(config-router-af)# redistribute ospf
awplus(config-router-af)# redistribute connected
```

**Related commands** [redistribute \(RIP\)](#)

# distance (RIP)

**Overview** This command sets the administrative distance for RIP routes. Your device uses this value to select between two or more routes to the same destination obtained from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). For more information, see the [Route Selection Feature Overview and Configuration Guide](#).

The **no** variant of this command sets the administrative distance for the RIP route to the default of 120.

**Syntax** `distance <1-255> [<ip-addr/prefix-length> [<access-list>]]`  
`no distance [<1-255>] [<ip-addr/prefix-length> [<access-list>]]`

| Parameter               | Description                                                                                                                   |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <1-255>                 | The administrative distance value you are setting for this RIP route.                                                         |
| <ip-addr/prefix-length> | The network IP address and prefix-length that you are changing the administrative distance for.                               |
| <access-list>           | Specifies the access-list name. This access list specifies which routes within the specified network this command applies to. |

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Examples** To set the administrative distance to 8 for the RIP routes within the 10.0.0.0/8 network that match the access-list "mylist", use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distance 8 10.0.0.0/8 mylist
```

To set the administrative distance to the default of 120 for the RIP routes within the 10.0.0.0/8 network that match the access-list "mylist", use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no distance 8 10.0.0.0/8 mylist
```

**Example (VRF-lite)** This example assigns a cost of 10 to the routes for the VRF instance blue, when redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address family ipv4 blue
awplus(config-router-af)# distance 10
```

# distribute-list (RIP)

**Overview** Use this command to filter incoming or outgoing route updates using the access-list or the prefix-list.

When running VRF-lite, this command can be applied to a specific VRF instance.

Use the **no** variant of this command to disable this feature.

**Syntax** `distribute-list {<access-list> | prefix <prefix-list>} {in|out} [<interface>]`

`no distribute-list {<access-list> | prefix <prefix-list>} {in|out} [<interface>]`

| Parameter                        | Description                                                                      |
|----------------------------------|----------------------------------------------------------------------------------|
| <code>prefix</code>              | Filter prefixes in routing updates.                                              |
| <code>&lt;access-list&gt;</code> | Specifies the IPv4 access-list number or name to use.                            |
| <code>&lt;prefix-list&gt;</code> | Specifies the name of the IPv4 prefix-list to use.                               |
| <code>in</code>                  | Filter incoming routing updates.                                                 |
| <code>out</code>                 | Filter outgoing routing updates.                                                 |
| <code>&lt;interface&gt;</code>   | The interface on which distribute-list applies. For instance: <code>vlan2</code> |

**Default** Disabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** Filter out incoming or outgoing route updates using access-list or prefix-list. If you do not specify the name of the interface, the filter will be applied to all interfaces.

**Examples** In this example the following commands are used to apply an access list called myfilter to filter incoming routing updates in `vlan2`

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distribute-list prefix myfilter in vlan2
```

**Example (VRF-lite)** This example applies the commands of the previous example, but to a specific VRF named blue:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# distribute-list prefix myfilter in
vlan2
```

**Related  
commands**    [access-list extended \(named\)](#)  
                  [ip prefix-list](#)

# fullupdate (RIP)

**Overview** Use this command to specify which routes RIP should advertise when performing a triggered update. By default, when a triggered update is sent, RIP will only advertise those routes that have changed since the last update. When **fullupdate** is configured, the device advertises the full RIP route table in outgoing triggered updates, including routes that have not changed. This enables faster convergence times, or allows inter-operation with legacy network equipment, but at the expense of larger update messages.

Use the **no** variant of this command to disable this feature.

**Syntax** fullupdate  
no fullupdate

**Default** By default this feature is disabled.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage (VRF-lite)** If VRF-lite is configured, you can apply this command for either the global routing environment, or to a specific VRF instance.

**Example** To enable the fullupdate (RIP) function, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# fullupdate
```

**Example (VRF-lite)** To enable the full update (RIP) function on the VRF instance named 'blue', use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# fullupdate
```

# ip summary-address rip

**Overview** Use this command to configure a summary IP address on a RIPv2 interface.

Use the **no** variant of this command to remove a summary IP address from a selected RIPv2 interface.

**Syntax** `ip summary-address rip {<ip-address/prefix-length>}`  
`no ip summary-address rip {<ip-address/prefix-length>}`

| Parameter                                     | Description                               |
|-----------------------------------------------|-------------------------------------------|
| <code>&lt;ip-address/prefix-length&gt;</code> | The summary IPv4 address to be advertised |

**Usage notes** Route summarization is a technique that helps network administrators in reducing the size of the routing tables by advertising a single super-network that covers a range of subnets.

You statically configure an IP summary address on a router interface. The router then advertises the summary address downstream through this interface. This means that:

- all the routers that are downstream from the configured interface will receive only the summary route, and none of the child routes via the RIP advertisement.
- As long as any of the child routes is valid, the router will propagate the summary route. But when the last child that is part of the summarized range disappears, then the router will stop advertising the summary route through the interface.

This command will be rejected if there is no IP address configured on the interface.

**NOTE:** *Manual route summarization is not supported when the interface/router is running in RIPv1.*

**Example** The subnets: 10.4.1.0/24, 10.4.2.128/25, 10.4.3.0/24 can be summarized and advertised as 10.4.0.0/16 on vlan1 using the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip summary-address rip 10.4.0.0/16
```

[show ip protocols rip](#)

**Command changes** Version 5.4.8-0.2 command added

# ip prefix-list

**Overview** Use this command to create an entry for an IPv4 prefix list.

Use the **no** variant of this command to delete the IPv4 prefix-list entry.

**Syntax**

```
ip prefix-list <list-name> [seq <1-429496725>] {deny|permit}
{any|<ip-prefix>} [ge <0-32>] [le <0-32>]
ip prefix-list <list-name> description <text>
ip prefix-list sequence-number
no ip prefix-list <list-name> [seq <1-429496725>]
no ip prefix-list <list-name> [description <text>]
no ip prefix-list sequence-number
```

| Parameter         | Description                                                                                          |
|-------------------|------------------------------------------------------------------------------------------------------|
| <list-name>       | Specifies the name of a prefix list.                                                                 |
| seq <1-429496725> | Sequence number of the prefix list entry.                                                            |
| deny              | Specifies that the prefixes are excluded from the list.                                              |
| permit            | Specifies that the prefixes are included in the list.                                                |
| <ip-prefix>       | Specifies the IPv4 address and length of the network mask in dotted decimal in the format A.B.C.D/M. |
| any               | Any prefix match. Same as <b>0.0.0.0/0 le 32</b> .                                                   |
| ge<0-32>          | Specifies the minimum prefix length to be matched.                                                   |
| le<0-32>          | Specifies the maximum prefix length to be matched.                                                   |
| <text>            | Text description of the prefix list.                                                                 |
| sequence-number   | Specify sequence numbers included or excluded in prefix list.                                        |

**Mode** Global Configuration

**Usage notes** When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. When setting these parameters, set the **le** value to be less than 32, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

**Example** In the following sample configuration, the last **ip prefix-list** command in the below list matches all, and the first **ip prefix-list** command denies the IP network 76.2.2.0:

```
awplus(config)# router bgp 100
awplus(config-router)# network 172.1.1.0
awplus(config-router)# network 172.1.2.0
awplus(config-router)# neighbor 10.6.5.3 remote-as 300
awplus(config-router)# neighbor 10.6.5.3 prefix-list mylist out
awplus(config-router)# exit
awplus(config)# ip prefix-list mylist seq 5 deny 76.2.2.0/24
awplus(config)# ip prefix-list mylist seq 100 permit any
```

To deny the IP addresses between 10.0.0.0/14 (10.0.0.0 255.252.0.0) and 10.0.0.0/22 (10.0.0.0 255.255.252.0) within the 10.0.0.0/8 (10.0.0.0 255.0.0.0) addressing range, enter the following commands:

```
awplus# configure terminal
awplus(config)# ip prefix-list mylist seq 12345 deny 10.0.0.0/8
ge 14 le 22
```

# ip rip authentication key-chain

**Overview** Use this command to enable RIPv2 authentication on an interface and specify the name of the key chain to be used.

Use the **no** variant of this command to disable this function.

**Syntax** `ip rip authentication key-chain <key-chain-name>`  
`no ip rip authentication key-chain`

| Parameter                           | Description                                                                                       |
|-------------------------------------|---------------------------------------------------------------------------------------------------|
| <code>&lt;key-chain-name&gt;</code> | Specify the name of the key chain. This is an alpha-numeric string, but it cannot include spaces. |

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command can only be used on VLAN interfaces.

Use this command to perform authentication on the interface. Not configuring the key chain results in no authentication at all.

The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use the [ip rip authentication string](#) command for single key authentication. Use the [ip rip authentication key-chain](#) command for multiple keys authentication. See the [RIP Feature Overview and Configuration Guide](#) for illustrated RIP configuration examples.

For multiple key authentication, use the following steps to configure a route to enable RIPv2 authentication using multiple keys at different times:

1) Define a key chain with a key chain name, using the following commands:

```
awplus# configure terminal
awplus(config)# key chain <key-chain-name>
```

2) Define a key on this key chain, using the following command:

```
awplus(config-keychain)# key <keyid>
```

3) Define the password used by the key, using the following command:

```
awplus(config-keychain-key)# key-string <key-password>
```

4) Enable authentication on the desired interface and specify the key chain to be used, using the following commands:

```
awplus# configure terminal
awplus(config)# interface <id>
awplus(config-if)# ip rip authentication key-chain
<key-chain-name>
```

- 5) Specify the mode of authentication for the given interface (text or MD5), using the following command:

```
awplus(config-if)# ip rip authentication mode {md5|text}
```

**Example** In the following example of a configuration for multiple keys authentication, a password “toyota” is set for key 1 in key chain “cars”. Authentication is enabled on vlan2 and the authentication mode is set to MD5:

```
awplus# configure terminal
awplus(config)# key chain cars
awplus(config-keychain)# key 1
awplus(config-keychain-key)# key-string toyota
awplus(config-keychain-key)# accept-lifetime 10:00:00 Oct 08
2016 duration 43200
awplus(config-keychain-key)# send-lifetime 10:00:00 Oct 08 2016
duration 43200
awplus(config-keychain-key)# exit
awplus(config-keychain)# exit
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication key-chain cars
awplus(config-if)# ip rip authentication mode md5
```

**Example** In the following example, the VLAN interface vlan23 is configured to use key-chain authentication with the keychain “mykey”. See the [key](#) command for a description of how a key chain is created.

```
awplus# configure terminal
awplus(config)# interface vlan23
awplus(config-if)# ip rip authentication key-chain mykey
```

**Related  
commands**

[key](#)  
[key chain](#)

# ip rip authentication mode

**Overview** Use this command to specify the type of authentication mode used for RIP v2 packets.

Use the **no** variant of this command to restore clear text authentication.

**Syntax** `ip rip authentication mode {md5|text}`  
`no ip rip authentication mode`

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| md5       | Uses the keyed MD5 authentication algorithm.            |
| text      | Specifies clear text or simple password authentication. |

**Default** Text authentication is enabled

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command can only be used on VLAN interfaces.

The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use the [ip rip authentication string](#) command for single key authentication. Use the [ip rip authentication key-chain](#) command for multiple keys authentication. See the [RIP Feature Overview and Configuration Guide](#) for illustrated RIP configuration examples.

**Usage: single key** Use the following steps to configure a route to enable RIPv2 authentication using a single key or password:

- 1) Define the authentication string or password used by the key for the desired interface, using the following commands:

```
awplus# configure terminal
awplus(config)# interface <id>
awplus(config-if)# ip rip authentication string <auth-string>
```

- 2) Specify the mode of authentication for the given interface (text or MD5), using the following commands:

```
awplus# configure terminal
awplus(config)# interface <id>
awplus(config-if)# ip rip authentication mode {md5|text}
```

**Usage: multiple key** For multiple keys authentication, use the following steps to configure a route to enable RIPv2 authentication using multiple keys at different times:

- 1) Define a key chain with a key chain name, using the following commands:

```
awplus# configure terminal
awplus(config)# key chain <key-chain-name>
```

- 2) Define a key on this key chain using the following command:

```
awplus(config-keychain)# key <keyid>
```

- 3) Define the password used by the key, using the following command:

```
awplus(config-keychain-key)# key-string <key-password>
```

- 4) Enable authentication on the desired interface and specify the key chain to be used, using the following commands:

```
awplus(config-if)# ip rip authentication key-chain
<key-chain-name>
```

- 5) Specify the mode of authentication for the given interface (text or MD5), using the following commands:

```
awplus(config-if)# ip rip authentication mode {md5|text}
```

**Example 1** In the following example of a configuration for multiple keys authentication, a password of "toyota" is set for key 1 in key chain "cars". Authentication is enabled on vlan2 and the authentication mode is set to MD5:

```
awplus# configure terminal
awplus(config)# key chain cars
awplus(config-keychain)# key 1
awplus(config-keychain-key)# key-string toyota
awplus(config-keychain-key)# accept-lifetime 10:00:00 Oct 08
2016 duration 43200
awplus(config-keychain-key)# send-lifetime 10:00:00 Oct 08 2016
duration 43200
awplus(config-keychain-key)# exit
awplus(config-keychain)# exit
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication key-chain cars
awplus(config-if)# ip rip authentication mode md5
```

**Example 2** The following example shows MD5 authentication configured on VLAN interface vlan2, ensuring authentication of RIP packets received on this interface.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication mode md5
```

**Example 3** The following example specifies “mykey” as the authentication string with MD5 authentication, for the VLAN interface vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication string mykey
awplus(config-if)# ip rip authentication mode md5
```

**Related commands** [ip rip authentication string](#)  
[ip rip authentication key-chain](#)

# ip rip authentication string

**Overview** Use this command to specify the authentication string or password used by a key. Use the **no** variant of this command to remove the authentication string.

**Syntax** `ip rip authentication string <auth-string>`  
`no ip rip authentication string`

| Parameter     | Description                                                                                               |
|---------------|-----------------------------------------------------------------------------------------------------------|
| <auth-string> | The authentication string or password used by a key. It is an alphanumeric string and can include spaces. |

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command can only be used on VLAN interfaces.

The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use this command to specify the password for a single key on an interface. Use the [ip rip authentication key-chain](#) command for multiple keys authentication. For information about configuring RIP, see the [RIP Feature Overview and Configuration Guide](#).

Use the following steps to configure a route to enable RIPv2 authentication using a single key or password:

- 1) Define the authentication string or password used by the key for the desired interface, using the following commands:

```
awplus# configure terminal
awplus(config)# interface <id>
```

- 2) Specify the mode of authentication for the given interface (text or MD5), using the following commands:

```
awplus# configure terminal
awplus(config-if)# ip rip authentication string <auth-string>
awplus(config)# interface <id>
awplus(config-if)# ip rip authentication mode {md5|text}
```

**Example** See the example below to specify mykey as the authentication string with MD5 authentication for the VLAN interface vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication string mykey
awplus(config-if)# ip rip authentication mode md5
```

**Example** In the following example, the VLAN interface `vlan2` is configured to have an authentication string as `guest`. Any received RIP packet in that interface should have the same string as password.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication string guest
```

**Related commands** [ip rip authentication key-chain](#)  
[ip rip authentication mode](#)

# ip rip receive-packet

**Overview** Use this command to configure the interface to enable the reception of RIP packets.

Use the **no** variant of this command to disable this feature.

**Syntax** ip rip receive-packet  
no ip rip receive-packet

**Default** Receive-packet is enabled

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command can only be configured on VLAN interfaces.

**Example** This example shows packet receiving being turned on for the VLAN interface `vlan3`:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip rip receive-packet
```

**Related commands** [ip rip send-packet](#)

# ip rip receive version

**Overview** Use this command to specify the version of RIP packets accepted on an interface and override the setting of the version command.

Use the **no** variant of this command to use the setting specified by the [version \(RIP\)](#) command.

**Syntax** `ip rip receive version {[1][2]}`  
`no ip rip receive version`

| Parameter | Description                                                     |
|-----------|-----------------------------------------------------------------|
| 1         | Specifies acceptance of RIP version 1 packets on the interface. |
| 2         | Specifies acceptance of RIP version 2 packets on the interface. |

**Default** Version 2

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command can only be used on VLAN interfaces.

This command applies to a specific VLAN interface and overrides any the version specified by the [version \(RIP\)](#) command.

RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

**Example** In the following example, the VLAN interface `vlan3` is configured to receive both RIP version 1 and 2 packets:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip rip receive version 1 2
```

**Related commands** [version \(RIP\)](#)

# ip rip send-packet

**Overview** Use this command to enable sending RIP packets through the current interface.  
Use the **no** variant of this command to disable this feature.

**Syntax** ip rip send-packet  
no ip rip send-packet

**Default** Send packet is enabled

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command can only be configured on VLAN interfaces.

**Example** This example shows packet sending being turned on for the VLAN interface `vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send-packet
```

**Related commands** [ip rip receive-packet](#)

# ip rip send version

**Overview** Use this command in Interface Configuration mode to specify the version of RIP packets sent on an interface and override the setting of the [version \(RIP\)](#) command. This mechanism causes RIP version 2 interfaces to send multicast packets instead of broadcasting packets.

Use the **no** variant of this command to use the setting specified by the [version \(RIP\)](#) command.

**Syntax** `ip rip send version {1|2|1 2|2 1}`  
`no ip rip send version`

| Parameter | Description                                                                                |
|-----------|--------------------------------------------------------------------------------------------|
| 1         | Specifies the sending of RIP version 1 packets out of an interface.                        |
| 2         | Specifies the sending of RIP version 2 packets out of an interface.                        |
| 12        | Specifies the sending of both RIP version 1 and RIP version 2 packets out of an interface. |
| 21        | Specifies the sending of both RIP version 2 and RIP version 1 packets out of an interface. |

**Default** RIP version 2 is enabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to a specific interface and overrides the version specified by the [version \(RIP\)](#) command.

RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces. Selecting version parameters 1 2 or 2 1 sends RIP version 1 and 2 packets.

Use the [ip rip send version 1-compatible](#) command in an environment where you cannot send multicast packets. For example, in environments where multicast is not enabled and where hosts do not listen to multicast.

**Examples** In the following example, the VLAN interface `v lan4` is configured to send both RIP version 1 and 2 packets.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send version 1 2
```

In the following example, the VLAN interface v l an4 is configured to send both RIP version 2 and 1 packets.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send version 2 1
```

In the following example, the VLAN interface v l an4 is configured to send RIP version 1 packets only.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send version 1
```

In the following example, the VLAN interface v l an4 is configured to send RIP version 2 packets only.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send version 2
```

In the following example, the VLAN interface v l an3 is configured to use the RIP version specified by the [version \(RIP\)](#) command.

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# no ip rip send version
```

**Related commands**   [ip rip send version 1-compatible](#)  
[version \(RIP\)](#)

# ip rip send version 1-compatible

**Overview** Use this command in Interface Configuration mode to send RIP version 1 compatible packets from a RIP version 2 interfaces to other RIP Interfaces. This mechanism causes RIP version 2 interfaces to send broadcast packets instead of multicasting packets, and is used in environments where multicast is not enabled or where hosts do not listen to multicast.

Use the **no** variant of this command to use the setting specified by the [version \(RIP\)](#) command, and disable the broadcast of RIP version 2 packets that are sent as broadcast packets.

**Syntax** ip rip send version 1-compatible  
no ip rip send version

| Parameter    | Description                                                                                                                                                                                                                  |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1-compatible | Specify this parameter to send RIP version 1 compatible packets from a version 2 RIP interface to other RIP interfaces. This mechanism causes version 2 RIP interfaces to broadcast packets instead of multicasting packets. |

**Default** RIP version 2 is enabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to a specific interface and overrides the version specified by the [version \(RIP\)](#) command.

RIP can be run in version 1 compatible mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Use the [ip rip send version](#) command in an environment where you can send multicast packets. For example, in environments where multicast is enabled and where hosts listen to multicast.

**Examples** In the following example, the VLAN interface v lan2 is configured to send RIP version 1-compatible packets.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip send version 1-compatible
```

In the following example, the VLAN interface v lan3 is configured to use the RIP version specified by the [version \(RIP\)](#) command.

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# no ip rip send version
```

**Related  
commands** [ip rip send version](#)  
[version \(RIP\)](#)

# ip rip split-horizon

**Overview** Use this command to turn on the split-horizon mechanism on the interface.  
Use the **no** variant of this command to disable this mechanism.

**Syntax** ip rip split-horizon [poisoned]  
no ip rip split-horizon

| Parameter | Description                                                                         |
|-----------|-------------------------------------------------------------------------------------|
| poisoned  | Performs split-horizon with poison-reverse. See "Usage" below for more information. |

**Default** Split horizon poisoned

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** Use this command to avoid including routes in updates sent to the same gateway from which they were learned. Without the **poisoned** parameter, using this command causes routes learned from a neighbor to be omitted from updates sent to that neighbor. With the **poisoned** parameter, using this command causes such routes to be included in updates, but sets their metrics to infinity. This advertises that these routes are not reachable.

**Example** To turn on split horizon poisoned on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip split-horizon poisoned
```

# key

**Overview** Use this command to manage, add and delete authentication keys in a key-chain.  
Use the **no** variant of this command to delete the authentication key.

**Syntax** key <keyid>  
no key <keyid>

| Parameter | Description                             |
|-----------|-----------------------------------------|
| <keyid>   | <0 - 2147483647> Key identifier number. |

**Mode** Keychain Configuration

**Usage** This command allows you to enter the keychain-key mode where a password can be set for the key.

**Example** The following example configures a key number 1 and shows the change into a **keychain- key** command mode prompt.

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)#
```

**Related commands** [key chain](#)  
[key-string](#)  
[accept-lifetime](#)  
[send-lifetime](#)

# key chain

**Overview** Use this command to enter the key chain management mode and to configure a key chain with a key chain name.

Use the **no** variant of this command to remove the key chain and all configured keys.

**Syntax** `key chain <key-chain-name>`  
`no key chain <key-chain-name>`

| Parameter                           | Description                                  |
|-------------------------------------|----------------------------------------------|
| <code>&lt;key-chain-name&gt;</code> | Specify the name of the key chain to manage. |

**Mode** Global Configuration

**Usage** This command allows you to enter the keychain mode from which you can specify keys on this key chain.

**Example** The following example shows the creation of a key chain named `mychain` and the change into **keychain** mode prompt.

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)#
```

**Related commands** [key](#)  
[key-string](#)  
[accept-lifetime](#)  
[send-lifetime](#)

# key-string

**Overview** Use this command to define the password to be used by a key.  
Use the **no** variant of this command to remove a password.

**Syntax** `key-string <key-password>`  
`no key-string`

| Parameter                         | Description                                                 |
|-----------------------------------|-------------------------------------------------------------|
| <code>&lt;key-password&gt;</code> | A string of characters to be used as a password by the key. |

**Mode** Keychain-key Configuration

**Usage** Use this command to specify passwords for different keys.

**Examples** In the following example, the password for key1 in the key chain named mychain is set to password **prime**:

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# key-string prime
```

In the following example, the password for key1 in the key chain named mychain is removed:

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# no key-string
```

**Related commands** [key](#)  
[key chain](#)  
[accept-lifetime](#)  
[send-lifetime](#)

# maximum-prefix

**Overview** Use this command to configure the maximum number of RIP routes stored in the routing table.

Use the **no** variant of this command to disable all limiting of the number of RIP routes stored in the routing table.

**Syntax** `maximum-prefix <maxprefix> [<threshold>]`  
`no maximum-prefix`

| Parameter                      | Description                                                                                                    |
|--------------------------------|----------------------------------------------------------------------------------------------------------------|
| <code>&lt;maxprefix&gt;</code> | <code>&lt;1 - 65535&gt;</code> The maximum number of RIP routes allowed.                                       |
| <code>&lt;threshold&gt;</code> | <code>&lt;1 - 100&gt;</code> Percentage of maximum routes to generate a warning. The default threshold is 75%. |

**Mode** Router Configuration

**Example** To configure the maximum number of RIP routes to 150, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# maximum-prefix 150
```

# neighbor (RIP)

**Overview** Use this command to specify a neighbor router. It is used for each router to which you wish to send unicast RIP updates.

Use the **no** variant of this command to stop sending unicast updates to the specific router.

**Syntax** neighbor <ip-address>  
no neighbor <ip-address>

| Parameter    | Description                                                                                  |
|--------------|----------------------------------------------------------------------------------------------|
| <ip-address> | The IP address of a neighboring router with which the routing information will be exchanged. |

**Default** Disabled

**Mode** Router Configuration

**Usage** Use this command to exchange nonbroadcast routing information. It can be used multiple times for additional neighbors.

The [passive-interface \(RIP\)](#) command disables sending routing updates on an interface. Use the neighbor command in conjunction with the [passive-interface \(RIP\)](#) to send routing updates to specific neighbors.

**Example** To specify the neighbor router to 1.1.1.1, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# passive-interface vlan1
awplus(config-router)# neighbor 1.1.1.1
```

**Related commands** [passive-interface \(RIP\)](#)

# network (RIP)

**Overview** Use this command to activate the transmission of RIP routing information on the defined network.

Use the **no** variant of this command to remove the specified network or VLAN as one that runs RIP.

**Syntax** `network {<network-address>[/<subnet-mask>] | <vlan-name>}`  
`no network {<network-address>[/<subnet-mask>] | <vlan-name>}`

| Parameter                                                  | Description                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;network-address&gt;[/&lt;subnet-mask&gt;]</code> | Specifies the network address to run RIP. Entering a subnet mask (or prefix length) for the network address is optional. Where no mask is entered, the device will attempt to apply a mask that is appropriate to the class (A, B, or C) of the address entered, e.g. an IP address of 10.0.0.0 will have a prefix length of 8 applied to it. |
| <code>&lt;vlan-name&gt;</code>                             | Specify a VLAN name with up to 32 alphanumeric characters to run RIP.                                                                                                                                                                                                                                                                         |

**Default** Disabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** Use this command to specify networks, or VLANs, to which routing updates will be sent and received. The connected routes corresponding to the specified network, or VLANs, will be automatically advertised in RIP updates. RIP updates will be sent and received within the specified network or VLAN.

When running VRF-lite, this command can be applied to a VRF instance.

**Example** Use the following commands to activate RIP routing updates on network 172.16.20.0/24:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# network 172.16.20.0/24
```

**Example (VRF-lite)** To activate RIP routing updates on vlan3 for VRF instance 'blue'.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# network vlan3
```

**Related  
commands**    `show ip rip`  
                  `show running-config`  
                  `clear ip rip route`

# offset-list (RIP)

**Overview** Use this command to add an offset to the **in** and **out** metrics of routes learned through RIP.

Use the **no** variant of this command to remove the offset list.

**Syntax** `offset-list <access-list> {in|out} <offset> [<interface>]`  
`no offset-list <access-list> {in|out} <offset> [<interface>]`

| Parameter     | Description                                                                                                      |
|---------------|------------------------------------------------------------------------------------------------------------------|
| <access-list> | Specifies the access-list number or names to apply. Note that you can only use standard ACLs, not extended ACLs. |
| in            | Indicates the access list will be used for metrics of incoming advertised routes.                                |
| out           | Indicates the access list will be used for metrics of outgoing advertised routes.                                |
| <offset>      | <0 - 16> Specifies that the offset is used for metrics of networks matching the access list.                     |
| <interface>   | An alphanumeric string that specifies the interface to match.                                                    |

**Default** The default offset value is the metric value of the interface over which the updates are being exchanged.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage** Use this command to specify the offset value that is added to the routing metric. When the networks match the access list the offset is applied to the metrics. No change occurs if the offset value is zero.

**Examples** In this example the router examines the RIP updates being sent out from interface vlan2 and adds 5 hops to the routes matching the IP addresses specified in the access list 8. To do this, use these commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# offset-list 8 in 5 vlan2
```

To apply this same command within the specific VRF instance named 'blue', use these commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# offset-list 8 in 5 vlan2
```

**Related  
commands** [access-list \(extended numbered\)](#)

# passive-interface (RIP)

**Overview** Use this command to block RIP broadcasts on the interface.  
Use the **no** variant of this command to disable this function.

**Syntax** `passive-interface <interface>`  
`no passive-interface <interface>`

| Parameter                      | Description                   |
|--------------------------------|-------------------------------|
| <code>&lt;interface&gt;</code> | Specifies the interface name. |

**Default** Disabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Example** Use the following commands to block RIP broadcasts on vlan20:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# passive-interface vlan20
```

**Example (VRF-lite)** To apply this above example to a specific VRF instance named 'green', use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf green
awplus(config-router-af)# passive-interface vlan20
```

**Related commands** [show ip rip](#)

# recv-buffer-size (RIP)

**Overview** Use this command to run-time configure the RIP UDP (User Datagram Protocol) receive-buffer size to improve UDP reliability by avoiding UDP receive buffer overrun.

Use the **no** variant of this command to reset the configured RIP UDP receive-buffer size to the system default (196608 bits).

**Syntax** `recv-buffer-size <8192-2147483647>`  
`no recv-buffer-size [<8192-2147483647>]`

| Parameter         | Description                                                             |
|-------------------|-------------------------------------------------------------------------|
| <8192-2147483647> | Specify the RIP UDP (User Datagram Protocol) buffer size value in bits. |

**Default** 196608 bits is the system default when reset using the **no** variant of this command.

**Mode** Router Configuration

**Examples** To run-time configure the RIP UDP, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# recv-buffer-size 23456789
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no recv-buffer-size 23456789
```

# redistribute (RIP)

**Overview** Use this command to redistribute information from other routing protocols into RIP.

When using VRF-lite, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to disable the specified redistribution. The parameters **metric** and **route-map** may be used with the **no** variant, but have no effect.

**Syntax** `redistribute {connected|static|ospf|bgp} [metric <0-16>]  
[route-map <route-map>]`  
`no redistribute {connected|static|ospf|bgp} [metric] [route-map]`

| Parameter     | Description                                                                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| route-map     | Optional. Specifies route-map that controls how routes are redistributed.                                                                                                                                                                             |
| <route-map>   | Optional. The name of the route map.                                                                                                                                                                                                                  |
| connected     | Redistribute from connected routes.                                                                                                                                                                                                                   |
| static        | Redistribute from static routes.                                                                                                                                                                                                                      |
| ospf          | Redistribute from Open Shortest Path First (OSPF).                                                                                                                                                                                                    |
| bgp           | Redistribute from Border Gateway Protocol (BGP).                                                                                                                                                                                                      |
| metric <0-16> | Optional. Sets the value of the metric that will be applied to routes redistributed into RIP from other protocols. If a value is not specified, and no value is specified using the <a href="#">default-metric (RIP)</a> command, the default is one. |

**Default** By default, the RIP metric value is set to 1.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Example** To apply the metric value 15 to static routes being redistributed into RIP, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# redistribute static metric 15
```

**Example (VRF-lite)** To apply the metric value 15 to static routes in address-family ipv4 VRF instance blue being redistributed into RIP, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# redistribute static metric 15
```

**Related commands** [default-metric \(RIP\)](#)

# restart rip graceful

**Overview** Use this command to force the RIP process to restart, and optionally set the grace-period.

**Syntax** restart rip graceful [grace-period <1-65535>]

**Mode** Privileged Exec

**Default** The default RIP grace-period is 60 seconds.

**Usage notes** After this command is executed, the RIP process immediately shuts down. It notifies the system that RIP has performed a graceful shutdown. Routes that have been installed into the route table by RIP are preserved until the specified grace-period expires.

When a **restart rip graceful** command is issued, the RIP configuration is reloaded from the last saved configuration. Ensure you first enter the command [copy running-config startup-config](#).

When a master failover happens on a VCStack, the RIP grace-period will apply the larger value of either the setting's configured value, or its default of 60 seconds.

**Example** To apply a restart rip graceful setting, grace-period to 100 seconds use the following commands:

```
awplus# copy running-config startup-config
awplus# restart rip graceful grace-period 100
```

# rip restart grace-period

**Overview** Use this command to change the grace period of RIP graceful restart.  
Use the **no** variant of this command to disable this function.

**Syntax** `rip restart grace-period <1-65535>`  
`no rip restart grace-period <1-65535>`

**Mode** Global Configuration

**Default** The default RIP grace-period is 60 seconds.

**Usage notes** Use this command to enable the **Graceful Restart** feature on the RIP process. Entering this command configures a grace period for RIP.

When a master failover happens on a VCStack, the RIP grace-period will be the longest period between the default value (60 seconds is the default RIP grace-period) and the configured RIP grace-period value from this command. So the configured RIP grace-period value will not be used for a VCStack master failover if it is shorter than the default RIP grace-period value.

**Example** `awplus# configure terminal`  
`awplus(config)# rip restart grace-period 200`

## route (RIP)

**Overview** Use this command to add a static RIP route.  
Use the **no** variant of this command to remove a static RIP route.

**Syntax** `route <ip-addr/prefix-length>`  
`no route <ip-addr/prefix-length>`

| Parameter                                  | Description                         |
|--------------------------------------------|-------------------------------------|
| <code>&lt;ip-addr/prefix-length&gt;</code> | The IPv4 address and prefix length. |

**Default** No static RIP route is added by default.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** Use this command to add a static RIP route. After adding the RIP route, the route can be checked in the RIP routing table.

**Example** To create a static RIP route to IP subnet 192.168.1.0/24, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# route 192.168.1.0/24
```

**Example (VRF-lite)** To create a static RIP route to IP subnet 192.168.1.0/24, for the VRF instance red, use the following commands

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# route 192.168.1.0/24
```

**Related commands** [show ip rip](#)  
[clear ip rip route](#)

# router rip

**Overview** Use this global command to enter Router Configuration mode to enable the RIP routing process.

Use the **no** variant of this command to disable the RIP routing process.

**Syntax** router rip  
no router rip

**Mode** Global Configuration

**Example** This command is used to begin the RIP routing process:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# version 1
awplus(config-router)# network 10.10.10.0/24
awplus(config-router)# network 10.10.11.0/24
awplus(config-router)# neighbor 10.10.10.10
```

**Related commands** network (RIP)  
version (RIP)

# send-lifetime

**Overview** Use this command to specify the time period during which the authentication key on a key chain can be sent.

**Syntax** `send-lifetime <start-date> {<end-date>|  
duration <seconds>|infinite}`  
`no send-lifetime`

| Parameter    | Description                                                                                                                       |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <start-date> | Specifies the start time and date in the format:<br><hh:mm:ss> <day> <month> <year> or<br><hh:mm:ss> <month> <day> <year>, where: |
|              | <hh:mm:ss> The time of the day, in hours, minutes and seconds                                                                     |
|              | <day> <1 - 31> The day of the month                                                                                               |
|              | <month> The month of the year (the first three letters of the month, for example, Jan)                                            |
|              | <year> <1993 - 2035> The year                                                                                                     |
| <end-date>   | Specifies the end time and date in the format:<br><hh:mm:ss> <day> <month> <year> or<br><hh:mm:ss> <month> <day> <year>, where:   |
|              | <hh:mm:ss> The time of the day, in hours, minutes and seconds                                                                     |
|              | <day> <1 - 31> The day of the month                                                                                               |
|              | <month> The month of the year (the first three letters of the month, for example, Jan)                                            |
|              | <year> <1993 - 2035> The year                                                                                                     |
| <seconds>    | <1 - 2147483646> Duration of the key in seconds.                                                                                  |
| infinite     | Never expires.                                                                                                                    |

**Mode** Keychain-key Configuration

**Example** The following example shows the setting of send-lifetime for key 1 on the key chain named "mychain".

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# send-lifetime 03:03:01 Jan 3 2016
04:04:02 Dec 6 2016
```

**Related  
commands**

# show debugging rip

**Overview** Use this command to display the RIP debugging status for these debugging options: nsm debugging, RIP event debugging, RIP packet debugging and RIP nsm debugging.

For information on filtering and saving command output, see the ["Getting\\_Started with AlliedWare Plus" Feature Overview and Configuration\\_Guide](#).

**Syntax** show debugging rip

**Mode** User Exec and Privileged Exec

**Usage notes** Use this command to display the debug status of RIP.

**Example** awplus# show debugging rip

# show ip prefix-list

**Overview** Use this command to display the IPv4 prefix-list entries.  
Note that this command is valid for RIP and BGP routing protocols only.

**Syntax** `show ip prefix-list [<name>|detail|summary]`

| Parameter | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| <name>    | Specify the name of a prefix list in this placeholder.                    |
| detail    | Specify this parameter to show detailed output for all IPv4 prefix lists. |
| summary   | Specify this parameter to show summary output for all IPv4 prefix lists.  |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip prefix-list`  
`awplus# show ip prefix-list 10.10.0.98/8`  
`awplus# show ip prefix-list detail`

**Related commands** [ip prefix-list](#)

# show ip protocols rip

- Overview** Use this command to display RIP process parameters and statistics.  
For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).
- Syntax** show ip protocols rip
- Mode** User Exec and Privileged Exec
- Example** awplus# show ip protocols rip
- Output** Figure 25-1: Example output from the **show ip protocols rip** command

```
Routing Protocol is "rip"
Sending updates every 30 seconds with +/-50%, next due in 12
seconds
Timeout after 180 seconds, garbage collect after 120 seconds
Outgoing update filter list for all interface is not set
Incoming update filter list for all interface is not set
Default redistribution metric is 1
Redistributing: connected static
Default version control: send version 2, receive version 2
Interface Send Recv Key-chain
 vlan25 2 2
Routing for Networks:
 10.10.0.0/24
Routing Information Sources:
 Gateway BadPackets BadRoutes Distance Last Update
Distance: (default is 120
```

# show ip rip

**Overview** Use this command to show RIP routes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip rip

**Mode** User Exec and Privileged Exec

**Example** awplus# show ip rip

**Output** Figure 25-2: Example output from the **show ip rip** command

```
awplus#show ip rip
Codes: R - RIP, Rc - RIP connected, Rs - RIP static
 C - Connected, S - Static, O - OSPF, B - BGP
Network Next Hop Metric From If Time
C 10.0.1.0/24 1 vlan20
S 10.10.10.0/24 1 vlan20
C 10.10.11.0/24 1 vlan20
S 192.168.101.0/24 1 vlan20
R 192.192.192.0/24 1 --
```

**Related commands** route (RIP)  
network (RIP)

clear ip rip route

show ip rip vrf interface

# show ip rip database

**Overview** Use this command to display information about the RIP database.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ip rip database [full]`

| Parameter | Description                                                     |
|-----------|-----------------------------------------------------------------|
| full      | Specify the full RIP database including sub-optimal RIP routes. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip rip database`  
`awplus# show ip rip database full`

**Related commands** [show ip rip](#)

# show ip rip interface

**Overview** Use this command to display information about the RIP interfaces. You can specify an interface name to display information about a specific interface.

**Syntax** `show ip rip interface [<interface>]`

| Parameter   | Description                                                       |
|-------------|-------------------------------------------------------------------|
| <interface> | The interface to display information about. For instance: v lan2. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip rip interface`

# timers (RIP)

**Overview** Use this command to adjust routing network timers.  
Use the **no** variant of this command to restore the defaults.

**Syntax** `timers basic <update> <timeout> <garbage>`  
`no timers basic`

| Parameter                    | Description                                                                                                                                                                                                                            |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;update&gt;</code>  | <code>&lt;5 - 2147483647&gt;</code><br>Specifies the period at which RIP route update packets are transmitted. The default is 30 seconds.                                                                                              |
| <code>&lt;timeout&gt;</code> | <code>&lt;5 - 2147483647&gt;</code><br>Specifies the routing information timeout timer in seconds. The default is 180 seconds. After this interval has elapsed and no updates for a route are received, the route is declared invalid. |
| <code>&lt;garbage&gt;</code> | <code>&lt;5 - 2147483647&gt;</code><br>Specifies the routing garbage collection timer in seconds. The default is 120 seconds.                                                                                                          |

**Default** Enabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** This command adjusts the RIP timing parameters.

The update timer is the time between sending out updates, that contain the complete routing table, to every neighboring router.

If an update for a given route has not been seen for the time specified by the timeout parameter, that route is no longer valid. However, it is retained in the routing table for a short time, with metric 16, so that neighbors are notified that the route has been dropped.

When the time specified by the garbage parameter expires the metric 16 route is finally removed from the routing table. Until the garbage time expires, the route is included in all updates sent by the router.

All the routers in the network must have the same timers to ensure the smooth operation of RIP throughout the network.

**Examples** To set the update timer to 30, the routing information timeout timer to 180, and the routing garbage collection timer to 120, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# timers basic 30 180 120
```

To set the update timer to 30, the routing information timeout timer to 180, and the routing garbage collection timer to 120 with VRF, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# timers basic 30 180 120
```

# undebg rip

**Overview** Use this command to disable the options set for debugging information of RIP events, packets and communication between RIP and NSM.

This command has the same effect as the **no debug rip** command.

**Syntax** undebg rip {all|events|nsm|<packet>}

| Parameter | Description                                                           |
|-----------|-----------------------------------------------------------------------|
| all       | Disables all RIP debugging.                                           |
| events    | Disables the logging of RIP events.                                   |
| nsm       | Disables the logging of RIP and NSM communication.                    |
| <packet>  | packet [recv send] [detail]<br>Disables the debugging of RIP packets. |
| recv      | Disables the logging of received packet information.                  |
| send      | Disables the logging of sent packet information.                      |
| detail    | Disables the logging of sent or received RIP packets.                 |

**Mode** Privileged Exec

**Example** To disable the options set for debugging RIP information events, use the following command:

```
awplus# undebg rip packet
```

**Related commands** [debug rip](#)

# version (RIP)

**Overview** Use this command to specify a RIP version used globally by the router.

If VRF-lite is configured, you can specify a RIP version either globally, or for a particular VRF instance.

Use the **no** variant of this command to restore the default version.

**Syntax** `version {1|2}`  
`no version`

| Parameter | Description                              |
|-----------|------------------------------------------|
| 1   2     | Specifies the version of RIP processing. |

**Default** Version 2

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Setting the version command has no impact on receiving updates, only on sending them. The [ip rip send version](#) command overrides the value set by the [version \(RIP\)](#) command on an interface-specific basis. The [ip rip receive version](#) command allows you to configure a specific interface to accept only packets of the specified RIP version. The [ip rip receive version](#) command and the [ip rip send version](#) command override the value set by this command.

**Examples** To specify a RIP version, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# version 1
```

To specify a RIP version with VRF, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# version 1
```

**Related commands** [ip rip receive version](#)  
[ip rip send version](#)

# RIPng for IPv6 Commands

## Introduction

**Overview** This chapter contains RIPng commands. RIPng (Routing Information Protocol next generation) is an extension of RIPv2 to support IPv6. RFC 2080 specifies RIPng. The differences between RIPv2 and RIPng are:

- RIPng does not support RIP updates authentication
- RIPng does not allow the attachment of arbitrary tags to routes
- RIPng requires the encoding of the next-hop for a set of routes

For more information, see the [RIPng Feature Overview and Configuration Guide](#).

- Command List**

# aggregate-address (IPv6 RIPng)

**Overview** Use this command to add an aggregate route to RIPng.  
Use the **no** variant of this command to remove the aggregate route from RIPng.

**Syntax** aggregate-address <ipv6-addr/prefix-length>  
no aggregate-address <ipv6-addr/prefix-length>

| Parameter                 | Description                                                                                                                     |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <ipv6-addr/prefix-length> | Specify the IPv6 Address in the format X:X::X:X/<br>Prefix-Length. The prefix-length is a decimal<br>integer between 1 and 128. |

**Mode** Router Configuration

**Usage notes** The route will not be added to the RIPng database unless the database contains at least one route which is contained within the address range covered by the aggregate route. As soon as there are any such component routes in the RIPng database, then the following occurs:

- the aggregate route is added to the RIPng database
- all the component routes that are within the address range covered by the aggregate route are retained in the RIPng database, but are marked as suppressed routes. The aggregate route will be advertised in RIPng updates, and the component route will no longer be advertised.

Note that simply having a component route in the IPv6 route database is not a sufficient condition for the aggregate route to be included into the RIPng database. The component route(s) must be in the RIPng database before the aggregate route will be included in the RIPng database. There is no restriction on the method by which the component routes have arrived into the RIPng database, it can be by being connected RIP interfaces, by redistribution or by direct inclusion using the **route** command in router IPv6 RIP configuration mode.

**Example** awplus# configure terminal  
awplus(config)# router ipv6 rip  
awplus(config-router)# aggregate-address 2001:db8::/32

# clear ipv6 rip route

**Overview** Use this command to clear specific data from the RIPng routing table.

**Syntax** `clear ipv6 rip route`  
`{<ipv6-addr/prefix-length>|all|connected|rip|static|ospf}`

| Parameter                                    | Description                                                                                                                                                                                                                   |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-addr/prefix-length&gt;</code> | Specify the IPv6 Address in format <code>X:X::X:X/Prefix-Length</code> . The prefix-length is a decimal integer between 1 and 128. Removes entries which exactly match this destination address from the RIPng routing table. |
| <code>connected</code>                       | Removes redistributed connected entries from RIPng routing table.                                                                                                                                                             |
| <code>static</code>                          | Removes redistributed static entries from the RIPng routing table.                                                                                                                                                            |
| <code>rip</code>                             | Removes RIPng routes from the RIPng routing table.                                                                                                                                                                            |
| <code>ospf</code>                            | Removes redistributed OSPFv3 routes from the RIPng routing table.                                                                                                                                                             |
| <code>all</code>                             | Clears the entire RIPng routing table.                                                                                                                                                                                        |

**Mode** Privileged Exec

**Example** `awplus# clear ipv6 rip route all`  
`awplus# clear ipv6 rip route 2001:db8::/32`

# debug ipv6 rip

**Overview** Use this command to enable RIPng debugging and specify debugging for RIPng events, RIPng packets, or RIPng communication with NSM processes.

Use the **no** variant of this command to disable RIPng debugging.

**Syntax** `debug ipv6 rip [all|events|nsm|packet [detail]|recv [detail]|send [detail]]`  
`no debug ipv6 rip [all|events|nsm|packet [detail]|recv [detail]|send [detail]]`

| Parameter | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| all       | Displays all RIPng debugging showing RIPng events debug information, RIPng received packets information, and RIPng sent packets information. |
| events    | Displays RIPng events debug information.                                                                                                     |
| nsm       | Displays RIPng and NSM communication.                                                                                                        |
| packet    | Displays RIPng packets only.                                                                                                                 |
| recv      | Displays information for received packets.                                                                                                   |
| send      | Displays information for sent packets.                                                                                                       |
| detail    | Displays detailed information for the sent or received packet.                                                                               |

**Default** RIPng debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# debug ipv6 rip events`  
`awplus# debug ipv6 rip packet send detail`  
`awplus# debug ipv6 rip nsm`

**Related commands** [undebug ipv6 rip](#)

# default-information originate (IPv6 RIPng)

- Overview** Use this command to generate a default route into RIPng.  
Use the **no** variant of this command to disable this feature.
- Syntax** default-information originate  
no default-information originate
- Default** Disabled
- Mode** Router Configuration
- Example** awplus# configure terminal  
awplus(config)# router ipv6 rip  
awplus(config-router)# default-information originate

# default-metric (IPv6 RIPng)

**Overview** Use this command to specify the metrics to be assigned to redistributed RIPng routes.

Use the **no** variant of this command to reset the RIPng metric back to its default (1).

**Syntax** `default-metric <1-16>`  
`no default-metric [<1-16>]`

| Parameter | Description   |
|-----------|---------------|
| <1 - 16>  | Metric value. |

**Default** By default, the RIPng metric value is set to 1.

**Mode** Router Configuration

**Usage** This command is used with the [redistribute \(IPv6 RIPng\)](#) command to make the routing protocol use the specified metric value for all redistributed RIPng routes, regardless of the original protocol that the route has been redistributed from.

Note, this metric is not applied to routes that are brought into RIPng by using the **route** command in router IPv6 RIP configuration mode. This metric is, though, applied to any RIPng aggregate routes that have been brought into the RIPng database due to the presence of a component route that was redistributed into RIPng.

Also note that the default-metric is applied to routes redistributed into RIPng with no metric assignment in the routemap associated with redistribution.

**Example**

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# default-metric 8
```

**Related commands** [ipv6 rip metric-offset](#)  
[redistribute \(IPv6 RIPng\)](#)

# distribute-list (IPv6 RIPng)

**Overview** Use this command to filter incoming or outgoing route updates using the access-list or the prefix-list.

Use the **no** variant of this command to disable this feature.

**Syntax** `distribute-list [<access-list>|prefix <prefix-list-name>]  
[in|out] [<interface>]`  
`no distribute-list [<access-list>|prefix <prefix-list-name>]  
[in|out] [<interface>]`  
`no distribute-list [prefix <prefix-list-name>] [in|out]  
[<interface>]`

| Parameter          | Description                                                                             |
|--------------------|-----------------------------------------------------------------------------------------|
| <access-list>      | Specifies the IPv6 access-list number or name to use.                                   |
| <prefix-list-name> | Filter prefixes in routing updates.<br>Specify the name of the IPv6 prefix-list to use. |
| <interface>        | The interface for which distribute-list applies. For instance: <code>vlan2</code> .     |
| in                 | Filter incoming routing updates.                                                        |
| out                | Filter outgoing routing updates.                                                        |

**Default** Disabled

**Mode** Router Configuration

**Usage notes** Filter out incoming or outgoing route updates using the access-list or the prefix-list. If you do not specify the name of the interface, the filter is applied to all the interfaces.

**Example** To filter incoming or outgoing route updates, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# distribute-list prefix myfilter in vlan2
```

**Related commands** [ipv6 access-list extended \(named\)](#)  
[ipv6 nd prefix](#)

# ipv6 prefix-list

**Overview** Use this command to create an IPv6 prefix list or an entry in an existing prefix list.

Use the **no** variant of this command to delete a whole prefix list, a prefix list entry, or a description.

**Syntax** `ipv6 prefix-list <list-name> [seq <1-429496725>] {deny|permit} {any|<ipv6-prefix>} [ge <0-128>] [le <0-128>]`  
`ipv6 prefix-list <list-name> description <text>`  
`no ipv6 prefix-list <list-name> [seq <1-429496725>]`  
`no ipv6 prefix-list <list-name> [description <text>]`

| Parameter         | Description                                                                          |
|-------------------|--------------------------------------------------------------------------------------|
| <list-name>       | Specifies the name of a prefix list.                                                 |
| seq <1-429496725> | Sequence number of the prefix list entry.                                            |
| deny              | Specifies that the prefixes are excluded from the list.                              |
| permit            | Specifies that the prefixes are included in the list.                                |
| <ipv6-prefix>     | Specifies the IPv6 prefix and prefix length in hexadecimal in the format X:X::X:X/M. |
| any               | Any prefix match. Same as ::0/0 le 128.                                              |
| ge <0-128>        | Specifies the minimum prefix length to be matched.                                   |
| le <0-128>        | Specifies the maximum prefix length to be matched.                                   |
| description       | Prefix list specific description.                                                    |
| <text>            | Up to 80 characters of text description of the prefix list.                          |

**Mode** Global Configuration

**Usage notes** When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. The parameters **ge** and **le** are only used if an ip-prefix is stated. When setting these parameters, set the **le** value to be less than 128, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

**Example** To check the first 32 bits of the prefix 2001:db8:: and that the subnet mask must be greater than or equal to 34 and less than or equal to 40, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 prefix-list mylist seq 12345 permit
2001:db8::/32 ge 34 le 40
```

**Related commands**

- match ipv6 address
- show ipv6 prefix-list
- show running-config ipv6 prefix-list

## ipv6 rip metric-offset

**Overview** Use this command to increment the metric value on incoming routes for a specified interface. This command can be used to artificially inflate the metric value for routes learned on the specified interface. Routes learned on the specified interface are only used if the routes to the same destination with a lower metric value in the routing table are down.

Use the **no** variant of this command to reset the metric value on incoming routes to the default value (1). You can set the metric value for redistributed routes with [default-metric \(IPv6 RIPng\)](#) and [redistribute \(IPv6 RIPng\)](#) commands in Router Configuration mode.

**Syntax** `ipv6 rip metric-offset <1-16>`  
`no ipv6 rip metric-offset <1-16>`

| Parameter | Description                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------|
| <1 - 16>  | Specify an increment to the metric value on an incoming route. The metric value for RIPng routes is the hop count for the route. |

**Default** The default RIPng metric value is 1.

**Mode** Interface Configuration for a VLAN interface only.

**Usage notes** When a RIPng route is received on a VLAN interface, the metric value for the interface set by this command is added to the metric value of the route in the routing table. Note this command only increments the metric for incoming routes on a specified interface. Increasing the metric value for a VLAN interface increases the metric value of routes received on that VLAN interface. This changes the route selected from the routing table.

The RIPng metric is the hop count. At regular intervals of the routing update timer (which has a default value of 30 seconds), and at the time of change in the topology, the RIPng router sends update messages to other routers. The listening routers update their route table with the new route, and increase the metric value of the path by one (referred to as a hop count). The router recognizes the IPv6 address advertising router as the next hop, then sends the routing updates to other routers. A maximum allowable hop count is 15. If a router reaches a metric value of 16 or more, the destination is identified as unreachable.

For information about how AlliedWare Plus adds routes, see the [“Route Selection” Feature Overview and Configuration Guide](#). See also the [default-metric \(IPv6 RIPng\)](#) and [redistribute \(IPv6 RIPng\)](#) commands to specify the metric for redistributed RIPng routes.

**Examples** To increment the metric-offset on the VLAN interface vlan2, enter the below commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# exit
awplus(config)# interface vlan2
awplus(config-if)# ipv6 rip metric-offset 1
```

To reset the metric-offset on the VLAN interface v lan2 to the default value, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 rip metric-offset 1
```

**Validation  
Commands** [show running-config](#)

**Related  
commands** [default-metric \(IPv6 RIPng\)](#)

# ipv6 rip split-horizon

**Overview** Use this command to perform the split-horizon action on the interface. The default is split-horizon with poisoned reverse.

Use the **no** variant of this command to disable this function.

**Syntax** `ipv6 rip split-horizon [poisoned]`  
`no ipv6 rip split-horizon`

| Parameter                  | Description                                    |
|----------------------------|------------------------------------------------|
| <code>split-horizon</code> | Perform split-horizon without poisoned reverse |
| <code>poisoned</code>      | Performs split-horizon with poisoned reverse.  |

**Default** Split-horizon with poisoned reverse is the default.

**Mode** Interface Configuration for a VLAN interface only.

**Usage notes** Use this command to avoid including routes in updates sent to the same gateway from which they were learned. Using the **split horizon** command omits routes learned from one neighbor, in updates sent to that neighbor. Using the **poisoned** parameter with this command includes such routes in updates, but sets their metrics to infinity. Thus, advertising that these routes are not reachable.

**Examples** To perform split-horizon with poisoned reverse on the VLAN interface `vlan2`, enter the below commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# exit
awplus(config)# interface vlan2
awplus(config-if)# ipv6 rip split-horizon poisoned
```

To disable split-horizon on the VLAN interface `vlan2`, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 rip split-horizon
```

**Validation Commands** `show running-config`

## ipv6 router rip

**Overview** Use this command to enable RIPng routing on an interface.  
Use the **no** variant of this command to disable RIPng routing on an interface.

**Syntax** `ipv6 router rip`  
`no ipv6 router rip`

**Default** RIPng routing is disabled by default.

**Mode** Interface Configuration for a VLAN interface only.

**Usage notes** This command can only be configured on VLAN interfaces.

**Examples** To enable RIPng routing on the VLAN interface vlan2, enter the below commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# exit
awplus(config)# interface vlan2
awplus(config-if)# ipv6 router rip
```

To disable RIPng routing on the VLAN interface vlan2, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 router rip
```

# neighbor (IPv6 RIPng)

**Overview** Use this command to specify a neighbor router.  
Use the **no** variant of this command to disable the specific router.

**Syntax** neighbor <ipv6-link-local-addr> <interface>  
no neighbor <ipv6-link-local-addr> <interface>

| Parameter              | Description                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <ipv6-link-local-addr> | Specify the link-local IPv6 address (in the format X:X::X:X) of a neighboring router to exchange routing information with. |
| <interface>            | The interface. For instance: v lan2.                                                                                       |

**Mode** Router Configuration

**Usage** Use this command to exchange non broadcast routing information. It can be used multiple times for additional neighbors.

The [passive-interface \(IPv6 RIPng\)](#) command disables sending routing updates on an interface. Use the neighbor command in conjunction with the [passive-interface \(IPv6 RIPng\)](#) command to send routing updates to specific neighbors.

**Examples** awplus# configure terminal  
awplus(config)# router ipv6 rip  
awplus(config-router)# neighbor 2001:db8:1::1 v lan2  
awplus# configure terminal  
awplus(config)# router ipv6 rip  
awplus(config-router)# no neighbor 2001:db8:1::1 v lan2

**Related commands** [passive-interface \(IPv6 RIPng\)](#)

## offset-list (IPv6 RIPng)

**Overview** Use this command to add an offset to in and out metrics to routes learned through RIPng.

Use the **no** variant of this command to remove an offset list.

**Syntax** `offset-list {<access-list-number>|<access-list-name>} {in|out} <offset> [<interface>]`  
`no offset-list {<access-list-number>|<access-list-name>} {in|out} <offset> [<interface>]`

| Parameter                               | Description                                                                                 |
|-----------------------------------------|---------------------------------------------------------------------------------------------|
| <code>&lt;access-list-number&gt;</code> | Specify an access-list number to apply to an offset-list.                                   |
| <code>&lt;access-list-name&gt;</code>   | Specify an access-list name to apply to an offset-list.                                     |
| <code>in</code>                         | Indicates the access-list will be used for metrics of incoming advertised routes            |
| <code>out</code>                        | Indicates the access-list will be used for metrics of outgoing advertised routes            |
| <code>&lt;offset&gt;</code>             | <0 - 16> Specifies that the offset is used for metrics of networks matching the access-list |
| <code>&lt;interface&gt;</code>          | The interface to match. For instance: <code>vlan2</code> .                                  |

**Default** The default offset value is the metric value of the interface over which the updates are being exchanged.

**Mode** Router Configuration

**Usage notes** Use this command to specify the offset value that is added to the routing metric. When the networks match the access list the offset is applied to the metrics. No change occurs if the offset value is zero.

**Example** In this example the router examines the RIPng updates being sent out from interface `vlan2` and adds 8 hops to the routes matching the ip addresses specified in the access list 2.

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# offset-list mylist in 8 vlan2
```

## passive-interface (IPv6 RIPng)

**Overview** Use this command to enable suppression of routing updates on an interface.  
Use the **no** variant of this command to disable this function.

**Syntax** `passive-interface <interface>`  
`no passive-interface <interface>`

| Parameter                      | Description                          |
|--------------------------------|--------------------------------------|
| <code>&lt;interface&gt;</code> | The interface. For instance: v lan2. |

**Default** Disabled

**Mode** Router Configuration

**Examples** To enable suppression of routing updates, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# passive-interface v lan2
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no passive-interface v lan2
```

## recv-buffer-size (IPv6 RIPng)

**Overview** Use this command to configure the RIPng UDP (User Datagram Protocol) receive-buffer size. This should improve UDP reliability by avoiding UDP receive buffer overruns.

Use the **no** variant of this command to unset the configured RIPng UDP receive-buffer size and set it back to the system default of 196608 bits.

**Syntax** `recv-buffer-size <8192-2147483647>`  
`no recv-buffer-size [<8192-2147483647>]`

**Default** The RIPng UDP receive-buffer-size is 196608 bits by default, and is reset to the default using the **no** variant of this command.

**Mode** Router Configuration

**Examples** To configure the RIPng UPD, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# recv-buffer-size 23456789
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no recv-buffer-size 23456789
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no recv-buffer-size
```

# redistribute (IPv6 RIPng)

**Overview** Use this command to redistribute information from other routing protocols into RIPng.

Use the **no** variant of this command to disable the specified redistribution. The parameters **metric** and **route-map** may be used on this command, but have no effect.

**Syntax** redistribute {connected|static|ospf} [metric <0-16>] [route-map <route-map>]  
no redistribute {connected|static|ospf} [metric <0-16>]  
[route-map <route-map>]

| Parameter   | Description                                                                                                                                                                                                                |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-16>      | Optional. Specifies the metric value to be used when redistributing information. If a value is not specified, and no value is specified using the <a href="#">default-metric (IPv6 RIPng)</a> command, the default is one. |
| <route-map> | Optional. Specifies route-map to be used to redistribute information.                                                                                                                                                      |
| connected   | Redistribute from connected routes.                                                                                                                                                                                        |
| static      | Redistribute from static routes.                                                                                                                                                                                           |
| ospf        | Redistribute from Open Shortest Path First (OSPF).                                                                                                                                                                         |

**Default** By default, the RIPng metric value is set to 1.

**Mode** Router Configuration

**Example** To redistribute information from other routing protocols into RIPng, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# redistribute static route-map mymap
awplus(config-router)# redistribute static metric 8
```

**Related commands** [default-metric \(IPv6 RIPng\)](#)

# route (IPv6 RIPng)

**Overview** Use this command to configure static RIPng routes.  
Use the **no** variant of this command to disable this function.

**Syntax** `route <ipv6-addr/prefix-length>`  
`no route <ipv6-addr/prefix-length>`

| Parameter                                    | Description                                                                                                                        |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-addr/prefix-length&gt;</code> | Specify the IPv6 Address in format <code>X:X::X:X/Prefix-Length</code> . The prefix-length is a decimal integer between 1 and 128. |

**Mode** Router Configuration

**Usage notes** Use this command to add a static RIPng route. After adding the RIPng route, the route can be checked in the RIPng routing table.

**Example** To configure static RIPng routes, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# route 2001:db8::1/64
```

**Related commands** `show ipv6 rip`  
`clear ipv6 rip route`

# router ipv6 rip

**Overview** Use this global command to enter Router Configuration mode to enable a RIPng routing process.

Use the **no** variant of this command to disable the RIPng routing process.

**Syntax** router ipv6 rip  
no router ipv6 rip

**Mode** Global Configuration

**Example** To enable a RIPng routing process, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)#
```

# show debugging ipv6 rip

**Overview** Use this command to see what debugging is turned on for RIPng options such as: nsm debugging, RIPng event debugging, RIPng packet debugging, and RIPng nsm debugging.

For information on filtering and saving command output, see the ["Getting\\_Started with AlliedWare Plus" Feature Overview and Configuration\\_Guide](#).

**Syntax** show debugging ipv6 rip

**Mode** User Exec and Privileged Exec

**Usage notes** Use this command to display the debug status of RIPng.

**Example** To display the RIPng debugging status, use the following command:  
awplus# show debugging ipv6 rip

# show ipv6 prefix-list

**Overview** Use this command to display the prefix-list entries.  
Note that this command is valid for RIPng and BGP4+ routing protocols only.

**Syntax** `show ipv6 prefix-list [<name>|detail|summary]`

| Parameter | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| <name>    | Specify the name of an individual IPv6 prefix list.                       |
| detail    | Specify this parameter to show detailed output for all IPv6 prefix lists. |
| summary   | Specify this parameter to show summary output for all IPv6 prefix lists.  |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 prefix-list`  
`awplus# show ipv6 prefix-list 10.10.0.98/8`  
`awplus# show ipv6 prefix-list detail`

**Related commands** [ipv6 prefix-list](#)

# show ipv6 protocols rip

**Overview** Use this command to display RIPng process parameters and statistics.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ipv6 protocols rip

**Mode** User Exec and Privileged Exec

**Example** To display RIPng process parameters and statistics, use the following command:

```
awplus# show ipv6 protocols rip
```

## Output

```
awplus#show ipv6 protocols rip
Routing Protocol is "RIPng"
 Sending updates every 30 seconds with +/-5 seconds, next due
in 6 seconds
 Timeout after 180 seconds, garbage collect after 120 seconds
 Outgoing update filter list for all interface is not set
 Incoming update filter list for all interface is not set
 Default redistribute metric is 1
 Redistributing:
 Interface
 vlan3
 Routing for Networks:
 fe80::200:cdff:fe27:c086 vlan1
```

# show ipv6 rip

**Overview** Use this command to show RIPng routes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ipv6 rip

**Mode** User Exec and Privileged Exec

**Example** To display RIPng routes, use the following command:

```
awplus# show ipv6 rip
```

## Output

Codes: R - RIP, Rc - RIP connected, Rs - RIP static, Ra - RIP aggregated, Rcx - RIP connect suppressed, Rsx - RIP static suppressed, C - Connected, S - Static, O - OSPF, B - BGP

|    | Network         | Next Hop        | If    | Met | Tag | Time  |
|----|-----------------|-----------------|-------|-----|-----|-------|
| R  | 2001:db8:1::/48 | 2001:db8:2::/48 | vlan3 | 3   | 0   | 02:28 |
| C  | 2001:db8:3::/48 | ::              | vlan2 | 1   | 0   |       |
| Ra | 2001:db8:4::/48 |                 | --    | 1   | 0   |       |
| Rs | 2001:db8:5::/48 | 2001:db8:1::/48 | vlan3 | 3   | 0   | 02:32 |
| Cs | 2001:db8:6::/48 | ::              | vlan3 | 1   | 0   |       |

**Related commands** [show ipv6 rip database](#)

# show ipv6 rip database

**Overview** Use this command to display information about the RIPng database.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ipv6 rip database [full]

| Parameter | Description                                                                |
|-----------|----------------------------------------------------------------------------|
| full      | Display all IPv6 RIPng full database entries including sub-optimal routes. |

**Mode** User Exec and Privileged Exec

**Example** To display information about the RIPng database, use the following command:

```
awplus# show ipv6 rip database
```

## Output

| Codes: R - RIP, Rc - RIP connected, Rs - RIP static, Ra - RIP aggregated, Rcx - RIP connect suppressed, Rsx - RIP static suppressed, C - Connected, S - Static, O - OSPF, B - BGP |                 |                 |       |     |     |       |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|-----------------|-------|-----|-----|-------|
|                                                                                                                                                                                   | Network         | Next Hop        | If    | Met | Tag | Time  |
| R                                                                                                                                                                                 | 2001:db8:1::/48 | 2001:db8:2::/48 | vlan3 | 3   | 0   | 02:28 |
| C                                                                                                                                                                                 | 2001:db8:3::/48 | ::              | vlan2 | 1   | 0   |       |

| Cs                                                                                                                                                                                | 2001:db8:6::/48 | ::              | vlan3 | 1   | 0   |       |

**Related commands** [show ipv6 rip](#)

# show ipv6 rip interface

**Overview** Use this command to display information about the RIPng interfaces. You can specify an interface name to display information about a specific interface.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** show ipv6 rip interface [<interface>]

| Parameter   | Description                                                       |
|-------------|-------------------------------------------------------------------|
| <interface> | The interface to display information about. For instance: v lan2. |

**Mode** User Exec and Privileged Exec

**Example** To display RIPng interface information, use the following command:

```
awplus# show ipv6 rip interface
```

## Output

```
lo is up, line protocol is up
RIPng is not enabled on this interface
vlan1 is up, line protocol is up
RIPng is not enabled on this interface
vlan2 is down, line protocol is down
RIPng is not enabled on this interface
vlan3 is up, line protocol is up
Routing Protocol: RIPng
Passive interface: Disabled
Split horizon: Enabled with Poisoned Reversed
IP interface address:
2001:db8:1::1/64
2001:db8:1::2/64
```

## timers (IPv6 RIPng)

**Overview** Use this command to adjust the RIPng routing network timers.

Use the **no** variant of this command to restore the defaults.

**Syntax** `timers basic <update> <timeout> <garbage>`  
`no timers basic`

| Parameter                    | Description                                                                                                                                                                                                                               |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;update&gt;</code>  | <code>&lt;5 - 2147483647&gt;</code> Specifies the RIPng routing table update timer in seconds. The default is 30 seconds.                                                                                                                 |
| <code>&lt;timeout&gt;</code> | <code>&lt;5 - 2147483647&gt;</code> Specifies the RIPng routing information timeout timer in seconds. The default is 180 seconds. After this interval has elapsed and no updates for a route are received, the route is declared invalid. |
| <code>&lt;garbage&gt;</code> | <code>&lt;5 - 2147483647&gt;</code> Specifies the RIPng routing garbage collection timer in seconds. The default is 120 seconds.                                                                                                          |

**Default** The default RIPng routing table update timer default is 30 seconds, the default RIPng routing information timeout timer is 180 seconds, and the default RIPng routing garbage collection timer is 120 seconds. The **no** variant of this command restores the default RIPng routing timers.

**Mode** Router Configuration

**Example** To adjust the RIPng routing network timers, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# timers basic 30 180 120
```

# undebg ipv6 rip

**Overview** Use this command to disable debugging options of RIPng events, RIPng packets, and communication between RIPng and NSM processes.

**Syntax** `undebg ipv6 rip [all|events|nsm|packet [recv|send][detail]]`

| Parameter | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| all       | Disables all RIPng debugging.                                             |
| events    | Disable the display of RIPng events information.                          |
| nsm       | Disable the display of RIPng and NSM communication.                       |
| packet    | Disable debugging of specified RIPng packets only.                        |
| recv      | Disable the display of information for received packets.                  |
| send      | Disable the display of information for sent packets.                      |
| detail    | Disable the display of detailed information for sent or received packets. |

**Mode** Privileged Exec and Global Configuration

**Example** To disable debugging options, use the following command:

```
awplus# undebg ipv6 rip events
awplus# undebg ipv6 rip all
awplus# undebg ipv6 rip packet send
awplus# undebg ipv6 rip packet recv detail
```

# area default-cost

**Overview** This command specifies a cost for the default summary route sent into a stub or NSSA area.

The **no** variant of this command removes the assigned default-route cost.

**Syntax** `area <area-id> default-cost <0-16777215>`  
`no area <area-id> default-cost`

| Parameter    | Description                                                                                                                                                                               |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>    | The OSPF area that you are specifying the default summary route cost for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. |
|              | <ip-addr> OSPF Area ID expressed in IPv4 address format A.B.C.D.                                                                                                                          |
|              | <0-4294967295> OSPF Area ID expressed as a decimal number within the range shown.                                                                                                         |
|              | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.                                                                                         |
| default-cost | Indicates the cost for the default summary route used for a stub or NSSA area.<br>Default: <b>1</b>                                                                                       |

**Mode** Router Configuration

**Usage** The default-cost option provides the metric for the summary default route, generated by the area border router, into the NSSA or stub area. Use this option only on an area border router that is attached to the NSSA or stub area. Refer to the RFC 3101 for information on NSSA.

**Example** To set the default cost to 10 in area 1 for the OSPF instance 100, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 default-cost 10
```

**Related commands** [area nssa](#)  
[area stub](#)

# area authentication

**Overview** Use this command to enable authentication for an OSPF area. Specifying the area authentication sets the authentication to Type 1 authentication or the Simple Text password authentication (details in RFC 2328).

The **no** variant of this command removes the authentication specification for an area.

**Syntax** `area <area-id> authentication [message-digest]`  
`no area <area-id> authentication`

| Parameter      | Description                                                                                                                           |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>      | The OSPF area that you are enabling authentication for. This can be entered in either dotted decimal format or normal decimal format. |
|                | <ip-addr> OSPF Area ID expressed in IPv4 address, entered in the form A.B.C.D.                                                        |
|                | <0-4294967295> OSPF Area ID expressed as a decimal number within the range shown.                                                     |
|                | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area OSPF Area ID.                           |
| message-digest | Enables MD5 authentication in the OSPF area.                                                                                          |

**Default** By default, no authentication occurs.

**Mode** Router Configuration

**Usage** All OSPF packets transmitted in this **area** must have the same password in their OSPF header. This ensures that only routers that have the correct password may join the routing domain.

Give all routers that are to communicate with each other through OSPF the same authentication password.

Use the [ip ospf authentication-key](#) command to specify a Simple Text password.  
Use the [ip ospf message-digest-key](#) command to specify MD5 password.

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 authentication
```

**Related commands** [ip ospf authentication](#)  
[ip ospf message-digest-key](#)

# area filter-list

**Overview** This command configures filters to advertise summary routes on Area Border Routers (ABR).

This command is used to suppress particular intra-area routes from/to an area to/from the other areas. You can use this command in conjunction with either the access-list or the prefix-list command.

The **no** variant of this command removes the filter configuration.

**Syntax**

```
area <area-id> filter-list access <access-list> {in|out}
area <area-id> filter-list prefix <prefix-list> {in|out}
no area <area-id> filter-list access <access-list> {in|out}
no area <area-id> filter-list prefix <prefix-list> {in|out}
```

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |           |                                                        |                |                                                                    |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|--------------------------------------------------------|----------------|--------------------------------------------------------------------|
| <area-id>      | <p>The OSPF area that you are configuring the filter for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format.</p> <table> <tr> <td>&lt;ip-addr&gt;</td><td>OSPF Area ID expressed in IPv4 address format A.B.C.D.</td></tr> <tr> <td>&lt;0-4294967295&gt;</td><td>OSPF Area ID expressed as a decimal number within the range shown.</td></tr> </table> <p>For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.</p> | <ip-addr> | OSPF Area ID expressed in IPv4 address format A.B.C.D. | <0-4294967295> | OSPF Area ID expressed as a decimal number within the range shown. |

**Mode** Router Configuration

**Example** To configure filters to advertise summary routes, use the following commands:

```
awplus# configure terminal
awplus(config)# access-list 1 deny 172.22.0.0
awplus(config)# router ospf 100
awplus(config-router)# area 1 filter-list access 1 in
```

## area nssa

**Overview** This command sets an area as a Not-So-Stubby-Area (NSSA). By default, no NSSA area is defined.

Use this command to simplify administration if you are connecting a central site using OSPF to a remote site that is using a different routing protocol. You can extend OSPF to cover the remote connection by defining the area between the central router and the remote router as an NSSA.

There are no external routes in an OSPF stub area, so you cannot redistribute from another protocol into a stub area. A NSSA allows external routes to be flooded within the area. These routes are then leaked into other areas. Although, the external routes from other areas still do not enter the NSSA. You can either configure an area to be a stub area or an NSSA, not both.

The **no** variant of this command removes this designation.

**Syntax** `area <area-id> nssa [default-information-originate <metric> | no-redistribution | no-summary | translator-role <role> ]`  
`no area <area-id> nssa [default-information-originate | no-redistribution | no-summary | translator-role ]`

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                    |                                                        |                  |                                                                    |

| metric<0-16777214>            | The metric value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                    |                                                        |                  |                                                                    |
| metric-type<1-2>              | External metric type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                    |                                                        |                  |                                                                    |
| no-redistribution             | Do not redistribute external route into NSSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                    |                                                        |                  |                                                                    |
| no-summary                    | Do not inject inter-area route into NSSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                    |                                                        |                  |                                                                    |
| translator-role               | Specify NSSA-ABR translator-role.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                    |                                                        |                  |                                                                    |

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| <role>    | The role type. Specify one of the following keywords:                   |
|           | always Router always translate NSSA-LSA to Type-5 LSA.                  |
|           | candidate Router may translate NSSA-LSA to Type-5 LSA if it is elected. |
|           | never Router never translate NSSA-LSA.                                  |

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 0.0.0.51 nssa
awplus(config-router)# area 3 nssa translator-role candidate
no-redistribution default-information-originate metric 34
metric-type 2
```

**Related commands** [area default-cost](#)

# area range

**Overview** Use this command to summarize OSPF routes at an area boundary, configuring an IPv4 address range which consolidates OSPF routes. By default, this feature is not enabled.

A summary route created by this command is then advertised to other areas by the Area Border Routers (ABRs). In this way, routing information is condensed at area boundaries and outside the area so that routes are exchanged between areas in an efficient manner.

If the network numbers in an area are arranged into sets of contiguous routes, the ABRs can be configured to advertise a summary route that covers all the individual networks within the area that fall into the specified range.

Use the cost parameter to specify a metric that will be advertised in the summary Link State Advertisement (LSA), rather than relying on the standard method to calculate the metric for the LSA.

The **no** variant of this command disables this function and restores default behavior.

**Syntax** `area <area-id> range <ip-addr/prefix-length> [advertise] [cost <0-16777215>]`

`area <area-id> range <ip-addr/prefix-length> not-advertise`

`no area <area-id> range <ip-addr/prefix-length>`

| Parameter               | Description                                                                                                                                                        |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>               | The OSPF area that you summarizing the routes for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. |
|                         | <ip-addr> OSPF Area ID expressed in IPv4 address format A.B.C.D.                                                                                                   |
|                         | <0-4294967295> OSPF Area ID expressed as a decimal number within the range shown.                                                                                  |
|                         | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.                                                                  |
| <ip-addr/prefix-length> | The area range prefix and length.                                                                                                                                  |
| advertise               | Advertise this range as a summary route into other areas.                                                                                                          |

| Parameter       | Description                                                                                                                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| not - advertise | Does not advertise this range.                                                                                                                                                                                                |
| cost            | Optionally override the metric that would normally be calculated for this summary with a user-defined cost to be advertised for this summary LSA. Specify the metric to be advertised for this route in the range 0-16777215. |

**Default** The area range is not configured by default. The area range is advertised if it is configured.

**Mode** Router Configuration

**Usage notes** You can configure multiple ranges on a single area with multiple instances of this command, so OSPF summarizes addresses for different sets of IPv4 address ranges. Ensure OSPF IPv4 routes exist in the area range for advertisement before using this command.

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 range 192.16.0.0/16
awplus(config-router)# area 1 range 203.18.0.0/16 cost 70
```

To remove a cost configured on an area range, re-enter the area range without the optional cost parameter. This will set the metric calculation back to the default algorithm.

```
awplus(config-router)# area 1 range 207.14.0.0/16 cost 35
awplus(config-router)# area 1 range 207.14.0.0/16
```

**Command changes** Version 5.5.0-0.1: parameter **cost** added

# area stub

**Overview** This command defines an OSPF area as a stub area. By default, no stub area is defined.

Use this command when routers in the area do not require learning about summary LSAs from other areas. You can define the area as a totally stubby area by configuring the Area Border Router of that area using the **area stub no-summary** command.

There are two stub area router configuration commands: the **area stub** and **area default-cost** commands. In all routers attached to the stub area, configure the area by using the **area stub** command. For an area border router (ABR) attached to the stub area, also use the **area default-cost** command.

The **no** variant of this command removes this definition.

**Syntax** `area <area-id> stub [no-summary]`  
`no area <area-id> stub [no-summary]`

| Parameter      | Description                                                                                                                                                                                                                                                              |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>      | The OSPF area that you are configuring as a stub area. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID. |
| <ip-addr>      | OSPF Area ID expressed in IPv4 address in the format A.B.C.D.                                                                                                                                                                                                            |
| <0-4294967295> | OSPF Area ID expressed as a decimal number within the range shown.                                                                                                                                                                                                       |
|                | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.                                                                                                                                                                        |
| no - summary   | Stops an ABR from sending summary link advertisements into the stub area.                                                                                                                                                                                                |

**Mode** Router Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# router ospf 100`  
`awplus(config-router)# area 1 stub`

**Related commands** [area default-cost](#)

# area virtual-link

**Overview** This command configures a link between two backbone areas that are physically separated through other non-backbone areas.

In OSPF, all non-backbone areas must be connected to a backbone area. If the connection to the backbone is lost, the virtual link repairs the connection.

The **no** variant of this command removes the virtual link.

**Syntax**

```
area <area-id> virtual-link <ip-addr> [<auth-key>|<msg-key>]
no area <area-id> virtual-link <ip-addr> [<auth-key>|<msg-key>]
area <area-id> virtual-link <ip-addr> authentication
[message-digest|null] [<auth-key>|<msg-key>]
no area <area-id> virtual-link <ip-addr> authentication
[message-digest|null] [<auth-key>|<msg-key>]
area <area-id> virtual-link <ip-addr> [authentication]
[dead-interval <1-65535>] [hello-interval <1-65535>]
[retransmit-interval <1-3600>] [transmit-delay <1-3600>]
no area <area-id> virtual-link <ip-addr> [authentication]
[dead-interval] [hello-interval] [retransmit-interval]
[transmit-delay]
```

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |              |                                                        |                |                                                                    |

| <1-255>        | The key ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |              |                                                        |                |                                                                    |
| <pswd-long>    | Authentication password of 16 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |              |                                                        |                |                                                                    |
| authentication | Enables authentication on this virtual link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |              |                                                        |                |                                                                    |

| Parameter           | Description                                                                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| message-digest      | Use message-digest authentication.                                                                                                                                      |
| null                | Use null authentication to override password or message digest.                                                                                                         |
| dead-interval       | If no packets are received from a particular neighbor for dead-interval seconds, the router considers that neighboring router as being off-line.<br>Default: 40 seconds |
|                     | <1-65535>      The number of seconds in the interval.                                                                                                                   |
| hello-interval      | The interval the router waits before it sends a hello packet.<br>Default: 10 seconds                                                                                    |
|                     | <1-65535>      The number of seconds in the interval.                                                                                                                   |
| retransmit-interval | The interval the router waits before it retransmits a packet.<br>Default: 5 seconds                                                                                     |
|                     | <1-3600>      The number of seconds in the interval.                                                                                                                    |
| transmit-delay      | The interval the router waits before it transmits a packet.<br>Default: 1 seconds                                                                                       |
|                     | <1-3600>      The number of seconds in the interval.                                                                                                                    |

### Mode Router Configuration

**Usage notes** You can configure virtual links between any two backbone routers that have an interface to a common non-backbone area. The protocol treats these two routers, joined by a virtual link, as if they were connected by an unnumbered point-to-point network. To configure a virtual link, you require:

- The transit area ID, i.e. the area ID of the non backbone area that the two backbone routers are both connected to.
- The corresponding virtual link neighbor's router ID. To see the router ID use the [show ip ospf](#) command.

Configure the **hello-interval** to be the same for all routers attached to a common network. A short **hello-interval** results in the router detecting topological changes faster but also an increase in the routing traffic.

The **retransmit-interval** is the expected round-trip delay between any two routers in a network. Set the value to be greater than the expected round-trip delay to avoid needless retransmissions.

The **transmit-delay** is the time taken to transmit a link state update packet on the interface. Before transmission, the link state advertisements in the update packet, are incremented by this amount. Set the **transmit-delay** to be greater than zero. Also, take into account the transmission and propagation delays for the interface.

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 virtual-link 10.10.11.50 hello 5
dead 10
```

# auto-cost reference bandwidth

**Overview** This command controls how OSPF calculates default metrics for the interface. Use the **no** variant of this command to assign cost based only on the interface bandwidth.

**Syntax** auto-cost reference-bandwidth <1-4294967>  
no auto-cost reference-bandwidth

| Parameter   | Description                                                  |
|-------------|--------------------------------------------------------------|
| <1-4294967> | The reference bandwidth in terms of Mbits per second (Mbps). |

**Default** 1000 Mbps

**Usage notes** By default, OSPF calculates the OSPF metric for an interface by dividing the reference bandwidth by the interface bandwidth. The default for the reference bandwidth is 1000 Mbps. As a result, if this default is used, there is very little difference between the metrics applied to interfaces of increasing bandwidth beyond 1000 Mbps.

The auto-cost command is used to alter this reference bandwidth in order to give a real difference between the metrics of high bandwidth links of differing bandwidths. In a network that has multiple links with high bandwidths, specify a larger reference bandwidth value to differentiate the costs on those links.

Cost is calculated by dividing the reference bandwidth (Mbps) by the layer 3 interface (Switched Virtual Interface (SVI), Loopback or Ethernet interface) bandwidth. Interface bandwidth may be altered by using the [bandwidth](#) command as the SVI does not auto detect the bandwidth based on the speed of associated switch ports.

When the reference bandwidth calculation results in a cost integer greater than 1 but contains a fractional value (value after the decimal point), the result rounds down to the nearest integer. The following example shows how the cost is calculated.

The reference bandwidth is 1000 Mbps and the interface bandwidth is 7 Mbps.

Calculation =  $1000/7$

Calculation result = 142.85 (integer of 142, fractional value of 0.85)

Result after rounding down to the nearest integer = 142 (Interface cost is 142)

When the reference bandwidth calculation results in a cost less than 1, it is rounded up to the nearest integer which is 1. The following example shows how the cost is calculated.

The reference bandwidth is 1000 Mbps and the interface bandwidth is 10000 Mbps.

Calculation =  $1000/10000$

Calculation result = 0.1

Result after rounding up to the nearest integer = 1 (Interface cost is 1)

The auto-cost reference bandwidth value should be consistent across all OSPF routers in the OSPF process.

Note that using the `ip ospf cost` command on a layer 3 interface will override the cost calculated by this command.

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# auto-cost reference-bandwidth 1000
```

**Related commands** `ip ospf cost`

# bandwidth

**Overview** Use this command to specify the maximum bandwidth to be used for each VLAN interface. The bandwidth value is in bits per second. OSPF uses this to calculate metrics for the VLAN interface.

The **no** variant of this command removes any applied bandwidth value and replaces it with a value equal to the lowest port speed within that VLAN.

**Syntax** `bandwidth <bandwidth-setting>`  
`no bandwidth`

| Parameter                              | Description                                                                                                                                                                                                                                                                      |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;bandwidth-setting&gt;</code> | Sets the bandwidth for the interface. Enter a value in the range 1 to 10000000000 bits per second. Note that to avoid entering many zeros, you can add k, m, or g to internally add 3, 6 or 9 zeros to the number entered. For example entering 1k is the same as entering 1000. |

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the bandwidth on VLAN2 to be 1 Mbps, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# bandwidth 1000000
```

Or

```
awplus(config-if)# bandwidth 1m
```

**Related commands** [show running-config access-list](#)  
[show interface](#)

# capability opaque

**Overview** This command enables opaque-LSAs. Opaque-LSAs are Type 9, 10 and 11 LSAs that deliver information used by external applications.

Use the **no** variant of this command to disable opaque-LSAs.

**Syntax** capability opaque  
no capability opaque

**Default** By default, opaque-LSAs are enabled.

**Mode** Router Configuration

**Example** awplus# configure terminal  
awplus(config)# router ospf 100  
awplus(config-router)# no capability opaque

# capability restart

**Overview** This command enables OSPF Graceful Restart or restart signaling features. By default, this is enabled.

Use the **no** variant of this command to disable OSPF Graceful Restart and restart signaling features.

**Syntax** `capability restart [graceful|signaling]`  
`no capability restart`

| Parameter              | Description                    |
|------------------------|--------------------------------|
| <code>graceful</code>  | Enable graceful OSPF restart.  |
| <code>signaling</code> | Enable OSPF restart signaling. |

**Default** Graceful restart

**Mode** Router Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# router ospf 100`  
`awplus(config-router)# capability restart graceful`

# clear ip ospf process

**Overview** This command clears and restarts the OSPF routing process. Specify the Process ID to clear one particular OSPF process. When no Process ID is specified, this command clears all running OSPF processes.

**Syntax** `clear ip ospf [<0-65535>] process`

| Parameter   | Description             |
|-------------|-------------------------|
| <0 - 65535> | The Routing Process ID. |

**Mode** Privileged Exec

**Example** `awplus# clear ip ospf process`

## compatible rfc1583

**Overview** This command changes the method used to calculate summary route to the that specified in RFC 1583. By default, OSPF uses the method specified in RFC 2328.

RFC 1583 specifies a method for calculating the metric for summary routes based on the minimum metric of the component paths available. RFC 2328 specifies a method for calculating metrics based on maximum cost.

It is possible that some ABRs in an area might conform to RFC 1583 and others support RFC 2328, which could lead to incompatibility in their interoperation. This command addresses this issue by allowing you to selectively disable compatibility with RFC 2328.

Use the **no** variant of this command to disable RFC 1583 compatibility.

**Syntax** compatible rfc1583  
no compatible rfc1583

**Mode** Router Configuration

**Example** awplus# configure terminal  
awplus(config)# router ospf 100  
awplus(config-router)# compatible rfc1583

# debug ospf events

**Overview** This command enables OSPF debugging for OSPF event troubleshooting.

To enable all debugging options, specify **debug ospf event** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF debugging. Use this command without parameters to disable all the options.

**Syntax** debug ospf events [abr] [asbr] [lsa] [nssa] [os] [router]  
[vlink]  
no debug ospf events [abr] [asbr] [lsa] [nssa] [os] [router]  
[vlink]

| Parameter | Description                  |
|-----------|------------------------------|
| abr       | Shows ABR events.            |
| asbr      | Shows ASBR events.           |
| lsa       | Shows LSA events.            |
| nssa      | Shows NSSA events.           |
| os        | Shows OS interaction events. |
| router    | Shows other router events.   |
| vlink     | Shows virtual link events.   |

**Mode** Privileged Exec and Global Configuration

**Example** awplus# debug ospf events asbr lsa

**Related commands** [terminal monitor](#)  
[undebug ospf events](#)

# debug ospf ifsm

- Overview** This command specifies debugging options for OSPF Interface Finite State Machine (IFSM) troubleshooting.
- To enable all debugging options, specify **debug ospf ifsm** with no additional parameters.
- The **no** and **undebug** variant of this command disable OSPF IFSM debugging. Use this command without parameters to disable all the options.

**Syntax** debug ospf ifsm [status] [events] [timers]  
no debug ospf ifsm [status] [events] [timers]

| Parameter | Description                       |
|-----------|-----------------------------------|
| events    | Displays IFSM event information.  |
| status    | Displays IFSM status information. |
| timers    | Displays IFSM timer information.  |

**Mode** Privileged Exec and Global Configuration

**Example** awplus# no debug ospf ifsm events status  
awplus# debug ospf ifsm status  
awplus# debug ospf ifsm timers

**Related commands** terminal monitor  
undebug ospf ifsm

# debug ospf lsa

**Overview** This command enables debugging options for OSPF Link State Advertisements (LSA) troubleshooting. This displays information related to internal operations of LSAs.

To enable all debugging options, specify **debug ospf lsa** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF LSA debugging. Use this command without parameters to disable all the options.

**Syntax** debug ospf lsa [flooding] [generate] [install] [maxage] [refresh]  
no debug ospf lsa [flooding] [generate] [install] [maxage] [refresh]

| Parameter | Description                              |
|-----------|------------------------------------------|
| flooding  | Displays LSA flooding.                   |
| generate  | Displays LSA generation.                 |
| install   | Show LSA installation.                   |
| maxage    | Shows maximum age of the LSA in seconds. |
| refresh   | Displays LSA refresh.                    |

**Mode** Privileged Exec and Global Configuration

**Examples** awplus# undebug ospf lsa refresh

**Output** Figure 27-1: Example output from the **debug ospf lsa** command

```
2002/05/09 14:08:11 OSPF: LSA[10.10.10.10:10.10.10.70]: instance(0x8139cd0)
created with Link State Update
2002/05/09 14:08:11 OSPF: RECV[LS-Upd]: From 10.10.10.70 via vlan5:10.10.10.50
(10.10.10.10 -> 224.0.0.5)
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: Begin send queue
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: # of LSAs 1, destination 224.0.0.5
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: End send queue
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: To 224.0.0.5 via vlan5:10.10.10.50
```

**Related commands** terminal monitor  
undebug ospf lsa

# debug ospf nfsm

- Overview** This command enables debugging options for OSPF Neighbor Finite State Machines (NFSMs).
- To enable all debugging options, specify **debug ospf nfsm** with no additional parameters.
- The **no** and **undebug** variant of this command disable OSPF NFSM debugging. Use this command without parameters to disable all the options.

**Syntax** debug ospf nfsm [events] [status] [timers]  
no debug ospf nfsm [events] [status] [timers]

| Parameter | Description                       |
|-----------|-----------------------------------|
| events    | Displays NFSM event information.  |
| status    | Displays NFSM status information. |
| timers    | Displays NFSM timer information.  |

**Mode** Privileged Exec and Global Configuration

**Examples** awplus# debug ospf nfsm events  
awplus# no debug ospf nfsm timers  
awplus# undebug ospf nfsm events

**Related commands** terminal monitor  
undebug ospf nfsm

# debug ospf nsm

**Overview** This command enables debugging options for the OSPF Network Service Module. To enable both debugging options, specify **debug ospf nsm** with no additional parameters. The **no** and **undebug** variant of this command disable OSPF NSM debugging. Use this command without parameters to disable both options.

**Syntax** debug ospf nsm [interface] [redistribute]  
no debug ospf nsm [interface] [redistribute]

| Parameter    | Description                           |
|--------------|---------------------------------------|
| interface    | Specify NSM interface information.    |
| redistribute | Specify NSM redistribute information. |

**Mode** Privileged Exec and Global Configuration

**Examples** awplus# debug ospf nsm interface  
awplus# no debug ospf nsm redistribute  
awplus# undebug ospf nsm interface

**Related commands** [terminal monitor](#)  
[undebug ospf nsm](#)

# debug ospf packet

**Overview** This command enables debugging options for OSPF packets.

To enable all debugging options, specify **debug ospf packet** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF packet debugging. Use this command without parameters to disable all options.

**Syntax** debug ospf packet [dd] [detail] [hello] [ls-ack] [ls-request] [ls-update] [recv] [send]

no debug ospf packet [dd] [detail] [hello] [ls-ack] [ls-request] [ls-update] [recv] [send]

| Parameter  | Description                                              |
|------------|----------------------------------------------------------|
| dd         | Specifies debugging for OSPF database descriptions.      |
| detail     | Sets the debug option to detailed information.           |
| hello      | Specifies debugging for OSPF hello packets.              |
| ls-ack     | Specifies debugging for OSPF link state acknowledgments. |
| ls-request | Specifies debugging for OSPF link state requests.        |
| ls-update  | Specifies debugging for OSPF link state updates.         |
| recv       | Specifies the debug option set for received packets.     |
| send       | Specifies the debug option set for sent packets.         |

**Mode** Privileged Exec and Global Configuration

**Examples** awplus# debug ospf packet detail

awplus# debug ospf packet dd send detail

awplus# no debug ospf packet ls-request recv detail

awplus# undebug ospf packet ls-request recv detail

**Related commands** [terminal monitor](#)

[undebug ospf packet](#)

# debug ospf route

- Overview** This command enables debugging of route calculation. Use this command without parameters to turn on all the options.
- To enable all debugging options, specify **debug ospf route** with no additional parameters.
- The **no** and **undebug** variant of this command disable OSPF route debugging. Use this command without parameters to disable all options.

**Syntax** debug ospf route [ase] [ia] [install] [spf]  
no debug ospf route [ase] [ia] [install] [spf]

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| ia        | Specifies the debugging of Inter-Area route calculation. |
| ase       | Specifies the debugging of external route calculation.   |
| install   | Specifies the debugging of route installation.           |
| spf       | Specifies the debugging of SPF calculation.              |

**Mode** Privileged Exec and Global Configuration

**Examples** awplus# debug ospf route  
awplus# no debug ospf route ia  
awplus# debug ospf route install  
awplus# undebug ospf route install

**Related commands** [terminal monitor](#)  
[undebug ospf route](#)

# default-information originate

**Overview** This command creates a default external route into an OSPF routing domain.

When you use the **default-information originate** command to redistribute routes into an OSPF routing domain, then the system acts like an Autonomous System Boundary Router (ASBR). By default, an ASBR does not generate a default route into the OSPF routing domain.

When using this command, also specify the **route-map** *<route-map>* option to avoid a dependency on the default network in the routing table.

The **metric-type** is an external link type associated with the default route advertised into the OSPF routing domain. The value of the external route could be either Type 1 or 2. The default is Type 2.

The **no** variant of this command disables this feature.

**Syntax** `default-information originate [always] [metric <metric>]  
[metric-type <1-2>] [route-map <route-map>]  
no default-information originate [always] [metric]  
[metric-type] [route-map]`

| Parameter                      | Description                                                                                                                                                                |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>always</code>            | Used to advertise the default route regardless of whether there is a default route.                                                                                        |
| <code>&lt;metric&gt;</code>    | The metric value used in creating the default route. Enter a value in the range 0 to 16777214. The default metric value is 10. The value used is specific to the protocol. |
| <code>&lt;1-2&gt;</code>       | External metric type for default routes, either OSPF External Type 1 or Type 2 metrics. Enter the value 1 or 2.                                                            |
| <code>route-map</code>         | Specifies to use a specific route-map.                                                                                                                                     |
| <code>&lt;route-map&gt;</code> | The route-map name. It is a string comprised of any characters, numbers or symbols.                                                                                        |

**Mode** Router Configuration

**Example** `awplus# configure terminal  
awplus(config)# router ospf 100  
awplus(config-router)# default-information originate always  
metric 23 metric-type 2 route-map myinfo`

**Related commands** [route-map](#)

# default-metric (OSPF)

**Overview** This command sets default metric values for the OSPF routing protocol.

The **no** variant of this command returns OSPF to using built-in, automatic metric translations, as appropriate for each routing protocol.

**Syntax** `default-metric <1-16777214>`  
`no default-metric [<1-16777214>]`

| Parameter                       | Description                                                          |
|---------------------------------|----------------------------------------------------------------------|
| <code>&lt;1-16777214&gt;</code> | Default metric value appropriate for the specified routing protocol. |

**Mode** Router Configuration

**Usage notes** A default metric facilitates redistributing routes even with incompatible metrics. If the metrics do not convert, the default metric provides an alternative and enables the redistribution to continue. The effect of this command is that OSPF will use the same metric value for **all** redistributed routes. Use this command in conjunction with the [redistribute \(OSPF\)](#) command.

**Examples**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# default-metric 100
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no default-metric
```

**Related commands** [redistribute \(OSPF\)](#)

# distance (OSPF)

**Overview** This command sets the administrative distance for OSPF routes based on the route type. Your device uses this value to select between two or more routes to the same destination from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). See the [Route\\_Selection Feature Overview and Configuration Guide](#) for more information.

Use the command **distance ospf** to set the distance for an entire category of OSPF routes, rather than the specific routes that pass an access list.

Use the command **distance <1-255>**, with no other parameter, to set the same distance for all OSPF route types.

The **no** variant of this command sets the administrative distance for all OSPF routes to the default of 110.

**Syntax** `distance <1-255>`  
`distance ospf {external <1-255>|inter-area <1-255>|intra-area <1-255>}`  
`no distance {ospf|<1-255>}`

| Parameter  | Description                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <1 - 255>  | Specify the Administrative Distance value for OSPF routes.                                                                                  |
| external   | Sets the distance for routes from other routing domains, learned by redistribution. Specify an OSPF external distance in the range <1-255>. |
| inter-area | Sets the distance for all routes from one area to another area. Specify an OSPF inter-area distance in the range <1-255>.                   |
| intra-area | Sets the distance for all routes within an area. Specify an OSPF intra-area distance in the range <1-255>.                                  |

**Default** The default OSPF administrative distance is 110. The default Administrative Distance for each type of route (intra, inter, or external) is 110.

**Mode** Router Configuration

**Usage notes** The administrative distance rates the trustworthiness of a routing information source. The distance could be any integer from 0 to 255. A higher distance value indicates a lower trust rating. For example, an administrative distance of 255 indicates that the routing information source cannot be trusted and should be ignored.

Use this command to set the distance for an entire group of routes, rather than a specific route that passes an access list.

**Examples** To set the following administrative distances for route types in OSPF 100:

- 20 for inter-area routes

- 10 for intra-area routes
- 40 for external routes

use the commands:

```
awplus(config)# router ospf 100
```

```
awplus(config-router)# distance ospf inter-area 20 intra-area
10 external 40
```

To set the administrative distance for all routes in OSPF 100 back to the default of 110, use the commands:

```
awplus(config)# router ospf 100
```

```
awplus(config-router)# no distance ospf
```

# distribute-list (OSPF)

**Overview** Use this command to apply filtering to the transfer of routing information between OSPF and the IP route table. You can apply filtering in either direction, from OSPF to the IP route table using an **in** distribute-list or from the IP route table to OSPF using an **out** distribute-list.

The effect of an **in** filter is that some route information that OSPF has learned from LSA updates will not be installed into the IP route table. The effect of an **out** filter is that some route information that could be redistributed to OSPF will not be redistributed to OSPF. See the **Usage** section below for the distinction between the **in** and **out** distribute-lists.

The entities that are used to perform filtering are ACLs or route-maps, which match on certain attributes in the routes that are being transferred.

For information about ACLs and route maps, see the [ACL Feature Overview and Configuration Guide](#) and the [Routemaps Feature Overview and Configuration Guide](#).

The **no** variant of this command removes the configured distribute-list command entry.

**Syntax** `distribute-list {<access-list-name>|route-map  
<route-map-name>} in`  
`distribute-list <access-list-name> out`  
`{bgp|connected|rip|static}`  
`no distribute-list <access-list-name> in`  
`no distribute-list <access-list-name> out`  
`{bgp|connected|rip|static}`

| Parameter          | Description                                                                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <access-list-name> | Specifies the name of the access list. The access list defines which networks are received and which are suppressed.                                                                 |
| in                 | Indicates that this applies to incoming advertised routes.                                                                                                                           |
| out                | Indicates that this applies to outgoing advertised routes.                                                                                                                           |
| <route-map-name>   | The name of the route-map that the distribute-list applies. This defines which networks are installed in the IP route table and which networks are filtered from the IP route table. |
| bgp                | Specify the redistribution of BGP routes.                                                                                                                                            |
| connected          | Specify the redistribution of connected routes.                                                                                                                                      |
| rip                | Specify the redistribution of RIP routes.                                                                                                                                            |
| static             | Specify the redistribution of static routes.                                                                                                                                         |

**Mode** Router Configuration

**Usage notes** There are **in** and **out** distribute-lists, which carry out different route filtering activities:

- The **in** distribute list is applied to the process of installing OSPF routes into the IP route table. The SPF calculations generate a set of routes calculated from the LSA database. By default, all of these routes become OSPF's candidate routes for inclusion into the IP route table.
- An **in** distribute-list can be used to control whether or not certain routes generated by the SPF calculation are included into the set of candidates for inclusion into the IP route table. Those routes that match **deny** entries in the distribute-list will not be considered for inclusion into the IP route table.
- The **out** distribute-list applies the process of redistributing non-OSPF routes into OSPF. If OSPF redistribution is configured, and an **out** distribute-list is also configured, then routes that match deny entries in the distribute-list will not be redistributed into OSPF.

**Examples** The following example shows the installation of OSPF routes into the IP route table with route map "mymap1" applied, which will process routes that have been tagged 100:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match tag 100
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# distribute-list route-map mymap1 in
```

Use the following commands to configure a route-map to specifically prevent OSPF from offering 192.168.1.0/24 as a candidate for inclusion into the IP route table:

```
awplus# configure terminal
awplus(config)# ip prefix-list 100 seq 5 permit 192.168.1.0/24
awplus(config)# route-map 100 deny 10
awplus(config-route-map)# match ip address prefix-list 100
awplus(config-route-map)# exit
awplus(config)# route-map 100 permit 20
awplus(config-router)# router ospf 1
awplus(config-router)# distribute-list route-map 100 in
```

The following example shows the distribution of BGP routing updates into OSPF, based on the access list "myacl1" that is defined to permit network 172.10.0.0:

```
awplus# configure terminal
awplus(config)# access-list standard myacl1 permit
172.10.0.0/16
awplus(config)# router ospf 100
awplus(config-router)# distribute-list myacl1 out bgp
awplus(config-router)# redistribute bgp
```

**Related  
commands**    [match interface](#)  
                  [redistribute \(OSPF\)](#)  
                  [route-map](#)

# enable db-summary-opt

**Overview** This command enables OSPF database summary list optimization.  
The **no** variant of this command disables database summary list optimization.

**Syntax** enable db-summary-opt  
no enable db-summary-opt

**Default** The default setting is disabled.

**Mode** Router Configuration

**Usage** When this feature is enabled, the database exchange process is optimized by removing the LSA from the database summary list for the neighbor, if the LSA instance in the database summary list is the same as, or less recent than, the listed LSA in the database description packet received from the neighbor.

**Examples** To enable OSPF database summary list optimization, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf
awplus(config-router)# enable db-summary-opt
```

To disable OSPF database summary list optimization, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf
awplus(config-router)# no enable db-summary-opt
```

**Validation  
Commands** [show running-config](#)

# host area

**Overview** This command configures a stub host entry belonging to a particular area. You can use this command to advertise specific host routes in the router-LSA as stub link. Since stub host belongs to the specified router, specifying cost is optional.

The **no** variant of this command removes the host area configuration.

**Syntax** `host <ip-address> area <area-id> [cost <0-65535>]`  
`no host <ip-address> area <area-id> [cost <0-65535>]`

| Parameter      | Description                                                                                                                                                                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address>   | The IPv4 address of the host, in dotted decimal notation.                                                                                                                                                                                                                        |
| <area-id>      | The OSPF area ID of the transit area that configuring the stub host entry for. Use one of the following formats: <ul style="list-style-type: none"><li>dotted decimal format, e.g. 0.0.1.2.</li><li>normal decimal format in the range &lt;0-4294967295&gt;, e.g. 258.</li></ul> |
| cost <0-65535> | The cost for the stub host entry.                                                                                                                                                                                                                                                |

**Default** By default, no host entry is configured.

**Mode** Router Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# router ospf 100`  
`awplus(config-router)# host 172.16.10.100 area 1`  
`awplus(config-router)# host 172.16.10.101 area 2 cost 10`

# ip ospf authentication

**Overview** This command sets the authentication method used when sending and receiving OSPF packets on the current VLAN interface. The default is to use no authentication. If no authentication method is specified in this command, then plain text authentication will be used.

The **no** variant of this command disables the authentication.

**Syntax** `ip ospf [<ip-address>] authentication [message-digest|null]`  
`no ip ospf [<ip-address>] authentication`

| Parameter      | Description                                                                                     |
|----------------|-------------------------------------------------------------------------------------------------|
| <ip-address>   | The IP address of the interface.                                                                |
| message-digest | Use the message digest authentication.                                                          |
| null           | Use no authentication. It overrides password or message-digest authentication of the interface. |

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** Use the [ip ospf authentication](#) command to specify a Simple Text password. Use the [ip ospf message-digest-key](#) command to specify MD5 password.

**Example** In this example, VLAN interface `vlan2` is configured to have no authentication. This will override any text or MD5 authentication configured on this interface.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf authentication null
```

**Related commands** [ip ospf authentication-key](#)  
[area authentication](#)  
[ip ospf message-digest-key](#)

# ip ospf authentication-key

**Overview** This command specifies an OSPF authentication password for the neighboring routers.

The **no** variant of this command removes the OSPF authentication password.

**Syntax** `ip ospf [<ip-address>] authentication-key <pswd-long>`  
`no ip ospf [<ip-address>] authentication-key`

| Parameter    | Description                                                                           |
|--------------|---------------------------------------------------------------------------------------|
| <ip-address> | The IPv4 address of the interface, in dotted decimal notation.                        |
| <pswd-long>  | Specifies the authentication password.<br>The string by the end of line will be used. |

**Default** By default, an authentication password is not specified.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command creates a password (key) that is inserted into the OSPF header when AlliedWare Plus™ software originates routing protocol packets. Assign a separate password to each network for different VLAN interfaces. All neighboring routers on the same network with the same password exchange OSPF routing data.

The key can be used only when authentication is enabled for an area. Use the **area authentication** command to enable authentication.

Simple password authentication allows a password to be configured for each area. Configure the routers in the same routing domain with the same password.

**Example** In the following example, an authentication key test is created on VLAN interface `vlan2` in area 0. Note that first authentication is enabled for area 0.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# network 10.10.10.0/24 area 0
awplus(config-router)# area 0 authentication
awplus(config-router)# exit
awplus(config)# interface vlan2
awplus(config-if)# ip ospf 3.3.3.3 authentication-key test
```

**Related commands** [area authentication](#)  
[ip ospf authentication](#)

# ip ospf cost

**Overview** This command explicitly specifies the cost of the link-state metric in a router-LSA. The **no** variant of this command resets the VLAN interface cost to the default.

**Syntax** `ip ospf [<ip-address>] cost <1-65535>`  
`no ip ospf [<ip-address>] cost`

| Parameter    | Description                                                    |
|--------------|----------------------------------------------------------------|
| <ip-address> | The IPv4 address of the interface, in dotted decimal notation. |
| <1-65535>    | The link-state metric.                                         |

**Default** By default there is no static value set and the OSPF cost is automatically calculated by using the [auto-cost reference bandwidth](#) command.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command explicitly sets a user specified cost of sending packets out the interface. Using this command overrides the cost value calculated automatically with the auto-cost reference bandwidth feature.

The interface cost indicates the overhead required to send packets across a certain VLAN interface. This cost is stated in the Router-LSA's link. Typically, the cost is inversely proportional to the bandwidth of an interface. By default, the cost of a VLAN interface is calculated according to the following formula:

$$\text{reference bandwidth} / \text{interface bandwidth}$$

To set the VLAN interface cost manually, use this command.

**Example** The following example shows setting ospf cost to 10 on VLAN interface v lan25 for IP address 10.10.10.50

```
awplus# configure terminal
awplus(config)# interface vlan25
awplus(config-if)# ip ospf 10.10.10.50 cost 10
```

**Related commands** [show ip ospf interface](#)  
[auto-cost reference bandwidth](#)

# ip ospf database-filter

**Overview** This command turns on the LSA database-filter for a particular VLAN interface. The **no** variant of this command turns off the LSA database-filter.

**Syntax** `ip ospf [<ip-address>] database-filter all out`  
`no ip ospf [<ip-address>] database-filter`

| Parameter    | Description                                                    |
|--------------|----------------------------------------------------------------|
| <ip-address> | The IPv4 address of the interface, in dotted decimal notation. |

**Default** By default, all outgoing LSAs are flooded to the interface.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** OSPF floods new LSAs over all interfaces in an area, except the interface on which the LSA arrives. This redundancy ensures robust flooding. However, too much redundancy can waste bandwidth and might lead to excessive link and CPU usage in certain topologies, resulting in destabilizing the network. To avoid this, use the **ip ospf database-filter** command to block flooding of LSAs over specified interfaces.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan1`  
`awplus(config-if# ip ospf database-filter all out`

# ip ospf dead-interval

**Overview** This command sets the interval during which no hello packets are received and after which a neighbor is declared dead.

The dead-interval is the amount of time that OSPF waits to receive an OSPF hello packet from the neighbor before declaring the neighbor is down. This value is advertised in the router's hello packets. It must be a multiple of the hello-interval and be the same for all routers on a specific network.

The **no** variant of this command returns the interval to the default of 40 seconds. If you have configured this command specifying the IP address of the interface and want to remove the configuration, specify the IP address ( **no ip ospf**<ip-address>**dead-interval**).

**Syntax** ip ospf [<ip-address>] dead-interval <1-65535>  
no ip ospf [<ip-address>] dead-interval

| Parameter    | Description                                                    |
|--------------|----------------------------------------------------------------|
| <ip-address> | The IPv4 address of the interface, in dotted decimal notation. |
| <1 - 65545>  | The interval in seconds.<br>Default: 40                        |

**Mode** Interface Configuration for a VLAN interface.

**Example** The following example shows configuring the dead-interval to 10 seconds on the VLAN interface v lan2.

```
awplus# configure terminal
awplus(config)# interface v lan2
awplus(config-if)# ip ospf dead-interval 10
```

**Related commands** [ip ospf hello-interval](#)  
[show ip ospf interface](#)

# ip ospf disable all

**Overview** This command completely disables OSPF packet processing on a VLAN interface. It overrides the [network area](#) command and disables the processing of packets on the specific interface.

Use the **no** variant of this command to restore OSPF packet processing on a selected interface.

**Syntax** ip ospf disable all  
no ip ospf disable all

**Mode** Interface Configuration for a VLAN interface.

**Example** awplus# configure terminal  
awplus(config)# interface vlan2  
awplus(config-if)# ip ospf disable all

# ip ospf hello-interval

- Overview** This command specifies the interval between hello packets.
- The hello-interval is advertised in the hello packets. Configure the same hello-interval for all routers on a specific network. A shorter hello interval ensures faster detection of topological changes, but results in more routing traffic.
- The **no** variant of this command returns the interval to the default of 10 seconds.

**Syntax** `ip ospf [<ip-address>] hello-interval <1-65535>`  
`no ip ospf [<ip-address>] hello-interval`

| Parameter    | Description                                                  |
|--------------|--------------------------------------------------------------|
| <ip-address> | The IP address of the interface, in dotted decimal notation. |
| <1 - 65535>  | The interval in seconds.<br>Default: 10                      |

**Default** The default interval is 10 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Example** The following example shows setting the hello-interval to 3 seconds on VLAN interface vlan2.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf hello-interval 3
```

**Related commands** [ip ospf dead-interval](#)  
[show ip ospf interface](#)

# ip ospf message-digest-key

**Overview** This command registers an MD5 key for OSPF MD5 authentication.

Message Digest Authentication is a cryptographic authentication. A key (password) and key-id are configured on each router. The router uses an algorithm based on the OSPF packet, the key, and the key-id to generate a message digest that gets appended to the packet.

The **no** variant of this command removes the MD5 key.

**Syntax** `ip ospf [<ip-address>] message-digest-key <key-id> md5  
<pswd-long>`  
`no ip ospf [<ip-address>] message-digest-key <key-id>`

| Parameter    | Description                                                                 |
|--------------|-----------------------------------------------------------------------------|
| <ip-address> | The IPv4 address of the interface, in dotted decimal notation.              |
| <key-id>     | A key ID number specified as an integer between 1 and 255.                  |
| md5          | Use the MD5 algorithm.                                                      |
| <pswd-long>  | The OSPF password. This is a string of 1 to 16 characters including spaces. |

**Default** By default, there is no MD5 key registered.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** Use this command for uninterrupted transitions between passwords. It allows you to add a new key without having to delete the existing key. While multiple keys exist, all OSPF packets will be transmitted in duplicate; one copy of the packet will be transmitted for each of the current keys. This is helpful for administrators who want to change the OSPF password without disrupting communication. The system begins a rollover process until all the neighbors have adopted the new password. This allows neighboring routers to continue communication while the network administrator is updating them with a new password. The router will stop sending duplicate packets once it detects that all of its neighbors have adopted the new password.

Maintain only one password per interface, removing the old password whenever you add a new one. This will prevent the local system from continuing to communicate with the system that is using the old password. Removing the old password also reduces overhead during rollover. All neighboring routers on the same network must have the same password value to enable exchange of OSPF routing data.

**Examples** The following example shows OSPF authentication on the VLAN interface vlan5 when IP address has not been specified.

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ip ospf authentication message-digest
awplus(config-if)# ip ospf message-digest-key 1 md5 yourpass
```

The following example shows configuring OSPF authentication on the VLAN interface vlan2 for the IP address 1.1.1.1. (If the interface has two IP addresses assigned-- 1.1.1.1 & 2.2.2.2, OSPF authentication will be enabled only for the IP address 1.1.1.1).

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf 1.1.1.1 authentication
message-digest
awplus(config-if)# ip ospf 1.1.1.1 message-digest-key 2 md5
yourpass
```

# ip ospf mtu

**Overview** This command sets the MTU size for OSPF. Whenever OSPF constructs packets, it uses the interface MTU size as Maximum IP packet size. This command forces OSPF to use the specified value, instead of the actual interface MTU size.

Use the **no** variant of this command to return the MTU size to the default.

**Syntax** `ip ospf mtu <576-65535>`  
`no ip ospf mtu`

**Default** By default, OSPF uses interface MTU derived from the interface.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command allows an administrator to configure the MTU size recognized by the OSPF protocol. It does not configure the MTU settings on the interface.

This command can be useful to ensure the OSPF neighbor relationship can fully establish via a network link, where the neighboring devices may have mismatched interface MTUs.

**Example** To change the OSPF MTU to 1446 on VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf mtu 1446
```

# ip ospf mtu-ignore

**Overview** Use this command to configure OSPF so that OSPF does not check the MTU size during DD (Database Description) exchange.

Use the **no** variant of this command to make sure that OSPF checks the MTU size during DD exchange.

**Syntax** `ip ospf [<ip-address>] mtu-ignore`  
`no ip ospf [<ip-address>] mtu-ignore`

| Parameter    | Description                                                |
|--------------|------------------------------------------------------------|
| <ip-address> | IPv4 address of the interface, in dotted decimal notation. |

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** By default, during the DD exchange process, OSPF checks the MTU size described in the DD packets received from the neighbor. If the MTU size does not match the interface MTU, the neighbor adjacency is not established. Using this command makes OSPF ignore this check and allows establishing of adjacency regardless of MTU size in the DD packet.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip ospf mtu-ignore`

# ip ospf network

**Overview** This command configures the OSPF network type to a type different from the default for the particular VLAN interface.

The **no** variant of this command returns the network type to the default for the particular VLAN interface.

**Syntax** `ip ospf network [broadcast|non-broadcast|point-to-point|point-to-multipoint]`  
`no ip ospf network`

| Parameter           | Description                                   |
|---------------------|-----------------------------------------------|
| broadcast           | Sets the network type to broadcast.           |
| non-broadcast       | Sets the network type to NBMA.                |
| point-to-multipoint | Sets the network type to point-to-multipoint. |
| point-to-point      | Sets the network type to point-to-point.      |

**Default** The default is the broadcast OSPF network type for a VLAN interface.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command forces the interface network type to the specified type. Depending on the network type, OSPF changes the behavior of the packet transmission and the link description in LSAs.

**Example** The following example shows setting the network type to point-to-point on the VLAN interface vlan2.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf network point-to-point
```

# ip ospf priority

**Overview** This command sets the router priority, which is a parameter used in the election of the designated router for the network.

The **no** variant of this command returns the router priority to the default of 1.

**Syntax** `ip ospf [<ip-address>] priority <priority>`  
`no ip ospf [<ip-address>] priority`

| Parameter    | Description                                             |
|--------------|---------------------------------------------------------|
| <ip-address> | The IP address of the interface.                        |
| <priority>   | <0-255> Specifies the Router Priority of the interface. |

**Default** The router priority for an interface is set to 1 by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** Set the priority to help determine the OSPF Designated Router (DR) for a network. If two routers attempt to become the DR, the router with the higher router priority becomes the DR. If the router priority is the same for two routers, the router with the higher router ID takes precedence.

Only routers with nonzero router priority values are eligible to become the designated or backup designated router.

Configure router priority for multi-access networks only and not for point-to-point networks.

**Example** The following example shows setting the OSPF priority value to 3 on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf priority 3
```

**Related commands** [ip ospf network](#)

# ip ospf resync-timeout

**Overview** Use this command to set the interval after which adjacency is reset if out-of-band resynchronization has not occurred. The interval period starts from the time a restart signal is received from a neighbor.

Use the **no** variant of this command to return to the default.

**Syntax** `ip ospf [<ip-address>] resync-timeout <1-65535>`  
`no ip ospf [<ip-address>] resync-timeout`

| Parameter    | Description                                                                |
|--------------|----------------------------------------------------------------------------|
| <ip-address> | The IP address of the interface.                                           |
| <1 - 65535>  | Specifies the resynchronization timeout value of the interface in seconds. |

**Mode** Interface Configuration for a VLAN interface.

**Example** The following example shows setting the OSPF resynchronization timeout value to 65 seconds on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf resync-timeout 65
```

# ip ospf retransmit-interval

**Overview** Use this command to specify the time between link-state advertisement (LSA) retransmissions for adjacencies belonging to the interface.

Use the **no** variant of this command to return to the default of 5 seconds.

**Syntax** `ip ospf [<ip-address>] retransmit-interval <1-65535>`  
`no ip ospf [<ip-address>] retransmit-interval`

| Parameter    | Description                        |
|--------------|------------------------------------|
| <ip-address> | The IP address of the interface.   |
| <1 - 65535>  | Specifies the interval in seconds. |

**Default** The default interval is 5 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** After sending an LSA to a neighbor, the router keeps the LSA until it receives an acknowledgment. In case the router does not receive an acknowledgment during the set time (the retransmit interval value) it retransmits the LSA. Set the retransmission interval value conservatively to avoid needless retransmission. The interval should be greater than the expected round-trip delay between two routers.

**Example** The following example shows setting the `ospf retransmit interval` to 6 seconds on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf retransmit-interval 6
```

# ip ospf transmit-delay

**Overview** Use this command to set the estimated time it takes to transmit a link-state-update packet on the VLAN interface.

Use the **no** variant of this command to return to the default of 1 second.

**Syntax** `ip ospf [<ip-address>] transmit-delay <1-65535>`  
`no ip ospf [<ip-address>] transmit-delay`

| Parameter    | Description                                                      |
|--------------|------------------------------------------------------------------|
| <ip-address> | The IP address of the VLAN interface.                            |
| <1 - 65535>  | Specifies the time, in seconds, to transmit a link-state update. |

**Default** The default interval is 1 second.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** The transmit delay value adds a specified time to the age field of an update. If the delay is not added, the time in which the LSA transmits over the link is not considered. This command is especially useful for low speed links. Add transmission and propagation delays when setting the transmit delay value.

**Example** The following example shows setting the OSPF transmit delay time to 3 seconds on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf transmit-delay 3
```

# max-concurrent-dd

**Overview** Use this command to set the limit for the number of Database Descriptors (DD) that can be processed concurrently.

Use the **no** variant of this command to reset the limit for the number of Database Descriptors (DD) that can be processed concurrently.

**Syntax** max-concurrent-dd <1-65535>  
no max-concurrent-dd

| Parameter | Description                         |
|-----------|-------------------------------------|
| <1-65535> | Specify the number of DD processes. |

**Mode** Router Configuration

**Usage** This command is useful when a router's performance is affected from simultaneously bringing up several OSPF adjacencies. This command limits the maximum number of DD exchanges that can occur concurrently per OSPF instance, thus allowing for all of the adjacencies to come up.

**Example** The following example sets the max-concurrent-dd value to 4, so that only 4 DD exchanges will be processed at a time.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router# max-concurrent-dd 4
```

# maximum-area

**Overview** Use this command to set the maximum number of OSPF areas.

Use the **no** variant of this command to set the maximum number of OSPF areas to the default.

**Syntax** `maximum-area <1-4294967294>`  
`no maximum-area`

| Parameter                         | Description                               |
|-----------------------------------|-------------------------------------------|
| <code>&lt;1-4294967294&gt;</code> | Specify the maximum number of OSPF areas. |

**Default** The default for the maximum number of OSPF areas is 4294967294.

**Mode** Router Configuration

**Usage notes** Use this command in router OSPF mode to specify the maximum number of OSPF areas.

**Examples** The following example sets the maximum number of OSPF areas to 2:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# maximum-area 2
```

The following example removes the maximum number of OSPF areas and resets to default:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no maximum-area
```

# neighbor (OSPF)

**Overview** Use this command to inform the router of other neighboring routers that are connected to the same NBMA network.

Use the **no** variant of this command to remove a configuration.

**Syntax** `neighbor <ip-address> [<cost>]{<priority>|<poll-interval>}`  
`no neighbor <ip-address> [<cost>]{<priority>|<poll-interval>}`

| Parameter                          | Description                                                                                                                                                                                                                   |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code>    | Specifies the interface IP address of the neighbor.                                                                                                                                                                           |
| <code>&lt;priority&gt;</code>      | <i>priority &lt;0-255&gt;</i><br>Specifies the router priority value of the non-broadcast neighbor associated with the specified IP address. The default is 0. This keyword does not apply to point-to-multipoint interfaces. |
| <code>&lt;poll-interval&gt;</code> | <i>poll-interval &lt;1-2147483647&gt;</i><br>Dead neighbor polling interval in seconds. It is recommended to set this value much higher than the hello interval. The default is 120 seconds.                                  |
| <code>&lt;cost&gt;</code>          | <i>cost &lt;1-65535&gt;</i><br>Specifies the link-state metric to this neighbor.                                                                                                                                              |

**Mode** Router Configuration

**Usage** To configure a neighbor on an NBMA network manually, use the `neighbor` command and include one neighbor entry for each known nonbroadcast network neighbor. The IP address used in this command is the neighbor's primary IP address on the interface where that neighbor connects to the NBMA network.

The poll interval is the reduced rate at which routers continue to send hello packets, when a neighboring router has become inactive. Set the poll interval to be much larger than hello interval.

**Examples** This example shows a neighbor configured with a priority value, poll interval time, and cost.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# neighbor 1.2.3.4 priority 1
poll-interval 90
awplus(config-router)# neighbor 1.2.3.4 cost 15
```

# network area

**Overview** Use this command to enable OSPF routing with a specified Area ID on any interfaces with IP addresses that match the specified network address.

Use the **no** variant of this command to disable OSPF routing on the interfaces.

**Syntax** network <network-address> area <area-id>  
no network <network-address> area <area-id>

| Parameter                   | Description                                                                                                                                                                                                                     |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <network-address>           | {<ip-network/m> <ip-addr><br><reverse-mask>}                                                                                                                                                                                    |
| <ip-network/m>              | IP address of the network, entered in the form A.B.C.D/M.<br>Dotted decimal notation followed by a forward slash, and then the subnet mask length.                                                                              |
| <ip-addr><br><reverse-mask> | IPv4 network address, entered in the form A.B.C.D, followed by the mask. Enter the mask as a wildcard, or reverse, mask (e.g. 0.0.0.255). Note that the device displays the mask as a subnet mask in the running configuration. |
| <area-id>                   | {<ip-addr> <0-4294967295>}                                                                                                                                                                                                      |
| <ip-addr>                   | OSPF Area ID in IPv4 address format, in the form A.B.C.D.                                                                                                                                                                       |
| <0-4294967295>              | OSPF Area ID as 4 octets unsigned integer value.                                                                                                                                                                                |

**Default** No **network area** is configured by default.

**Mode** Router Configuration

**Usage notes** OSPF routing can be enabled per IPv4 subnet. The network address can be defined using either the prefix length or a wild card mask. A wild card mask is comprised of consecutive 0's as network bits and consecutive 1's as host bits.

**Examples** The following commands show the use of the **network area** command with OSPF multiple instance support disabled:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# network 10.0.0.0/8 area 3
awplus(config-router)# network 10.0.0.0/8 area 1.1.1.1
```

The following commands disable OSPF routing with Area ID 3 on all interfaces:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no network 10.0.0.0/8 area3
```

# ospf abr-type

**Overview** Use this command to set an OSPF Area Border Router (ABR) type.

Use the **no** variant of this command to revert the ABR type to the default setting (Cisco).

**Syntax** ospf abr-type {cisco|ibm|standard}  
no ospf abr-type {cisco|ibm|standard}

| Parameter | Description                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------|
| cisco     | Specifies an alternative ABR using Cisco implementation (RFC 3509). This is the default ABR type. |
| ibm       | Specifies an alternative ABR using IBM implementation (RFC 3509).                                 |
| standard  | Specifies a standard behavior ABR (RFC 2328).                                                     |

**Default** ABR type Cisco

**Mode** Router Configuration

**Usage** Specifying the ABR type allows better interoperability between different implementations. This command is specially useful in a multi-vendor environment. The different ABR types are:

- Cisco ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and one of them is the backbone area.
- IBM ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and the backbone area is configured. In this case the configured backbone need not be actively connected.
- Standard ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached to it.

**Example** awplus# configure terminal  
awplus(config)# router ospf 100  
awplus(config-router)# ospf abr-type ibm

# ospf restart grace-period

**Overview** Use this command to configure the grace-period for restarting OSPF routing.  
Use the **no** variant of this command to revert to the default grace-period.

**Syntax** ospf restart grace-period <1-1800>  
no ospf restart grace-period

| Parameter  | Description                            |
|------------|----------------------------------------|
| <1 - 1800> | Specifies the grace period in seconds. |

**Default** In the AlliedWare Plus™ OSPF implementation, the default OSPF grace-period is 180 seconds.

**Mode** Global Configuration

**Usage notes** Use this command to enable the OSPF Graceful Restart feature and set the restart grace-period. Changes from the default restart grace-period are displayed in the running- config. The restart grace-period is not displayed in the running-config if it has been reset to the default using the **no** variant of this command.

When a master failover happens on a VCStack, the grace-period will be the longer of the default value (180 seconds) and the configured value from this command. Therefore, the configured grace-period value will only be used in a master failover if it is longer than 180 seconds.

**Example** To set the OSPF restart grace-period to 250 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ospf restart grace-period 250
```

To reset the OSPF restart grace-period to the default (180 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no ospf restart grace-period
```

**Validation Commands** [show running-config](#)

**Related commands** [ospf restart helper](#)  
[restart ospf graceful](#)

# ospf restart helper

**Overview** Use this command to configure the **helper** behavior for the OSPF Graceful Restart feature.

Use the **no** variant of this command to revert to the default grace-period.

**Syntax** `ospf restart helper {max-grace-period  
<grace-period>|only-reload|only-upgrade}  
ospf restart helper {never router-id <router-id>}  
no ospf restart helper [max-grace-period]`

| Parameter        | Description                                                                                                                       |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| max-grace-period | Specify help if received grace-period is less than a specified value.                                                             |
| <grace-period>   | Maximum grace period accepted in seconds in range <1-1800>.                                                                       |
| never            | Specify the local policy to never to act as a helper for this feature.                                                            |
| only-reload      | Specify help only on software reloads not software upgrades.                                                                      |
| only-upgrade     | Specify help only on software upgrades not software reloads.                                                                      |
| router-id        | Enter the router-id keyword to specify the OSPF Router ID that is never to act as a helper for the OSPF Graceful Restart feature. |
| <router-id>      | <A.B.C.D><br>Specify the OSPF Router ID in dotted decimal format A.B.C.D                                                          |

**Default** In the AlliedWare Plus™ OSPF implementation, the default OSPF grace-period is 180 seconds.

**Mode** Global Configuration

**Usage** The **ospf restart helper** command requires at least one parameter, but you may use more than one in the same command (excluding parameter **never**).

The **no** version of this command turns off the OSPF restart helper, while the **no ospf restart helper max-grace-period** command resets the max-grace-period, rather than the helper policy itself.

**Example**

```
awplus# configure terminal
awplus(config)# ospf restart helper only-reload
awplus# configure terminal
awplus(config)# ospf restart helper never router-id 10.10.10.1
awplus# configure terminal
awplus(config)# no ospf restart helper max-grace-period
```

**Related  
commands**   ospf restart grace-period  
                 restart ospf graceful

# ospf router-id

**Overview** Use this command to specify a router ID for the OSPF process.  
Use the **no** variant of this command to disable this function.

**Syntax** ospf router-id *<ip-address>*  
no ospf router-id

| Parameter                 | Description                                     |
|---------------------------|-------------------------------------------------|
| <i>&lt;ip-address&gt;</i> | Specifies the router ID in IPv4 address format. |

**Mode** Router Configuration

**Usage** Configure each router with a unique router-id. In an OSPF router process that has active neighbors, a new router-id takes effect at the next reload or when you restart OSPF manually.

**Example** The following example shows a specified router ID 2.3.4.5.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# ospf router-id 2.3.4.5
```

**Related commands** [show ip ospf](#)

# overflow database

**Overview** Use this command to limit the maximum number of Link State Advertisements (LSAs) that can be supported by the current OSPF instance.

Use the **no** variant of this command to have no limit on the maximum number of LSAs.

**Syntax** `overflow database <0-4294967294> {hard|soft}`  
`no overflow database`

| Parameter      | Description                                                                |
|----------------|----------------------------------------------------------------------------|
| <0-4294967294> | The maximum number of LSAs.                                                |
| hard           | Shutdown occurs if the number of LSAs exceeds the specified value.         |
| soft           | Warning message appears if the number of LSAs exceeds the specified value. |

**Mode** Router Configuration

**Usage** Use **hard** with this command if a shutdown is required if the number of LSAs exceeds the specified number. Use **soft** with this command if a shutdown is not required, but a warning message is required, if the number of LSAs exceeds the specified number.

**Example** The following example shows setting the database overflow to 500, and a shutdown to occur, if the number of LSAs exceeds 500.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# overflow database 500 hard
```

# overflow database external

**Overview** Use this command to configure the size of the external database and the time the router waits before it tries to exit the overflow state.

Use the **no** variant of this command to revert to default.

**Syntax** `overflow database external <max-lsas> <recover-time>`  
`no overflow database external`

| Parameter                         | Description                                                                                                                                                                                                                  |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;max-lsas&gt;</code>     | <code>&lt;0-2147483647&gt;</code> The maximum number of Link State Advertisements (LSAs). Note that this value should be the same on all routers in the AS.                                                                  |
| <code>&lt;recover-time&gt;</code> | <code>&lt;0-65535&gt;</code> the number of seconds the router waits before trying to exit the database overflow state. If this parameter is 0, router exits the overflow state only after an explicit administrator command. |

**Mode** Router Configuration

**Usage** Use this command to limit the number of AS-external-LSAs a router can receive, once it is in the wait state. It takes the number of seconds specified as the `<recover-time>` to recover from this state.

**Example** The following example shows setting the maximum number of LSAs to 5 and the time to recover from overflow state to be 3:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# overflow database external 50 3
```

# passive-interface (OSPF)

**Overview** Use this command to suppress the sending of Hello packets on all interfaces, or on a specified interface. If you use the **passive-interface** command without the optional parameters then **all** interfaces are put into passive mode.

Use the **no** variant of this command to allow the sending of Hello packets on all interfaces, or on the specified interface. If you use the **no** variant of this command without the optional parameters then **all** interfaces are removed from passive mode.

**Syntax** `passive-interface [<interface>][<ip-address>]`  
`no passive-interface [<interface>][<ip-address>]`

| Parameter    | Description                                               |
|--------------|-----------------------------------------------------------|
| <interface>  | The name of the interface.                                |
| <ip-address> | IP address of the interface, entered in the form A.B.C.D. |

**Mode** Router Configuration

**Usage notes** Configure an interface to be passive if you wish its connected route to be treated as an OSPF route (rather than an AS-external route), but do not wish to actually exchange any OSPF packets via this interface.

**Examples** To configure passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# passive-interface
```

To remove passive interface mode on interface vlan2, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# no passive-interface vlan2
```

To remove passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# no passive-interface
```

# redistribute (OSPF)

**Overview** Use this command to redistribute routes from other routing protocols, static routes and connected routes into an OSPF routing table.

Use the **no** variant of this command to disable this function.

**Syntax** `redistribute {bgp|connected|rip|static} {metric  
<0-16777214>|metric-type {1|2}|route-map <name>|tag  
<0-4294967295>}`  
`no redistribute {bgp|connected|rip|static} {metric  
<0-16777214>|metric-type {1|2}|route-map <name>|tag  
<0-4294967295>}`

| Parameter   | Description                                                            |
|-------------|------------------------------------------------------------------------|
| bgp         | Specifies that this applies to the redistribution of BGP routes.       |
| connected   | Specifies that this applies to the redistribution of connected routes. |
| rip         | Specifies that this applies to the redistribution of RIP routes.       |
| static      | Specifies that this applies to the redistribution of static routes.    |
| metric      | Specifies the external metric.                                         |
| metric-type | Specifies the external metric-type.                                    |
| route-map   | Specifies name of the route-map.                                       |
| tag         | Specifies the external route tag.                                      |

**Default** The default metric value for routes redistributed into OSPF is 20. The metric can also be defined using the [set metric](#) command for a route map. Note that a metric defined using the [set metric](#) command for a route map overrides a metric defined with this command.

**Mode** Router Configuration

**Usage notes** You use this command to inject routes, learned from other routing protocols, into the OSPF domain to generate AS-external-LSAs. If a route-map is configured by this command, then that route-map is used to control which routes are redistributed and can set metric and tag values on particular routes.

The metric, metric-type, and tag values specified on this command are applied to any redistributed routes that are not explicitly given a different metric, metric-type, or tag value by the route map.

See the [OSPF Feature Overview and Configuration Guide](#) for more information about metrics, and about behavior when configured in route maps.

Note that this command does not redistribute the default route. To redistribute the default route, use the [default-information originate](#) command.

**Example** The following example shows redistribution of BGP routes into OSPF routing table 100, with metric 12.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# redistribute bgp metric 12
```

The following example shows the configuration of a route-map named rmap2, which is then applied using the **redistribute route-map** command, so routes learned via interface vlan1 can be redistributed as type-1 external LSAs:

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 3
awplus(config-route-map)# match interface vlan1
awplus(config-route-map)# set metric-type 1
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# redistribute rip route-map rmap2
```

Note that configuring a route-map and applying it with the **redistribute route-map** command allows you to filter which routes are distributed from another routing protocol (such as RIP). A route-map can also set the metric, tag, and metric-type of the redistributed routes.

**Related commands**

- [distribute-list \(OSPF\)](#)
- [match interface](#)
- [route-map](#)
- [show ip ospf database external](#)

# restart ospf graceful

**Overview** Use this command to force the OSPF process to restart, and optionally set the grace-period.

**Syntax** `restart ospf graceful [grace-period <1-1800>]`

| Parameter    | Description                  |
|--------------|------------------------------|
| grace-period | Specify the grace period.    |
| <1-1800>     | The grace period in seconds. |

**Default** In the AlliedWare Plus™ OSPF implementation, the default OSPF grace-period is 180 seconds.

**Mode** Privileged Exec

**Usage notes** After this command is executed, the OSPF process immediately shuts down. It notifies the system that OSPF has performed a graceful shutdown. Routes installed by OSPF are preserved until the grace-period expires.

When a **restart ospf graceful** command is issued, the OSPF configuration is reloaded from the last saved configuration. Ensure you first enter the command [copy running-config startup-config](#).

When a master failover happens on a VCStack, the grace-period will be the longer of the default value (180 seconds) and the configured value from this command. Therefore, the configured grace-period value will only be used in a master failover if it is longer than 180 seconds.

**Example**

```
awplus# copy running-config startup-config
awplus# restart ospf graceful grace-period 200
```

**Related commands** [ospf restart grace-period](#)  
[ospf restart helper](#)

# router ospf

**Overview** Use this command to enter Router Configuration mode to configure an OSPF routing process. You must specify the process ID with this command for multiple OSPF routing processes on the device.

Use the **no** variant of this command to terminate an OSPF routing process.

Use the **no** parameter with the **process-id** parameter, to terminate and delete a specific OSPF routing process. If no **process-id** is specified on the **no** variant of this command, then all OSPF routing processes are terminated, and all OSPF configuration is removed.

**Syntax** router ospf [<process-id>]  
no router ospf [<process-id>]

**Syntax (VRF-lite)** router ospf [<process-id>] [<vrf-instance>]  
no router ospf [<process-id>]

| Parameter      | Description                                                                  |
|----------------|------------------------------------------------------------------------------|
| <process-id>   | A positive number from 1 to 65535, that is used to define a routing process. |
| <vrf-instance> | The VRF instance to be associated with the OSPF routing process.             |

**Default** No routing process is defined by default.

**Mode** Global Configuration

**Usage notes** The process ID of OSPF is an optional parameter for the **no** variant of this command only. When removing all instances of OSPF, you do not need to specify each Process ID, but when removing particular instances of OSPF you must specify each Process ID to be removed.

When using VRF-lite, this command can be used to associate a process-id with a VRF instance that has been created using the [ip vrf](#) command.

**Example** To enter Router Configuration mode to configure an existing OSPF routing process 100, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)#
```

**Example (VRF-lite)** To enter Router Configuration mode to configure an existing OSPF routing process 100 for VRF instance red, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100 red
awplus(config-router)#
```

# router-id

**Overview** Use this command to specify a router ID for the OSPF process.

Use the **no** variant of this command to force OSPF to use the previous OSPF router-id behavior.

**Syntax** `router-id <ip-address>`  
`no router-id`

| Parameter                       | Description                                     |
|---------------------------------|-------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | Specifies the router ID in IPv4 address format. |

**Mode** Router Configuration

**Usage** Configure each router with a unique router-id. In an OSPF router process that has active neighbors, a new router-id is used at the next reload or when you restart OSPF manually.

**Example** The following example shows a fixed router ID 10.10.10.60

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# router-id 10.10.10.60
```

**Related commands** [show ip ospf](#)

# show debugging ospf

- Overview** Use this command to see what debugging is turned on for OSPF.  
For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).
- Syntax** show debugging ospf
- Mode** User Exec and Privileged Exec
- Example** awplus# show debugging ospf
- Output** Figure 27-2: Example output from the **show debugging ospf** command

```
OSPF debugging status:
 OSPF packet Link State Update debugging is on
 OSPF all events debugging is on
```

# show ip ospf

**Overview** Use this command to display general information about all OSPF routing processes. Include the process ID parameter with this command to display information about specified instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip ospf  
show ip ospf <process-id>

| Parameter    | Description                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <process-id> | <0-65535> The ID of the router process for which information will be displayed. If this parameter is included, only the information for the specified routing process is displayed. |

**Mode** User Exec and Privileged Exec

**Examples** To display general information about all OSPF routing processes, use the command:

```
awplus# show ip ospf
```

To display general information about OSPF routing process 100, use the command:

```
awplus# show ip ospf 100
```

**Table 1:** Example output from the **show ip ospf** command

```
Route Licence: Route : Limit=0, Allocated=0, Visible=0, Internal=0
Route Licence: Breach: Current=0, Watermark=0
Routing Process "ospf 10" with ID 192.168.1.1
Process uptime is 10 hours 24 minutes
Process bound to VRF default
Conforms to RFC2328, and RFC1583 Compatibility flag is disabled
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Graceful Restart
SPF schedule delay min 0.500 secs, SPF schedule delay max 50.0 secs
Refresh timer 10 secs
Number of incoming current DD exchange neighbors 0/5
Number of outgoing current DD exchange neighbors 0/5
Number of external LSA 0. Checksum 0x000000
Number of opaque AS LSA 0. Checksum 0x000000
Number of non-default external LSA 0
```

**Table 1:** Example output from the **show ip ospf** command (cont.)

```
External LSA database is unlimited.
Number of LSA originated 0
Number of LSA received 0
Number of areas attached to this router: 2
 Area 0 (BACKBONE) (Inactive)
 Number of interfaces in this area is 0(0)
 Number of fully adjacent neighbors in this area is 0
 Area has no authentication
 SPF algorithm executed 0 times
 Number of LSA 0. Checksum 0x000000

 Area 1 (Inactive)
 Number of interfaces in this area is 0(0)
 Number of fully adjacent neighbors in this area is 0
 Number of fully adjacent virtual neighbors through this area is 0
 Area has no authentication
 SPF algorithm executed 0 times
 Number of LSA 0. Checksum 0x000000
```

**Table 2:** Example output from the **show ip ospf <process-id>** command

```
Routing Process "ospf 100" with ID 10.10.11.146
Process uptime is 0 minute
Conforms to RFC2328, and RFC1583Compatibility flag is disabled
Supports only single TOS(TOS0) routes
Supports opaque LSA
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Refresh timer 10 secs
Number of external LSA 0. Checksum Sum 0x0
Number of non-default external LSA 0
External LSA database is unlimited.
Number of areas attached to this router: 1
 Area 1
 Number of interfaces in this area is 1(1)
 Number of fully adjacent neighbors in this area is 0
 Number of fully adjacent virtual neighbors through this area is 0
 Area has no authentication
 SPF algorithm executed 0 times
 Number of LSA 1. Checksum Sum 0x00e3e2
```

**Table 3:** Parameters in the output of the **show ip ospf** command

| Output Parameter        |           | Meaning                                                                 |
|-------------------------|-----------|-------------------------------------------------------------------------|
| Route Licence: Route:   | Limit     | The maximum number of OSPF routes which may be used for forwarding.     |
|                         | Allocated | The current total number of OSPF routes allocated in the OSPF module.   |
|                         | Visible   | The current number of OSPF routes which may be used for forwarding.     |
|                         | Internal  | The number of OSPF internal routes used for calculating paths to ASBRs. |
| Number of external LSA  |           | The number of external link-state advertisements                        |
| Number of opaque AS LSA |           | Number of opaque link-state advertisements                              |

**Related commands** [router ospf](#)

# show ip ospf border-routers

**Overview** Use this command to display the ABRs and ASBRs for all OSPF instances. Include the process ID parameter with this command to view data about specified instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip ospf border-routers  
show ip ospf *<process-id>* border-routers

| Parameter                 | Description                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------|
| <i>&lt;process-id&gt;</i> | <i>&lt;0-65535&gt;</i> The ID of the router process for which information will be displayed. |

**Mode** User Exec and Privileged Exec

**Output** Figure 27-3: Example output from the **show ip ospf border-routers** command

```
OSPF process 1 internal Routing Table
Codes: i - Intra-area route, I - Inter-area route
i 10.15.0.1 [10] via 10.10.0.1, vlan2, ASBR, Area 0.0.0.0
i 172.16.10.1 [10] via 10.10.11.50, vlan3, ABR, ASBR, Area
0.0.0.0
```

# show ip ospf database

**Overview** Use this command to display a database summary for OSPF information. Include the process ID parameter with this command to display information about specified instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf [<process-id>] database`  
`[self-originate|max-age|adv router <adv-router-id>]`

| Parameter       | Description                                                                                                                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <process-id>    | <0-65535> The ID of the router process for which information will be displayed.                                                                                                                              |
| self-originate  | Displays self-originated link states.                                                                                                                                                                        |
| max-age         | Displays LSAs in MaxAge list. It maintains the list of the all LSAs in the database which have reached the max-age which is 3600 seconds.                                                                    |
| adv-router      | Advertising Router LSA.                                                                                                                                                                                      |
| <adv-router-id> | The Advertising Router ID (usually entered in IPv4 address format A.B.C.D).<br>Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format. |

**Mode** User Exec and Privileged Exec

**Examples** To display the ABRs and ASBRs for all OSPF instances, use the command:

```
awplus# show ip ospf border-routers
```

To display the ABRs and ASBRs for the specific OSPF instance 721, use the command:

```
awplus# show ip ospf 721 border-routers
```

**Output** Figure 27-4: Example output from the **show ip ospf database** command

|                                               |             |     |            |        |      |

# show ip ospf database asbr-summary

**Overview** Use this command to display information about the Autonomous System Boundary Router (ASBR) summary LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus”\\_Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database asbr-summary [<ip-addr>]  
[self-originate|adv-router <advrouter-ip-addr>]`

| Parameter                         | Description                                    |
|-----------------------------------|------------------------------------------------|
| <ip-addr>                         | A link state ID, as an IP address.             |
| self-originate                    | Displays self-originated link states.          |
| adv-router<br><advrouter-ip-addr> | Displays all the LSAs of the specified router. |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip ospf database asbr-summary 1.2.3.4  
self-originate`  
`awplus# show ip ospf database asbr-summary self-originate`  
`awplus# show ip ospf database asbr-summary 1.2.3.4 adv-router  
2.3.4.5`

# show ip ospf database external

**Overview** Use this command to display information about the external LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database external adv-router [<adv-router-id>]  
[self-originate|adv-router<adv-router-id>]`

| Parameter        | Description                                                                                                                                                                                                  |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| adv-router       | Displays all the LSAs of the specified router.                                                                                                                                                               |
| self-originate   | Displays self-originated link states.                                                                                                                                                                        |
| <adv-router- id> | The Advertising Router ID (usually entered in IPv4 address format A.B.C.D).<br>Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format. |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip ospf database external 1.2.3.4 self-originate`  
`awplus# show ip ospf database external self-originate`  
`awplus# show ip ospf database external 1.2.3.4 adv-router 2.3.4.5`

**Output** Figure 27-6: Example output from the **show ip ospf database external self-originate** command

```
OSPF Router process 100 with ID (10.10.11.50)
 AS External Link States
 LS age: 298
 Options: 0x2 (*|-|-|-|-|E|-)
 LS Type: AS-external-LSA

```

# show ip ospf database network

**Overview** Use this command to display information about the network LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database network [<adv-router-id>]  
[self-originate|<adv-router-id>]`

| Parameter       | Description                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------|
| <adv-router-id> | The router ID of the advertising router, in IPv4 address format. Note however, that this no longer represents a real address. |
| self-originate  | Displays self-originated link states.                                                                                         |
| adv-router      | Displays all the LSAs of the specified router.                                                                                |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip ospf database network 1.2.3.4 self-originate`  
`awplus# show ip ospf database network self-originate`  
`awplus# show ip ospf database network 1.2.3.4 adv-router 2.3.4.5`

**Output** Figure 27-8: Example output from the **show ip ospf database network** command

```
OSPF Router process 200 with ID (192.30.30.2)
 Net Link States (Area 0.0.0.0)
LS age: 1387
Options: 0x2 (*|-|-|-|-|E|-)
LS Type: network-LSA
Link State ID: 192.10.10.9 (address of Designated Router)
Advertising Router: 192.30.30.3
LS Seq Number: 80000001
Checksum: 0xe1b0
Length: 32
Network Mask: /24
 Attached Router: 192.20.20.1
 Attached Router: 192.30.30.3
OSPF Router process 200 with ID (192.30.30.2)
 Net Link States (Area 0.0.0.0)
...
```

# show ip ospf database nssa-external

**Overview** Use this command to display information about the NSSA external LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database nssa-external [<ip-address>]  
[self-originate|<advrouter>]`

| Parameter      | Description                                    |
|----------------|------------------------------------------------|
| <advrouter>    | adv-router <ip-address>                        |
| adv-router     | Displays all the LSAs of the specified router. |
| <ip-address>   | A link state ID, as an IP address.             |
| self-originate | Displays self-originated link states.          |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip ospf database nssa-external 1.2.3.4  
self-originate`

`awplus# show ip ospf database nssa-external self-originate`

`awplus# show ip ospf database nssa-external 1.2.3.4 adv-router  
2.3.4.5`

**Output** Figure 27-9: Example output from the **show ip ospf database nssa-external adv-router** command

```
OSPF Router process 100 with ID (10.10.11.50)
 NSSA-external Link States (Area 0.0.0.0)
 NSSA-external Link States (Area 0.0.0.1 [NSSA])
LS age: 78
Options: 0x0 (*|-|-|-|-|-|-)

# show ip ospf database opaque-area

**Overview** Use this command to display information about the area-local (link state type 10) scope LSAs. Type-10 Opaque LSAs are not flooded beyond the borders of their associated area.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database opaque-area [<ip-address>]  
[self-originate|<advrouter>]`

| Parameter      | Description                                    |
|----------------|------------------------------------------------|
| <advrouter>    | adv-router <ip-address>                        |
| adv-router     | Displays all the LSAs of the specified router. |
| <ip-address>   | A link state ID, as an IP address.             |
| self-originate | Displays self-originated link states.          |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip ospf database opaque-area 1.2.3.4  
self-originate`  
`awplus# show ip ospf database opaque-area self-originate`  
`awplus# show ip ospf database opaque-area 1.2.3.4 adv-router  
2.3.4.5`

**Output** Figure 27-10: Example output from the **show ip ospf database opaque-area** command

```
OSPF Router process 100 with ID (10.10.11.50)
 Area-Local Opaque-LSA (Area 0.0.0.0)
LS age: 262
Options: 0x2 (*|-|-|-|-|E|-)
LS Type: Area-Local Opaque-LSA
Link State ID: 10.0.25.176 (Area-Local Opaque-Type/ID)
Opaque Type: 10
Opaque ID: 6576
Advertising Router: 10.10.11.50
LS Seq Number: 80000001
Checksum: 0xb413
Length: 26
```

# show ip ospf database opaque-as

**Overview** Use this command to display information about the link-state type 11 LSAs. This type of link-state denotes that the LSA is flooded throughout the Autonomous System (AS).

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip ospf database opaque-as [<ip-address>]  
[self-originate|<advrouter>]

| Parameter      | Description                                    |
|----------------|------------------------------------------------|
| <advrouter>    | adv-router <ip-address>                        |
| adv-router     | Displays all the LSAs of the specified router. |
| <ip-address>   | A link state ID, as an IP address.             |
| self-originate | Displays self-originated link states.          |

**Mode** User Exec and Privileged Exec

**Examples** awplus# show ip ospf database opaque-as 1.2.3.4 self-originate  
awplus# show ip ospf database opaque-as self-originate  
awplus# show ip ospf database opaque-as 1.2.3.4 adv-router  
2.3.4.5

**Output** Figure 27-11: Example output from the **show ip ospf database opaque-as** command

```
OSPF Router process 100 with ID (10.10.11.50)
AS-Global Opaque-LSA
LS age: 325
Options: 0x2 (*|-|-|-|-|E|-)
LS Type: AS-external Opaque-LSA
Link State ID: 11.10.9.23 (AS-external Opaque-Type/ID)
Opaque Type: 11
Opaque ID: 657687
Advertising Router: 10.10.11.50
LS Seq Number: 80000001
Checksum: 0xb018
Length: 25
```

# show ip ospf database opaque-link

**Overview** Use this command to display information about the link-state type 9 LSAs. This type denotes a link-local scope. The LSAs are not flooded beyond the local network.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database opaque-link [<ip-address>]  
[self-originate]<advrouter>]`

| Parameter      | Description                                    |
|----------------|------------------------------------------------|
| <advrouter>    | adv-router <ip-address>                        |
| adv-router     | Displays all the LSAs of the specified router. |
| <ip-address>   | A link state ID, as an IP address.             |
| self-originate | Displays self-originated link states.          |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip ospf database opaque-link 1.2.3.4  
self-originate`  
`awplus# show ip ospf database opaque-link self-originate`  
`awplus# show ip ospf database opaque-link 1.2.3.4 adv-router  
2.3.4.5`

**Output** Figure 27-12: Example output from the **show ip ospf database opaque-link** command

```
OSPF Router process 100 with ID (10.10.11.50)
 Link-Local Opaque-LSA (Link hme0:10.10.10.50)
LS age: 276
Options: 0x2 (*| -| -| -| -| E| -)
LS Type: Link-Local Opaque-LSA
Link State ID: 10.0.220.247 (Link-Local Opaque-Type/ID)
Opaque Type: 10
Opaque ID: 56567
Advertising Router: 10.10.11.50
LS Seq Number: 80000001
Checksum: 0x744e
Length: 26
 Link-Local Opaque-LSA (Link hme1:10.10.11.50)
```

# show ip ospf database router

**Overview** Use this command to display information only about the router LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database router [<adv-router-id>  
self-originate|<adv-router-id>]`

| Parameter        | Description                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------|
| adv-router       | Displays all the LSAs of the specified router.                                                                                |
| self-originate   | Displays self-originated link states.                                                                                         |
| <adv-router- id> | The router ID of the advertising router, in IPv4 address format. Note however, that this no longer represents a real address. |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip ospf database router 1.2.3.4 self-originate`  
`awplus# show ip ospf database router self-originate`  
`awplus# show ip ospf database router 1.2.3.4 adv-router 2.3.4.5`

**Output** Figure 27-13: Example output from the **show ip ospf database router** command

```
OSPF Router process 100 with ID (10.10.11.50)

# show ip ospf interface

**Overview** Use this command to display interface information for OSPF.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** show ip ospf interface [*<interface-name>*]

| Parameter                     | Description                       |
|-------------------------------|-----------------------------------|
| <i>&lt;interface-name&gt;</i> | The VLAN name, for example vlan3. |

**Mode** User Exec and Privileged Exec

**Examples** awplus# show ip ospf interface vlan2

**Output** Figure 27-17: Example output from the **show ip ospf interface** command

```
vlan2 is up, line protocol is up
Internet Address 1.1.1.1/24, Area 0.0.0.0, MTU 1500
Process ID 0, Router ID 33.33.33.33, Network Type BROADCAST, Cost: 10
Transmit Delay is 1 sec, State Waiting, Priority 1, TE Metric 0
No designated router on this network
No backup designated router on this network
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
 Hello due in 00:00:02
Neighbor Count is 0, Adjacent neighbor count is 0
Crypt Sequence Number is 1106347721
Hello received 0 sent 1, DD received 0 sent 0
LS-Req received 0 sent 0, LS-Upd received 0 sent 0
LS-Ack received 0 sent 0, Discarded 0
```

# show ip ospf neighbor

**Overview** Use this command to display information on OSPF neighbors. Include the **ospf-id** parameter with this command to display information about specified instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip ospf [*<ospf-id>*] neighbor *<neighbor-ip-addr>* [detail]  
show ip ospf [*<ospf-id>*] neighbor detail [all]  
show ip ospf [*<ospf-id>*] neighbor [all]  
show ip ospf [*<ospf-id>*] neighbor interface *<ip-addr>*

| Parameter                       | Description                                                                     |
|---------------------------------|---------------------------------------------------------------------------------|
| <i>&lt;ospf-id&gt;</i>          | <0-65535> The ID of the router process for which information will be displayed. |
| <i>&lt;neighbor-ip-addr&gt;</i> | The Neighbor ID, entered as an IP address.                                      |
| all                             | Include downstatus neighbor.                                                    |
| detail                          | Detail of all neighbors.                                                        |
| <i>&lt;ip-addr&gt;</i>          | IP address of the interface.                                                    |

**Mode** User Exec and Privileged Exec

**Examples** awplus# show ip ospf neighbor detail  
awplus# show ip ospf neighbor 1.2.3.4  
awplus# show ip ospf neighbor interface 10.10.10.50 detail all

**Output** Note that before a device enters OSPF Graceful Restart it first informs its OSPF neighbors. In the **show** output, the \* symbol beside the **Dead Time** parameter indicates that the device has been notified of a neighbor entering the graceful restart state, as shown in the figures below.

Figure 27-18: Example output from the **show ip ospf neighbor** command

|                                |     |             |           |             |           |
|--------------------------------|-----|-------------|-----------|-------------|-----------|
| OSPF process 1:                |     |             |           |             |           |
| Neighbor ID                    | Pri | State       | Dead Time | Address     | Interface |
| 10.10.10.50                    | 1   | Full/DR     | 00:00:38  | 10.10.10.50 | vlan1     |
| OSPF process 100:              |     |             |           |             |           |

# show ip ospf route

**Overview** Use this command to display the OSPF routing table. Include the **ospf-id** parameter with this command to display the OSPF routing table for specified instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip ospf [*<ospf-id>*] route

| Parameter              | Description                                                                                                                                                                                       |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;ospf-id&gt;</i> | <i>&lt;0-65535&gt;</i> The ID of the router process for which information will be displayed. If this parameter is included, only the information for this specified routing process is displayed. |

**Mode** User Exec and Privileged Exec

**Examples** To display the OSPF routing table, use the command:

```
awplus# show ip ospf route
```

**Output** Figure 27-21: Example output from the **show ip ospf route** command for a specific process

```
OSPF process 1:
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
 N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
 E1 - OSPF external type 1, E2 - OSPF external type 2
O 10.10.0.0/24 [10] is directly connected, vlan1, Area 0.0.0.0
O 10.10.11.0/24 [10] is directly connected, vlan2, Area 0.0.0.0
O 10.10.11.100/32 [10] is directly connected, lo, Area 0.0.0.0
E2 10.15.0.0/24 [10/50] via 10.10.0.1, vlan1
IA 172.16.10.0/24 [30] via 10.10.11.50, vlan2, Area 0.0.0.0

# show ip ospf virtual-links

**Overview** Use this command to display virtual link information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip ospf virtual-links

**Mode** User Exec and Privileged Exec

**Examples** To display virtual link information, use the command:

```
awplus# show ip ospf virtual-links
```

**Output** Figure 27-22: Example output from the **show ip ospf virtual-links** command

```
Virtual Link VLINK0 to router 10.10.0.9 is up
 Transit area 0.0.0.1 via interface vlan5
 Transmit Delay is 1 sec, State Point-To-Point,
 Timer intervals configured, Hello 10, Dead 40, Wait 40,
 Retransmit 5
 Hello due in 00:00:02
 Adjacency state Full
Virtual Link VLINK1 to router 10.10.0.123 is down
 Transit area 0.0.0.1 via interface *
 Transmit Delay is 1 sec, State Down,
 Timer intervals configured, Hello 10, Dead 40, Wait 40,
 Retransmit 5
 Hello due in inactive
 Adjacency state Down
```

# show ip protocols ospf

**Overview** Use this command to display OSPF process parameters and statistics.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip protocols ospf

**Mode** User Exec and Privileged Exec

**Examples** To display OSPF process parameters and statistics, use the command:

```
awplus# show ip protocols ospf
```

**Output** Figure 27-23: Example output from the **show ip protocols ospf** command

```
Routing Protocol is "ospf 200"
 Invalid after 0 seconds, hold down 0, flushed after 0
 Outgoing update filter list for all interfaces is
 Redistributed kernel filtered by filter1
 Incoming update filter list for all interfaces is
 Redistributing: kernel
 Routing for Networks:
 192.30.30.0/24
 192.40.40.0/24
 Routing Information Sources:
 Gateway Distance Last Update
 Distance: (default is 110)
 Address Mask Distance List
```

# summary-address

**Overview** Use this command to summarize, or possibly suppress, external routes that have the specified address range.

Use the **no** variant of this command to stop summarizing, or suppressing, external routes that have the specified address range.

**Syntax** `summary-address <ip-addr/prefix-length> [not-advertise] [tag <0-4294967295>]`  
`no summary-address <ip-addr/prefix-length> [not-advertise] [tag <0-4294967295>]`

| Parameter                                  | Description                                                                                                                                                                                   |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-addr/prefix-length&gt;</code> | Specifies the base IP address of the summary address. The range of addresses given as IPv4 starting address and a prefix length.                                                              |
| <code>not-advertise</code>                 | Set the <b>not-advertise</b> option if you do not want OSPF to advertise either the summary address or the individual networks within the range of the summary address.                       |
| <code>tag &lt;0-4294967295&gt;</code>      | The tag parameter specifies the tag value that OSPF places in the AS external LSAs created as a result of redistributing the summary route. The tag overrides tags set by the original route. |

**Default** The default tag value for a summary address is 0.

**Mode** Router Configuration

**Usage notes** An address range is a pairing of an address and a mask that is almost the same as IP network number. For example, if the specified address range is 192.168.0.0/255.255.240.0, it matches: 192.168.1.0/24, 192.168.4.0/22, 192.168.8.128/25 and so on.

Redistributing routes from other protocols into OSPF requires the router to advertise each route individually in an external LSA. Use the **summary address** command to advertise one summary route for all redistributed routes covered by a specified network address and mask. This helps decrease the size of the OSPF link state database.

Ensure OSPF routes exist in the summary address range for advertisement before using this command.

**Example** The following example uses the **summary-address** command to aggregate external LSAs that match the network 172.16.0.0/16 and assign a Tag value of 3.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# summary-address 172.16.0.0/16 tag 3
```

## timers spf exp

**Overview** Use this command to adjust route calculation timers using exponential back-off delays.

Use **no** form of this command to return to the default exponential back-off timer values.

**Syntax** `timers spf exp <min-holdtime> <max-holdtime>`  
`no timers spf exp`

| Parameter                         | Description                                                                                                                                                                                |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;min-holdtime&gt;</code> | <code>&lt;0-2147483647&gt;</code><br>Specifies the minimum delay between receiving a change to the SPF calculation in milliseconds. The default SPF min-holdtime value is 50 milliseconds. |
| <code>&lt;max-holdtime&gt;</code> | <code>&lt;0-2147483647&gt;</code><br>Specifies the maximum delay between receiving a change to the SPF calculation in milliseconds. The default SPF max-holdtime value is 50 seconds.      |

**Mode** Router Configuration

**Default** The default SPF min-holdtime is 50 milliseconds. The default SPF max-holdtime is 40 seconds.

**Usage** This command configures the minimum and maximum delay time between the receipt of a topology change and the calculation of the Shortest Path First (SPF).

**Examples** To set the minimum delay time to 5 milliseconds and maximum delay time to 10 milliseconds, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# timers spf exp 5 10
```

To reset the minimum and maximum delay times to the default values, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no timers spf exp
```

# abr-type

**Overview** Use this command to set an OSPF Area Border Router (ABR) type.

Use the **no** variant of this command to revert the ABR type to the default setting (cisco).

**Syntax** `abr-type {cisco|ibm|standard}`  
`no abr-type {cisco|ibm|standard}`

| Parameter | Description                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------|
| cisco     | Specifies an alternative ABR using Cisco implementation (RFC 3509). This is the default ABR type. |
| ibm       | Specifies an alternative ABR using IBM implementation (RFC 3509).                                 |
| standard  | Specifies a standard behavior ABR (RFC 2328).                                                     |

**Default** ABR type cisco

**Mode** Router Configuration

**Usage notes** Specifying the ABR type allows better interoperability between different implementations. This command is specially useful in a multi-vendor environment. The different ABR types are:

- Cisco ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and one of them is the backbone area.
- IBM ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and the backbone area is configured. In this case the configured backbone need not be actively connected.
- Standard ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached to it.

**Example** To set the ABR type to "ibm" use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# abr-type ibm
```

# area authentication ipsec spi

**Overview** Use this command in Router Configuration mode to enable either MD5 (Message-Digest 5) or SHA1 (Secure Hash Algorithm 1) authentication for a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable the authentication configured for a specified OSPF area.

**Syntax** `area <area-id> authentication ipsec spi <256-4294967295> {md5 <MD5-key>|sha1 <SHA1-key>}`  
`no area <area-id> authentication ipsec spi <256-4294967295>`

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |           |                                                        |                |                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|--------------------------------------------------------|----------------|--------------------------------------------------------------------|
| <area-id>        | The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats:<br><table><tr><td>&lt;ip-addr&gt;</td><td>OSPF area-ID expressed in IPv4 address format A.B.C.D.</td></tr><tr><td>&lt;0-4294967295&gt;</td><td>OSPF area-ID expressed as a decimal number within the range shown.</td></tr></table><br>For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID. | <ip-addr> | OSPF area-ID expressed in IPv4 address format A.B.C.D. | <0-4294967295> | OSPF area-ID expressed as a decimal number within the range shown. |
| <ip-addr>        | OSPF area-ID expressed in IPv4 address format A.B.C.D.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |           |                                                        |                |                                                                    |
| <0-4294967295>   | OSPF area-ID expressed as a decimal number within the range shown.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |           |                                                        |                |                                                                    |
| <256-4294967295> | Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.                                                                                                                                                                                                                                                                                                                                                                                                       |           |                                                        |                |                                                                    |
| md5              | Specify the MD5 (Message-Digest 5) hashing algorithm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |           |                                                        |                |                                                                    |
| <MD5-key>        | Enter an MD5 key containing up to 32 hexadecimal characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |           |                                                        |                |                                                                    |
| sha1             | Specify the SHA-1 (Secure Hash Algorithm 1) hashing algorithm.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |           |                                                        |                |                                                                    |
| <SHA1-key>       | Enter an SHA-1 key containing up to 40 hexadecimal characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |           |                                                        |                |                                                                    |

**Mode** Router Configuration

**Usage notes** Use this command on an OSPFv3 area; use the [area virtual-link authentication ipsec spi](#) command on an OSPFv3 area virtual link. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information and examples.

**NOTE:** You can configure an authentication security policy (SPI) on an OSPFv3 area with this command, or on a VLAN interface with the [ipv6 ospf authentication spi](#) command.

When you configure authentication for an area, the security policy is applied to all VLAN interfaces in the area. However, we recommend a different authentication security policy is applied to each interface for higher security.

If you apply the **ipv6 ospf authentication null** command, this affects authentication configured on both the VLAN interface and the OSPFv3 area.

This is due to OSPFv3 hello messages ingressing VLAN interfaces, which are part of area authentication, not being authenticated. So neighbors time out.

**Example** To enable MD5 authentication with a 32 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 authentication ipsec spi 1000 md5
1234567890ABCDEF1234567890ABCDEF
```

To enable SHA-1 authentication with a 40 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 authentication ipsec spi 1000
sha1 1234567890ABCDEF1234567890ABCDEF12345678
```

To disable authentication for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 authentication ipsec spi 1000
```

## area default-cost (IPv6 OSPF)

**Overview** This command specifies a cost for the default summary route sent into a stub area. The **no** variant of this command removes the assigned default-route cost.

**Syntax** `area <area-id> default-cost <0-16777215>`  
`no area <area-id> default-cost`

| Parameter      | Description                                                                                                                                                                               |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>      | The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats: |
|                | <code>&lt;ip-addr&gt;</code> OSPF area-ID expressed in IPv4 address format A.B.C.D.                                                                                                       |
|                | <code>&lt;0-4294967295&gt;</code> OSPF area-ID expressed as a decimal number within the range shown.                                                                                      |
|                | For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.                                                                                                       |
| default - cost | Indicates the cost for the default summary route used for a stub area.<br>Default: 1                                                                                                      |

**Mode** Router Configuration

**Usage** The default-cost option provides the metric for the summary default route, generated by the area border router, into the stub area. Use this option only on an area border router that is attached to the stub area.

**Example** To set the default cost to 10 in area 1 for the OSPF process P2, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf P2
awplus(config-router)# area 1 default-cost 10
```

**Related commands** [area stub \(IPv6 OSPF\)](#)

# area encryption ipsec spi esp

**Overview** Use this command in Router Configuration mode to enable either AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) or 3DES (Triple Data Encryption Standard) ESP (Encapsulating Security Payload) encryption for a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable the encryption configured for a specified OSPF area.

**Syntax** area <area-id> encryption ipsec spi <256-4294967295> esp  
{aes-cbc <AES-CBC-key>|3des <3DES-key>|null}{md5  
<MD5-key>|sha1 <SHA1-key>}  
no area <area-id> encryption ipsec spi <256-4294967295>

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |           |                                                        |                |                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|--------------------------------------------------------|----------------|--------------------------------------------------------------------|
| <area-id>        | The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats:<br><table><tr><td>&lt;ip-addr&gt;</td><td>OSPF area-ID expressed in IPv4 address format A.B.C.D.</td></tr><tr><td>&lt;0-4294967295&gt;</td><td>OSPF area-ID expressed as a decimal number within the range shown.</td></tr></table><br>For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID. | <ip-addr> | OSPF area-ID expressed in IPv4 address format A.B.C.D. | <0-4294967295> | OSPF area-ID expressed as a decimal number within the range shown. |
| <ip-addr>        | OSPF area-ID expressed in IPv4 address format A.B.C.D.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |           |                                                        |                |                                                                    |
| <0-4294967295>   | OSPF area-ID expressed as a decimal number within the range shown.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |           |                                                        |                |                                                                    |
| <256-4294967295> | Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.                                                                                                                                                                                                                                                                                                                                                                                                       |           |                                                        |                |                                                                    |
| esp              | Specify the esp keyword (Encapsulating Security Payload) to then apply either AES-CBC or 3DES encryption.                                                                                                                                                                                                                                                                                                                                                                                                            |           |                                                        |                |                                                                    |
| aes-cbc          | Specify this keyword to enable AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) encryption.                                                                                                                                                                                                                                                                                                                                                                                                              |           |                                                        |                |                                                                    |
| <AES-CBC-key>    | Enter an AES-CBC key containing either 32, 48, or 64 hexadecimal characters.                                                                                                                                                                                                                                                                                                                                                                                                                                         |           |                                                        |                |                                                                    |
| 3des             | Specify 3DES (Triple Data Encryption Standard) encryption.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |           |                                                        |                |                                                                    |
| <3DES-key>       | Enter a 3DES key containing 48 hexadecimal characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |           |                                                        |                |                                                                    |
| null             | Specify ESP without AES-CBC or 3DES encryption applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |           |                                                        |                |                                                                    |
| md5              | Specify the MD5 (Message-Digest 5) encryption algorithm.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |           |                                                        |                |                                                                    |
| <MD5-key>        | Enter an MD5 key containing 32 hexadecimal characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |           |                                                        |                |                                                                    |
| sha1             | Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |           |                                                        |                |                                                                    |
| <SHA1-key>       | Enter an SHA-1 key containing 40 hexadecimal characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |           |                                                        |                |                                                                    |

**Mode** Router Configuration

**Usage notes** When you issue this command, authentication and encryption are both enabled.

Use this command on an OSPFv3 area, use the [area virtual-link encryption ipsec spi](#) command on an OSPFv3 area virtual link. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Security is achieved using the IPv6 ESP extension header. The IPv6 ESP extension header is used to provide confidentiality, integrity, authentication, and confidentiality. Authentication fields are removed from OSPF for IPv6 packet headers, so applying IPv6 ESP extension headers are required for integrity, authentication, and confidentiality.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information and examples.

**NOTE:** You can configure an encryption security policy (SPI) on an OSPFv3 area with this command, or on a VLAN interface with the [ipv6 ospf encryption spi esp](#) command.

When you configure encryption for an area, the security policy is applied to all VLAN interfaces in the area. However, we recommend a different encryption security policy is applied to each interface for higher security.

If you apply the **ipv6 ospf encryption null** command, this affects encryption configured on both the VLAN interface and the OSPFv3 area.

This is due to OSPFv3 hello messages ingressing VLAN interfaces, which are part of area encryption, not being being encrypted. So neighbors time out.

**Example** To enable ESP encryption, but not apply an AES-CBC key or an 3DES key, and MD5 authentication with a 32 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp null
md5 1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption, but not apply an AES-CBC key or an 3DES key, and SHA-1 authentication with a 40 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp null
sha1 1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with a 48 hexadecimal character 3DES key and a 32 hexadecimal character MD5 authentication for OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp 3des
1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF md5
1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption with a 32 hexadecimal character AES-CBC key, and a 40 hexadecimal character SHA-1 authentication key for OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp
aes-cbc 1234567890ABCDEF1234567890ABCDEF sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To disable ESP encryption for OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 encryption ipsec spi 1000
```

## area range (IPv6 OSPF)

**Overview** Use this command to summarize OSPFv3 routes at an area boundary, configuring an IPv6 address range which consolidates OSPFv3 routes. By default, this feature is not enabled.

A summary route created by this command is then advertised to other areas by the Area Border Routers (ABRs). In this way, routing information is condensed at area boundaries and outside the area so that routes are exchanged between areas in an efficient manner.

If the network numbers in an area are arranged into sets of contiguous routes, the ABRs can be configured to advertise a summary route that covers all the individual networks within the area that fall into the specified range.

The **no** variant of this command disables this function and restores default behavior.

**Syntax** `area <area-id> range <ipv6address/prefix-length> [advertise|not-advertise]`  
`no area <area-id> range <ipv6address/prefix-length>`

| Parameter               | Description                                                                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>               | The OSPFv3 area that you summarizing the routes for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. |
|                         | <A . B . C . D>      OSPF area-ID expressed in IPv4 address format A.B.C.D.                                                                                          |
|                         | <0 - 4294967295>    OSPF area-ID expressed as a decimal number within the range shown.                                                                               |
|                         | For example the values 0.0.1.2 and decimal 258 would both define the same area-ID.                                                                                   |
| <ip-addr/prefix-length> | The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.                                                          |
| advertise               | Advertise this range as a summary route into other areas.                                                                                                            |
| not-advertise           | Do not advertise this range.                                                                                                                                         |

**Default** The area range is not configured by default. The area range is advertised if it is configured.

**Mode** Router Configuration

**Usage notes** You can configure multiple ranges on a single area with multiple instances of this command, so OSPFv3 summarizes addresses for different sets of IPv6 address ranges.

Ensure OSPFv3 IPv6 routes exist in the area range for advertisement before using this command.

**Example**   awplus# configure terminal  
awplus(config)# router ipv6 ospf P2  
awplus(config-router)# area 1 range 2000::/3

## area stub (IPv6 OSPF)

**Overview** This command defines an OSPF area as a stub area. By default, no stub area is defined.

Use this command when routers in the area do not require learning about external LSAs. You can define the area as a totally stubby area by configuring the Area Border Router of that area using the **area stub no-summary** command.

The **no** variant of this command removes this definition.

**Syntax** `area <area-id> stub [no-summary]`  
`no area <area-id> stub [no-summary]`

| Parameter    | Description                                                                                                                                                                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>    | The OSPF area that you are configuring as a stub area. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area-ID. |
|              | <A . B . C . D> OSPF area-ID, expressed in the IPv4 address format <A.B.C.D>.                                                                                                                                                                                            |
|              | <0 - 4294967295> OSPF area-ID expressed as a decimal number within the range shown.                                                                                                                                                                                      |
|              | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area-ID.                                                                                                                                                                        |
| no - summary | Stops an ABR from sending summary link advertisements into the stub area.                                                                                                                                                                                                |

**Mode** Router Configuration

**Usage** There are two stub area router configuration commands: the **area stub** and **area default-cost** commands. In all routers attached to the stub area, configure the area by using the **area stub** command. For an area border router (ABR) attached to the stub area, also use the **area default-cost** command.

**Example** `awplus# configure terminal`  
`awplus(config)# router ipv6 ospf 100`  
`awplus(config-router)# area 100 stub`

**Related commands** [area default-cost \(IPv6 OSPF\)](#)

## area virtual-link (IPv6 OSPF)

**Overview** This command configures a link between a non-backbone area and the backbone, through other non-backbone areas.

In OSPF, all non-backbone areas must be connected to a backbone area. If the connection to the backbone is lost, the virtual link repairs the connection.

The **no** variant of this command removes the virtual link.

**Syntax** `area <area-id> virtual-link <router-id>`  
`no area <area-id> virtual-link <router-id>`  
`area <area-id> virtual-link <router-id>`  
`no area <area-id> virtual-link <router-id>`  
`area <area-id> virtual-link <router-id> [hello-interval`  
`<1-65535>] [retransmit-interval <1-65535>] [transmit-delay`  
`<1-65535>]`  
`no area <area-id> virtual-link <router-id> [hello-interval]`  
`[retransmit-interval] [transmit-delay]`

| Parameter           | Description                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>           | The area-ID of the transit area that the virtual link passes through. This can be entered in either dotted decimal format or normal decimal format as shown below. |
|                     | <code>&lt;A . B . C . D&gt;</code> OSPF area-ID, expressed in the IPv4 address format <code>&lt;A.B.C.D&gt;</code> .                                               |
|                     | <code>&lt;0 - 4294967295&gt;</code> OSPF area-ID expressed as a decimal number within the range shown.                                                             |
|                     | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area-ID.                                                                  |
| <router-id>         | The OSPF router ID of the virtual link neighbor.                                                                                                                   |
| dead-interval       | If no packets are received from a particular neighbor for dead-interval seconds, the router considers the neighbor router to be off-line.<br>Default: 40 seconds   |
|                     | <code>&lt;1 - 65535&gt;</code> The number of seconds in the interval.                                                                                              |
| hello-interval      | The interval the router waits before it sends a hello packet.<br>Default: 10 seconds                                                                               |
|                     | <code>&lt;1 - 65535&gt;</code> The number of seconds in the interval.                                                                                              |
| retransmit-interval | The interval the router waits before it retransmits a packet.<br>Default: 5 seconds                                                                                |
|                     | <code>&lt;1 - 65535&gt;</code> The number of seconds in the interval.                                                                                              |

| Parameter      | Description                                                                       |
|----------------|-----------------------------------------------------------------------------------|
| transmit-delay | The interval the router waits before it transmits a packet.<br>Default: 1 seconds |
|                | <1 - 65535>      The number of seconds in the interval.                           |

**Mode** Router Configuration

**Usage** You can configure virtual links between any two backbone routers that have an interface to a common non-backbone area. The protocol treats these two routers, joined by a virtual link, as if they were connected by an unnumbered point-to-point network. To configure a virtual link, you require:

- The transit area-ID, i.e. the area-ID of the non-backbone area that the two backbone routers are both connected to.
- The corresponding virtual link neighbor's router ID. To see the router ID use the [show ipv6 ospf](#) command.

Configure the **hello-interval** to be the same for all routers attached to a common network. A short **hello-interval** results in the router detecting topological changes faster but also an increase in the routing traffic.

The **retransmit-interval** is the expected round-trip delay between any two routers in a network. Set the value to be greater than the expected round-trip delay to avoid needless retransmissions.

The **transmit-delay** is the time taken to transmit a link state update packet on the interface. Before transmission, the link state advertisements in the update packet, are incremented by this amount. Set the **transmit-delay** to be greater than zero. Also, take into account the transmission and propagation delays for the interface.

**Example** To configure a virtual link through area 1 to the router with router-ID 10.10.11.50, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# area 1 virtual-link 10.10.11.50 hello 5
dead 10
```

**Related commands** [show ipv6 ospf](#)

# area virtual-link authentication ipsec spi

**Overview** Use this command in Router Configuration mode to enable authentication for virtual links in a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable authentication for virtual links in a specified OSPF area.

**Syntax** `area <area-id> virtual-link <router-ID> authentication ipsec spi <256-4294967295> {md5 <MD5-key>|sha1 <SHA1-key>}`  
`no area <area-id> virtual-link <router-ID> authentication ipsec spi <256-4294967295>`

| Parameter        | Description                                                                                                                                                                               |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>        | The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats: |
|                  | <ip-addr> OSPF area-ID expressed in IPv4 address format A.B.C.D.                                                                                                                          |
|                  | <0-4294967295> OSPF area-ID expressed as a decimal number within the range shown.                                                                                                         |
|                  | For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.                                                                                                       |
| virtual-link     | Specify a virtual link and its parameters.                                                                                                                                                |
| <router-ID>      | Enter a router ID associated with a virtual link neighbor in IPv4 address format A.B.C.D.                                                                                                 |
| authentication   | Specify this keyword to enable authentication.                                                                                                                                            |
| ipsec            | Specify this keyword to use IPsec authentication.                                                                                                                                         |
| spi              | Specify this keyword to set the SPI (Security Parameters Index).                                                                                                                          |
| <256-4294967295> | Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.                                                                            |
| md5              | Specify the MD5 (Message-Digest 5) encryption algorithm.                                                                                                                                  |
| <MD5-key>        | Enter an MD5 key containing 32 hexadecimal characters.                                                                                                                                    |
| sha1             | Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm.                                                                                                                         |
| <SHA1-key>       | Enter an SHA-1 key containing 40 hexadecimal characters.                                                                                                                                  |

**Mode** Router Configuration

**Usage notes** Use this command on an OSPFv3 area virtual link, use the [area authentication ipsec spi](#) command on an OSPFv3 area. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by

link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

OSPFv3 areas are connected to a backbone area. Virtual links can be configured to repair lost connections to a backbone area for OSPFv3 areas. To configure an OSPFv3 virtual link, use a router ID instead of the IPv6 prefix of the router.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information and examples.

**Example** To enable MD5 authentication with a 32 hexadecimal character key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1
authentication ipsec spi 1000 md5
1234567890ABCDEF1234567890ABCDEF
```

To enable SHA-1 authentication with a 40 hexadecimal character key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1
authentication ipsec spi 1000 sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To disable authentication for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 virtual-link ipsec spi 1000
```

# area virtual-link encryption ipsec spi

**Overview** Use this command in Router Configuration mode to enable either AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) or 3DES (Triple Data Encryption Standard) ESP (Encapsulating Security Payload) encryption for virtual links in a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable encryption configured for virtual links in a specified OSPF area.

**Syntax** `area <area-id> virtual-link <router-ID> encryption ipsec spi <256-4294967295> esp {aes-cbc <AES-CBC-key>|3des <3DES-key>|null}{md5 <MD5-key>|sha1 <SHA1-key>}`  
`no area <area-id> encryption ipsec spi <256-4294967295>`

| Parameter        | Description                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>        | The OSPF area that you are specifying the summary route default- cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats: |
|                  | <ip-addr> OSPF area-ID expressed in IPv4 address format A.B.C.D.                                                                                                                           |
|                  | <0-4294967295> OSPF area-ID expressed as a decimal number within the range shown.                                                                                                          |
|                  | For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.                                                                                                        |
| virtual-link     | Specify a virtual link and its parameters.                                                                                                                                                 |
| <router-ID>      | Enter a router ID associated with a virtual link neighbor in IPv4 address format A.B.C.D.                                                                                                  |
| encryption       | Specify this keyword to enable encryption.                                                                                                                                                 |
| ipsec            | Specify this keyword to use IPsec authentication.                                                                                                                                          |
| spi              | Specify this keyword to set the SPI (Security Parameters Index).                                                                                                                           |
| <256-4294967295> | Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.                                                                             |
| esp              | Specify the esp keyword (Encapsulating Security Payload) to then apply either AES-CBC or 3DES encryption.                                                                                  |
| aes-cbc          | Specify this keyword to enable AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) encryption.                                                                                    |
| <AES-CBC-key>    | Enter an AES-CBC key containing either 32, 48, or 64 hexadecimal characters.                                                                                                               |
| 3des             | Specify 3DES (Triple Data Encryption Standard) encryption.                                                                                                                                 |
| <3DES-key>       | Enter a 3DES key containing 48 hexadecimal characters.                                                                                                                                     |

| Parameter    | Description                                                       |
|--------------|-------------------------------------------------------------------|
| null         | Specify ESP without AES-CBC or 3DES encryption applied.           |
| md5          | Specify the MD5 (Message-Digest 5) encryption algorithm.          |
| <MD5 - key>  | Enter an MD5 key containing 32 hexadecimal characters.            |
| sha1         | Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm. |
| <SHA1 - key> | Enter an SHA-1 key containing 40 hexadecimal characters.          |

**Mode** Router Configuration

**Usage notes** When you issue this command, authentication and encryption are both enabled.

Use this command on an OSPFv3 area virtual link, use the [area encryption ipsec spi esp](#) command on an OSPFv3 area. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Security is achieved using the IPv6 ESP extension header. ESP is used to provide confidentiality, integrity, authentication, and confidentiality. Authentication fields are removed from OSPF for IPv6 packet headers. The IPv6 ESP extension header is required for integrity, authentication, and confidentiality.

Note that interface configuration takes priority over area configuration. If an interface configuration is removed then an area configuration is applied to an interface instead.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information and examples.

**Example** To enable ESP encryption, but not apply an AES-CBC key or a 3DES key, and MD5 authentication with a 32 hexadecimal character key for virtual links in OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp null md5 1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption, but not apply an AES-CBC key or a 3DES key, and SHA-1 authentication with a 40 hexadecimal character key for virtual links in OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp null sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with a 32 hexadecimal character AES-CBC key and a 40 hexadecimal character SHA-1 authentication key for virtual links in OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp aes-cbc 1234567890ABCDEF1234567890ABCDEF
sha1 1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with a 48 hexadecimal character 3DES key and a 40 hexadecimal character SHA-1 authentication key for virtual links in OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp 3des
1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To disable authentication for virtual links in OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 virtual-link 10.0.0.1
authentication ipsec spi 1000
```

# auto-cost reference bandwidth (IPv6 OSPF)

**Overview** This command controls how OSPF calculates default metrics for the interface.

Use the **no** variant of this command to assign cost based only on the interface bandwidth.

**Syntax** auto-cost reference-bandwidth <1-4294967>  
no auto-cost reference-bandwidth

| Parameter   | Description                                                   |
|-------------|---------------------------------------------------------------|
| <1-4294967> | The reference bandwidth, measured in Mbits per second (Mbps). |

**Default** 1000 Mbps

**Usage notes** By default, OSPF calculates the OSPF metric for an interface by dividing the reference bandwidth by the interface bandwidth. The default for the reference bandwidth is 1000 Mbps. As a result, if this default is used, there is very little difference between the metrics applied to interfaces of increasing bandwidth beyond 1000 Mbps.

The auto-cost command is used to alter this reference bandwidth in order to give a real difference between the metrics of high bandwidth links of differing bandwidths. In a network that has multiple links with high bandwidths, specify a larger reference bandwidth value to differentiate the costs on those links.

Cost is calculated by dividing the reference bandwidth (Mbps) by the layer 3 interface (Switched Virtual Interface (SVI), Loopback or Ethernet interface) bandwidth. Interface bandwidth may be altered by using the [bandwidth](#) command as the SVI does not auto-detect the bandwidth based on the speed of associated device ports.

When the reference bandwidth calculation results in a cost integer greater than 1 but contains a fractional value (the value after the decimal point), the result rounds down to the nearest integer. The following example shows how the cost is calculated.

The reference bandwidth is 1000 Mbps and the interface bandwidth is 7 Mbps.

Calculation =  $1000/7$

Calculation result = 142.85 (integer of 142, fractional value of 0.85)

Result after rounding down to the nearest integer = 142 (Interface cost is 142)

When the reference bandwidth calculation results in a cost less than 1, it is rounded up to the nearest integer which is 1. The following example shows how the cost is calculated.

The reference bandwidth is 1000 Mbps and the interface bandwidth is 10000 Mbps.

Calculation =  $1000/10000$

Calculation result = 0.1

Result after rounding up to the nearest integer = 1 (Interface cost is 1)

The auto-cost reference bandwidth value should be consistent across all OSPF routers in the OSPF process.

Note that using the `ipv6 ospf cost` command on a layer 3 interface will override the cost calculated by this command.

**Mode** Router Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# router ipv6 ospf 20`  
`awplus(config-router)# auto-cost reference-bandwidth 1000`

**Related commands** `ipv6 ospf cost`

# bandwidth

**Overview** Use this command to specify the maximum bandwidth to be used for each VLAN interface. The bandwidth value is in bits per second. OSPF uses this to calculate metrics for the VLAN interface.

The **no** variant of this command removes any applied bandwidth value and replaces it with a value equal to the lowest port speed within that VLAN.

**Syntax** `bandwidth <bandwidth-setting>`  
`no bandwidth`
