|                    | show rmon statistics . . . . .                    | 2391        |
| <b>Chapter 58:</b> | <b>Secure Shell (SSH) Commands . . . . .</b>      | <b>2393</b> |
|                    | Introduction . . . . .                            | 2393        |
|                    | banner login (SSH) . . . . .                      | 2395        |
|                    | clear ssh . . . . .                               | 2396        |
|                    | crypto key destroy hostkey . . . . .              | 2397        |
|                    | crypto key destroy userkey . . . . .              | 2398        |
|                    | crypto key generate hostkey . . . . .             | 2399        |
|                    | crypto key generate userkey . . . . .             | 2400        |
|                    | crypto key pubkey-chain knownhosts . . . . .      | 2401        |
|                    | crypto key pubkey-chain userkey . . . . .         | 2403        |
|                    | debug ssh client . . . . .                        | 2405        |
|                    | debug ssh server . . . . .                        | 2406        |
|                    | service ssh . . . . .                             | 2407        |
|                    | show banner login . . . . .                       | 2409        |
|                    | show crypto key hostkey . . . . .                 | 2410        |
|                    | show crypto key pubkey-chain knownhosts . . . . . | 2411        |
|                    | show crypto key pubkey-chain userkey . . . . .    | 2412        |
|                    | show crypto key userkey . . . . .                 | 2413        |
|                    | show running-config ssh . . . . .                 | 2414        |
|                    | show ssh . . . . .                                | 2416        |
|                    | show ssh client . . . . .                         | 2418        |
|                    | show ssh server . . . . .                         | 2419        |
|                    | show ssh server allow-users . . . . .             | 2421        |
|                    | show ssh server deny-users . . . . .              | 2422        |
|                    | ssh . . . . .                                     | 2423        |
|                    | ssh client . . . . .                              | 2425        |
|                    | ssh server . . . . .                              | 2427        |
|                    | ssh server allow-users . . . . .                  | 2429        |
|                    | ssh server authentication . . . . .               | 2431        |
|                    | ssh server deny-users . . . . .                   | 2433        |
|                    | ssh server max-auth-tries . . . . .               | 2435        |
|                    | ssh server resolve-host . . . . .                 | 2436        |
|                    | ssh server scp . . . . .                          | 2437        |
|                    | ssh server sftp . . . . .                         | 2438        |

---

|                    |                                        |             |
|--------------------|----------------------------------------|-------------|
|                    | undebg ssh client . . . . .            | 2439        |
|                    | undebg ssh server . . . . .            | 2440        |
| <b>Chapter 59:</b> | <b>Trigger Commands . . . . .</b>      | <b>2441</b> |
|                    | Introduction . . . . .                 | 2441        |
|                    | active (trigger) . . . . .             | 2443        |
|                    | day . . . . .                          | 2444        |
|                    | debug trigger . . . . .                | 2446        |
|                    | description (trigger) . . . . .        | 2447        |
|                    | repeat . . . . .                       | 2448        |
|                    | script . . . . .                       | 2449        |
|                    | show debugging trigger . . . . .       | 2451        |
|                    | show running-config trigger . . . . .  | 2452        |
|                    | show trigger . . . . .                 | 2453        |
|                    | test . . . . .                         | 2458        |
|                    | time (trigger) . . . . .               | 2459        |
|                    | trap . . . . .                         | 2461        |
|                    | trigger . . . . .                      | 2462        |
|                    | trigger activate . . . . .             | 2463        |
|                    | type atmf node . . . . .               | 2464        |
|                    | type cpu . . . . .                     | 2467        |
|                    | type interface . . . . .               | 2468        |
|                    | type memory . . . . .                  | 2469        |
|                    | type periodic . . . . .                | 2470        |
|                    | type ping-poll . . . . .               | 2471        |
|                    | type reboot . . . . .                  | 2472        |
|                    | type stack disabled-master . . . . .   | 2473        |
|                    | type stack link . . . . .              | 2474        |
|                    | type stack master-fail . . . . .       | 2475        |
|                    | type stack member . . . . .            | 2476        |
|                    | type time . . . . .                    | 2477        |
|                    | type usb . . . . .                     | 2478        |
|                    | undebg trigger . . . . .               | 2479        |
| <b>Chapter 60:</b> | <b>Ping-Polling Commands . . . . .</b> | <b>2480</b> |
|                    | Introduction . . . . .                 | 2480        |
|                    | active (ping-polling) . . . . .        | 2482        |
|                    | clear ping-poll . . . . .              | 2483        |
|                    | critical-interval . . . . .            | 2484        |
|                    | debug ping-poll . . . . .              | 2485        |
|                    | description (ping-polling) . . . . .   | 2486        |
|                    | fail-count . . . . .                   | 2487        |
|                    | ip (ping-polling) . . . . .            | 2488        |
|                    | length (ping-poll data) . . . . .      | 2489        |
|                    | normal-interval . . . . .              | 2490        |
|                    | ping-poll . . . . .                    | 2491        |
|                    | sample-size . . . . .                  | 2492        |
|                    | show counter ping-poll . . . . .       | 2494        |
|                    | show ping-poll . . . . .               | 2496        |
|                    | source-ip . . . . .                    | 2500        |
|                    | timeout (ping polling) . . . . .       | 2502        |
|                    | up-count . . . . .                     | 2503        |

---

|                    |                                             |             |
|--------------------|---------------------------------------------|-------------|
|                    | undebg ping-poll . . . . .                  | 2504        |
| <b>Chapter 61:</b> | <b>sFlow Commands . . . . .</b>             | <b>2505</b> |
|                    | Introduction . . . . .                      | 2505        |
|                    | debug sflow . . . . .                       | 2506        |
|                    | debug sflow agent . . . . .                 | 2507        |
|                    | sflow agent (address) . . . . .             | 2508        |
|                    | sflow collector (address) . . . . .         | 2510        |
|                    | sflow collector max-datagram-size . . . . . | 2512        |
|                    | sflow enable . . . . .                      | 2513        |
|                    | sflow max-header-size . . . . .             | 2514        |
|                    | sflow polling-interval . . . . .            | 2516        |
|                    | sflow sampling-rate . . . . .               | 2517        |
|                    | show debugging sflow . . . . .              | 2518        |
|                    | show running-config sflow . . . . .         | 2520        |
|                    | show sflow . . . . .                        | 2521        |
|                    | show sflow interface . . . . .              | 2523        |
|                    | undebg sflow . . . . .                      | 2524        |

# List of Commands

|                                                     |      |
|-----------------------------------------------------|------|
| (access-list extended ICMP filter) .....            | 1401 |
| (access-list extended IP filter).....               | 1403 |
| (access-list extended IP protocol filter).....      | 1406 |
| (access-list extended TCP UDP filter).....          | 1410 |
| (access-list hardware ICMP filter) .....            | 1370 |
| (access-list hardware IP protocol filter).....      | 1373 |
| (access-list hardware MAC filter).....              | 1378 |
| (access-list hardware TCP UDP filter).....          | 1381 |
| (access-list standard named filter) .....           | 1417 |
| (access-list standard numbered filter).....         | 1419 |
| (ipv6 access-list extended IP protocol filter)..... | 1468 |
| (ipv6 access-list extended TCP UDP filter) .....    | 1471 |
| (ipv6 access-list named ICMP filter) .....          | 1441 |
| (ipv6 access-list named IPv6 filter) .....          | 1444 |
| (ipv6 access-list named protocol filter).....       | 1447 |
| (ipv6 access-list named TCP UDP filter) .....       | 1451 |
| (ipv6 access-list standard filter) .....            | 1475 |
| aaa accounting auth-mac .....                       | 1698 |
| aaa accounting auth-web .....                       | 1700 |
| aaa accounting commands.....                        | 1702 |
| aaa accounting dot1x.....                           | 1704 |
| aaa accounting login.....                           | 1706 |
| aaa accounting update.....                          | 1709 |
| aaa authentication auth-mac.....                    | 1711 |
| aaa authentication auth-web.....                    | 1713 |

# Part 1: Setup and Troubleshooting

# 1

# CLI Navigation Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for the commands used to navigate between different modes. This chapter also provides a reference for the help and show commands used to help navigate within the CLI.

- Command List**
- “[configure terminal](#)” on page 89
  - “[disable \(Privileged Exec mode\)](#)” on page 90
  - “[do](#)” on page 91
  - “[enable \(Privileged Exec mode\)](#)” on page 92
  - “[end](#)” on page 94
  - “[exit](#)” on page 95
  - “[help](#)” on page 96
  - “[logout](#)” on page 97
  - “[show history](#)” on page 98

# configure terminal

**Overview** This command enters the Global Configuration command mode.

**Syntax** `configure terminal`

**Mode** Privileged Exec

**Example** To enter the Global Configuration command mode (note the change in the command prompt), enter the command:

```
awplus# configure terminal  
awplus(config)#
```

# disable (Privileged Exec mode)

**Overview** This command exits the Privileged Exec mode, returning the prompt to the User Exec mode. To end a session, use the [exit](#) command.

**Syntax** `disable`

**Mode** Privileged Exec

**Example** To exit the Privileged Exec mode, enter the command:

```
awplus# disable
awplus>
```

**Related Commands**

- [enable \(Privileged Exec mode\)](#)
- [end](#)
- [exit](#)

# do

**Overview** This command lets you to run User Exec and Privileged Exec mode commands when you are in any configuration mode.

**Syntax** `do <command>`

| Parameter                    | Description                             |
|------------------------------|-----------------------------------------|
| <code>&lt;command&gt;</code> | Specify the command and its parameters. |

**Mode** Any configuration mode

**Example** `awplus# configure terminal`  
`awplus(config)# do ping 192.0.2.23`

# enable (Privileged Exec mode)

**Overview** This command enters the Privileged Exec mode and optionally changes the privilege level for a session. If a privilege level is not specified then the maximum privilege level (15) is applied to the session. If the optional privilege level is omitted then only users with the maximum privilege level can access Privileged Exec mode without providing the password as specified by the [enable password](#) or [enable secret](#) commands. If no password is specified then only users with the maximum privilege level set with the [username](#) command can assess Privileged Exec mode.

**Syntax** `enable [<privilege-level>]`

| Parameter                              | Description                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;privilege - level&gt;</code> | Specify the privilege level for a CLI session in the range <1-15>, where 15 is the maximum privilege level, 7 is the intermediate privilege level and 1 is the minimum privilege level. The privilege level for a user must match or exceed the privilege level set for the CLI session for the user to access Privileged Exec mode. Privilege level for a user is configured by <a href="#">username</a> . |

**Mode** User Exec

**Usage** Many commands are available from the Privileged Exec mode that configure operating parameters for the device, so you should apply password protection to the Privileged Exec mode to prevent unauthorized use. Passwords can be encrypted but then cannot be recovered. Note that non-encrypted passwords are shown in plain text in configurations.

The [username](#) command sets the privilege level for the user. After login, users are given access to privilege level 1. Users access higher privilege levels with the [enable \(Privileged Exec mode\)](#) command. If the privilege level specified is higher than the users configured privilege level specified by the [username](#) command, then the user is prompted for the password for that level.

Note that a separate password can be configured for each privilege level using the [enable password](#) and the [enable secret](#) commands from the Global Configuration mode. The [service password-encryption](#) command encrypts passwords configured by the [enable password](#) and the [enable secret](#) commands, so passwords are not shown in plain text in configurations.

**Example** The following example shows the use of the **enable** command to enter the Privileged Exec mode (note the change in the command prompt).

```
awplus> enable
awplus#
```

The following example shows the **enable** command enabling access the Privileged Exec mode for users with a privilege level of 7 or greater. Users with a privilege level of 7 or greater do not need to enter a password to access Privileged Exec mode. Users with a privilege level 6 or less need to enter a password to access

Privilege Exec mode. Use the [enable password](#) command or the [enable secret](#) commands to set the password to enable access to Privileged Exec mode.

```
awplus> enable 7
```

```
awplus#
```

**Related  
Commands**

[disable \(Privileged Exec mode\)](#)

[enable password](#)

[enable secret](#)

[exit](#)

[service password-encryption](#)

[username](#)

# end

**Overview** This command returns the prompt to the Privileged Exec command mode from any other advanced command mode.

**Syntax** end

**Mode** All advanced command modes, including Global Configuration and Interface Configuration modes.

**Example** The following example shows the use of the **end** command to return to the Privileged Exec mode directly from Interface mode.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# end
awplus#
```

**Related Commands**

- disable (Privileged Exec mode)
- enable (Privileged Exec mode)
- exit

# exit

**Overview** This command exits the current mode, and returns the prompt to the mode at the previous level. When used in User Exec mode, the **exit** command terminates the session.

**Syntax** `exit`

**Mode** All command modes, including Global Configuration and Interface Configuration modes.

**Example** The following example shows the use of the **exit** command to exit Interface mode, and return to Configure mode.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# exit
awplus(config)#
```

**Related Commands**

- [disable \(Privileged Exec mode\)](#)
- [enable \(Privileged Exec mode\)](#)
- [end](#)

# help

**Overview** This command displays a description of the AlliedWare Plus™ OS help system.

**Syntax** help

**Mode** All command modes

**Example** To display a description on how to use the system help, use the command:

```
awplus# help
```

**Output** Figure 1-1: Example output from the **help** command

```
When you need help at the command line, press '?'.

If nothing matches, the help list will be empty. Delete
characters until entering a '?' shows the available options.

Enter '?' after a complete parameter to show remaining valid
command parameters (e.g. 'show ?').

Enter '?' after part of a parameter to show parameters that
complete the typed letters (e.g. 'show ip?').
```

# logout

**Overview** This command exits the User Exec or Privileged Exec modes and ends the session.

**Syntax** `logout`

**Mode** User Exec and Privileged Exec

**Example** To exit the User Exec mode, use the command:

```
awplus# logout
```

# show history

**Overview** This command lists the commands entered in the current session. The history buffer is cleared automatically upon reboot.

The output lists all command line entries, including commands that returned an error.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show history`

**Mode** User Exec and Privileged Exec

**Example** To display the commands entered during the current session, use the command:

```
awplus# show history
```

**Output** Figure 1-2: Example output from the **show history** command

```
1 en
2 show ru
3 conf t
4 route-map er deny 3
5 exit
6 ex
7 di
```

# 2

# File and Configuration Management Commands

## Introduction

This chapter provides an alphabetical reference of AlliedWare Plus™ OS file and configuration management commands.

### Filename Syntax and Keyword Usage

Many of the commands in this chapter use the placeholder “filename” to represent the name and location of the file that you want to act on. The following table explains the syntax of the filename for each different type of file location.

| When you copy a file...                 | Use this syntax:                                                                                                                        | Example:                                                                                                                                             |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Copying in local Flash memory           | <code>flash: [/] [&lt;directory&gt;/] &lt;filename&gt;</code>                                                                           | To specify a file in the configs directory in Flash:<br><code>flash:configs/example.cfg</code>                                                       |
| Copying to or from a USB storage device | <code>usb: [/] [&lt;directory&gt;/] &lt;filename&gt;</code>                                                                             | To specify a file in the top-level directory of the USB stick:<br><code>usb:example.cfg</code>                                                       |
| Copying with HTTP                       | <code>http://[ [&lt;username&gt;:&lt;password&gt;]@ ] {&lt;hostname&gt; &lt;host-ip&gt;} [ /&lt;filepath&gt; ] /&lt;filename&gt;</code> | To specify a file in the configs directory on the server:<br><code>http://www.company.com/configs/example.cfg</code>                                 |
| Copying with TFTP                       | <code>tftp://[ [&lt;location&gt;] /&lt;directory&gt; ] /&lt;filename&gt;</code>                                                         | To specify a file in the top-level directory of the server:<br><code>tftp://172.1.1.1/example.cfg</code>                                             |
| Copying with SCP                        | <code>scp://&lt;username&gt;@&lt;location&gt; [ /&lt;directory&gt; ] [ /&lt;filename&gt; ]</code>                                       | To specify a file in the configs directory on the server, logging on as user “bob”:<br>e.g.<br><code>scp://bob@10.10.0.12/configs/example.cfg</code> |

| When you copy a file...               | Use this syntax:                                                                                                      | Example:                                                                                                                              |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Copying with SFTP                     | <code>sftp://[&lt;location&gt;]/&lt;directory&gt;/<br/>/&lt;filename&gt;</code>                                       | To specify a file in the top-level directory of the server:<br><code>sftp://10.0.0.5/example.cfg</code>                               |
| Copying to or from stack member Flash | <code>&lt;hostname&gt;-&lt;stack_ID&gt;/flash: [ / ] [ &lt;directory&gt; / ]<br/>&lt;stack_member_filename&gt;</code> | To specify a file in the configs directory on member 2 of a stack named vcstack:<br><code>vcstack-2/flash:/configs/example.cfg</code> |

**Valid characters** The filename and path can include characters from up to four categories. The categories are:

- 1) uppercase letters: A to Z
- 2) lowercase letters: a to z
- 3) digits: 0 to 9
- 4) special symbols: all printable ASCII characters not included in the previous three categories. Including the following characters:

- -
- /
- .
- \_
- @
- "
- '
- \*
- :
- ~
- ?

Do not use spaces or parentheses within filenames. Use hyphens or underscores instead.

### Syntax for directory listings

A leading slash (/) indicates the root of the current filesystem location.

In commands where you need to specify the local filesystem's Flash base directory, you may use **flash** or **flash:** or **flash:/**. For example, these commands are all the same:

- `dir flash`
- `dir flash:`
- `dir flash:/`

Similarly, you can specify the USB storage device base directory with **usb** or **usb:** or **usb:/**

You cannot name a directory or subdirectory **flash**, **nvs**, **usb**, **card**, **tftp**, **scp**, **sftp** or **http**. These keywords are reserved for tab completion when using various file commands.

In a stacked environment you can only access `flash` and `nvs` using the stack member filepath (e.g. `dir awplus-2/flash:/`). To access a USB storage device on a backup stack member, use the [remote-login](#) command.

- [“show running-config”](#) on page 139
- [“show running-config interface”](#) on page 143
- [“show startup-config”](#) on page 145
- [“show version”](#) on page 146
- [“write file”](#) on page 148
- [“write memory”](#) on page 149
- [“write terminal”](#) on page 150

# autoboot enable

**Overview** This command enables the device to restore a release file and/or a configuration file from external media, such as a USB storage device.

When the Autoboot feature is enabled, the device looks for a special file called `autoboot.txt` on the external media. If this file exists, the device will check the key and values in the file and recover the device with a new release file and/or configuration file from the external media. An example of a valid `autoboot.txt` file is shown in the following figure.

Figure 2-1: Example `autoboot.txt` file

```
[AlliedWare Plus]
Copy_from_external_media_enabled=yes
Boot_Release=x310-5.4.6-1.1.rel
Boot_Config=network1.cfg
```

Use the **no** variant of this command to disable the Autoboot feature.

**NOTE:** *This command is not supported in a stacked configuration.*

**Syntax** `autoboot enable`  
`no autoboot enable`

**Default** The Autoboot feature operates the first time the device is powered up in the field, after which the feature is disabled by default.

**Mode** Global Configuration

**Example** To enable the Autoboot feature, use the command:

```
awplus# configure terminal
awplus# configure terminal
awplus(config)# no autoboot enable
```

**Related Commands** [create autoboot](#)  
[show autoboot](#)  
[show boot](#)

# boot config-file

**Overview** Use this command to set the configuration file to use during the next boot cycle.  
Use the **no** variant of this command to remove the configuration file.

**Syntax** `boot config-file <filepath-filename>`  
`no boot config-file`

| Parameter                              | Description                                                                                                                                                                            |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;filepath-filename&gt;</code> | Filepath and name of a configuration file.<br>The specified configuration file must exist in the specified filesystem.<br>Valid configuration files must have a <b>.cfg</b> extension. |

**Mode** Global Configuration

**Usage** You can only specify that the configuration file is on a USB storage device if there is a backup configuration file already specified in Flash. If you attempt to set the configuration file on a USB storage device and a backup configuration file is not specified in Flash, the following error message is displayed:

```
% Backup configuration files must be stored in the flash  
filesystem
```

For an explanation of the configuration fallback order, see the [File Management Feature Overview and Configuration Guide](#).

**Examples** To run the configuration file “branch.cfg” stored on the device’s Flash filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal  
awplus(config)# boot config-file flash:/branch.cfg
```

To stop running the configuration file “branch.cfg” stored on the device’s Flash filesystem when the device boots up, use the commands:

```
awplus# configure terminal  
awplus(config)# no boot config-file flash:/branch.cfg
```

To run the configuration file “branch.cfg” stored on the switch’s USB storage device filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal  
awplus(config)# boot config-file usb:/branch.cfg
```

To stop running the configuration file “branch.cfg” stored on the switch’s USB storage device filesystem when the device boots up, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no boot config-file usb:/branch.cfg
```

**Related  
Commands**

[boot config-file backup](#)

[boot system](#)

[boot system backup](#)

[show boot](#)

# boot config-file backup

**Overview** Use this command to set a backup configuration file to use if the main configuration file cannot be accessed.

Use the **no** variant of this command to remove the backup configuration file.

**Syntax** `boot config-file backup <filepath-filename>`  
`no boot config-file backup`

| Parameter                              | Description                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;filepath-filename&gt;</code> | Filepath and name of a backup configuration file. Backup configuration files must be in the Flash filesystem. Valid backup configuration files must have a <b>.cfg</b> extension. |
| <code>backup</code>                    | The specified file is a backup configuration file.                                                                                                                                |

**Mode** Global Configuration

**Usage** For an explanation of the configuration fallback order, see the [File Management Feature Overview and Configuration Guide](#).

**Examples** To set the configuration file `backup.cfg` as the backup to the main configuration file, use the commands:

```
awplus# configure terminal
awplus(config)# boot config-file backup flash:/backup.cfg
```

To remove the configuration file `backup.cfg` as the backup to the main configuration file, use the commands:

```
awplus# configure terminal
awplus(config)# no boot config-file backup flash:/backup.cfg
```

**Related Commands** [boot config-file](#)  
[boot system](#)  
[boot system backup](#)  
[show boot](#)

# boot system

**Overview** Use this command to set the release file to load during the next boot cycle.  
Use the **no** variant of this command to remove the release file as the boot file.

**Syntax** `boot system <filepath-filename>`  
`no boot system`

| Parameter                              | Description                                                                                                                                                                                                   |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;filepath-filename&gt;</code> | Filepath and name of a release file.<br>The specified release file must exist and must be stored in the root directory of the specified filesystem.<br>Valid release files must have a <b>.rel</b> extension. |

**Mode** Global Configuration

**Usage** You can only specify that the release file is on a USB storage device if there is a backup release file already specified in Flash. If you attempt to set the release file on a USB storage device and a backup release file is not specified in Flash, the following error message is displayed:

```
% A backup boot image must be set before setting a current boot  
image on USB storage device
```

In a VCStack configuration, the stack only accepts a release file on a USB storage device if a USB storage device is inserted in all stack members and all stack members have a bootloader version that supports booting from it. If a stack member has a USB storage device removed an error message is displayed. For example, if stack member 2 does not have a USB storage device inserted the following message is displayed:

```
% Stack member 2 has no USB storage device inserted
```

**Examples** To run the release file x310-5.4.6-1.1.rel stored on the device's Flash filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal  
awplus(config)# boot system flash:/x310-5.4.6-1.1.rel
```

To remove the release file x310-5.4.6-1.1.rel stored on the device's Flash filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal  
awplus(config)# no boot system flash:/x310-5.4.6-1.1.rel
```

To run the release file x310-5.4.6-1.1.rel stored on the switch's USB storage device filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal
awplus(config)# boot system usb:/x310-5.4.6-1.1.rel
```

To remove the release file x310-5.4.6-1.1.rel stored on the switch's USB storage device filesystem the next time the device boots up, use the commands:

```
awplus# configure terminal
awplus(config)# boot system usb:/x310-5.4.6-1.1.rel
```

In a VCStack configuration, if there is not enough space to synchronize the new release across the stack, the boot system command has an interactive mode that prompts you to delete old releases.

```
awplus# configure terminal
awplus(config)# boot system x310-5.4.6-1.1.rel
```

```
Insufficient flash available on stack member-2 (11370496)
to synchronize file x310-5.4.6-1.1.rel
(14821895) .

List of release files on stack member-2
      x310-5.4.6-0.1.rel (14822400)

Select files to free up space,
Delete awplus-2/flash:/x310-5.4.6-0.1.rel? (y/n) [n]:y
```

Answering "y" at the prompt will cause the system to delete the specified file:

```
awplus(config)# y
```

```
Deleting selected files, please wait.....
Successful operation
VCS synchronizing file across the stack, please wait.....
File synchronization with stack member-2 successfully completed
[DONE]
```

# boot system backup

**Overview** Use this command to set a backup release file to load if the main release file cannot be loaded.

Use the **no** variant of this command to remove the backup release file as the backup boot file.

**Syntax** `boot system backup <filepath-filename>`  
`no boot system backup`

| Parameter                              | Description                                                                                                                                              |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;filepath-filename&gt;</code> | Filepath and name of a backup release file. Backup release files must be in the Flash filesystem. Valid release files must have a <b>.rel</b> extension. |
| <code>backup</code>                    | The specified file is a backup release file.                                                                                                             |

**Mode** Global Configuration

**Examples** To specify the file x310-5.4.6-0.1.rel as the backup to the main release file, use the commands:

```
awplus# configure terminal
awplus(config)# boot system backup flash:/x310-5.4.6-0.1.rel
```

To remove the file x310-5.4.6-0.1.rel as the backup to the main release file, use the commands:

```
awplus# configure terminal
awplus(config)# no boot system backup flash:/x310-5.4.6-0.1.rel
```

**Related Commands** [boot config-file](#)  
[boot config-file backup](#)  
[boot system](#)  
[show boot](#)

# cd

**Overview** This command changes the current working directory.

**Syntax** `cd <directory-name>`

| Parameter                           | Description                     |
|-------------------------------------|---------------------------------|
| <code>&lt;directory-name&gt;</code> | Name and path of the directory. |

**Mode** Privileged Exec

**Example** To change to the directory called `images`, use the command:

```
awplus# cd images
```

**Related  
Commands**

- `dir`
- `pwd`
- `show file systems`

# copy (filename)

**Overview** This command copies a file. This allows you to:

- copy files from your device to a remote device
- copy files from a remote device to your device
- copy files stored on Flash memory to or from a different memory type, such as a USB storage device
- create two copies of the same file on your device

**Syntax** `copy <source-name> <destination-name>`

| Parameter                             | Description                                                                                                   |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>&lt;source-name&gt;</code>      | The filename and path of the source file. See <a href="#">Introduction</a> on page 99 for valid syntax.       |
| <code>&lt;destination-name&gt;</code> | The filename and path for the destination file. See <a href="#">Introduction</a> on page 99 for valid syntax. |

**Mode** Privileged Exec

**Examples** To use TFTP to copy the file bob.key into the current directory from the remote server at 10.0.0.1, use the command:

```
awplus# copy tftp://10.0.0.1/bob.key bob.key
```

To use SFTP to copy the file new.cfg into the current directory from a remote server at 10.0.1.2, use the command:

```
awplus# copy sftp://10.0.1.2/new.cfg bob.key
```

To use SCP with the username “beth” to copy the file old.cfg into the directory config\_files on a remote server that is listening on TCP port 2000, use the command:

```
awplus# copy scp://beth@serv:2000/config_files/old.cfg old.cfg
```

To copy the file newconfig.cfg onto your device’s Flash from a USB storage device, use the command:

```
awplus# copy usb:/newconfig.cfg flash:/newconfig.cfg
```

To copy the file newconfig.cfg to a USB storage device from your device’s Flash, use the command:

```
awplus# copy flash:/newconfig.cfg usb:/newconfig.cfg
```

To copy the file config.cfg into the current directory from a USB storage device, and rename it to configtest.cfg, use the command:

```
awplus# copy usb:/config.cfg configtest.cfg
```

To copy the file config.cfg into the current directory from a remote file server, and rename it to configtest.cfg, use the command:

```
awplus# copy fserver:/config.cfg configtest.cfg
```

To copy the file test.txt from the top level of Flash on stack member 2 to the current directory in the stack master, use the command:

```
awplus# copy awplus-2/flash:/test.txt test.txt
```

Note that you must specify either the NVS or Flash filesystem on the (backup) stack member (**flash:** in this example).

Commands**

[copy zmodem](#)

[edit \(filename\)](#)

[show file systems](#)

# copy current-software

**Overview** This command copies the AlliedWare Plus™ OS software that the device has booted from, to a destination file. Specify whether the destination is Flash or USB when saving the software to the local filesystem.

**Syntax** `copy current-software <destination-name>`

| Parameter                             | Description                                                                                                                                                                                                                                                                                            |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;destination-name&gt;</code> | The filename and path where you would like the current running-release saved. This command creates a file if no file exists with the specified filename. If a file already exists, then the CLI prompts you before overwriting the file. See <a href="#">Introduction</a> on page 99 for valid syntax. |

**Mode** Privileged Exec

**Example** To copy the current software as installed in the working directory with the file name `my-release.rel`, use the command:

```
awplus# copy current-software my-release.rel
```

**Related Commands** [boot system backup](#)  
[show boot](#)

# copy debug

**Overview** This command copies a specified debug file to a destination file. Specify whether the destination is Flash or USB when saving the software to the local filesystem.

**Syntax** `copy debug {<destination-name>|debug|flash|nvs|scp|tftp|usb}  
{<source-name>|debug|flash|nvs|scp|tftp|usb}`

| Parameter          | Description                                                                                                                      |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <destination-name> | The filename and path where you would like the debug output saved. See <a href="#">Introduction</a> on page 99 for valid syntax. |
| <source-name>      | The filename and path where the debug output originates. See <a href="#">Introduction</a> on page 99 for valid syntax.           |

**Mode** Privileged Exec

**Example** To copy debug output to a USB storage device with a filename “my-debug”, use the following command:

```
awplus# copy debug usb:my-debug
```

**Output** Figure 2-2: CLI prompt after entering the **copy debug** command

```
Enter source file name []:
```

**Related  
Commands** [delete debug](#)  
[move debug](#)

# copy running-config

**Overview** This command copies the running-config to a destination file, or copies a source file into the running-config. Commands entered in the running-config do not survive a device reboot unless they are saved in a configuration file.

**Syntax** `copy <source-name> running-config`  
`copy running-config [<destination-name>]`  
`copy running-config startup-config`

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <source-name>      | The filename and path of a configuration file. This must be a valid configuration file with a <b>.cfg</b> filename extension. Specify this when you want the script in the file to become the new running-config. See <a href="#">Introduction</a> on page 99 for valid syntax.                                                                                                                            |
| <destination-name> | The filename and path where you would like the current running-config saved. This command creates a file if no file exists with the specified filename. If a file already exists, then the CLI prompts you before overwriting the file. See <a href="#">Introduction</a> on page 99 for valid syntax. If you do not specify a file name, the device saves the running-config to a file called default.cfg. |
| startup-config     | Copies the running-config into the file set as the current startup-config file.                                                                                                                                                                                                                                                                                                                            |

**Mode** Privileged Exec

**Examples** To copy the running-config into the startup-config, use the command:

```
awplus# copy running-config startup-config
```

To copy the file layer3.cfg into the running-config, use the command:

```
awplus# copy layer3.cfg running-config
```

To use SCP to copy the running-config as current.cfg to the remote server listening on TCP port 2000, use the command:

```
awplus# copy running-config  
scp://user@server:2000/config_files/current.cfg
```

**Related Commands** [copy startup-config](#)  
[write file](#)  
[write memory](#)

# copy startup-config

**Overview** This command copies the startup-config script into a destination file, or alternatively copies a configuration script from a source file into the startup-config file. Specify whether the destination is Flash or USB when loading from the local filesystem.

**Syntax** `copy <source-name> startup-config`  
`copy startup-config <destination-name>`

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;source-name&gt;</code>      | The filename and path of a configuration file. This must be a valid configuration file with a <b>.cfg</b> filename extension. Specify this to copy the script in the file into the startup-config file. Note that this does not make the copied file the new startup file, so any further changes made in the configuration file are not added to the startup-config file unless you reuse this command. See <a href="#">Introduction</a> on page 99 for valid syntax. |
| <code>&lt;destination-name&gt;</code> | The destination and filename that you are saving the startup-config as. This command creates a file if no file exists with the specified filename. If a file already exists, then the CLI prompts you before overwriting the file. See <a href="#">Introduction</a> on page 99 for valid syntax.                                                                                                                                                                       |

**Mode** Privileged Exec

**Examples** To copy the file `Layer3.cfg` to the startup-config, use the command:

```
awplus# copy Layer3.cfg startup-config
```

To copy the startup-config as the file `oldconfig.cfg` in the current directory, use the command:

```
awplus# copy startup-config oldconfig.cfg
```

**Related Commands** [copy running-config](#)

# copy zmodem

**Overview** This command allows you to copy files using ZMODEM using Minicom. ZMODEM works over a serial connection and does not need any interfaces configured to do a file transfer.

**Syntax** `copy <source-name> zmodem`  
`copy zmodem`

| Parameter                        | Description                                                                                             |
|----------------------------------|---------------------------------------------------------------------------------------------------------|
| <code>&lt;source-name&gt;</code> | The filename and path of the source file. See <a href="#">Introduction</a> on page 99 for valid syntax. |

**Mode** Privileged Exec

**Example** To copy the local file `asuka.key` using ZMODEM, use the command:  
`awplus# copy asuka.key zmodem`

**Related Commands** [copy \(filename\)](#)  
[show file systems](#)

# create autoboot

**Overview** Use this command to create an `autoboot.txt` file on external media. This command will automatically ensure that the keys and values that are expected in this file are correct. After the file is created the **create autoboot** command will copy the current release and configuration files across to the external media. The external media is then available to restore a release file and/or a configuration file to the device.

**Syntax** `create autoboot usb`

**Mode** Privileged Exec

**Example** To create an `autoboot.txt` file on a USB storage device, use the command:

```
awplus# create autoboot usb
```

**Related  
Commands** [autoboot enable](#)  
[show autoboot](#)  
[show boot](#)

# delete

**Overview** This command deletes files or directories.

**Syntax** delete [force] [recursive] <filename>

| Parameter  | Description                                                                                                |
|------------|------------------------------------------------------------------------------------------------------------|
| force      | Ignore nonexistent filenames and never prompt before deletion.                                             |
| recursive  | Remove the contents of directories recursively.                                                            |
| <filename> | The filename and path of the file to delete. See <a href="#">Introduction</a> on page 99 for valid syntax. |

**Mode** Privileged Exec

**Examples** To delete the file `temp.cfg` from the current directory, use the command:

```
awplus# delete temp.cfg
```

To delete the read-only file `one.cfg` from the current directory, use the command:

```
awplus# delete force one.cfg
```

To delete the directory `old_configs`, which is not empty, use the command:

```
awplus# delete recursive old_configs
```

To delete the directory `new_configs`, which is not empty, without prompting if any read-only files are being deleted, use the command:

```
awplus# delete force recursive new_configs
```

**Related  
Commands** [erase startup-config](#)  
[rmdir](#)

# delete debug

**Overview** Use this command to delete a specified debug output file.

**Syntax** `delete debug <source-name>`

| Parameter                        | Description                                                                                                                |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;source-name&gt;</code> | The filename and path where the debug output originates. See <a href="#">Introduction</a> on page 99 for valid URL syntax. |

**Mode** Privileged Exec

**Example** To delete debug output, use the following command:

```
awplus# delete debug
```

**Output** Figure 2-3: CLI prompt after entering the **delete debug** command

```
Enter source file name []:
```

**Related  
Commands** [copy debug](#)  
[move debug](#)

# dir

**Overview** This command lists the files on a filesystem. If no directory or file is specified then this command lists the files in the current working directory.

**Syntax** `dir [all] [recursive] [sort [reverse] [name|size|time]]  
[<filename>|debug|flash|nvs|usb]`

| Parameter  | Description                                                                                                                                  |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| all        | List all files.                                                                                                                              |
| recursive  | List the contents of directories recursively.                                                                                                |
| sort       | Sort directory listing.                                                                                                                      |
| reverse    | Sort using reverse order.                                                                                                                    |
| name       | Sort by name.                                                                                                                                |
| size       | Sort by size.                                                                                                                                |
| time       | Sort by modification time (default).                                                                                                         |
| <filename> | The name of the directory or file. If no directory or file is specified, then this command lists the files in the current working directory. |
| debug      | Debug root directory                                                                                                                         |
| flash      | Flash memory root directory                                                                                                                  |
| nvs        | NVS memory root directory                                                                                                                    |
| usb        | USB storage device root directory                                                                                                            |

**Mode** Privileged Exec

**Usage** In a stacked environment you can use the CLI on a stack master to access filesystems that are located on another stack member. The syntax is:

```
<hostname>-<stack_ID>/flash: [/] [<directory> /]  
<stack_member_filename>
```

For example, to specify a file in the “configs” directory on member 2 of a stack, enter:

```
awplus-2/flash:/configs/example.cfg
```

**Examples** To list the files in the current working directory, use the command:

```
awplus# dir
```

To list the non-hidden files in the root of the Flash filesystem, use the command:

```
awplus# dir flash
```

To list all the files in the root of the Flash filesystem, use the command:

```
awplus# dir all flash:
```

To list recursively the files in the Flash filesystem, use the command:

```
awplus# dir recursive flash:
```

To list the files in alphabetical order, use the command:

```
awplus# dir sort name
```

To list the files by size, smallest to largest, use the command:

```
awplus# dir sort reverse size
```

To sort the files by modification time, oldest to newest, use the command:

```
awplus# dir sort reverse time
```

To list the files within the Flash filesystem for stack member 2, use the command:

```
awplus# dir awplus-2/flash:/
```

Note that you must specify the filesystem on the stack member (**flash** in this example).

**Output** Figure 2-4: Example output from the **dir** command

```
awplus#dir
  630 -rw- May 19 2016 23:36:31 example.cfg
23652123 -rw- May 17 2016 03:41:18 x310-5.4.6-1.1.rel
  149 -rw- Feb  9 2016 00:40:35 exception.log
```

**Related  
Commands** [cd](#)  
[pwd](#)

# edit

**Overview** This command opens a text file in the AlliedWare Plus™ text editor. Once opened you can use the editor to alter to the file.

If a filename is specified and it already exists, then the editor opens it in the text editor.

If no filename is specified, the editor prompts you for one when you exit it.

Before starting the editor make sure your terminal, terminal emulation program, or Telnet client is 100% compatible with a VT100 terminal. The editor uses VT100 control sequences to display text on the terminal.

For more information about using the editor, including control sequences, see the [File Management Feature Overview and Configuration Guide](#).

**Syntax** edit [<filename>]

| Parameter  | Description                                   |
|------------|-----------------------------------------------|
| <filename> | Name of a file in the local Flash filesystem. |

**Mode** Privileged Exec

**Examples** To create and edit a new text file, use the command:

```
awplus# edit
```

To edit the existing configuration file `myconfig.cfg` stored on your device's Flash memory, use the command:

```
awplus# edit myconfig.cfg
```

**Related Commands** [edit \(filename\)](#)  
[show file](#)

# edit (filename)

**Overview** This command opens a remote text file as read-only in the AlliedWare Plus™ text editor.

Before starting the editor make sure your terminal, terminal emulation program, or Telnet client is 100% compatible with a VT100 terminal. The editor uses VT100 control sequences to display text on the terminal.

**Syntax** `edit <filename>`

| Parameter                     | Description                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------|
| <code>&lt;filename&gt;</code> | The filename and path of the remote file. See <a href="#">Introduction</a> on page 99 for valid syntax. |

**Mode** Privileged Exec

**Example** To view the file `bob.key` stored in the security directory of a TFTP server, use the command:

```
awplus# edit tftp://security/bob.key
```

**Related  
Commands** [copy \(filename\)](#)  
[edit](#)  
[show file](#)

# erase startup-config

**Overview** This command deletes the file that is set as the startup-config file, which is the configuration file that the system runs when it boots up.

At the next restart, the device loads the default configuration file, default.cfg. If default.cfg no longer exists, then the device loads with the factory default configuration. This provides a mechanism for you to return the device to the factory default settings.

**Syntax** `erase startup-config`

**Mode** Privileged Exec

**Example** To delete the file currently set as the startup-config, use the command:

```
awplus# erase startup-config
```

**Related Commands**

- [boot config-file backup](#)
- [copy running-config](#)
- [copy startup-config](#)
- [show boot](#)

# ip tftp source-interface

**Overview** Use this command to manually specify the IP address that all TFTP requests originate from. This is useful in network configurations where TFTP servers only accept requests from certain devices, or where the server cannot dynamically determine the source of the request.

Use the **no** variant of this command to stop specifying a source.

**Syntax** `ip tftp source-interface [<interface>|<ip-add>]`  
`no ip tftp source-interface`

| Parameter   | Description                                                                                                                |
|-------------|----------------------------------------------------------------------------------------------------------------------------|
| <interface> | The VLAN that TFTP requests originate from. The device will use the IP address of this interface as its source IP address. |
| <ip-add>    | The IP address that TFTP requests originate from, in dotted decimal format                                                 |

**Default** There is no default source specified.

**Mode** Global Configuration

**Usage** This command is helpful in network configurations where TFTP traffic needs to traverse point-to-point links or subnets within your network, and you do not want to propagate those point-to-point links through your routing tables.

In those circumstances, the TFTP server cannot dynamically determine the source of the TFTP request, and therefore cannot send the requested data to the correct device. Specifying a source interface or address enables the TFTP server to send the data correctly.

**Example** To specify that TFTP requests originate from the IP address 192.0.2.1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip tftp source-interface 192.0.2.1
```

**Related Commands** [copy \(filename\)](#)

# ipv6 tftp source-interface

**Overview** Use this command to manually specify the IPv6 address that all TFTP requests originate from. This is useful in network configurations where TFTP servers only accept requests from certain devices, or where the server cannot dynamically determine the source of the request.

Use the **no** variant of this command to stop specifying a source.

**Syntax** `ipv6 tftp source-interface [<interface>|<ipv6-add>]`  
`no ipv6 tftp source-interface`

| Parameter   | Description                                                                                                                    |
|-------------|--------------------------------------------------------------------------------------------------------------------------------|
| <interface> | The VLAN that TFTP requests originate from. The device will use the IPv6 address of this interface as its source IPv6 address. |
| <ipv6-add>  | The IPv6 address that TFTP requests originate from, in the format x:x::x, for example, 2001:db8::8a2e:7334.                    |

**Default** There is no default source specified.

**Mode** Global Configuration

**Usage** This command is helpful in network configurations where TFTP traffic needs to traverse point-to-point links or subnets within your network, and you do not want to propagate those point-to-point links through your routing tables.

In those circumstances, the TFTP server cannot dynamically determine the source of the TFTP request, and therefore cannot send the requested data to the correct device. Specifying a source interface or address enables the TFTP server to send the data correctly.

**Example** To specify that TFTP requests originate from the IPv6 address 2001:db8::8a2e:7334, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 tftp source-interface 2001:db8::8a2e:7334
```

**Related Commands** [copy \(filename\)](#)

# mkdir

**Overview** This command makes a new directory.

**Syntax** `mkdir <name>`

| Parameter                 | Description                                               |
|---------------------------|-----------------------------------------------------------|
| <code>&lt;name&gt;</code> | The name and path of the directory that you are creating. |

**Mode** Privileged Exec

**Usage** You cannot name a directory or subdirectory **flash**, **nvs**, **usb**, **card**, **tftp**, **scp**, **sftp** or **http**. These keywords are reserved for tab completion when using various file commands.

**Example** To make a new directory called `images` in the current directory, use the command:

```
awplus# mkdir images
```

**Related  
Commands** `cd`  
`dir`  
`pwd`

# move

**Overview** This command renames or moves a file.

**Syntax** `move <source-name> <destination-name>`

| Parameter                             | Description                                                                                                  |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <code>&lt;source-name&gt;</code>      | The filename and path of the source file. See <a href="#">Introduction</a> on page 99 for valid syntax.      |
| <code>&lt;destination-name&gt;</code> | The filename and path of the destination file. See <a href="#">Introduction</a> on page 99 for valid syntax. |

**Mode** Privileged Exec

**Examples** To rename the file `temp.cfg` to `startup.cfg`, use the command:

```
awplus# move temp.cfg startup.cfg
```

To move the file `temp.cfg` from the root of the Flash filesystem to the directory `myconfigs`, use the command:

```
awplus# move temp.cfg myconfigs/temp.cfg
```

**Related Commands**

- [delete](#)
- [edit](#)
- [show file](#)
- [show file systems](#)

# move debug

**Overview** This command moves a specified debug file to a destination debug file.

**Syntax** `move debug {<destination-name>|debug|flash|nvs|usb}`

| Parameter                             | Description                                                                                                                         |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;destination-name&gt;</code> | The filename and path where you would like the debug output moved to. See <a href="#">Introduction</a> on page 99 for valid syntax. |

**Mode** Privileged Exec

**Example** To move debug output onto a USB storage device with a filename “my-debug”, use the following command:

```
awplus# move debug usb:my-debug
```

**Output** Figure 2-5: CLI prompt after entering the **move debug** command

```
Enter source file name []:
```

**Related  
Commands** [copy debug](#)  
[delete debug](#)

# pwd

**Overview** This command prints the current working directory.

**Syntax** `pwd`

**Mode** Privileged Exec

**Example** To print the current working directory, use the command:

```
awplus# pwd
```

**Related  
Commands** `cd`

# rmkdir

**Overview** This command removes a directory. This command only works on empty directories, unless you specify the optional **force** keyword.

**Syntax** `rmkdir [force] <name>`

| Parameter                 | Description                                                                                                    |
|---------------------------|----------------------------------------------------------------------------------------------------------------|
| <code>force</code>        | Optional keyword that allows you to delete directories that are not empty and contain files or subdirectories. |
| <code>&lt;name&gt;</code> | The name and path of the directory.                                                                            |

**Mode** Privileged Exec

**Usage** In a stacked environment you can use the CLI on a stack master to access filesystems that are located on another stack member. See the [Introduction](#) on page 99 for syntax details.

**Examples** To remove the directory “images” from the top level of the Flash filesystem, use the command:

```
awplus# rmkdir flash:/images
```

To create a directory called “level1” containing a subdirectory called “level2”, and then force the removal of both directories, use the commands:

```
awplus# mkdir level1
awplus# mkdir level1/level2
awplus# rmkdir force level1
```

To remove a directory called “test” from the top level of the Flash filesystem on stack member 3, use the command:

```
awplus# rmkdir awplus-3/flash:/test
```

Note that you must specify the filesystem (**flash:** in this example).

**Related  
Commands**

- [cd](#)
- [dir](#)
- [mkdir](#)
- [pwd](#)

# show autoboot

**Overview** This command displays the Autoboot configuration and status.

**Syntax** show autoboot

**Mode** Privileged Exec

**Example** To show the Autoboot configuration and status, use the command:

```
awplus# show autoboot
```

**Output** Figure 2-6: Example output from the **show autoboot** command

```
awplus#show autoboot
Autoboot configuration
-----
Autoboot status           : enabled
USB file autoboot.txt exists : yes

Restore information on USB
Autoboot enable in autoboot.txt : yes
Restore release file       : x310-5.4.6-1.1.rel
(file exists)
Restore configuration file  : network_1.cfg (file exists)
```

Figure 2-7: Example output from the **show autoboot** command when an external media source is not present

```
awplus#show autoboot
Autoboot configuration
-----
Autoboot status           : enabled
External media source     : USB not found.
```

**Related Commands**

- [autoboot enable](#)
- [create autoboot](#)
- [show boot](#)

# show boot

**Overview** This command displays the current boot configuration. We recommend that the currently running release is set as the current boot image.

**Syntax** show boot

**Mode** Privileged Exec

**Example** To show the current boot configuration, use the command:

```
awplus# show boot
```

**Output** Figure 2-8: Example output from the **show boot** command when the current boot config is on a USB storage device

```
awplus#show boot
Boot configuration
-----
Current software   : x310-5.4.6-1.1.rel
Current boot image : usb:/x310-5.4.6-1.1.rel
Backup boot image  : flash:/x310-5.4.6-0.1.rel
Default boot config: flash:/default.cfg
Current boot config: usb:/my.cfg (file exists)
Backup boot config: flash:/backup.cfg (file not found)
Autoboot status    : enabled
```

**Table 1:** Parameters in the output of the **show boot** command

| Parameter           | Description                                                                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Current software    | The current software release that the device is using.                                                                                                           |
| Current boot image  | The boot image currently configured for use during the next boot cycle.                                                                                          |
| Backup boot image   | The boot image to use during the next boot cycle if the device cannot load the main image.                                                                       |
| Default boot config | The default startup configuration file. The device loads this configuration script if no file is set as the startup-config file.                                 |
| Current boot config | The configuration file currently configured as the startup-config file. The device loads this configuration file during the next boot cycle if this file exists. |

**Table 1:** Parameters in the output of the **show boot** command (cont.)

| Parameter          | Description                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------|
| Backup boot config | The configuration file to use during the next boot cycle if the main configuration file cannot be loaded. |
| Autoboot status    | The status of the Autoboot feature; either enabled or disabled.                                           |

**Related  
Commands**

[autoboot enable](#)  
[boot config-file backup](#)  
[boot system backup](#)  
[show autoboot](#)

# show file

**Overview** This command displays the contents of a specified file.

**Syntax** `show file <filename>`

| Parameter                     | Description                                                                         |
|-------------------------------|-------------------------------------------------------------------------------------|
| <code>&lt;filename&gt;</code> | Name of a file on the local Flash filesystem, or name and directory path of a file. |

**Mode** Privileged Exec

**Example** To display the contents of the file `oldconfig.cfg`, which is in the current directory, use the command:

```
awplus# show file oldconfig.cfg
```

**Related  
Commands**

- [edit](#)
- [edit \(filename\)](#)
- [show file systems](#)

# show file systems

**Overview** This command lists the filesystems and their utilization information where appropriate.

**Syntax** show file systems

**Mode** Privileged Exec

**Examples** To display the filesystems, use the command:

```
awplus# show file systems
```

**Output** Figure 2-9: Example output from the **show file systems** command

| awplus#show file systems |          |        |       |          |         |          |       |
|--------------------------|----------|--------|-------|----------|---------|----------|-------|
| Size (b)                 | Free (b) | Type   | Flags | Prefixes | S/D/V   | Lcl/Ntwk | Avail |
| 63.0M                    | 28.5M    | flash  | rw    | flash:   | static  | local    | Y     |
| -                        | -        | system | rw    | system:  | virtual | local    | -     |
| 10.0M                    | 9.8M     | debug  | rw    | debug:   | static  | local    | Y     |

**Table 2:** Parameters in the output of the **show file systems** command

| Parameter             | Description                                                                                                                    |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------|
| Size (B)<br>Available | The total memory available to this filesystem. The units are given after the value and are M for Megabytes or k for kilobytes. |
| Free (B)              | The total memory free within this filesystem. The units are given after the value and are M for Megabytes or k for kilobytes.  |
| Type                  | The memory type used for this filesystem; one of:<br>flash<br>system<br>nvs<br>usbstick<br>tftp<br>scp<br>sftp<br>http.        |
| Flags                 | The file setting options: rw (read write), ro (read only).                                                                     |

**Table 2:** Parameters in the output of the **show file systems** command (cont.)

| Parameter  | Description                                                                                                                                  |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Prefixes   | The prefixes used when entering commands to access the filesystems; one of:<br>flash<br>system<br>nvs<br>usb<br>tftp<br>scp<br>sftp<br>http. |
| S/V/D      | The memory type: static, virtual, dynamic.                                                                                                   |
| Lcl / Ntwk | Whether the memory is located locally or via a network connection.                                                                           |
| Avail      | Whether the memory is accessible: Y (yes), N (no), - (not applicable)                                                                        |

- [show file](#)

# show running-config

**Overview** This command displays the current configuration of your device. Its output includes all non-default configuration. The default settings are not displayed.

You can control the output in the following ways:

- To display only lines that contain a particular word, enter the following parameters after the command:  

```
| include <word>
```
- To start the display at the first line that contains a particular word, enter the following parameters after the command:  

```
| begin <word>
```
- To save the output to a file, enter the following parameters after the command:  

```
> <filename>
```

**Syntax** `show running-config`

**Mode** Privileged Exec and Global Configuration

**Example** To display the current configuration of your device, use the command:

```
awplus# show running-config [<feature>|full]
```

| Parameter           | Description                                                                                                                               |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <feature>           | Display only the configuration for a single feature. The features available depend on your device and will be some of the following list: |
| access-list         | ACL configuration                                                                                                                         |
| antivirus           | Antivirus configuration                                                                                                                   |
| application         | Application configuration                                                                                                                 |
| as-path             | Autonomous system path filter configuration                                                                                               |
| as-path access-list | Configuration of ACLs for AS path filtering                                                                                               |
| atmf                | Allied Telesis Management Framework configuration                                                                                         |
| bgp                 | Border Gateway Protocol (BGP) configuration                                                                                               |
| community-list      | Community-list configuration                                                                                                              |
| crypto              | Security-specific configuration                                                                                                           |
| dhcp                | DHCP configuration                                                                                                                        |
| dpi                 | Deep Packet Inspection configuration                                                                                                      |

| Parameter            | Description                                                                                     |
|----------------------|-------------------------------------------------------------------------------------------------|
| entity               | Entity configuration                                                                            |
| firewall             | Firewall configuration                                                                          |
| interface            | Interface configuration. See <a href="#">show running-config interface</a> for further options. |
| ip                   | Internet Protocol (IP) configuration                                                            |
| ip pim dense-mode    | PIM-DM configuration                                                                            |
| ip pim sparse-mode   | PIM-SM configuration                                                                            |
| ip route             | IP static route configuration                                                                   |
| ip-reputation        | IP Reputation configuration                                                                     |
| ips                  | IPS configuration                                                                               |
| ipsec                | Internet Protocol Security (IPSec) configuration                                                |
| ipv6                 | Internet Protocol version 6 (IPv6) configuration                                                |
| ipv6 access-list     | IPv6 ACL configuration                                                                          |
| ipv6 mroute          | IPv6 multicast route configuration                                                              |
| ipv6 prefix-list     | IPv6 prefix list configuration                                                                  |
| ipv6 route           | IPv6 static route configuration                                                                 |
| isakmp               | Internet Security Association Key Management Protocol (ISAKMP) configuration                    |
| key chain            | Authentication key management configuration                                                     |
| l2tp-profile         | L2TP tunnel profile configuration                                                               |
| lldp                 | LLDP configuration                                                                              |
| log                  | Logging utility configuration                                                                   |
| malware-protection   | Malware protection configuration                                                                |
| nat                  | Network Address Translation configuration                                                       |
| power-inline         | Power over Ethernet (PoE) configuration                                                         |
| policy-based-routing | Policy-based routing (PBR) configuration                                                        |
| pppoe-ac             | PPPoE access concentrator configuration                                                         |
| prefix-list          | Prefix-list configuration                                                                       |
| route-map            | Route-map configuration                                                                         |
| router               | Router configuration                                                                            |
| router-id            | Configuration of the router identifier for this system                                          |

| Parameter | Description                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------|
|           | security-password Strong password security configuration                                                                          |
|           | snmp SNMP configuration                                                                                                           |
|           | ssh Secure Shell configuration                                                                                                    |
|           | switch Switch configuration                                                                                                       |
|           | web-control Web Control configuration                                                                                             |
| full      | Display the running-config for all features. This is the default setting, so is the same as entering <b>show running-config</b> . |

# show running-config interface

**Overview** This command displays the current configuration of one or more interfaces on the device.

**Syntax** `show running-config interface [<interface-list>] [dot1x|ip igmp|ip multicast|ip pim dense-mode|ip pim sparse-mode|ipv6 rip|lacp|mstp|ospf|rip|rstp|stp]`

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface-list>   | The interfaces or ports to display information about. An interface-list can be: <ul style="list-style-type: none"><li>a VLAN (e.g. vlan2), a LAN port (e.g. port1.0.4), a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po2)</li><li>a continuous range of VLANs, ports, static channel groups or dynamic (LACP) channel groups, separated by a hyphen (e.g. vlan2-8, or port1.0.1-1.0.4, or sa1-2, or po1-2)</li><li>a comma-separated list of the above (e.g. vlan2,vlan20-30). Do not mix interface types in a list.</li></ul> The specified interfaces must exist. |
| dot1x              | Displays running configuration for 802.1X port authentication for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| lacp               | Displays running configuration for LACP (Link Aggregation Control Protocol) for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| ip igmp            | Displays running configuration for IGMP (Internet Group Management Protocol) for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| ip multicast       | Displays running configuration for general multicast settings for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| ip pim sparse-mode | Displays running configuration for PIM-SM (Protocol Independent Multicast - Sparse Mode) for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ip pim dense-mode  | Displays running configuration for PIM-DM (Protocol Independent Multicasting - Dense Mode) for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| mstp               | Displays running configuration for MSTP (Multiple Spanning Tree Protocol) for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| ospf               | Displays running configuration for OSPF (Open Shortest Path First) for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| rip                | Displays running configuration for RIP (Routing Information Protocol) for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| ipv6 rip           | Displays running configuration for RIPng (RIP for IPv6) for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Parameter | Description                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------|
| rstp      | Displays running configuration for RSTP (Rapid Spanning Tree Protocol) for the specified interfaces. |
| stp       | Displays running configuration for STP (Spanning Tree Protocol) for the specified interfaces.        |

**Mode** Privileged Exec and Global Configuration

**Default** Displays information for all protocols on all interfaces

**Examples** To display the current running configuration of your device for ports 1 to 4, use the command:

```
awplus# show running-config interface port1.0.1-port1.0.4
```

To display the current running configuration of a device for VLAN 1, use the command:

```
awplus# show running-config interface vlan1
```

To display the current running configuration of a device for VLANs 1 and 3-5, use the command:

```
awplus# show running-config interface vlan1,vlan3-vlan5
```

To display the current OSPF configuration of your device for ports 1 to 6, use the command:

```
awplus# show running-config interface port1.0.1-port1.0.6 ospf
```

**Output** Figure 2-11: Example output from a **show running-config interface port1.0.2** command

```
awplus#show running-config interface port1.0.2
!
interface port1.0.2
  switchport
  switchport mode access
!
```

**Related Commands** [copy running-config](#)  
[show running-config](#)

# show startup-config

**Overview** This command displays the contents of the start-up configuration file, which is the file that the device runs on start-up.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show startup-config`

**Mode** Privileged Exec

**Example** To display the contents of the current start-up configuration file, use the command:

```
awplus# show startup-config
```

**Output** Figure 2-12: Example output from the **show startup-config** command

```
awplus#show startup-config
!
service password-encryption
!
no banner motd
!
username manager privilege 15 password 8 $1$bJoVec4D$JwOJGPr7YqoExA0GVasdE0
!
no service ssh
!
service telnet
!
service http
!
no clock timezone
.
.
.
line con 0
line vty 0 4
!
end
```

- [copy running-config](#)
- [copy startup-config](#)
- [erase startup-config](#)
- [show boot](#)

# show version

**Overview** This command displays the version number and copyright details of the current AlliedWare Plus™ OS your device is running.

**Syntax** show version

**Mode** User Exec and Privileged Exec

**Example** To display the version details of your currently installed software, use the command:

```
awplus# show version
```

**Output** Figure 2-13: Example output from the **show version** command

```
awplus#show version

AlliedWare Plus (TM) 5.4.3 19/11/12 13:22:32

Build name : x310-5.4.6-1.1.rel
Build date : Fri Jun 6 13:22:32 NZST 2014
Build type : RELEASE

**Related**    [boot system backup](#)  
**Commands**    [show boot](#)

# write file

**Overview** This command copies the running-config into the file that is set as the current startup-config file. This command is a synonym of the **write memory** and **copy running-config startup-config** commands.

**Syntax** write [file]

**Mode** Privileged Exec

**Example** To write configuration data to the start-up configuration file, use the command:

```
awplus# write file
```

**Related  
Commands**

- [copy running-config](#)
- [write memory](#)
- [show running-config](#)

# write memory

**Overview** This command copies the running-config into the file that is set as the current startup-config file. This command is a synonym of the **write file** and **copy running-config startup-config** commands.

**Syntax** write [memory]

**Mode** Privileged Exec

**Example** To write configuration data to the start-up configuration file, use the command:

```
awplus# write memory
```

**Related  
Commands**

- [copy running-config](#)
- [write file](#)
- [show running-config](#)

# write terminal

**Overview** This command displays the current configuration of the device. This command is a synonym of the [show running-config](#) command.

**Syntax** write terminal

**Mode** Privileged Exec

**Example** To display the current configuration of your device, use the command:

```
awplus# write terminal
```

**Related  
Commands** [show running-config](#)

# 3

# User Access Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure user access.

- Command List**
- “clear line console” on page 153
  - “clear line vty” on page 154
  - “enable password” on page 155
  - “enable secret” on page 158
  - “exec-timeout” on page 161
  - “flowcontrol hardware (asyn/console)” on page 163
  - “length (asyn)” on page 165
  - “line” on page 166
  - “privilege level” on page 168
  - “security-password history” on page 169
  - “security-password forced-change” on page 170
  - “security-password lifetime” on page 171
  - “security-password minimum-categories” on page 172
  - “security-password minimum-length” on page 173
  - “security-password reject-expired-pwd” on page 174
  - “security-password warning” on page 175
  - “service advanced-vty” on page 176
  - “service password-encryption” on page 177
  - “service telnet” on page 178
  - “service terminal-length (deleted)” on page 179

- ["show privilege"](#) on page 180
- ["show security-password configuration"](#) on page 181
- ["show security-password user"](#) on page 182
- ["show telnet"](#) on page 183
- ["show users"](#) on page 184
- ["telnet"](#) on page 185
- ["telnet server"](#) on page 186
- ["terminal length"](#) on page 187
- ["terminal resize"](#) on page 188
- ["username"](#) on page 189

# clear line console

**Overview** This command resets a console line. If a terminal session exists on the line then the terminal session is terminated. If console line settings have changed then the new settings are applied.

**Syntax** `clear line console 0`

**Mode** Privileged Exec

**Example** To reset the console line (asyn), use the command:

```
awplus# clear line console 0
```

```
awplus# % The new settings for console line 0 have been applied
```

**Related Commands**

- [clear line vty](#)
- [flowcontrol hardware \(asyn/console\)](#)
- [line](#)
- [show users](#)

# clear line vty

**Overview** This command resets a VTY line. If a session exists on the line then it is closed.

**Syntax** `clear line vty <0-32>`

| Parameter | Description |
|-----------|-------------|
| <0-32>    | Line number |

**Mode** Privileged Exec

**Example** To reset the first vty line, use the command:

```
awplus# clear line vty 1
```

**Related  
Commands**

# enable password

**Overview** To set a local password to control access to various privilege levels, use the **enable password** Global Configuration command. Use the **enable password** command to modify or create a password to be used, and use the **no enable password** command to remove the password.

Note that the **enable secret** command is an alias for the **enable password** command, and the **no enable secret** command is an alias for the **no enable password** command. Issuing a **no enable password** command removes a password configured with the **enable secret** command. The **enable password** command is shown in the running and startup configurations. Note that if the **enable secret** command is entered then **enable password** is shown in the configuration.

**NOTE:** Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option 8 for GUI users.

**Syntax** `enable password [<plain>|8 <hidden>|level <1-15> 8 <hidden>]`  
`no enable password [level <1-15>]`

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <plain>   | Specifies the unencrypted password.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 8         | Specifies a hidden password will follow.                                                                                                                                                                                                                                                                                                                                                                                                              |
| <hidden>  | Specifies the hidden encrypted password. Use an encrypted password for better security where a password crosses the network or is stored on a TFTP server.                                                                                                                                                                                                                                                                                            |
| level     | Privilege level <1-15>. Level for which the password applies. You can specify up to 16 privilege levels, using numbers 1 through 15. Level 1 is normal EXEC-mode user privileges for User Exec mode. If this argument is not specified in the command or the <b>no</b> variant of the command, the privilege level defaults to 15 (enable mode privileges) for Privileged Exec mode. A privilege level of 7 can be set for intermediate CLI security. |

**Default** The privilege level for enable password is level 15 by default. Previously the default was level 1.

**Mode** Global Configuration

**Usage** This command enables the Network Administrator to set a password for entering the Privileged Exec mode when using the **enable (Privileged Exec mode)** command. There are three methods to enable a password. In the examples below, for each method, note that the configuration is different and the configuration file output is different, but the password string to be used to enter the Privileged Exec mode with the **enable** command is the same (**mypasswd**).

A user can now have an intermediate CLI security level set with this command for privilege level 7 to access all the show commands in Privileged Exec mode and all

the commands in User Exec mode, but not any configuration commands in Privileged Exec mode.

Note that the [enable password](#) command is an alias for the [enable secret](#) command and one password per privilege level is allowed using these commands. Do not assign one password to a privilege level with [enable password](#) and another password to a privilege level with [enable secret](#). Use [enable password](#) or [enable secret](#) commands. Do not use both on the same level.

### Using plain passwords

The plain password is a clear text string that appears in the configuration file as configured.

```
awplus# configure terminal
awplus(config)# enable password mypasswd
awplus(config)# end
```

This results in the following show output:

```
awplus#show run
Current configuration:
hostname awplus
enable password mypasswd
!
interface lo
```

### Using encrypted passwords

You can configure an encrypted password using the [service password-encryption](#) command. First, use the [enable password](#) command to specify the string that you want to use as a password (**mypasswd**). Then, use the [service password-encryption](#) command to encrypt the specified string (**mypasswd**). The advantage of using an encrypted password is that the configuration file does not show **mypasswd**, it will only show the encrypted string **fU7zHzuutY2SA**.

**NOTE:** Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option 8 for GUI users.

```
awplus# configure terminal
awplus(config)# enable password mypasswd
awplus(config)# service password-encryption
awplus(config)# end
```

This results in the following show output:

```
awplus#show run
Current configuration:
hostname awplus
enable password 8 fU7zHzuutY2SA
service password-encryption
!
interface lo
```

### Using hidden passwords

You can configure an encrypted password using the **HIDDEN** parameter (**8**) with the [enable password](#) command. Use this method if you already know the encrypted string corresponding to the plain text string that you want to use as a

password. It is not required to use the [service password-encryption](#) command for this method. The output in the configuration file will show only the encrypted string, and not the text string.

```
awplus# configure terminal
awplus(config)# enable password 8 fU7zHzuutY2SA
awplus(config)# end
```

This results in the following show output:

```
awplus#show run
Current configuration:
hostname awplus
enable password 8 fU7zHzuutY2SA
!
interface lo
```

### **Related Commands**

# enable secret

**Overview** To set a local password to control access to various privilege levels, use the **enable secret** Global Configuration command. Use the **enable secret** command to modify or create a password to be used, and use the **no enable secret** command to remove the password.

Note that the **enable secret** command is an alias for the **enable password** command, and the **no enable secret** command is an alias for the **no enable password** command. Issuing a **no enable password** command removes a password configured with the **enable secret** command. The **enable password** command is shown in the running and startup configurations. Note that if the **enable secret** command is entered then **enable password** is shown in the configuration.

**NOTE:** Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option 8 for GUI users.

**Syntax** `enable secret [<plain>|8 <hidden>|level <0-15> 8 <hidden>]`  
`no enable secret [level <1-15>]`

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <plain>   | Specifies the unencrypted password.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 8         | Specifies a hidden password will follow.                                                                                                                                                                                                                                                                                                                                                                                                              |
| <hidden>  | Specifies the hidden encrypted password. Use an encrypted password for better security where a password crosses the network or is stored on a TFTP server.                                                                                                                                                                                                                                                                                            |
| level     | Privilege level <1-15>. Level for which the password applies. You can specify up to 16 privilege levels, using numbers 1 through 15. Level 1 is normal EXEC-mode user privileges for User Exec mode. If this argument is not specified in the command or the <b>no</b> variant of the command, the privilege level defaults to 15 (enable mode privileges) for Privileged Exec mode. A privilege level of 7 can be set for intermediate CLI security. |

**Default** The privilege level for enable secret is level 15 by default.

**Mode** Global Configuration

**Usage** This command enables the Network Administrator to set a password for entering the Privileged Exec mode when using the **enable (Privileged Exec mode)** command. There are three methods to enable a password. In the examples below, for each method, note that the configuration is different and the configuration file output is different, but the password string to be used to enter the Privileged Exec mode with the **enable** command is the same (**mypasswd**).

A user can have an intermediate CLI security level set with this command for privilege level 7 to access all the show commands in Privileged Exec mode and all

the commands in User Exec mode, but not any configuration commands in Privileged Exec mode.

Note that the `enable secret` command is an alias for the `enable password` command and one password per privilege level is allowed using these commands. Do not assign one password to a privilege level with `enable password` and another password to a privilege level with `enable secret`. Use `enable password` or `enable secret` commands. Do not use both on the same level.

### Using plain passwords

The plain password is a clear text string that appears in the configuration file as configured.

```
awplus# configure terminal
awplus(config)# enable secret mypasswd
awplus(config)# end
```

This results in the following show output:

```
awplus#show run
Current configuration:
hostname awplus
enable password mypasswd
!
interface lo
```

### Using encrypted passwords

Configure an encrypted password using the `service password-encryption` command. First, use the `enable password` command to specify the string that you want to use as a password (**mypasswd**). Then, use the `service password-encryption` command to encrypt the specified string (**mypasswd**). The advantage of using an encrypted password is that the configuration file does not show **mypasswd**, it will only show the encrypted string **fU7zHzuutY2SA**.

**NOTE:** Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option 8 for GUI users.

```
awplus# configure terminal
awplus(config)# enable secret mypasswd
awplus(config)# service password-encryption
awplus(config)# end
```

This results in the following show output:

```
awplus#show run
Current configuration:
hostname awplus
enable password 8 fU7zHzuutY2SA
service password-encryption
!
interface lo
```

### Using hidden passwords

Configure an encrypted password using the **HIDDEN** parameter (**8**) with the `enable password` command. Use this method if you already know the encrypted string corresponding to the plain text string that you want to use as a password. It

is not required to use the [service password-encryption](#) command for this method. The output in the configuration file will show only the encrypted string, and not the text string:

```
awplus# configure terminal
awplus(config)# enable secret 8 fU7zHzuutY2SA
awplus(config)# end
```

This results in the following show output:

```
awplus#show run
Current configuration:
hostname awplus
enable password 8 fU7zHzuutY2SA
!
interface lo
```

### **Related Commands**

[enable \(Privileged Exec mode\)](#)

[service password-encryption](#)  
[privilege level](#)  
[show privilege](#)  
[username](#)  
[show running-config](#)

# exec-timeout

**Overview** This command sets the interval your device waits for user input from either a console or VTY connection. Once the timeout interval is reached, the connection is dropped. This command sets the time limit when the console or VTY connection automatically logs off after no activity.

The **no** variant of this command removes a specified timeout and resets to the default timeout (10 minutes).

**Syntax** `exec-timeout {<minutes>} [<seconds>]`  
`no exec-timeout`

| Parameter | Description                                           |
|-----------|-------------------------------------------------------|
| <minutes> | <0-35791> Required integer timeout value in minutes   |
| <seconds> | <0-2147483> Optional integer timeout value in seconds |

**Default** The default for the **exec-timeout** command is 10 minutes and 0 seconds (**exec-timeout 10 0**).

**Mode** Line Configuration

**Usage** This command is used set the time the telnet session waits for an idle VTY session, before it times out. An **exec-timeout 0 0** setting will cause the telnet session to wait indefinitely. The command **exec-timeout 0 0** is useful while configuring a device, but reduces device security.

If no input is detected during the interval then the current connection resumes. If no connections exist then the terminal returns to an idle state and disconnects incoming sessions.

**Examples** To set VTY connections to timeout after 2 minutes, 30 seconds if there is no response from the user, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# exec-timeout 2 30
```

To reset the console connection to the default timeout of 10 minutes 0 seconds if there is no response from the user, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no exec-timeout
```

**Validation Commands** `show running-config`

**Related  
Commands**    [line](#)  
                  [service telnet](#)

# flowcontrol hardware (asyn/console)

**Overview** Use this command to enable RTS/CTS (Ready To Send/Clear To Send) hardware flow control on a terminal console line (asyn port) between the DTE (Data Terminal Equipment) and the DCE (Data Communications Equipment).

**Syntax** `flowcontrol hardware`  
`no flowcontrol hardware`

**Mode** Line Configuration

**Default** Hardware flow control is disabled by default.

**Usage** Hardware flow control makes use of the RTS and CTS control signals between the DTE and DCE where the rate of transmitted data is faster than the rate of received data. Flow control is a technique for ensuring that a transmitting entity does not overwhelm a receiving entity with data. When the buffers on the receiving device are full, a message is sent to the sending device to suspend the transmission until the data in the buffers has been processed.

Hardware flow control can be configured on terminal console lines (e.g. asyn0). For Reverse Telnet connections, hardware flow control must be configured to match on both the Access Server and the Remote Device. For terminal console sessions, hardware flow control must be configured to match on both the DTE and the DCE. Settings are saved in the running configuration. Changes are applied after reboot, clear line console, or after closing the session.

Use **show running-config** and **show startup-config** commands to view hardware flow control settings that take effect after reboot for a terminal console line. See the **show running-config** command output:

```
awplus#show running-config
!
line con 1
  speed 9600
  mode out 2001
  flowcontrol hardware
!
```

Note that line configuration commands do not take effect immediately. Line configuration commands take effect after one of the following commands or events:

- issuing a [clear line console](#) command
- issuing a [reboot](#) command
- logging out of the current session

**Examples** To enable hardware flow control on terminal console line asyn0, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# flowcontrol hardware
```

To disable hardware flow control on terminal console line asyn0, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no flowcontrol hardware
```

**Related  
Commands**

- [clear line console](#)
- [show running-config](#)
- [speed \(asyn\)](#)

# length (asyn)

**Overview** Use this command to specify the number of rows of output that the device will display before pausing, for the console or VTY line that you are configuring.

The **no** variant of this command restores the length of a line (terminal session) attached to a console port or to a VTY to its default length of 22 rows.

**Syntax** `length <0-512>`  
`no length`

| Parameter                  | Description                                          |
|----------------------------|------------------------------------------------------|
| <code>&lt;0-512&gt;</code> | Number of lines on screen. Specify 0 for no pausing. |

**Mode** Line Configuration

**Default** The length of a terminal session is 22 rows. The **no length** command restores the default.

**Usage** If the output from a command is longer than the length of the line the output will be paused and the '–More–' prompt allows you to move to the next screen full of data.

A length of 0 will turn off pausing and data will be displayed to the console as long as there is data to display.

**Examples** To set the terminal session length on the console to 10 rows, use the command:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# length 10
```

To reset the terminal session length on the console to the default (22 rows), use the command:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no length
```

To display output to the console continuously, use the command:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# length 0
```

**Related  
Commands** [terminal resize](#)  
[terminal length](#)

# line

**Overview** Use this command to enter line configuration mode for the specified VTYS or the console. The command prompt changes to show that the device is in Line Configuration mode.

**Syntax** `line vty <first-line> [<last-line>]`  
`line console 0`

| Parameter                       | Description                                              |
|---------------------------------|----------------------------------------------------------|
| <code>&lt;first-line&gt;</code> | <code>&lt;0-32&gt;</code> Specify the first line number. |
| <code>&lt;last-line&gt;</code>  | <code>&lt;0-32&gt;</code> Specify the last line number.  |
| <code>console</code>            | The console terminal line(s) for local access.           |
| <code>vty</code>                | Virtual terminal for remote console access.              |

**Mode** Global Configuration

**Usage** In Line Configuration mode, you can configure console and virtual terminal settings, including setting [speed \(asyn\)](#), [length \(asyn\)](#), [privilege level](#), and authentication ([login authentication](#)) or accounting ([accounting login](#)) method lists.

To change the console (asyn) port speed, use this **line** command to enter Line Configuration mode before using the [speed \(asyn\)](#) command. Set the console speed (Baud rate) to match the transmission rate of the device connected to the console (asyn) port on your device.

Note that line configuration commands do not take effect immediately. Line configuration commands take effect after one of the following commands or events:

- issuing a [clear line console](#) command
- issuing a [reboot](#) command
- logging out of the current session

**Examples** To enter Line Configuration mode in order to configure all VTYS, use the commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)#
```

To enter Line Configuration mode to configure the console (asyn 0) port terminal line, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)#
```

**Related  
Commands**

- accounting login
- clear line console
- clear line vty
- flowcontrol hardware (asyn/console)
- length (asyn)
- login authentication
- privilege level
- speed (asyn)

# privilege level

**Overview** This command sets a privilege level for VTY or console connections. The configured privilege level from this command overrides a specific user's initial privilege level at the console login.

**Syntax** `privilege level <1-15>`

**Mode** Line Configuration

**Usage** You can set an intermediate CLI security level for a console user with this command by applying privilege level 7 to access all show commands in Privileged Exec and all User Exec commands. However, intermediate CLI security will not show configuration commands in Privileged Exec.

**Examples** To set the console connection to have the maximum privilege level, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# privilege level 15
```

To set all vty connections to have the minimum privilege level, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# privilege level 1
```

To set all vty connections to have an intermediate CLI security level, to access all show commands, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# privilege level 7
```

# security-password history

**Overview** This command specifies the number of previous passwords that are unable to be reused. A new password is invalid if it matches a password retained in the password history.

The **no** variant of the command disables this feature.

**Syntax** `security-password history <0-15>`  
`no security-password history`

| Parameter | Description                                                                                                                                                                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-15>    | The allowable range of previous passwords to match against. A value of 0 will disable the history functionality and is equivalent to the <b>no security-password history</b> command. If the history functionality is disabled, all users' password history is reset and all password history is lost. |

**Default** The default history value is 0, which will disable the history functionality.

**Mode** Global Configuration

**Examples** To restrict reuse of the three most recent passwords, use the command:

```
awplus# configure terminal
awplus(config)# security-password history 3
```

To allow the reuse of recent passwords, use the command:

```
awplus# configure terminal
awplus(config)# no security-password history
```

- [show security-password configuration](#)

# security-password forced-change

**Overview** This command specifies whether or not a user is forced to change an expired password at the next login. If this feature is enabled, users whose passwords have expired are forced to change to a password that must comply with the current password security rules at the next login.

Note that to use this command, the lifetime feature must be enabled with the [security-password lifetime](#) command and the reject-expired-pwd feature must be disabled with the [security-password reject-expired-pwd](#) command.

The **no** variant of the command disables this feature.

**Syntax** `security-password forced-change`  
`no security-password forced-change`

**Default** The forced-change feature is disabled by default.

**Mode** Global Configuration

**Example** To force a user to change their expired password at the next login, use the command:

```
awplus# configure terminal
awplus(config)# security-password forced-change
```

**Related Commands**

# security-password lifetime

**Overview** This command enables password expiry by specifying a password lifetime in days.

Note that when the password lifetime feature is disabled, it also disables the [security-password forced-change](#) command and the [security-password warning](#) command.

The **no** variant of the command disables this feature.

**Syntax** `security-password lifetime <0-1000>`  
`no security-password lifetime`

| Parameter                   | Description                                                                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;0-1000&gt;</code> | Password lifetime specified in days. A value of 0 will disable lifetime functionality and the password will never expire. This is equivalent to the <b>no security-password lifetime</b> command. |

**Default** The default password lifetime is 0, which will disable the lifetime functionality.

**Mode** Global Configuration

**Example** To configure the password lifetime to 10 days, use the command:

```
awplus# configure terminal
awplus(config)# security-password lifetime 10
```

- [show security-password configuration](#)

# security-password minimum-categories

**Overview** This command specifies the minimum number of categories that the password must contain in order to be considered valid. The password categories are:

- uppercase letters: A to Z
- lowercase letters: a to z
- digits: 0 to 9
- special symbols: all printable ASCII characters not included in the previous three categories. The question mark (?) cannot be used as it is reserved for help functionality.

Note that to ensure password security, the minimum number of categories should align with the lifetime selected, i.e. the fewer categories specified the shorter the lifetime specified.

**Syntax** `security-password minimum-categories <1-4>`

| Parameter | Description                                                          |
|-----------|----------------------------------------------------------------------|
| <1-4>     | Number of categories the password must satisfy, in the range 1 to 4. |

**Default** The default number of categories that the password must satisfy is 1.

**Mode** Global Configuration

**Example** To configure the required minimum number of character categories to be 3, use the command:

```
awplus# configure terminal
awplus(config)# security-password minimum-categories 3
```

- [username](#)

# security-password minimum-length

**Overview** This command specifies the minimum allowable password length. This value is checked against when there is a password change or a user account is created.

**Syntax** `security-password minimum-length <1-23>`

| Parameter                 | Description                                        |
|---------------------------|----------------------------------------------------|
| <code>&lt;1-23&gt;</code> | Minimum password length in the range from 1 to 23. |

**Default** The default minimum password length is 1.

**Mode** Global Configuration

**Example** To configure the required minimum password length as 8, use the command:

```
awplus# configure terminal
awplus(config)# security-password minimum-length 8
```

**Related Commands**

- [show security-password configuration](#)
- [username](#)

# security-password reject-expired-pwd

**Overview** This command specifies whether or not a user is allowed to login with an expired password. Users with expired passwords are rejected at login if this functionality is enabled. Users then have to contact the Network Administrator to change their password.

**CAUTION:** *Once all users' passwords are expired you are unable to login to the device again if the security-password reject-expired-pwd command has been executed. You will have to reboot the device with a default configuration file, or load an earlier software version that does not have the security password feature.*

*We recommend you never have the command line "security-password reject-expired-pwd" in a default config file.*

Note that when the reject-expired-pwd functionality is disabled and a user logs on with an expired password, if the forced-change feature is enabled with [security-password forced-change](#) command, a user may have to change the password during login depending on the password lifetime specified by the [security-password lifetime](#) command.

The **no** variant of the command disables this feature.

**Syntax** `security-password reject-expired-pwd`  
`no security-password reject-expired-pwd`

**Default** The reject-expired-pwd feature is disabled by default.

**Mode** Global Configuration

**Example** To configure the system to reject users with an expired password, use the command:

```
awplus# configure terminal
awplus(config)# security-password reject-expired-pwd
```

**Related Commands**

- [security-password forced-change](#)
- [security-password history](#)
- [security-password lifetime](#)
- [security-password minimum-categories](#)
- [security-password minimum-length](#)

- [show security-password user](#)

# security-password warning

**Overview** This command specifies the number of days before the password expires that the user will receive a warning message specifying the remaining lifetime of the password.

Note that the warning period cannot be set unless the lifetime feature is enabled with the [security-password lifetime](#) command.

The **no** variant of the command disables this feature.

**Syntax** `security-password warning <0-1000>`  
`no security-password warning`

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-1000>  | Warning period in the range from 0 to 1000 days. A value 0 disables the warning functionality and no warning message is displayed for expiring passwords. This is equivalent to the <b>no security-password warning</b> command. The warning period must be less than, or equal to, the password lifetime set with the <a href="#">security-password lifetime</a> command. |

**Default** The default warning period is 0, which disables warning functionality.

**Mode** Global Configuration

**Example** To configure a warning period of three days, use the command:

```
awplus# configure terminal
awplus(config)# security-password warning 3
```

**Related Commands**

- [security-password forced-change](#)
- [security-password history](#)
- [security-password lifetime](#)

# service advanced-vty

**Overview** This command enables the advanced-vty help feature. This allows you to use TAB completion for commands. Where multiple options are possible, the help feature displays the possible options.

The **no service advanced-vty** command disables the advanced-vty help feature.

**Syntax** `service advanced-vty`  
`no service advanced-vty`

**Default** The advanced-vty help feature is enabled by default.

**Mode** Global Configuration

**Examples** To disable the advanced-vty help feature, use the command:

```
awplus# configure terminal
awplus(config)# no service advanced-vty
```

To re-enable the advanced-vty help feature after it has been disabled, use the following commands:

```
awplus# configure terminal
awplus(config)# service advanced-vty
```

# service password-encryption

**Overview** Use this command to enable password encryption. This is enabled by default. When password encryption is enabled, the device displays passwords in the running config in encrypted form instead of in plain text.

Use the **no service password-encryption** command to stop the device from displaying newly-entered passwords in encrypted form. This does not change the display of existing passwords.

**NOTE:** Do not use encrypted passwords for GUI users. The GUI requires unencrypted user passwords only - not encrypted user passwords. Do not use option 8 for GUI users.

**Syntax** service password-encryption  
no service password-encryption

**Mode** Global Configuration

**Example** awplus# configure terminal  
awplus(config)# service password-encryption

**Validation Commands** show running-config

**Related Commands** enable password

# service telnet

**Overview** Use this command to enable the telnet server. The server is enabled by default. Enabling the telnet server starts the device listening for incoming telnet sessions on the configured port.

The server listens on port 23, unless you have changed the port by using the [privilege level](#) command.

Use the **no** variant of this command to disable the telnet server. Disabling the telnet server will stop the device listening for new incoming telnet sessions. However, existing telnet sessions will still be active.

**Syntax** `service telnet [ip|ipv6]`  
`no service telnet [ip|ipv6]`

**Default** The IPv4 and IPv6 telnet servers are enabled by default.  
The configured telnet port is TCP port 23 by default.

**Mode** Global Configuration

**Examples** To enable both the IPv4 and IPv6 telnet servers, use the following commands:

```
awplus# configure terminal
awplus(config)# service telnet
```

To enable the IPv6 telnet server only, use the following commands:

```
awplus# configure terminal
awplus(config)# service telnet ipv6
```

To disable both the IPv4 and IPv6 telnet servers, use the following commands:

```
awplus# configure terminal
awplus(config)# no service telnet
```

To disable the IPv6 telnet server only, use the following commands:

```
awplus# configure terminal
awplus(config)# no service telnet ipv6
```

**Related  
Commands** [clear line vty](#)  
[show telnet](#)  
[telnet server](#)

# service terminal-length (deleted)

**Overview** This command has been deleted in Software Version 5.4.5-0.1 and later.

# show privilege

**Overview** This command displays the current user privilege level, which can be any privilege level in the range <1-15>. Privilege levels <1-6> allow limited user access (all User Exec commands), privilege levels <7-14> allow restricted user access (all User Exec commands plus Privileged Exec show commands). Privilege level 15 gives full user access to all Privileged Exec commands.

**Syntax** `show privilege`

**Mode** User Exec and Privileged Exec

**Usage** A user can have an intermediate CLI security level set with this command for privilege levels <7-14> to access all show commands in Privileged Exec mode and all commands in User Exec mode, but no configuration commands in Privileged Exec mode.

**Example** To show the current privilege level of the user, use the command:

```
awplus# show privilege
```

**Output** Figure 3-1: Example output from the **show privilege** command

```
awplus#show privilege
Current privilege level is 15
awplus#disable
awplus>show privilege
Current privilege level is 1
```

**Related Commands** [privilege level](#)

# show security-password configuration

**Overview** This command displays the configuration settings for the various security password rules.

**Syntax** `show security-password configuration`

**Mode** Privileged Exec

**Example** To display the current security-password rule configuration settings, use the command:

```
awplus# show security-password configuration
```

**Output** Figure 3-2: Example output from the **show security-password configuration** command

```
Security Password Configuration
Minimum password length ..... 8
Minimum password character categories to match ..... 3
Number of previously used passwords to restrict..... 4
Password lifetime ..... 30 day(s)
    Warning period before password expires ..... 3 day(s)
Reject expired password at login ..... Disabled
    Force changing expired password at login ..... Enabled
```

**Related Commands** [show running-config security-password](#)  
[show security-password user](#)

# show security-password user

**Overview** This command displays user account and password information for all users.

**Syntax** `show security-password user`

**Mode** Privileged Exec

**Example** To display the system users' remaining lifetime or last password change, use the command:

```
awplus# show security-password user
```

**Output** Figure 3-3: Example output from the **show security-password** user command

| User account and password information |           |                 |                    |
|---------------------------------------|-----------|-----------------|--------------------|
| UserName                              | Privilege | Last-PWD-Change | Remaining-lifetime |
| -----                                 |           |                 |                    |
| manager                               | 15        | 4625 day(s) ago | No Expiry          |
| bob15                                 | 15        | 0 day(s) ago    | 30 days            |
| ted7                                  | 7         | 0 day(s) ago    | No Expiry          |
| mike1                                 | 1         | 0 day(s) ago    | No Expiry          |

**Related Commands** [show running-config security-password](#)  
[show security-password configuration](#)

# show telnet

**Overview** This command shows the Telnet server settings.

**Syntax** `show telnet`

**Mode** User Exec and Privileged Exec

**Example** To show the Telnet server settings, use the command:

```
awplus# show telnet
```

**Output** Figure 3-4: Example output from the **show telnet** command

```
Telnet Server Configuration
-----
Telnet server           : Enabled
Protocol                : IPv4, IPv6
Port                    : 23
```

**Related  
Commands**

- [clear line vty](#)
- [service telnet](#)
- [show users](#)
- [telnet server](#)

# show users

**Overview** This command shows information about the users who are currently logged into the device.

**Syntax** `show users`

**Mode** User Exec and Privileged Exec

**Example** To show the users currently connected to the device, use the command:

```
awplus# show users
```

**Output** Figure 3-5: Example output from the **show users** command

| Line   | User    | Host(s) | Idle     | Location    | Priv | Idletime | Timeout |
|--------|---------|---------|----------|-------------|------|----------|---------|
| con 0  | manager | idle    | 00:00:00 | ttyS0       | 15   | 10       | N/A     |
| vtty 0 | bob     | idle    | 00:00:03 | 172.16.11.3 | 1    | 0        | 5       |

**Table 1:** Parameters in the output of the **show users** command

| Parameter | Description                                                                                |
|-----------|--------------------------------------------------------------------------------------------|
| Line      | Console port user is connected to.                                                         |
| User      | Login name of user.                                                                        |
| Host(s)   | Status of the host the user is connected to.                                               |
| Idle      | How long the host has been idle.                                                           |
| Location  | URL location of user.                                                                      |
| Priv      | The privilege level in the range 1 to 15, with 15 being the highest.                       |
| Idletime  | The time interval the device waits for user input from either a console or VTY connection. |
| Timeout   | The time interval before a server is considered unreachable.                               |

# telnet

**Overview** Use this command to open a telnet session to a remote device.

**Syntax** `telnet {<hostname>|[ip] <ipv4-addr>|[ipv6] <ipv6-addr>}  
[<port>]`

| Parameter   | Description                                                                                                                               |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <hostname>  | The host name of the remote system.                                                                                                       |
| ip          | Keyword used to specify the IPv4 address or host name of a remote system.                                                                 |
| <ipv4-addr> | An IPv4 address of the remote system.                                                                                                     |
| ipv6        | Keyword used to specify the IPv6 address of a remote system                                                                               |
| <ipv6-addr> | Placeholder for an IPv6 address in the format x:x::x:x, for example, 2001:db8::8a2e:7334                                                  |
| <port>      | Specify a TCP port number (well known ports are in the range 1-1023, registered ports are 1024-49151, and private ports are 49152-65535). |

**Mode** User Exec and Privileged Exec

**Examples** To connect to TCP port 2602 on the device at 10.2.2.2, use the command:

```
awplus# telnet 10.2.2.2 2602
```

To connect to the telnet server `host.example`, use the command:

```
awplus# telnet host.example
```

To connect to the telnet server `host.example` on TCP port 100, use the command:

```
awplus# telnet host.example 100
```

# telnet server

**Overview** This command enables the telnet server on the specified TCP port. If the server is already enabled then it will be restarted on the new port. Changing the port number does not affect the port used by existing sessions.

**Syntax** `telnet server {<1-65535>|default}`

| Parameter | Description                         |
|-----------|-------------------------------------|
| <1-65535> | The TCP port to listen on.          |
| default   | Use the default TCP port number 23. |

**Mode** Global Configuration

**Example** To enable the telnet server on TCP port 2323, use the following commands:

```
awplus# configure terminal
awplus(config)# telnet server 2323
```

**Related  
Commands** [show telnet](#)

# terminal length

**Overview** Use the **terminal length** command to specify the number of rows of output that the device will display before pausing, for the currently-active terminal only.

Use the **terminal no length** command to remove the length specified by this command. The default length will apply unless you have changed the length for some or all lines by using the [length \(asyn\)](#) command.

**Syntax** `terminal length <length>`  
`terminal no length [<length>]`

| Parameter                   | Description                                                                                                             |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;length&gt;</code> | <code>&lt;0-512&gt;</code> Number of rows that the device will display on the currently-active terminal before pausing. |

**Mode** User Exec and Privileged Exec

**Examples** The following example sets the number of lines to 15:

```
awplus# terminal length 15
```

The following example removes terminal length set previously:

```
awplus# terminal no length
```

**Related  
Commands** [terminal resize](#)  
[length \(asyn\)](#)

# terminal resize

**Overview** Use this command to automatically adjust the number of rows of output on the console, which the device will display before pausing, to the number of rows configured on the user's terminal.

**Syntax** `terminal resize`

**Mode** User Exec and Privileged Exec

**Usage** When the user's terminal size is changed, then a remote session via SSH or TELNET adjusts the terminal size automatically. However, this cannot normally be done automatically for a serial or console port. This command automatically adjusts the terminal size for a serial or console port.

**Examples** The following example automatically adjusts the number of rows shown on the console:

```
awplus# terminal resize
```

**Related  
Commands** [length \(asyn\)](#)  
[terminal length](#)

# username

**Overview** This command creates or modifies a user to assign a privilege level and a password.

**NOTE:** The default username privilege level of 1 is not shown in running-config output. Any username privilege level that has been modified from the default is shown.

**Syntax**

```
username <name> privilege <1-15> [password [8] <password>]
username <name> password [8] <password>
no username <name>
```

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Mode** Global Configuration

**Default** The privilege level is 1 by default. Note the default is not shown in running-config output.

**Usage** An intermediate CLI security level (privilege level 7 to privilege level 14) allows a CLI user access to the majority of show commands, including the platform show commands that are available at privilege level 1 to privilege level 6. Note that some show commands, such as **show running-configuration** and **show startup-configuration**, are only available at privilege level 15.

**Examples** To create the user "bob" with a privilege level of 15, for all show commands including show running-configuration and show startup-configuration and to access configuration commands in Privileged Exec command mode, and the password "bobs\_secret", use the commands:

```
awplus# configure terminal
```

```
awplus(config)# username bob privilege 15 password bobs_secret
```

To create a user "junior\_admin" with a privilege level of 7, which will have intermediate CLI security level access for most show commands, and the password "show\_only", use the commands:

```
awplus# configure terminal
```

```
awplus(config)# username junior_admin privilege 7 password  
show_only
```

# Feature Licensing Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for each of the Feature Licensing commands. Feature Licensing enables you to use advanced features such as Layer 3 routing.

To see which Feature Licenses are available for your device, see the [AlliedWare Plus Datasheet](#).

For step-by-step instructions about how to license AlliedWare Plus devices, see the [Licensing Feature Overview and Configuration\\_Guide](#).

- Command List**
- “[license](#)” on page 192
  - “[show license](#)” on page 194
  - “[show license brief](#)” on page 196
  - “[show license brief member](#)” on page 198
  - “[show license member](#)” on page 200

# license

**Overview** This command activates the licensed software feature set on a standalone switch, or a stack of switches.

Use the **no** variant of this command to deactivate the licensed software feature set on a standalone switch, or a stack of switches.

For feature licenses, contact your authorized distributor or reseller. If a license key expires or is incorrect so the license key is invalid, then some software features will be unavailable.

**NOTE:** See the AlliedWare Plus™ datasheet for a list of current feature licenses available by product. Purchase licenses from your authorized dealer or reseller.

In a live network, only install feature licenses during scheduled maintenance. For example, if a feature license includes EPSR, installing that licence will cause EPSR to be restarted with a temporary loss of EPSR network traffic.

**Syntax** `license <label> <key>`  
`no license <label>`

| Parameter                  | Description                                                                                                                                                                                        |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;label&gt;</code> | A name for the feature license. To determine names already in use, use the <a href="#">show license</a> command. This can be the default name supplied for the feature, or a renamed feature name. |
| <code>&lt;key&gt;</code>   | The encrypted license key to enable a set of software features.                                                                                                                                    |

**Mode** Privileged Exec

**Usage** You can change the license label using this command to make it specific to you when you initially add a license. Once a license is added, any change to the license label first requires removal of the license before adding a license again with a new license label.

The default feature license labels are issued along with encrypted license keys by e-mail for you to apply using this command to activate features. You can change default feature license labels, but they must be 15 characters or less.

For example, you may want to change the label of the premium license to "premium-license". You can check your new license label by using the [show license](#) command.

In a stacked configuration, the **license** command will add a license to all stack members and the **no license** command will remove a license from all stack members. If you introduce a new stack member and it lacks a feature license that is possessed by the other stack members, a warning message will be generated at bootup. If this occurs, use the the **license** command to add the license to all stack members, including the new stack members.

If you add a feature license you will be prompted at the console that the feature needs to restart. For example, if the feature license contains a license for the EPSR protocol, then that protocol will restart, but you do not need to manually restart the whole device for the new license to take effect. Restarting of individual protocols in this manner could result in the loss of network traffic. Only install licenses in scheduled maintenance periods for devices in a live environment.

**Examples** To activate the license called "IPv6" that has the key 12345678ABCDE123456789ABCDE, use the command:

```
awplus# license IPv6 12345678ABCDE123456789ABCDE
```

To deactivate the license called "IPv6", use the command:

```
awplus# no license ipv6
```

**Output** Figure 4-1: Example of a license command entry to remove a feature license:

```
awplus#no license IPv6
Stack member 1: Removal of "IPv6" will disable the following features:
  IPv6

INFO: Uninstalling license key will disable the affected modules immediately.
Would you like to continue? (y/n): y

Stack member 1 removed 1 license

1 license removed.
```

**Related  
Commands** [show license](#)  
[show license member](#)

# show license

**Overview** This command displays information about a specific software feature license, or all enabled software feature licenses on the device.

**Syntax** `show license [feature] [<label>|index <index-number>]`

| Parameter               | Description                                                                                                                             |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| feature                 | Only display license information for any applied feature licenses.                                                                      |
| <label>                 | The license name to show information about. This can be used instead of the index number to identify a specific license.                |
| index<br><index-number> | The index number of the license to show information about. This can be used instead of the license name to identify a specific license. |

**Mode** User Exec and Privileged Exec

**Usage** In a stacked configuration, this command will display licenses applied to a stack master only.

In a stacked configuration, use the [show license member](#) command instead if you need to display license information for a specific stack member or all stack members.

**Examples** To display full information about all enabled licenses, use the command:

```
awplus# show license
```

To display full information about the licenses with index number 1, use the command:

```
awplus# show license index 1
```

**Output** Figure 4-2: Example output from **show license**

```
awplus#show license
Board region: Global
Software Licenses
-----
Index                : 1
License name         : Base License
Customer name        : Base License
Quantity of licenses : 1
Type of license      : Full
License issue date   : 12-Jul-2014
License expiry date  : N/A
Features included    : IPv6Basic, LAG-FULL, MLDSnoop, RADIUS-100, VCS,
                      VRRP
```

Table 4-1: Parameters in the output of **show license**

| Parameter            | Description                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------|
| Board region         | Name of the region for the Base License features.                                                   |
| Index                | Index identifying entry. The index is assigned automatically by the software. It is not configured. |
| License name         | Name of the license key bundle (case-sensitive).                                                    |
| Customer name        | Customer name.                                                                                      |
| Quantity of licenses | Quantity of licensed installations.                                                                 |
| Type of license      | Full or Trial.                                                                                      |
| License issue date   | Date the license was generated.                                                                     |
| License expiry date  | Expiry date for trial license.                                                                      |
| Features included    | List of features included in the feature license.                                                   |

# show license brief

**Overview** This command displays information about a specific software feature license, or all enabled software feature licenses on the device.

**Syntax** `show license [feature] [<label>|index <index-number>] brief`

| Parameter               | Description                                                                                                                             |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| feature                 | Only display license information for any applied feature licenses.                                                                      |
| <label>                 | The license name to show information about. This can be used instead of the index number to identify a specific license.                |
| index<br><index-number> | The index number of the license to show information about. This can be used instead of the license name to identify a specific license. |
| brief                   | Displays a brief summary of license information.                                                                                        |

**Mode** User Exec and Privileged Exec

**Usage** This command will display licenses applied to a stack master only.  
In a stacked configuration, use the [show license brief member](#) command instead if you need to display license information for a specific stack member or all stack members.

**Examples** To display a brief summary of information about all feature licenses, use the command:

```
awplus# show license feature brief
```

**Output** Figure 4-3: Example output from **show license brief**

```
awplus#show license brief

# show license brief member

**Overview** Use this command to display information about either a specific software license, or all software feature licenses enabled on either a specific stack member or all stack members.

**Syntax** `show license [<label>] brief member [<1-8>|all]`

| Parameter | Description                                           |
|-----------|-------------------------------------------------------|
| <label>   | The name of the license to show information about.    |
| brief     | Display a brief summary of license information.       |
| <1-8>     | The ID of the stack member to show information about. |
| all       | Display information about all stack members.          |

**Mode** User Exec and Privileged Exec

**Usage** Use the **show license brief member all** command for brief table output of all licenses per stack member.

**Examples** To display a brief summary of information about all enabled licenses on stack member 2, use the command:

```
awplus# show license brief member 2
```

To display a brief summary about all enabled licenses on all stack members, use the command:

```
awplus# show license brief member all
```

To display a brief summary about the license `name1` on all stack members, use the command:

```
awplus# show license name1 brief member all
```

**Output** Figure 4-4: Example output from **show license brief member**

```
awplus#show license brief member 1
Board region: Global
Software Release Licenses

# show license member

**Overview** Use this command to display information about either a specific software license, or all software feature licenses enabled on either a specific stack member or all stack members.

**Syntax** `show license [<label>] member [<1-8>|all]`

| Parameter | Description                                           |
|-----------|-------------------------------------------------------|
| <label>   | The name of the license to show information about.    |
| <1-8>     | The ID of the stack member to show information about. |
| all       | Display information about all stack members.          |

**Mode** User Exec and Privileged Exec

**Usage** Use the **show license member all** command to display full list output of all licenses per stack member.

**Examples** To display full information about all enabled licenses on all stack members, use the command:

```
awplus# show license member all
```

To display full information about all enabled licenses on stack member 2, use the command:

```
awplus# show license member 2
```

To display full information about the license `name1` on all stack members, use the command:

```
awplus# show license name1 member all
```

**Output** Figure 4-5: Example output from **show license member**

```
awplus#show license member all

# GUI Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure the GUI. For more information, see the [Getting Started with Alliedware Plus](#)

- Command List**
- [“atmf topology-gui enable”](#) on page 203
  - [“gui-timeout”](#) on page 204
  - [“log event-host”](#) on page 206
  - [“service http”](#) on page 207
  - [“show http”](#) on page 208

# atmf topology-gui enable

**Overview** Use this command to enable the operation of AMF Vista Manager on the Master device.

Use the **no** variant of this command to disable this feature.

**Syntax** `atmf topology-gui enable`  
`no atmf topology-gui enable`

**Default** By default the GUI support will not be enabled on AMF Master devices. An AMF Controller device will have the GUI enabled by default. Regular nodes (not master or controller) will always have it disabled.

**Mode** Global Configuration mode

**Usage** This command is run from an AMF Master node. Topology information about your network is displayed in the GUI. For example; Node Name, status (i.e. link state, node status and recovery status), Role (i.e. Master or Controller) and IP address.

**Example** To enable AMF Vista Manager on Node1, use the following commands:

```
Node1# configure terminal
Node1(config)# atmf topology-gui enable
```

To disable AMF Vista Manager on Node1, use the following commands:

```
Node1# configure terminal
Node1(config)# no atmf topology-gui enable
```

**Related  
Commands** [atmf enable](#)  
[gui-timeout](#)  
[log event-host](#)  
[service http](#)

# gui-timeout

**Overview** Use this command to configure an idle timeout period for a GUI session. The time can be set in minutes and/or seconds.

Use the **no** variant of this command to disable the GUI session idle timeout.

**Syntax** `gui-timeout <minutes> [<seconds>]`  
`no gui-timeout`

| Parameter | Description                                               |
|-----------|-----------------------------------------------------------|
| <minutes> | Specifies the idle time in minutes from 0 through 35791   |
| <seconds> | Specifies the idle time in seconds from 0 through 2147483 |

**Default** Disabled

**Mode** Global Configuration

**Usage** The GUI uses the configured timeout period (set in either minutes and/or seconds) to determine when a GUI session should be closed. Once the GUI timeout has expired, you will need to login to reactivate your session.

To enter seconds only, enter 0 for minutes, followed by a space, and then enter the seconds.

If the GUI timeout is disabled, a GUI session will remain active until you terminate it. No idle time will be configured.

The same timeout period will apply to all GUI sessions logged into a specific stand-alone device or stack.

**Examples** Use this command to configure the GUI timeout period for 3 minutes and 30 seconds for a GUI session.

```
awplus# gui-timeout 3 30
```

Use this command to configure the GUI timeout period for 0 minutes and 61 seconds for a GUI session.

```
awplus# gui-timeout 0 61
```

Use this command to disable the GUI timeout period.

```
awplus# no gui-timeout
```

**Output** Figure 5-1: Example output from **gui-timeout**

```
awplus#configure terminal
awplus(config)#gui-timeout 3 30
The new gui-timeout settings [3 min 30 sec] will apply to new sessions only
```

**Related  
Commands** [show running-config](#)

# log event-host

**Overview** Use this command to set up an external host to log AMF topology events through Vista Manager. This command is run on the Master device.

Use the **no** variant of this command to disable log events through Vista Manager.

**Syntax** `log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event`  
`no log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event`

| Parameter   | Description                    |
|-------------|--------------------------------|
| <ipv4-addr> | ipv4 address of the event host |
| <ipv6-addr> | ipv6 address of the event host |

**Default** Log events are disabled by default.

**Mode** Global Configuration

**Usage** Event hosts are set so syslog sends the messages out as they come.

**NOTE:** *There is a difference between log event and log host messages:*

- Log event messages are sent out as they come by syslog
- Log host messages are set to wait for a number of messages (20) to send them out together for traffic optimization.

**Example** To enable Node 1 to log event messages from host ipv6 address 192.0.2.31, use the following commands:

```
Node1# configure terminal
```

```
Node1(config)# log event-host 192.0.2.31 atmf-topology-event
```

To disable Node 1 to log event messages from host ipv6 address 192.0.2.31, use the following commands:

```
Node1# configure terminal
```

```
Node1(config)# no log event-host 192.0.2.31 atmf-topology-event
```

**Related Commands** [atmf topology-gui enable](#)

# service http

**Overview** Use this command to enable the HTTP (Hypertext Transfer Protocol) service. This service, which is enabled by default, is required to support the AlliedWare Plus™ GUI Java applet on a Java enabled browser.

Use the **no** variant of this command to disable the HTTP feature.

**Syntax** `service http`  
`no service http`

**Default** Enabled

**Mode** Global Configuration

**Validation** `show running-config`  
**Commands**

# show http

**Overview** This command shows the HTTP server settings.

**Syntax** show http

**Mode** User Exec and Privileged Exec

**Example** To show the HTTP server settings, use the command:

```
awplus# show http
```

**Output** Figure 5-2: Example output from the **show http** command

```
awplus#show http
HTTP Server Configuration
-----

# banner exec

**Overview** This command configures the User Exec mode banner that is displayed on the console after you login. The **banner exec default** command restores the User Exec banner to the default banner. Use the **no banner exec** command to disable the User Exec banner and remove the default User Exec banner.

**Syntax** `banner exec <banner-text>`  
`banner exec default`  
`no banner exec`

**Default** By default, the AlliedWare Plus™ version and build date is displayed at console login, such as:

```
AlliedWare Plus (TM) 5.4.6-1 09/30/16 00:44:25
```

**Mode** Global Configuration

**Examples** To configure a User Exec mode banner after login (in this example, to tell people to use the **enable** command to move to Privileged Exec mode), enter the following commands:

```
awplus#configure terminal

awplus(config)#banner exec Use enable to move to Priv Exec mode

awplus(config)#exit

awplus#exit
awplus login: manager

Password:

Use enable to move to Priv Exec mode

awplus>
```

To restore the default User Exec mode banner after login, enter the following commands:

```
awplus#configure terminal

awplus(config)#banner exec default

awplus(config)#exit

awplus#exit
awplus login: manager

Password:

AlliedWare Plus (TM) 5.4.6-1 09/30/16 13:03:59

awplus>
```

To remove the User Exec mode banner after login, enter the following commands:

```
awplus#configure terminal

awplus(config)#no banner exec

awplus(config)#exit

awplus#exit

awplus login: manager

Password:

awplus>
```

**Related  
Commands**   [banner login \(system\)](#)  
[banner motd](#)

## banner login (system)

**Overview** This command configures the login banner that is displayed on the console when you login. The login banner is displayed on all connected terminals. The login banner is displayed after the MOTD (Message-of-the-Day) banner and before the login username and password prompts.

Use the **no banner login** command to disable the login banner.

**Syntax** `banner login`  
`no banner login`

**Default** By default, no login banner is displayed at console login.

**Mode** Global Configuration

**Examples** To configure a login banner of "Authorised users only" to be displayed when you login, enter the following commands:

```
awplus#configure terminal
awplus(config)#banner login
Type CNTL/D to finish.
Authorised users only
awplus(config)#exit
awplus#exit
authorised users only
awplus login: manager
Password:
AlliedWare Plus (TM) 5.4.6-1 09/30/16 13:03:59
awplus>
```

To remove the login banner, enter the following commands:

```
awplus#configure terminal

awplus(config)#no banner login

awplus(config)#exit

awplus#exit

awplus login: manager

Password:

AlliedWare Plus (TM) 5.4.6-1 09/30/16 13:03:59

awplus>
```

**Related  
Commands**   [banner exec](#)  
                  [banner motd](#)

# banner motd

**Overview** Use this command to create or edit the text MotD (Message-of-the-Day) banner displayed before login. The MotD banner is displayed on all connected terminals. The MotD banner is useful for sending messages that affect all network users, for example, any imminent system shutdowns.

Use the **no** variant of this command to delete the MotD banner.

**Syntax** `banner motd <motd-text>`  
`no banner motd`

| Parameter                      | Description                                          |
|--------------------------------|------------------------------------------------------|
| <code>&lt;motd-text&gt;</code> | The text to appear in the Message of the Day banner. |

**Default** By default, the device displays the AlliedWare Plus™ OS version and build date when you login.

**Mode** Global Configuration

**Examples** To configure a MotD banner of "System shutdown at 6pm today" to be displayed when you log in, enter the following commands:

```
awplus>enable

awplus#configure terminal

awplus(config)#banner motd System shutdown at 6pm today

awplus(config)#exit

awplus#exit

System shutdown at 6pm today

awplus login: manager

Password:

AlliedWare Plus (TM) 5.4.6-1 09/30/16 13:03:59
```

To delete the login banner, enter the following commands:

```
awplus>enable

# clock set

**Overview** This command sets the time and date for the system clock.

**Syntax** `clock set <hh:mm:ss> <day> <month>  
<year>`

| Parameter  | Description                                  |
|------------|----------------------------------------------|
| <hh:mm:ss> | Local time in 24-hour format                 |
| <day>      | Day of the current month, from 1 to 31       |
| <month>    | The first three letters of the current month |
| <year>     | Current year, from 2000 to 2035              |

**Mode** Privileged Exec

**Usage** Configure the timezone before setting the local time. Otherwise, when you change the timezone, the device applies the new offset to the local time.

**NOTE:** *If Network Time Protocol (NTP) is enabled, then you cannot change the time or date using this command. NTP maintains the clock automatically using an external time source. If you wish to manually alter the time or date, you must first disable NTP.*

**Example** To set the time and date on your system to 2pm on the 2nd of October 2016, use the command:

```
awplus# clock set 14:00:00 2 oct 2016
```

**Related  
Commands** [clock timezone](#)

# clock summer-time date

**Overview** This command defines the start and end of summertime for a specific year only, and specifies summertime's offset value to Standard Time for that year.

The **no** variant of this command removes the device's summertime setting. This clears both specific summertime dates and recurring dates (set with the [clock summer-time recurring](#) command).

By default, the device has no summertime definitions set.

**Syntax**

```
clock summer-time <timezone-name> date <start-day>
<start-month> <start-year> <start-time> <end-day>
<end-month> <end-year> <end-time> <1-180>

no clock summer-time
```

| Parameter       | Description                                                                         |
|-----------------|-------------------------------------------------------------------------------------|
| <timezone-name> | A description of the summertime zone, up to 6 characters long.                      |
| date            | Specifies that this is a date-based summertime setting for just the specified year. |
| <start-day>     | Day that the summertime starts, from 1 to 31.                                       |
| <start-month>   | First three letters of the name of the month that the summertime starts.            |
| <start-year>    | Year that summertime starts, from 2000 to 2035.                                     |
| <start-time>    | Time of the day that summertime starts, in the 24-hour time format HH:MM.           |
| <end-day>       | Day that summertime ends, from 1 to 31.                                             |
| <end-month>     | First three letters of the name of the month that the summertime ends.              |
| <end-year>      | Year that summertime ends, from 2000 to 2035.                                       |
| <end-time>      | Time of the day that summertime ends, in the 24-hour time format HH:MM.             |
| <1-180>         | The offset in minutes.                                                              |

**Mode** Global Configuration

**Examples** To set a summertime definition for New Zealand using NZST (UTC+12:00) as the standard time, and NZDT (UTC+13:00) as summertime, with the summertime set to begin on the 25th of September 2016 and end on the 2nd of April 2017:

```
awplus(config)# clock summer-time NZDT date 25 sep 2:00 2016 2
apr 2:00 2017 60
```

To remove any summertime settings on the system, use the command:

```
awplus(config)# no clock summer-time
```

**Related  
Commands**   [clock summer-time recurring](#)  
[clock timezone](#)

# clock summer-time recurring

**Overview** This command defines the start and end of summertime for every year, and specifies summertime's offset value to Standard Time.

The **no** variant of this command removes the device's summertime setting. This clears both specific summertime dates (set with the [clock summer-time date](#) command) and recurring dates.

By default, the device has no summertime definitions set.

**Syntax**

```
clock summer-time <timezone-name> recurring <start-week>
<start-day> <start-month>
<start-time> <end-week> <end-day> <end-month> <end-time>
<1-180>

no clock summer-time
```

| Parameter       | Description                                                                                                                                                                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <timezone-name> | A description of the summertime zone, up to 6 characters long.                                                                                                                                                                                                                |
| recurring       | Specifies that this summertime setting applies every year from now on.                                                                                                                                                                                                        |
| <start-week>    | Week of the month when summertime starts, in the range 1-5. The value 5 indicates the last week that has the specified day in it for the specified month. For example, to start summertime on the last Sunday of the month, enter 5 for <start-week> and sun for <start-day>. |
| <start-day>     | Day of the week when summertime starts. Valid values are mon, tue, wed, thu, fri, sat or sun.                                                                                                                                                                                 |
| <start-month>   | First three letters of the name of the month that summertime starts.                                                                                                                                                                                                          |
| <start-time>    | Time of the day that summertime starts, in the 24-hour time format HH:MM.                                                                                                                                                                                                     |
| <end-week>      | Week of the month when summertime ends, in the range 1-5. The value 5 indicates the last week that has the specified day in it for the specified month. For example, to end summertime on the last Sunday of the month, enter 5 for <end-week> and sun for <end-day>.         |
| <end-day>       | Day of the week when summertime ends. Valid values are mon, tue, wed, thu, fri, sat or sun.                                                                                                                                                                                   |
| <end-month>     | First three letters of the name of the month that summertime ends.                                                                                                                                                                                                            |
| <end-time>      | Time of the day that summertime ends, in the 24-hour time format HH:MM.                                                                                                                                                                                                       |
| <1-180>         | The offset in minutes.                                                                                                                                                                                                                                                        |

**Mode** Global Configuration

**Examples** To set a summertime definition for New Zealand using NZST (UTC+12:00) as the standard time, and NZDT (UTC+13:00) as summertime, with summertime set to start on the last Sunday in September, and end on the 1st Sunday in April, use the command:

```
awplus(config)# clock summer-time NZDT recurring 5 sun sep 2:00  
1 sun apr 2:00 60
```

To remove any summertime settings on the system, use the command:

```
awplus(config)# no clock summer-time
```

**Related  
Commands** [clock summer-time date](#)  
[clock timezone](#)

# clock timezone

**Overview** This command defines the device's clock timezone. The timezone is set as a offset to the UTC.

The **no** variant of this command resets the system time to UTC.

By default, the system time is set to UTC.

**Syntax** `clock timezone <timezone-name> {minus|plus}  
[<0-13>|<0-12>:<00-59>]  
no clock timezone`

| Parameter       | Description                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <timezone-name> | A description of the timezone, up to 6 characters long.                                                                                                                  |
| minus or plus   | The direction of offset from UTC. The <b>minus</b> option indicates that the timezone is behind UTC. The <b>plus</b> option indicates that the timezone is ahead of UTC. |
| <0-13>          | The offset in hours or from UTC.                                                                                                                                         |
| <0-12>:<00-59>  | The offset in hours or from UTC.                                                                                                                                         |

**Mode** Global Configuration

**Usage** Configure the timezone before setting the local time. Otherwise, when you change the timezone, the device applies the new offset to the local time.

**Examples** To set the timezone to New Zealand Standard Time with an offset from UTC of +12 hours, use the command:

```
awplus(config)# clock timezone NZST plus 12
```

To set the timezone to Indian Standard Time with an offset from UTC of +5:30 hours, use the command:

```
awplus(config)# clock timezone IST plus 5:30
```

To set the timezone back to UTC with no offsets, use the command:

```
awplus(config)# no clock timezone
```

**Related Commands** [clock set](#)  
[clock summer-time date](#)  
[clock summer-time recurring](#)

# continuous-reboot-prevention

**Overview** Use this command to enable and to configure the continuous reboot prevention feature. Continuous reboot prevention allows the user to configure the time period during which reboot events are counted, the maximum number of times the switch can reboot within the specified time period, referred to as the threshold, and the action to take if the threshold is exceeded.

Use the **no** variant of this command to disable the continuous reboot prevention feature or to return the **period**, **threshold** and **action** parameters to the defaults.

**Syntax**

```
continuous-reboot-prevention enable  
continuous-reboot-prevention [period <0-604800>] [threshold  
<1-10>] [action [linkdown|logonly|stopreboot]]  
no continuous-reboot-prevention enable  
no continuous-reboot-prevention [period] [threshold] [action]}
```

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable    | Enable the continuous reboot prevention feature.                                                                                                                                                                                                                                                                                                                                                                                                 |
| period    | Set the period of time in which reboot events are counted.<br><0-604800> Period value in seconds. The default is 600.                                                                                                                                                                                                                                                                                                                            |
| threshold | Set the maximum number of reboot events allowed in the specified period.<br><1-10> Threshold value. The default is 1.                                                                                                                                                                                                                                                                                                                            |
| action    | Set the action taken if the threshold is exceeded.<br>linkdown Reboot procedure continues and all switch ports and stack ports stay link-down. The reboot event is logged. This is the default action.<br>logonly Reboot procedure continues normally and the reboot event is logged.<br>stopreboot Reboot procedure stops until the user enters the key "c" via the CLI. Normal reboot procedure then continues and the reboot event is logged. |

**Default** Continuous reboot prevention is disabled by default. The default period value is 600, the default threshold value is 1 and the default action is linkdown.

**Mode** Global Configuration

**Usage** Note that user-initiated reboots via the CLI, and software version auto-synchronization reboots, are not counted toward the threshold value.

**Examples** To enable continuous reboot prevention, use the commands:

```
awplus# configure terminal
awplus(config)# continuous-reboot-prevention enable
```

To set the period to 500 and action to stopreboot, use the commands:

```
awplus# configure terminal
awplus(config)# continuous-reboot-prevention period 500 action
stopreboot
```

To return the period and action to the defaults and keep the continuous reboot prevention feature enabled, use the commands:

```
awplus# configure terminal
awplus(config)# no continuous-reboot-prevention period action
```

To disable continuous reboot prevention, use the commands:

```
awplus# configure terminal
awplus(config)# no continuous-reboot-prevention enable
```

Commands** [show continuous-reboot-prevention](#)  
[show reboot history](#)  
[show tech-support](#)

# ecofriendly led

**Overview** Use this command to enable the eco-friendly LED (Light Emitting Diode) feature, which turns off power to the port LEDs, including the stack port status LEDs. Power to the system status and stack management LEDs is not disabled.

Use the **no** variant of this command to disable the eco-friendly LED feature.

**Syntax** `ecofriendly led`  
`no ecofriendly led`

**Default** The eco-friendly LED feature is disabled by default.

**Mode** Global Configuration

**Usage** When the eco-friendly LED feature is enabled, a change in port status will not affect the display of the associated LED. When the eco-friendly LED feature is disabled and power is returned to port LEDs, the LEDs will correctly show the current state of the ports.

In a stacked environment, enabling the eco-friendly LED feature on the stack master will apply the feature to every member of the stack.

For an example of how to configure a trigger to turn off power to port LEDs, see the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To enable the eco-friendly LED feature which turns off power to all port LEDs, use the following commands:

```
awplus# configure terminal
awplus(config)# ecofriendly led
```

To disable the eco-friendly LED feature, use the following command:

```
awplus# configure terminal
awplus(config)# no ecofriendly led
```

**Related Commands** [ecofriendly lpi](#)  
[show ecofriendly](#)

## ecofriendly lpi

Use this command to conserve power by enabling the eco-friendly LPI (Low Power Idle) feature. This feature reduces the power supplied to the ports by the switch whenever the ports are idle and are connected to IEEE 802.3az Energy Efficient Ethernet compliant host devices.

LPI is a feature of the IEEE 802.3az Energy Efficient Ethernet (EEE) standard. LPI lowers power consumption of switch ports during periods of low link utilization when connected to IEEE 802.3az compliant host devices. If no data is sent then the switch port can enter a sleep state, called Low Power Idle (LPI), to conserve power used by the switch.

Use the **no** variant of this command to disable the eco-friendly LPI feature.

**Syntax**    `ecofriendly lpi`  
             `no ecofriendly lpi`

**Default**    The eco-friendly LPI feature is disabled by default.

**Mode**       Interface Configuration for a switch port, or Interface Configuration for a range of switch ports.

**Usage**       For an example of how to configure a trigger to enable the eco-friendly LPI feature, see the [Triggers Feature Overview and Configuration Guide](#).

All ports configured for LPI must support LPI in hardware and must be configured to auto negotiate by default or by using the [speed](#) and [duplex](#) commands as needed.

**Examples**    To enable the eco-friendly LPI feature on a switch port, port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# ecofriendly lpi
```

To enable the eco-friendly LPI feature on a range of switch ports, port1.0.2-port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.4
awplus(config-if)# ecofriendly lpi
```

To disable the eco-friendly feature on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no ecofriendly lpi
```

To disable the eco-friendly feature on a range of switch ports, port1.0.2-port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.4
awplus(config-if)# no ecofriendly lpi
```

# findme

**Overview** Use this command to physically locate a specific device from a group of similar devices. Activating the command causes a selected number of port LEDs to alternately flash green then amber (if that device has amber LEDs) at a rate of 1 Hz.

Use the **no** variant of this command to deactivate the Find Me feature prior to the timeout expiring.

**Syntax** `findme [interface <port-list>|member <stack-ID>] [timeout <duration>]`  
`no findme`

| Parameter                                | Description                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>interface &lt;port-list&gt;</code> | The ports to flash. The port list can be: <ul style="list-style-type: none"><li>• a switch port, e.g. <code>port1.0.4</code></li><li>• a continuous range of ports separated by a hyphen, e.g. <code>port1.0.1-1.0.4</code></li><li>• a comma-separated list of ports and port ranges, e.g. <code>port1.0.1,port1.0.5-1.0.6</code>.</li></ul> |
| <code>member &lt;stack-ID&gt;</code>     | Stack member number, from 1 to 8.                                                                                                                                                                                                                                                                                                             |
| <code>timeout &lt;duration&gt;</code>    | How long the LEDs flash, in seconds, in the range 5 to 3600 seconds.                                                                                                                                                                                                                                                                          |

**Default** By default all port LEDs flash for 60 seconds.

**Mode** Privileged Exec

**Usage** Running the **findme** command causes the device's port LEDs to flash. An optional **timeout** parameter specifies the flash behavior duration. Normal LED behavior is restored automatically after either the default time, or a specified time has elapsed, or a **no findme** command is used. You can specify which interface or interfaces are flashed with the optional **interface** parameter.

You can specify a particular stack member with the optional **member** parameter. All available interfaces are flashed by default.

**NOTE:** The **interface** and **member** parameters are mutually exclusive.

**Example** To activate the Find Me feature for the default duration (60 seconds) on all ports, use the following command:

```
awplus# findme
```

To activate the Find Me feature for 120 seconds on all ports, use the following command:

```
awplus# findme timeout 120
```

To activate the Find Me feature for the default duration (60 seconds) on switch port interfaces port1.0.2 through port1.0.4, use the following command:

```
awplus# findme interface port1.0.2-1.0.4
```

In the example above, ports 2 to 4 will flash 4 times and then all ports will flash twice. Each alternate flash will be amber (if that device has amber LEDs). This pattern will repeat until **timeout** (default or set) or **no findme** commands are used.

To deactivate the Find Me feature, use the following command:

```
awplus# no findme
```

To activate the Find Me feature for the default duration on stack member 2, use the following command:

```
awplus# findme member 2
```

In the example above, all ports on member 2 will flash 4 times and then all ports in the stack will flash twice. Each alternate flash will be amber (if that device has amber LEDs). This pattern will repeat until the timeout (default or set) expires or the **no findme** command is used.

# findme trigger

**Overview** When this command is enabled, the LED flashing functionality of the **find-me** command is applied whenever any or all of the selected parameter conditions is detected.

Use the **no** variant to remove the findme trigger function for the selected parameter.

**Syntax** `findme trigger {all|loopprot|thrash-limit|qsp}`  
`no findme trigger {all|loopprot|thrash-limit|qsp}`

| Parameter    | Description                                                                             |
|--------------|-----------------------------------------------------------------------------------------|
| all          | Enable the find-me function whenever any of the listed parameter conditions is detected |
| loopprot     | Enable the findme function whenever the loop protection condition is detected.          |
| thrash-limit | Enable the findme function whenever the thrash-limiting condition is detected.          |
| qsp          | Enable the findme function whenever the QoS Storm Protection condition is detected.     |

**Default** The findme trigger function is disabled.

**Mode** Global config

**Example** To enable action LED flashing for the loop protection function:

```
awplus# findme trigger loopprot
```

**Related Commands** [findme](#)  
[loop-protection loop-detect](#)  
[storm-protection](#)

# hostname

**Overview** This command sets the name applied to the device as shown at the prompt. The hostname is:

- displayed in the output of the [show system](#) command
- displayed in the CLI prompt so you know which device you are configuring
- stored in the MIB object sysName

Use the **no** variant of this command to revert the hostname setting to its default. For devices that are not part of an AMF network, the default is “awplus”.

**Syntax** `hostname <hostname>`  
`no hostname [<hostname>]`

| Parameter                     | Description                                                                                                     |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>&lt;hostname&gt;</code> | Specifies the name given to a specific device. This is also referred to as the Node name in AMF output screens. |

**Default** awplus

**Mode** Global Configuration

**Usage** On a stack, in a network that is not running AMF, the stack master will have a host name of “awplus” by default, and this also becomes the name of the stack. Individual stack members (excluding the master) will have a host name that is the stack name hyphenated with a numeric suffix. For example, “awplus-1”, “awplus-2” and so on.

The **hostname** command can then be used to change the stack name and the stack master's host name. For example, for the hostname “Lab”, the stack master's host name will be “Lab” and the other stack members will have host names “Lab-1”, “Lab-2” and so on.

In case of stack master fail-over, or stack split, the new stack will use the previous stack name as its host name and the stack name, unless you change it by executing the **hostname** command on the new stack master.

Within an AMF network, any device without a user-defined hostname will automatically be assigned a name based on its MAC address.

To efficiently manage your network using AMF, we strongly advise that you devise a naming convention for your network devices and apply an appropriate hostname to each device.

The name must also follow the rules for ARPANET host names. The name must start with a letter, end with a letter or digit, and use only letters, digits, and hyphens. Refer to RFC 1035.

**Example** To set the system name to HQ-Sales, use the command:

```
awplus# configure terminal
awplus(config)# hostname HQ-Sales
```

This changes the prompt to:

```
HQ-Sales(config)#
```

To revert to the default hostname awplus, use the command:

```
HQ-Sales(config)# no hostname
```

This changes the prompt to:

```
awplus(config)#
```

**NOTE:** When AMF is configured, running the **no hostname** command will apply a hostname that is based on the MAC address of the device node, for example, **node\_0000\_5e00\_5301**.

**Related  
Commands** [show system](#)

# max-fib-routes

**Overview** This command enables you to control the maximum number of FIB routes configured. It operates by providing parameters that enable you to configure preset maximums and warning message thresholds. The operation of these parameters is explained in the Parameter / Description table shown below.

**NOTE:** For static routes use the [max-static-routes](#) command.

Use the **no** variant of this command to set the maximum number of FIB routes to the default of 4294967294 FIB routes.

**Syntax** `max-fib-routes <1-4294967294> [<1-100>|warning-only]`  
`no max-fib-routes`

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| max-fib-routes | This is the maximum number of routes that can be stored in the device's Forwarding Information dataBase. In practice, other practical system limits would prevent this maximum being reached.                                                                                                                                                |
| <1-4294967294> | The allowable configurable range for setting the maximum number of FIB-routes.                                                                                                                                                                                                                                                               |
| <1-100>        | This parameter enables you to optionally apply a percentage value. This percentage will be based on the maximum number of FIB routes you have specified. This will cause a warning message to appear when your routes reach your specified percentage value. Routes can continue to be added until your configured maximum value is reached. |
| warning-only   | This parameter enables you to optionally apply a warning message. If you set this option a warning message will appear if your maximum configured value is reached. Routes can continue to be added until your device reaches either the maximum capacity value of 4294967294, or a practical system limit.                                  |

**Default** The default number of fib routes is the maximum number of fib routes (4294967294).

**Mode** Global Configuration

**Examples** To set the maximum number of dynamic routes to 2000 and warning threshold of 75%, use the following commands:

```
awplus# config terminal
awplus(config)# max-fib-routes 2000 75
```

# max-static-routes

**Overview** Use this command to set the maximum number of static routes, excluding FIB (Forwarding Information Base) routes.

**NOTE:** For FIB routes use the [max-fib-routes](#) command.

Use the **no** variant of this command to set the maximum number of static routes to the default of 1000 static routes.

**Syntax** max-static-routes <1-1000>  
no max-static-routes

**Default** The default number of static routes is the maximum number of static routes (1000).

**Mode** Global Configuration

**Example** To reset the maximum number of static routes to the default maximum, use the command:

```
awplus# configure terminal
awplus(config)# no max-static-routes
```

**NOTE:** Static routes are applied before adding routes to the RIB (Routing Information Base). Therefore, rejected static routes will not appear in the running config.

**Related  
Commands** [max-fib-routes](#)

# no debug all

**Overview** This command disables the debugging facility for all features on your device. This stops the device from generating any diagnostic debugging messages.

The debugging facility is disabled by default.

**Syntax** `no debug all [ipv6|dot1x|nsm|ospf|vrrp]`

| Parameter | Description                                                                |
|-----------|----------------------------------------------------------------------------|
| dot1x     | Turns off all debugging for IEEE 802.1X port-based network access-control. |
| ipv6      | Turns off all debugging for IPv6 (Internet Protocol version 6).            |
| nsm       | Turns off all debugging for the NSM (Network Services Module).             |
| ospf      | Turns off all debugging for OSPF (Open Path Shortest First).               |
| vrrp      | Turns off all debugging for VRRP (Virtual Router Redundancy Protocol).     |

**Mode** Global Configuration and Privileged Exec

**Example** To disable debugging for all features, use the command:

```
awplus# no debug all
```

To disable all 802.1X debugging, use the command:

```
awplus# no debug all dot1x
```

To disable all IPv6 debugging, use the command:

```
awplus# no debug all ipv6
```

To disable all NSM debugging, use the command:

```
awplus# no debug all nsm
```

To disable all OSPF debugging, use the command:

```
awplus# no debug all ospf
```

To disable all VRRP debugging, use the command:

```
awplus# no debug all vrrp
```

**Related Commands** [undebug all](#)

# reboot

**Overview** This command halts the device and performs a cold restart (also known as reload). It displays a confirmation request before restarting.

You can reboot a stand-alone device, a stack, or a specified stack member.

**Syntax**

```
reboot <stack-ID>
reload <stack-ID>
reboot
reload
```

| Parameter  | Description                       |
|------------|-----------------------------------|
| <stack-ID> | Stack member number, from 1 to 8. |

**Mode** Privileged Exec

**Usage** The **reboot** and **reload** commands perform the same action.

When restarting the whole stack, you can either use this **reboot** command to reboot all stack members immediately, or to minimize downtime, reboot the stack members in a rolling sequence by using the [reboot rolling](#) command.

**Examples** To restart a stand-alone device, use the command:

```
awplus# reboot
reboot system? (y/n): y
```

To restart all devices in a stack, use the command:

```
awplus# reboot
Are you sure you want to reboot the whole
stack? (y/n): y
```

To restart stack member 2, use the command:

```
awplus# reboot stack-member 2
reboot stack-member 2 system? (y/n): y
```

If the specified stack member ID does not exist in the current stack, the command is rejected.

**Related  
Commands**

- [reboot rolling](#)
- [reload rolling](#)

# reload

**Overview** This command performs the same function as the [reboot](#) command.

# show clock

**Overview** This command displays the system's current configured local time and date. It also displays other clock related information such as timezone and summertime configuration.

**Syntax** show clock

**Mode** User Exec and Privileged Exec

**Example** To display the system's current local time, use the command:

```
awplus# show clock
```

**Output** Figure 6-1: Example output from the **show clock** command for a device using New Zealand time

```
Local Time: Mon, 17 Oct 2016 13:56:06 +1200
UTC Time: Mon, 17 Oct 2016 01:56:06 +0000
Timezone: NZST
Timezone Offset: +12:00
Summer time zone: NZDT
Summer time starts: Last Sunday in September at 02:00:00
Summer time ends: First Sunday in April at 02:00:00
Summer time offset: 60 mins
Summer time recurring: Yes
```

**Table 1:** Parameters in the output of the **show clock** command

| Parameter             | Description                                                                     |
|-----------------------|---------------------------------------------------------------------------------|
| Local Time            | Current local time.                                                             |
| UTC Time              | Current UTC time.                                                               |
| Timezone              | The current configured timezone name.                                           |
| Timezone Offset       | Number of hours offset to UTC.                                                  |
| Summer time zone      | The current configured summertime zone name.                                    |
| Summer time starts    | Date and time set as the start of summer time.                                  |
| Summer time ends      | Date and time set as the end of summer time.                                    |
| Summer time offset    | Number of minutes that summer time is offset from the system's timezone.        |
| Summer time recurring | Whether the device will apply the summer time settings every year or only once. |

**Related  
Commands**

- [clock set](#)
- [clock summer-time date](#)
- [clock summer-time recurring](#)
- [clock timezone](#)

# show continuous-reboot-prevention

**Overview** This command displays the current continuous reboot prevention configuration.

**Syntax** `show continuous-reboot-prevention`

**Mode** User Exec and Privileged Exec

**Examples** To show the current continuous reboot prevention configuration, use the command:

```
awplus# show continuous-reboot-prevention
```

**Output** Figure 6-2: Example output from the **show continuous-reboot-prevention** command

```
-----  
Continuous reboot prevention  
-----  
status=disabled  
period=600  
threshold=1  
action=linkdown  
-----
```

**Related Commands** [continuous-reboot-prevention](#)  
[show reboot history](#)

# show cpu

**Overview** This command displays a list of running processes with their CPU utilization. For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show cpu [<stack-ID>] [sort {thrds|pri|sleep|runtime}]`

| Parameter  | Description                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <stack-ID> | Stack member number, from 1 to 8.                                                                                                           |
| sort       | Changes the sorting order using the following fields. If you do not specify a field, then the list is sorted by percentage CPU utilization. |
|            | thrds      Sort by the number of threads.                                                                                                   |
|            | pri        Sort by the process priority.                                                                                                    |
|            | sleep      Sort by the average time sleeping.                                                                                               |
|            | runtime    Sort by the runtime of the process.                                                                                              |

**Mode** User Exec and Privileged Exec

**Examples** To show the CPU utilization of current processes, sorting them by the number of threads the processes are using, use the command:

```
awplus# show cpu sort thrds
```

To show CPU utilization for a specific stack member (in this example stack member 2), use the following command:

```
awplus# show cpu 2
```

**Output** Figure 6-3: Example output from **show cpu**

```
Stack member 2:

CPU averages:
 1 second: 12%, 20 seconds: 2%, 60 seconds: 2%
System load averages:
 1 minute: 0.03, 5 minutes: 0.02, 15 minutes: 0.00
Current CPU load:
 userspace: 6%, kernel: 4%, interrupts: 1% iowaits: 0%

**Table 2:** Parameters in the output of the **show cpu** command

| Parameter            | Description                                                                  |
|----------------------|------------------------------------------------------------------------------|
| Stack member         | Stack member number.                                                         |
| CPU averages         | Average CPU utilization for the periods stated.                              |
| System load averages | The average number of processes waiting for CPU time for the periods stated. |
| Current CPU load     | Current CPU utilization specified by load types.                             |
| pid                  | Identifier number of the process.                                            |
| name                 | A shortened name for the process                                             |
| thrds                | Number of threads in the process.                                            |
| cpu%                 | Percentage of CPU utilization that this process is consuming.                |
| pri                  | Process priority state.                                                      |

**Table 2:** Parameters in the output of the **show cpu** command (cont.)

| Parameter | Description                                                                                                                             |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------|
| state     | Process state; one of "run", "sleep", "zombie", and "dead".                                                                             |
| sleep%    | Percentage of time that the process is in the sleep state.                                                                              |
| runtime   | The time that the process has been running for, measured in jiffies. A jiffy is the duration of one tick of the system timer interrupt. |

**Related  
Commands**

[show memory](#)  
[show memory allocations](#)  
[show memory history](#)  
[show memory pools](#)  
[show process](#)

# show cpu history

**Overview** This command prints a graph showing the historical CPU utilization.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show [<stack-ID>] cpu history`

| Parameter  | Description                       |
|------------|-----------------------------------|
| <stack-ID> | Stack member number, from 1 to 8. |

**Mode** User Exec and Privileged Exec

**Usage** This command’s output displays three graphs of the percentage CPU utilization:

- per second for the last minute, then
- per minute for the last hour, then
- per 30 minutes for the last 30 hours.

If this command is entered on the stack master, it will print graphs for all the stack members. A stack member heading will be displayed to distinguish the different graphs for every stack member.

**Examples** To display a graph showing the historical CPU utilization of the device, use the command:

```
awplus# show cpu history
```

To display the CPU utilization history graph for stack member 2, use the command:

```
awplus# show 2 cpu history
```

where 2 is the node id of the stack member.

**Output** Figure 6-4: Example output from the **show cpu history** command

- `show memory allocations`
- `show memory pools`
- `show process`

# show debugging

- Overview** This command displays information for all debugging options.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).
- Syntax** `show debugging`
- Default** This command runs all the **show debugging** commands in alphabetical order.
- Mode** User Exec and Privileged Exec
- Usage** This command displays all debugging information, similar to the way the [show tech-support](#) command displays all show output for use by Allied Telesis authorized service personnel only.
- Example** To display all debugging information, use the command:  
`awplus# show debugging`
- Output** Figure 6-5: Example output from the **show debugging** command

```
awplus#show debugging
AAA debugging status:
  Authentication debugging is off
  Accounting debugging is off

% DHCP Snooping service is disabled

802.1X debugging status:

EPSR debugging status:
  EPSR Info debugging is off
  EPSR Message debugging is off
  EPSR Packet debugging is off
  EPSR State debugging is off

IGMP Debugging status:
  IGMP Decoder debugging is off
  IGMP Encoder debugging is off
...
```

# show ecofriendly

**Overview** This command displays the switch's eco-friendly configuration status. The [ecofriendly led](#) and [ecofriendly lpi](#) configuration status are shown in the [show ecofriendly](#) output.

**Syntax** `show ecofriendly`

**Mode** Privileged Exec and Global Configuration

**Example** To display the switch's eco-friendly configuration status, use the following command:

```
awplus# show ecofriendly
```

**Output** Figure 6-6: Example output from the **show ecofriendly** command

```
awplus#show ecofriendly
Front panel port LEDs          normal

...
```

**Table 3:** Parameters in the output of the **show ecofriendly** command

| Parameter                                                | Description                                                                                                                                                                                                      |
|----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| normal                                                   | The eco-friendly LED feature is disabled and port LEDs show the current state of the ports. This is the default setting.                                                                                         |
| off                                                      | The eco-friendly LED feature is enabled and power to the port LEDs is disabled.                                                                                                                                  |
| normal<br>(configuration<br>overridden by eco<br>button) | The eco-friendly LED feature has been disabled with the eco-switch button, overriding the configuration set with the <a href="#">ecofriendly led</a> command. The port LEDs show the current state of the ports. |

**Table 3:** Parameters in the output of the **show ecofriendly** command (cont.)

| Parameter                                    | Description                                                                                                                                                                                      |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| off (configuration overridden by eco button) | The eco-friendly LED feature has been enabled with the eco-switch button, overriding the configuration set with the <a href="#">ecofriendly led</a> command. Power to the port LEDs is disabled. |
| Port                                         | Displays the port number as assigned by the switch.                                                                                                                                              |
| Name                                         | Displays the port name if a name is configured for a port number.                                                                                                                                |
| Configured                                   | The eco-friendly LPI feature is configured on the port. Either LPI or off is displayed.                                                                                                          |
| Status                                       | The eco-friendly LPI feature is active on the port. Either LPI or off is displayed. Ports that are not running show a dash (-).                                                                  |

**Related  
Commands**   [ecofriendly led](#)  
[ecofriendly lpi](#)

# show interface memory

**Overview** This command displays the shared memory used by either all interfaces, or the specified interface or interfaces. The output is useful for diagnostic purposes by Allied Telesis authorized service personnel.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show interface memory`  
`show interface <port-list> memory`

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port-list> | Display information about only the specified port or ports. The port list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.0.4), a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4, or sa1-2, or po1-2)</li><li>• a comma-separated list of ports and port ranges (e.g. port1.0.1,port1.0.4-1.0.6). Do not mix switch ports, static channel groups, and dynamic (LACP) channel groups in the same list.</li></ul> |

**Mode** User Exec and Privileged Exec

**Example** To display the shared memory used by all interfaces, use the command:

```
awplus# show interface memory
```

To display the shared memory used by port1.0.1 and port1.0.5 to port1.0.6, use the command:

```
awplus# show interface port1.0.1,port1.0.5-1.0.6 memory
```

**Output** Figure 6-7: Example output from the **show interface memory** command

```
awplus#show interface memory
Vlan blocking state shared memory usage
-----
```

| Interface | shmid   | Bytes Used | nattch | Status |

# show memory

**Overview** This command displays the memory used by each process that is currently running. For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show memory [<stack-ID>] [sort {size|peak|stk}]`

| Parameter  | Description                                                                                                                                |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <stack-ID> | Stack member number, from 1 to 8.                                                                                                          |
| sort       | Changes the sorting order for the list of processes. If you do not specify this, then the list is sorted by percentage memory utilization. |
|            | size Sort by the amount of memory the process is currently using.                                                                          |
|            | peak Sort by the amount of memory the process is currently using.                                                                          |
|            | stk Sort by the stack size of the process.                                                                                                 |

**Mode** User Exec and Privileged Exec

**Example** To display the memory used by the current running processes, use the command:

```
awplus# show memory
```

**Output** Figure 6-9: Example output from **show memory**

```
awplus#show memory

Stack member 1:

**Table 4:** Parameters in the output of the **show memory** command

| Parameter    | Description                                                      |
|--------------|------------------------------------------------------------------|
| Stack member | Stack member number.                                             |
| RAM total    | Total amount of RAM memory free.                                 |
| free         | Available memory size.                                           |
| buffers      | Memory allocated kernel buffers.                                 |
| pid          | Identifier number for the process.                               |
| name         | Short name used to describe the process.                         |
| mem%         | Percentage of memory utilization the process is currently using. |
| size         | Amount of memory currently used by the process.                  |
| peak         | Greatest amount of memory ever used by the process.              |
| data         | Amount of memory used for data.                                  |
| stk          | The stack size.                                                  |

# show memory allocations

**Overview** This command displays the memory allocations used by processes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show memory allocations [<process>]`

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| <process> | Displays the memory allocation used by the specified process. |

**Mode** User Exec and Privileged Exec

**Example** To display the memory allocations used by all processes on your device, use the command:

```
awplus# show memory allocations
```

**Output** Figure 6-10: Example output from the **show memory allocations** command

```
awplus#show memory allocations

# show memory history

**Overview** This command prints a graph showing the historical memory usage.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show memory history [<stack-ID>]`

| Parameter  | Description                       |
|------------|-----------------------------------|
| <stack-ID> | Stack member number, from 1 to 8. |

**Mode** User Exec and Privileged Exec

**Usage** This command’s output displays three graphs of the percentage memory utilization:

- per second for the last minute, then
- per minute for the last hour, then
- per 30 minutes for the last 30 hours.

**Examples** To show a graph displaying the historical memory usage for either a single unstacked device, or a complete stack, use the command:

```
awplus# show memory history
```

To show a graph displaying the historical memory usage for specific stack member (stack member 2 in this example) within a stack, use the command:

```
awplus# show memory history 2
```

**Output** Figure 6-11: Example output from the **show memory history** command

```

# show memory pools

**Overview** This command shows the memory pools used by processes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show memory pools [<process>]`

| Parameter                    | Description                                              |
|------------------------------|----------------------------------------------------------|
| <code>&lt;process&gt;</code> | Displays the memory pools used by the specified process. |

**Mode** User Exec and Privileged Exec

**Example** To show the memory pools used by processes, use the command:

```
awplus# show memory pools
```

**Output** Figure 6-12: Example output from the **show memory pools** command

```
awplus#show memory pools
Memory pools for imi

# show memory shared

**Overview** This command displays shared memory allocation information. The output is useful for diagnostic purposes by Allied Telesis authorized service personnel.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show memory shared`

**Mode** User Exec and Privileged Exec

**Example** To display information about the shared memory allocation used on the device, use the command:

```
awplus# show memory shared
```

**Output** Figure 6-13: Example output from the **show memory shared** command

```
awplus#show memory shared
Shared Memory Status
-----
Segment allocated   = 39
Pages allocated     = 39
Pages resident      = 11

Shared Memory Limits
-----
Maximum number of segments           = 4096
Maximum segment size (kbytes)        = 32768
Maximum total shared memory (pages) = 2097152
Minimum segment size (bytes)         = 1
```

# show process

**Overview** This command lists a summary of the current running processes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show process [<stack-ID>] [sort {cpu|mem}]`

| Parameter  | Description                                                 |
|------------|-------------------------------------------------------------|
| <stack-ID> | Stack member number, from 1 to 8.                           |
| sort       | Changes the sorting order for the list of processes.        |
|            | cpu Sorts the list by the percentage of CPU utilization.    |
|            | mem Sorts the list by the percentage of memory utilization. |

**Mode** User Exec and Privileged Exec

**Examples** To show a graph displaying the historical memory usage for either a single unstacked device, or a complete stack, use the command:

```
awplus# show memory history
```

To show a graph displaying the historical memory usage for specific stack member (stack member 2 in this example) within a stack, use the command:

```
awplus# show memory history 2
```

**Example** To display a summary of the current running processes, use the command:

```
awplus# show process
```

To display a summary of the current running processes on stack member 2, use the command:

```
awplus# show process 2
```

**Output** Figure 6-14: Example output from the **show process** command

```

2016-10-09  19:56:16  Expected    User Request
2016-10-09  20:36:06  Unexpected  Rebooting due to VCS duplicate master (Continuous
reboot prevention)
2016-10-09  19:51:20  Expected    User Request
```

**Table 6:** Parameters in the output from the **show reboot history** command

| Parameter  | Description                                                                                                                                                                                |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Unexpected | A non-intended reboot.<br>The reboot is counted by the continuous reboot prevention feature, as long as the reboot occurred in the time period specified for continuous reboot prevention. |
| Expected   | A planned or user-triggered reboot.<br>The reboot is not counted by the continuous reboot prevention feature.                                                                              |

**Table 6:** Parameters in the output from the **show reboot history** command

| Parameter                    | Description                                                                                                                                                                                                                 |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Continuous reboot prevention | A continuous reboot prevention event has occurred. The action taken is configured with the <b>continuous-reboot-prevention</b> command. The next time period during which reboot events are counted begins from this event. |
| User request                 | User initiated reboot via the CLI.                                                                                                                                                                                          |

**Related Commands** [show continuous-reboot-prevention](#)  
[show tech-support](#)

# show router-id

**Overview** Use this command to show the Router ID of the current system.

**Syntax** `show router-id`

**Mode** User Exec and Privileged Exec

**Example** To display the Router ID of the current system, use the command:

```
awplus# show router-id
```

**Output** Figure 6-16: Example output from the **show router-id** command

```
awplus>show router-id  
Router ID: 10.55.0.2 (automatic)
```

# show system

**Overview** This command displays general system information about the device, including the hardware, installed, memory, and software versions loaded. It also displays location and contact details when these have been set.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show system`

**Mode** User Exec and Privileged Exec

**Example** To display configuration information, use the command:

```
awplus# show system
```

**Output** Figure 6-17: Example output from **show system**

```
awplus#show system

**Commands**

# show system environment

**Overview** This command displays the current environmental status of your device and any attached PSU, XEM, or other expansion option. The environmental status covers information about temperatures, fans, and voltage.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show system environment`

**Mode** User Exec and Privileged Exec

**Example** To display the system’s environmental status, use the command:

```
awplus# show system environment
```

**Output** Figure 6-19: Example output from the **show system environment** command

```
Stack Environment Monitoring Status

Stack member 1:

Overall Status: Normal

Resource ID: 1  Name: x310-26FT

```

**Related Commands** [show system](#)

# show system interrupts

**Overview** Use this command to display the number of interrupts for each IRQ (Interrupt Request) used to interrupt input lines on a PIC (Programmable Interrupt Controller) on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show system interrupts`

**Mode** User Exec and Privileged Exec

**Example** To display information about the number of interrupts for each IRQ in your device, use the command:

```
awplus# show system interrupts
```

**Output** Figure 6-20: Example output from the **show system interrupts** command

```
awplus>show system interrupts
      CPU0
  1:      2   CPM2 SIU   Level Enabled   0   i2c-mpc

**Related Commands** [show system environment](#)

# show system mac

**Overview** This command displays the physical MAC address available on a standalone switch, or a stack. This command also shows the virtual MAC address for a stack if the stack virtual MAC address feature is enabled with the [stack virtual-mac](#) or the [stack enable](#) command.

**Syntax** `show system mac`

**Mode** User Exec and Privileged Exec

**Usage** For more information about the virtual MAC address feature, see the [VCStack Feature Overview and Configuration Guide](#).

**Example** To display the physical MAC address enter the following command:

```
awplus# show system mac
```

**Output** Figure 6-21: Example output from the **show system mac** command

```
awplus#show system mac  
eccd.6d9d.4eed (system)
```

**Output** Figure 6-22: Example output showing how to use the **stack virtual-mac** command and the **show system mac** command

```
awplus#configure terminal  
Enter configuration commands, one per line. End with CNTL/Z.  
awplus(config)#stack virtual-mac  
% Please check that the new MAC 0000.cd37.0065 is unique within  
the network.  
% Save the config and restart the system for this change to take  
effect.

# show system pci device

**Overview** Use this command to display the PCI devices on your device.

**Syntax** show system pci device

**Mode** User Exec and Privileged Exec

**Example** To display information about the PCI devices on your device, use the command:

```
awplus# show system pci device
```

**Output** Figure 6-23: Example output from the **show system pci device** command

```
awplus#show system pci device
00:0c.0 Class 0200: 11ab:00d1 (rev 01)

        \-0d.0 11ab:00d1
```

**Related Commands** [show system environment](#)  
[show system pci device](#)

# show system serialnumber

**Overview** This command shows the serial number information for the device.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show system serialnumber`

**Mode** User Exec and Privileged Exec

**Example** To display the serial number information for the device, use the command:

```
awplus# show system serialnumber
```

**Output** Figure 6-25: Example output from the **show system serial number** command

```
awplus#show system serialnumber  
45AX5300X
```

# show tech-support

**Overview** This command generates system and debugging information for the device and saves it to a file.

You can optionally limit the command output to display only information for a given protocol or feature. The features available depend on your device and will be a subset of the features listed in the table below.

The command generates a large amount of output, which is saved to a file in compressed format. The output file name can be specified by outfile option. If the output file already exists, a new file name is generated with the current time stamp. If the output filename does not end with ".gz", then ".gz" is appended to the filename. Since output files may be too large for Flash on the device we recommend saving files to external memory or a TFTP server whenever possible to avoid device lockup. This method is not likely to be appropriate when running the working set option of AMF across a range of physically separated devices.

**Syntax** `show tech-support`  
`{ [all|atmf|auth|bgp|card|dhcpsn|epsr|firewall|igmp|ip|ipv6|mld|openflow|ospf|ospf6|pim|rip|ripng|stack|stp|system|tacacs+|update]} [outfile <filename>]`

| Parameter | Description                                |
|-----------|--------------------------------------------|
| all       | Display full information                   |
| atmf      | Display ATMF-specific information          |
| auth      | Display authentication-related information |
| bgp       | Display BGP-related information            |
| card      | Display Chassis Card specific information  |
| dhcpsn    | Display DHCP Snooping specific information |
| epsr      | Display EPSR specific information          |
| firewall  | Display firewall specific information      |
| igmp      | Display IGMP specific information          |
| ip        | Display IP specific information            |
| ipv6      | Display IPv6 specific information          |
| mld       | Display MLD specific information           |
| openflow  | Display information related to OpenFlow    |
| ospf      | Display OSPF related information           |
| ospf6     | Display OSPF6 specific information         |
| pim       | Display PIM related information            |
| rip       | RIP related information                    |

| Parameter  | Description                                                                                                     |
|------------|-----------------------------------------------------------------------------------------------------------------|
| ripng      | Display RIPNG specific information                                                                              |
| stack      | Display stacking device information                                                                             |
| stp        | Display STP specific information                                                                                |
| system     | Display general system information                                                                              |
| tacacs+    | Display TACACS+ information                                                                                     |
| update     | Display resource update specific information                                                                    |
|            | Output modifier                                                                                                 |
| >          | Output redirection                                                                                              |
| >>         | Output redirection (append)                                                                                     |
| outfile    | Output file name                                                                                                |
| <filename> | Specifies a name for the output file. If no name is specified, this file will be saved as: tech-support.txt.gz. |

**Default** Captures **all** information for the device.

By default the output is saved to the file 'tech-support.txt.gz' in the current directory. If this file already exists in the current directory then a new file is generated with the time stamp appended to the file name, for example 'tech-support20161009.txt.gz', so the previous file is retained.

**Usage** This command is useful for collecting a large amount of information about all protocols or specific protocols on your device so that it can then be analyzed for troubleshooting purposes. The output of this command can be provided to technical support staff when reporting a problem.

**Mode** Privileged Exec

**Examples** To produce the output needed by technical support staff, use the command:

```
awplus# show tech-support
```

# speed (asyn)

**Overview** This command changes the console speed from the device. Note that a change in console speed is applied for subsequent console sessions. Exit the current session to enable the console speed change using the [clear line console](#) command.

**Syntax** `speed <console-speed-in-bps>`

| Parameter              | Description                                       |
|------------------------|---------------------------------------------------|
| <console-speed-in-bps> | Console speed Baud rate in bps (bits per second). |
| 1200                   | 1200 Baud                                         |
| 2400                   | 2400 Baud                                         |
| 9600                   | 9600 Baud                                         |
| 19200                  | 19200 Baud                                        |
| 38400                  | 38400 Baud                                        |
| 57600                  | 57600 Baud                                        |
| 115200                 | 115200 Baud                                       |

**Default** The default console speed baud rate is 9600 bps.

**Mode** Line Configuration

**Usage** This command is used to change the console (asyn) port speed. Set the console speed to match the transmission rate of the device connected to the console (asyn) port on your device.

**Example** To set the terminal console (asyn0) port speed from the device to 57600 bps, then exit the session, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# speed 57600
awplus(config-line)# exit
awplus(config)# exit
awplus# exit
```

Then log in again to enable the change:

```
awplus login:
Password:
awplus>
```

# system territory (deprecated)

**Overview** This command has been deprecated in Software Version 5.4.4-0.1 and later. It now has no effect.

It is no longer useful to specify a system territory, so there is no alternative command.

# terminal monitor

**Overview** Use this command to display debugging output on a terminal.

To display the cursor after a line of debugging output, press the Enter key.

Use the command **terminal no monitor** to stop displaying debugging output on the terminal, or use the timeout option to stop displaying debugging output on the terminal after a set time.

**Syntax** terminal monitor [<1-60>]  
terminal no monitor

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| <1-60>    | Set a timeout between 1 and 60 seconds for terminal output. |

**Default** Disabled

**Mode** User Exec and Privileged Exec

**Examples** To display debugging output on a terminal, enter the command:

```
awplus# terminal monitor
```

To specify timeout of debugging output after 60 seconds, enter the command:

```
awplus# terminal monitor 60
```

To stop displaying debugging output on the terminal, use the command:

```
awplus# terminal no monitor
```

**Related Commands** All debug commands

# undebug all

**Overview** This command applies the functionality of the [no debug all](#) command.

# Pluggables and Cabling Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure and monitor Pluggables and Cabling, including:

- Cable Fault Locator for finding faults in copper cabling
- Optical Digital Diagnostic Monitoring (DDM) to help find fiber issues when links go down
- Active Fiber Monitoring for detecting changes in optical power received over fiber cables.

For more information, see the [Pluggables and Cabling Feature Overview and Configuration\\_Guide](#).

  - “[show system pluggable diagnostics](#)” on page 300
  - “[show test cable-diagnostics tdr](#)” on page 302
  - “[test cable-diagnostics tdr interface](#)” on page 303

# clear test cable-diagnostics tdr

**Overview** Use this command to clear the results of the last cable test that was run.

**Syntax** `clear test cable-diagnostics tdr`

**Mode** Privileged Exec

**Examples** To clear the results of a previous cable-diagnostics test use the following commands:

```
awplus# clear test cable-diagnostics tdr
```

**Related Commands** [show test cable-diagnostics tdr](#)  
[test cable-diagnostics tdr interface](#)

# debug fiber-monitoring

**Overview** Use this command to enable debugging of active fiber monitoring on the specified ports.

Use the **no** variant of this command to disable debugging on all ports or the specified ports.

**Syntax** `debug fiber-monitoring interface <port-list>`  
`no debug fiber-monitoring [interface <port-list>]`

| Parameter   | Description                                                                                                                 |
|-------------|-----------------------------------------------------------------------------------------------------------------------------|
| <port-list> | The list of fiber ports to enable or disable debugging for, as a single port, a comma separated list or a hyphenated range. |

**Default** Debugging of active fiber monitoring is disabled by default.

**Mode** User Exec/Privileged Exec

**Usage** While debugging is enabled by this command for a port, all the optical power readings for the port are sent to the console.

**Example** To enable debugging messages for active fiber monitoring of port 1.0.2 to be sent to the console, use the commands:

```
awplus# debug fiber-monitoring interface port 1.0.2  
awplus# terminal monitor
```

To disable debugging messages for active fiber monitoring on port 1.0.2, use the command:

```
awplus# no debug fiber-monitoring interface port 1.0.2
```

To disable all debugging messages for active fiber monitoring, use the command:

```
awplus# no debug fiber-monitoring
```

**Output** Figure 7-1: Example output from **debug fiber-monitoring**

```
awplus#debug fiber-monitoring interface port2.0.1
awplus#terminal monitor
% Warning: Console logging enabled

```

**Related Commands** [show system fiber-monitoring](#)

# fiber-monitoring action

**Overview** Use this command to specify an action to be taken if the optical power received on the port changes from the baseline by the amount specified in the **fiber-monitoring sensitivity** command.

Use the **no** variant of this command to remove the specified action or all actions from the port.

**Syntax** `fiber-monitoring action {trap|shutdown}`  
`no fiber-monitoring action [trap|shutdown]`

| Parameter | Description                |
|-----------|----------------------------|
| trap      | Send an SNMP notification. |
| shutdown  | Shutdown the port.         |

**Default** By default a log message is generated, but no additional action is performed.

**Mode** Interface Configuration mode for a fiber port.

**Usage** If fiber monitoring is enabled and this command is not used to set an action, a change in received power on a fiber port only generates a log message.

**Example** To set the device to send an SNMP notification when ports 1.0.1 or 1.0.2 receive reduced power, use the commands:

```
awplus(config)# interface port1.0.1-1.0.2
awplus(config-if)# fiber-monitoring action trap
```

To set the device to send an SNMP notification and to shut down the port when ports 1.0.1 or 1.0.2 receive reduced power, use the commands:

```
awplus(config)# interface port1.0.1-1.0.2
awplus(config-if)# fiber-monitoring action trap shutdown
```

To set the device not to send an SNMP notification when ports 1.0.1 or 1.0.2 receive reduced power, use the commands:

```
awplus(config)# interface port1.0.1-1.0.2
awplus(config-if)# no fiber-monitoring action trap
```

To set the device not to perform any action when it receives reduced power on ports 1.0.1 or 1.0.2, use the commands:

```
awplus(config)# interface port1.0.1-1.0.2
awplus(config-if)# no fiber-monitoring action
```

**Related Commands** [fiber-monitoring sensitivity](#)  
[show system fiber-monitoring](#)

# fiber-monitoring baseline

- Overview** Use this command to configure how the baseline value for comparison is calculated for active fiber monitoring on the port.
- Note that alarm generation will not commence until the link has been up for a full averaging period.
- Use the **no** variant of this command to set the fiber-monitoring baseline to its default value.

**Syntax** fiber-monitoring baseline (average <12-150>|fixed <1-65535>)  
no fiber-monitoring baseline

| Parameter | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| average   | Set the baseline optical power received to be based on the moving average of the specified number of most recent (non-zero) values. Default. |
| <12-150>  | The number of most recent values to average for the baseline. Default: 12.                                                                   |
| fixed     | Set the baseline to a fixed level of received optical power. Not recommended—see Usage below.                                                |
| <1-65535> | The fixed baseline value of received optical power in 0.0001mW.                                                                              |

**Default** The default is a moving average of the last 12 values. If the **fiber-monitoring interval** is set to its default (5s), the **fiber-monitoring baseline** default will be the average over the last minute.

**Mode** Interface Configuration for a fiber port

**Usage** ***CAUTION:** We do not recommend setting a fixed value because gradual change over time caused by temperature fluctuations, etc. could lead to unnecessary alarms.*

There are two ways to configure the baseline. The first is to choose a number of readings to average. This is the default and recommended method. The second is to set a fixed value in units of x0.0001mW.

If a fixed value is required, the easiest way is to enable fiber monitoring on the port and use the **show system fiber-monitoring** command to see what readings can be expected.

**Example** To set the baseline optical power to a moving average of the last 30 readings, use the command:

```
awplus(config-if)# fiber-monitoring baseline average 30
```

To set the baseline to its default, averaging the last 12 readings, use the command:

```
awplus(config-if)# no fiber-monitoring baseline
```

**Related  
Commands**    fiber-monitoring interval  
                 fiber-monitoring sensitivity

# fiber-monitoring enable

**Overview** Use this command to enable active fiber monitoring on a fiber port. If the port can support fiber monitoring but does not have the correct SFP or fiber type installed, the configuration will be saved, and monitoring will commence when a supported SFP is inserted. Disabling and re-enabling fiber monitoring on a port resets the baseline calculation.

Use the **no** variants of this command to disable active fiber monitoring on the interface, or to remove all the configuration and state for the ports, respectively.

**Syntax** fiber-monitoring enable  
no fiber-monitoring enable  
no fiber-monitoring

**Default** Active fiber monitoring is disabled by default.

**Mode** Interface Configuration mode for a fiber port

**Examples** To enable active fiber monitoring on a ports 1.0.1 and 1.0.2, use the commands:

```
awplus(config)# interface port1.0.1-1.0.2  
awplus(config-if)# fiber-monitoring enable
```

To disable fiber monitoring on the ports, use the commands:

```
awplus(config)# interface port1.0.1-1.0.2  
awplus(config-if)# no fiber-monitoring enable
```

To remove all fiber-monitoring configuration and state for the ports, use the commands:

```
awplus(config)# interface port1.0.1-1.0.2  
awplus(config-if)# no fiber-monitoring
```

**Related Commands** [fiber-monitoring action](#)  
[fiber-monitoring sensitivity](#)  
[show system fiber-monitoring](#)

# fiber-monitoring interval

**Overview** Use this command to configure the fiber monitoring polling interval in seconds for the port. The optical power will be read every <interval> seconds and compared against the calculated threshold values to see if a log message or other action is required.

Use the **no** variant of this command to reset the polling interval to the default (5 seconds).

**Syntax** fiber-monitoring interval <2-60>  
no fiber-monitoring interval

| Parameter | Description                                |
|-----------|--------------------------------------------|
| <2-60>    | Optical power polling interval in seconds. |

**Default** The interval is set to 5 seconds by default.

**Mode** Interface configuration mode for a fiber port.

**Example** To set the fiber monitoring polling interval for port 1.0.2 to 30 seconds, use the commands:

```
awplus(config)# interface port1.0.2  
awplus(config-if)# fiber-monitoring interval 30
```

To reset the fiber monitoring polling interval back to the default (5s), use the commands:

```
awplus(config)# interface port1.0.2  
awplus(config-if)# no fiber-monitoring interval
```

**Related Commands** [fiber-monitoring baseline](#)  
[show system fiber-monitoring](#)

# fiber-monitoring sensitivity

**Overview** Use this command to configure the sensitivity of the alarm thresholds on the port for active fiber monitoring.

Use the **no** variant of this command to reset the sensitivity to the default.

**Syntax** `fiber-monitoring sensitivity (low|medium|high|highest|fixed <25-65535>)|relative <0.01-10.0>`  
`no fiber-monitoring sensitivity`

| Parameter            | Description                                            |
|----------------------|--------------------------------------------------------|
| low                  | Low sensitivity (+/-2 dB)                              |
| medium               | Medium sensitivity (1 dB) (default)                    |
| high                 | High sensitivity (the greater of 0.5 dB and 0.0025 mW) |
| highest              | The highest sensitivity available: 0.0025mW            |
| fixed<25-65535>      | Fixed sensitivity at the specified level in 0.0001 mW. |
| relative <0.01-10.0> | Relative sensitivity at the specified level in dB.     |

**Default** The default is medium sensitivity.

**Mode** User Exec/Privileged Exec

**Usage** A log message is generated and configured actions are taken if the received optical power drops below the baseline value by the sensitivity configured with this command.

The sensitivity can be configured to one of four pre-defined levels in decibels or to a fixed absolute delta in units of 0.0001mW. The alarm thresholds can be seen in the **show system fiber-monitoring** output. The maximum absolute sensitivity configurable is 0.0025 mW. Note that 0.0025 mW equates to a reduction of approximately 1dB at the maximum attenuation of an AT-SPLX10/1.

**Example** To set the fiber monitoring sensitivity for port 1.0.2 to a relative sensitivity of 0.1 dB, use the commands:

```
awplus(config)# interface port1.0.2
awplus(config-if)# fiber-monitoring sensitivity relative 0.1
```

To reset the fiber monitoring sensitivity to the default (medium), use the commands:

```
awplus(config)# interface port1.0.2
awplus(config-if)# no fiber-monitoring sensitivity
```

**Related  
Commands**    fiber-monitoring action  
                  fiber-monitoring baseline  
                  show system fiber-monitoring

# show system fiber-monitoring

**Overview** Use this command to display settings and current status for Active Fiber Monitoring.

**Syntax** `show system fiber-monitoring`

**Mode** User Exec/Privileged Exec

**Example** To display configuration and status for active fiber monitoring on ports, use the command:

```
awplus# show system fiber-monitoring
```

**Output** Figure 7-2: Example output from **show system fiber-monitoring**

```
awplus#show sys fiber-monitoring
Fiber Monitoring Status
  Reading units 0.0001mW

Stack member 1:

Interface port1.0.1
Status:          enabled
Supported:       Supported pluggable
Debugging:       disabled
Interval:        2 seconds
Sensitivity:     1.00dB
Baseline type:   average of last 35 values greater than 50
Status:
  Baseline value: 496
  Alarm threshold: 393
  Alarm:          no
  Last 12 Readings: 498 498 498 498 498 498 498 498 498 498 498 498
  Minimum reading: 486
  Maximum reading: 498

Interface port1.0.2
Status:          enabled
Supported:       Supported pluggable
Debugging:       disabled
Interval:        2 seconds
Sensitivity:     1.00dB
Baseline type:   average of last 30 values greater than 50
Status:
  Baseline value: 0
  Alarm threshold: 0
  Alarm:          no
  Last 12 Readings: 0 0 0 0 0 0 0 0 0 0 0 0
  Minimum reading: 0
  Maximum reading: 0
```

Table 7-1: Parameters in the output from **show system fiber-monitoring**

| Parameter        | Description                                                                                                                                                 |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reading units    | The units for optical power readings in the rest of the display, e.g. 0.0001mW.                                                                             |
| Status           | Whether active fiber monitoring is enabled or disabled for this port.                                                                                       |
| Supported        | Whether the pluggable inserted in this port supports active fiber monitoring.                                                                               |
| Debugging        | Whether debugging of active fiber monitoring is enabled or disabled for this port.                                                                          |
| Interval         | The configured interval between readings of optical power on this port.                                                                                     |
| Sensitivity      | The configured sensitivity threshold for optical power changes on this port.                                                                                |
| Baseline type    | How the baseline optical power level is calculated: either the average of the specified number of previous readings or a specified fixed value in 0.0001mW. |
| Status           | Current values for the following parameters.                                                                                                                |
| Baseline value   | The baseline value, calculated according to the configured baseline method, in 0.0001mW.                                                                    |
| Alarm threshold  | The current threshold for a change in optical power, calculated according to the configured sensitivity method, that will result in action.                 |
| Alarm            | Whether the optical power at the most recent reading fallen below the threshold.                                                                            |
| Last 12 readings | The last 12 optical power values measured, in 0.0001mW, with oldest value first.                                                                            |
| Minimum reading  | The lowest optical power reading since the fiber pluggable was last inserted, or since active fiber monitoring was last enabled on the port.                |
| Maximum reading  | The highest optical power reading since the fiber pluggable was last inserted, or since active fiber monitoring was last enabled on the port.               |

# show system pluggable

**Overview** This command displays **brief** pluggable transceiver information showing the pluggable type, the pluggable serial number, and the pluggable port on the device. Different types of pluggable transceivers are supported in different models of device. See your Allied Telesis dealer for more information about the models of pluggables that your device supports.

**Syntax** `show system pluggable [<port-list>]`

| Parameter   | Description                                                                                   |
|-------------|-----------------------------------------------------------------------------------------------|
| <port-list> | The switch ports or ports to display information about (e.g. port1.0.25 or port1.0.25-1.0.26) |

**Mode** User Exec and Privileged Exec

**Example** To display brief information about all installed pluggable transceivers, use the command:

```
awplus# show system pluggable
```

**Example** To display brief information about pluggable transceivers installed in port1.0.25 through port1.0.26, use the command:

```
awplus# show system pluggable port1.0.25-1.0.26
```

**Output** Figure 7-3: Example output from **show system pluggable port1.0.25-1.0.26**

| System Pluggable Information |              |            |                  |          |             |
|------------------------------|--------------|------------|------------------|----------|-------------|
| Port                         | Manufacturer | Device     | Serial Number    | Datecode | Type        |
| 1.0.25                       | AGILENT      | HFBR-5710L | 0401312315461272 | 040131   | 1000BASE-SX |
| 1.0.26                       | AGILENT      | QBCU-5730R | AK0614GKF7       | 060408   | 1000BASE-T  |

**Table 8:** Parameters in the output from the **show system pluggable** command

| Parameter    | Description                                                          |
|--------------|----------------------------------------------------------------------|
| Stack member | The stack member number.                                             |
| Port         | Specifies the vendor's name for the installed pluggable transceiver. |
| Vendor Name  | Specifies the vendor's name for the installed pluggable transceiver. |
| Device Name  | Specifies the device name for the installed pluggable transceiver.   |

**Table 8:** Parameters in the output from the **show system pluggable** command

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device Type            | Specifies the device type for the installed pluggable transceiver.                                                                                                                                                                                                                                                                                                             |
| Serial Number          | Specifies the serial number for the installed pluggable transceiver.                                                                                                                                                                                                                                                                                                           |
| Manufacturing Datecode | Specifies the manufacturing datecode for the installed pluggable transceiver. Checking the manufacturing datecode with the vendor may be useful when determining Laser Diode aging issues. For more information, see "How To Troubleshoot Fiber and Pluggable Issues" in the <a href="#">"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide</a> . |
| SFP Laser Wavelength   | Specifies the laser wavelength of the installed pluggable transceiver.                                                                                                                                                                                                                                                                                                         |
| Datecode               | Specifies the manufacturing datecode for the installed pluggable transceiver. Checking the manufacturing datecode with the vendor may be useful when determining Laser Diode aging issues. For more information, see "How To Troubleshoot Fiber and Pluggable Issues" in the <a href="#">"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide</a> . |
| Device Type            | Specifies the device type for the installed pluggable transceiver                                                                                                                                                                                                                                                                                                              |

- [show system pluggable diagnostics](#)

# show system pluggable detail

**Overview** This command displays detailed pluggable transceiver information showing the pluggable type, the pluggable serial number, and the pluggable port on the device. Different types of pluggable transceivers are supported in different models of device. See your Allied Telesis dealer for more information about the models of pluggables that your device supports.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show system pluggable [<port-list>] detail`

| Parameter                      | Description                                                                                   |
|--------------------------------|-----------------------------------------------------------------------------------------------|
| <code>&lt;port-list&gt;</code> | The switch ports or ports to display information about (e.g. port1.0.25 or port1.0.25-1.0.26) |

**Mode** User Exec and Privileged Exec

**Usage** In addition to the information about pluggable transceivers displayed using the `show system pluggable` command (port, manufacturer, serial number, manufacturing datecode, and type information), the **show system pluggable detail** command displays the following information:

- **SFP Laser Wavelength:** Specifies the laser wavelength of the installed pluggable transceiver
- **Single mode Fiber:** Specifies the link length supported by the pluggable transceiver using single mode fiber
- **OM1 (62.5μ m) Fiber:** Specifies the link length, in meters (m) or kilometers (km) supported by the pluggable transceiver using 62.5 micron multi-mode fiber.
- **OM2 (50μ m) Fiber:** Specifies the link length (in meters or kilometers) supported by the pluggable transceiver using 50 micron multi-mode fiber.
- **Diagnostic Calibration:** Specifies whether the pluggable transceiver supports DDM or DOM Internal or External Calibration.
  - **Internal** is displayed if the pluggable transceiver supports DDM or DOM Internal Calibration.
  - **External** is displayed if the pluggable transceiver supports DDM or DOM External Calibration.
  - a dash (-) is displayed if neither Internal Calibration or External Calibration is supported.
- **Power Monitoring:** Displays the received power measurement type, which can be either **OMA**(Optical Module Amplitude) or **Avg**(Average Power) measured in μW.

**NOTE:** For parameters that are not supported or not specified, a hyphen is displayed instead.

**Example** To display detailed information about the pluggable transceivers installed in a particular port on the device, use a command like:

```
awplus# show system pluggable port1.0.25 detail
```

To display detailed information about all the pluggable transceivers installed on the device, use the command:

```
awplus# show system pluggable detail
```

**Output** Figure 7-4: Example output from the **show system pluggable detail** command for a specific port on a device

```
awplus#show system pluggable port1.0.25 detail
System Pluggable Information Detail

Port1.0.25
=====
Vendor Name:          AGILENT
Device Name:          HFCT-5710L
Device Revision:      A
Device Type:          1000BASE-LX
Serial Number:        0402142241184360
Manufacturing Datecode: 040214
SFP Laser Wavelength: -
Link Length Supported
  Single Mode Fiber : 10Km
  OM1 (62.5um) Fiber: 550m
  OM2 (50um) Fiber : 550m
Diagnostic Calibration: Internal
Power Monitoring:      Avg
FEC BER support:      -
```

**Table 9:** Parameters in the output from the **show system pluggable detail** command:

| Parameter       | Description                                                                                                                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Stack member    | The stack member number.                                                                                                                                                                    |
| Port            | Specifies the port the pluggable transceiver is installed in.                                                                                                                               |
| Vendor Name     | Specifies the vendor's name for the installed pluggable transceiver.                                                                                                                        |
| Device Name     | Specifies the device name for the installed pluggable transceiver.                                                                                                                          |
| Device Revision | Specifies the hardware revision code for the pluggable transceiver. This may be useful for troubleshooting because different devices may support different pluggable transceiver revisions. |

**Table 9:** Parameters in the output from the **show system pluggable detail** command: (cont.)

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device Type            | Specifies the device type for the installed pluggable transceiver..                                                                                                                                                                                                                                                                                                                                     |
| Serial Number          | Specifies the serial number for the installed pluggable transceiver.                                                                                                                                                                                                                                                                                                                                    |
| Manufacturing Datecode | Specifies the manufacturing datecode for the installed pluggable transceiver. Checking the manufacturing datecode with the vendor may be useful when determining Laser Diode aging issues. For more information, see "How To Troubleshoot Fiber and Pluggable Issues" in the <a href="#">"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide</a> .                          |
| SFP Laser Wavelength   | Specifies the laser wavelength of the installed pluggable transceiver.                                                                                                                                                                                                                                                                                                                                  |
| Single Mode Fiber      | Specifies the link length supported by the pluggable transceiver using single mode fiber.                                                                                                                                                                                                                                                                                                               |
| OM1 (62.5um) Fiber     | Specifies the link length (in $\mu\text{m}$ - micron) supported by the pluggable transceiver using 62.5 micron multi-mode fiber.                                                                                                                                                                                                                                                                        |
| OM2 (50um) Fiber       | Specifies the link length (in $\mu\text{m}$ - micron) supported by the pluggable transceiver using 50 micron multi-mode fiber.                                                                                                                                                                                                                                                                          |
| Diagnostic Calibration | Specifies whether the pluggable transceiver supports DDM or DOM Internal or External Calibration:<br><b>Internal</b> is displayed if the pluggable transceiver supports DDM or DOM Internal Calibration.<br><b>External</b> is displayed if the pluggable transceiver supports DDM or DOM External Calibration.<br>- is displayed if neither Internal Calibration or External Calibration is supported. |
| Power Monitoring       | Displays the received power measurement type, which can be either <b>OMA</b> (Optical Module Amplitude) or <b>Avg</b> (Average Power) measured in $\mu\text{W}$ .                                                                                                                                                                                                                                       |

# show system pluggable diagnostics

**Overview** This command displays diagnostic information about SFP and SFP+ pluggable transceivers that support Digital Diagnostic Monitoring (DDM).

Different types of pluggable transceivers are supported in different models of device. See your device's Datasheet for more information about the models of pluggables that your device supports.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show system pluggable [<port-list>] diagnostics`

| Parameter                      | Description                                                                                   |
|--------------------------------|-----------------------------------------------------------------------------------------------|
| <code>&lt;port-list&gt;</code> | The switch ports or ports to display information about (e.g. port1.0.25 or port1.0.25-1.0.26) |

**Mode** User Exec and Privileged Exec

**Usage** Modern optical SFP and SFP+ transceivers support Digital Diagnostics Monitoring (DDM) functions.

Diagnostic monitoring features allow you to monitor real-time parameters of the pluggable transceiver, such as optical output power, optical input power, temperature, laser bias current, and transceiver supply voltage. Additionally, RX LOS (Loss of Signal) is shown when the received optical level is below a preset threshold. Monitor these parameters to check on the health of all transceivers, selected transceivers or a specific transceiver installed in a device.

**Examples** To display detailed information about all pluggable transceivers installed on a standalone device, use the command:

```
awplus# show system pluggable diagnostics
```

**Output** Figure 7-5: Example output from the **show system pluggable diagnostics** command on a device

```
awplus#show system pluggable diagnostics
System Pluggable Information Diagnostics
```

| Port1.0.25        | Status  |       | Alarms |        |         | Warnings |        |
|-------------------|---------|-------|--------|--------|---------|----------|--------|
|                   | Reading | Alarm | Max    | Min    | Warning | Max      | Min    |

| Rx Power: (mW)    | 1.739   | -     | 18.000 | 0.000  | -       | 10.000   | 0.200  |
| Rx LOS:           | Rx Up   |       |        |        |         |          |        |

**Table 10:** Parameters in the output from the **show system pluggables diagnostics** command

| Parameter        | Description                                                                                                                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Temp (Degrees C) | Shows the temperature inside the transceiver.                                                                                                                                                                                               |
| Vcc (Volts)      | Shows voltage supplied to the transceiver.                                                                                                                                                                                                  |
| Tx Bias (mA)     | Shows current to the Laser Diode in the transceiver.                                                                                                                                                                                        |
| Tx Power (mW)    | Shows the amount of light transmitted from the transceiver.                                                                                                                                                                                 |
| Rx Power (mW)    | Shows the amount of light received in the transceiver.                                                                                                                                                                                      |
| Rx LOS           | Rx Loss of Signal. This indicates whether: <ul style="list-style-type: none"> <li>light is being received (Rx Up) and therefore the link is up, or</li> <li>light is not being received (Rx Down) and therefore the link is down</li> </ul> |

- [show system pluggable](#)
- [show system pluggable detail](#)

# show test cable-diagnostics tdr

**Overview** Use this command to display the results of the last cable-diagnostics test that was run using the TDR (Time Domain Reflectometer) on a fixed copper cable port.

The displayed status of the cable can be either:

- OK
- Open
- Short (within-pair)
- Short (across-pair)
- Error

**Syntax** `show test cable-diagnostics tdr`

**Mode** Privileged Exec

**Examples** To show the results of a cable-diagnostics test use the following command:

```
awplus# show test cable-diagnostics tdr
```

**Output** Figure 7-6: Example output from the **show test cable-diagnostics tdr** command

| Port  | Pair | Length | Status |
|-------|------|--------|--------|
| ----- |      |        |        |
| 1.0.1 | A    | —      | OK     |
|       | B    | —      | OK     |
|       | C    | —      | OK     |
|       | D    | —      | OK     |

**Related Commands** [clear test cable-diagnostics tdr](#)  
[test cable-diagnostics tdr interface](#)

# test cable-diagnostics tdr interface

**Overview** Use this command to apply the Cable Fault Locator's cable-diagnostics tests to twisted pair data cables for a selected port. The tests will detect either correct, short circuit, or open, circuit terminations. For more information on running the CFL, see the ["Cable Fault Locator" Feature Overview and Configuration Guide](#).

The test can take several seconds to complete. See the related show command to display the test results.

A new test can only be started if no other test is in progress. CFL cannot run on a port that is currently supplying power via PoE.

The displayed status of the cable can be either, OK, Short (within-pair), or Open. The "Open" or "Short" status is accompanied with the distance from the source port to the incorrect termination.

**Syntax** test cable-diagnostics tdr interface <interface>

| Parameter         | Description                                                |
|-------------------|------------------------------------------------------------|
| cable-diagnostics | The cable diagnostic tests.                                |
| tdr               | Time Domain Reflectometry.                                 |
| interface         | Selects the interface to test.                             |
| <interface>       | Interface number of the port to be tested, e.g. port1.0.2. |

**Mode** Privileged Exec

**Example** To run a cable test on the cable inserted into port1.0.1 use the following command:

```
awplus# test cable-diagnostics tdr interface port1.0.1
```

You will receive the following message:

```
Link will go down while test is in progress. Continue? (y/n): y
Select y to continue.
```

```
awplus# y
```

You will then receive the following message:

```
Test started. This will take several seconds to complete. Use
"show test cable-diagnostics tdr" to print results.
```

# Logging Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure logging.

- Command List**
- [“clear exception log”](#) on page 306
  - [“clear log”](#) on page 307
  - [“clear log buffered”](#) on page 308
  - [“clear log permanent”](#) on page 309
  - [“default log buffered”](#) on page 310
  - [“default log console”](#) on page 311
  - [“default log email”](#) on page 312
  - [“default log host”](#) on page 313
  - [“default log monitor”](#) on page 314
  - [“default log permanent”](#) on page 315
  - [“log buffered”](#) on page 316
  - [“log buffered \(filter\)”](#) on page 317
  - [“log buffered exclude”](#) on page 320
  - [“log buffered size”](#) on page 323
  - [“log console”](#) on page 324
  - [“log console \(filter\)”](#) on page 325
  - [“log console exclude”](#) on page 328
  - [“log email”](#) on page 331
  - [“log email \(filter\)”](#) on page 332
  - [“log email exclude”](#) on page 335

- ["show log config"](#) on page 374
- ["show log permanent"](#) on page 376
- ["show running-config log"](#) on page 378

# clear exception log

**Overview** This command resets the contents of the exception log, but does not remove the associated core files.

**NOTE:** *When this command is used within a stacked environment, it will remove the contents of the exception logs in all stack members.*

**Syntax** `clear exception log`

**Mode** Privileged Exec

**Example** `awplus# clear exception log`

# clear log

**Overview** This command removes the contents of the buffered and permanent logs.

**NOTE:** *When this command is used within a stacked environment, it will remove the contents of the buffered and permanent logs in all stack members.*

**Syntax** `clear log`

**Mode** Privileged Exec

**Example** To delete the contents of the buffered and permanent log use the command:

```
awplus# clear log
```

**Related  
Commands**

- [clear log buffered](#)
- [clear log permanent](#)
- [show log](#)

# clear log buffered

**Overview** This command removes the contents of the buffered log.

**NOTE:** *When this command is used within a stacked environment, it will remove the contents of the buffered logs in all stack members.*

**Syntax** `clear log buffered`

**Mode** Privileged Exec

**Example** To delete the contents of the buffered log use the following commands:

```
awplus# clear log buffered
```

**Related  
Commands**

[default log buffered](#)

[log buffered](#)

[log buffered \(filter\)](#)

[log buffered size](#)

[log buffered exclude](#)

[show log](#)

[show log config](#)

# clear log permanent

**Overview** This command removes the contents of the permanent log.

**NOTE:** *When this command is used within a stacked environment, it will remove the contents of the permanent logs in all stack members.*

**Syntax** `clear log permanent`

**Mode** Privileged Exec

**Example** To delete the contents of the permanent log use the following commands:

```
awplus# clear log permanent
```

**Related Commands**

- [default log permanent](#)
- [log permanent](#)
- [log permanent \(filter\)](#)
- [log permanent exclude](#)
- [log permanent size](#)
- [show log config](#)
- [show log permanent](#)

# default log buffered

**Overview** This command restores the default settings for the buffered log stored in RAM. By default the size of the buffered log is 50 kB and it accepts messages with the severity level of “warnings” and above.

**Syntax** `default log buffered`

**Default** The buffered log is enabled by default.

**Mode** Global Configuration

**Example** To restore the buffered log to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log buffered
```

**Related Commands**

- [clear log buffered](#)
- [log buffered](#)
- [log buffered \(filter\)](#)
- [log buffered size](#)
- [log buffered exclude](#)
- [show log](#)
- [show log config](#)

# default log console

**Overview** This command restores the default settings for log messages sent to the terminal when a [log console](#) command is issued. By default all messages are sent to the console when a **log console** command is issued.

**Syntax** default log console

**Mode** Global Configuration

**Example** To restore the log console to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log console
```

**Related Commands**

- [log console](#)
- [log console \(filter\)](#)
- [log console exclude](#)
- [show log config](#)

# default log email

**Overview** This command restores the default settings for log messages sent to an email address. By default no filters are defined for email addresses. Filters must be defined before messages will be sent. This command also restores the remote syslog server time offset value to local (no offset).

**Syntax** `default log email <email-address>`

| Parameter                          | Description                               |
|------------------------------------|-------------------------------------------|
| <code>&lt;email-address&gt;</code> | The email address to send log messages to |

**Mode** Global Configuration

**Example** To restore the default settings for log messages sent to the email address `admin@alliedtelesis.com` use the following commands:

```
awplus# configure terminal
awplus(config)# default log email admin@alliedtelesis.com
```

**Related Commands**

- [log email](#)
- [log email \(filter\)](#)
- [log email exclude](#)
- [log email time](#)
- [show log config](#)

# default log host

**Overview** This command restores the default settings for log sent to a remote syslog server. By default no filters are defined for remote syslog servers. Filters must be defined before messages will be sent. This command also restores the remote syslog server time offset value to local (no offset).

**Syntax** `default log host <ip-addr>`

| Parameter | Description                              |
|-----------|------------------------------------------|
| <ip-addr> | The IP address of a remote syslog server |

**Mode** Global Configuration

**Example** To restore the default settings for messages sent to the remote syslog server with IP address 10.32.16.21 use the following commands:

```
awplus# configure terminal
awplus(config)# default log host 10.32.16.21
```

**Related Commands**

- [log host](#)
- [log host \(filter\)](#)
- [log host exclude](#)
- [log host source](#)
- [log host time](#)
- [show log config](#)

# default log monitor

**Overview** This command restores the default settings for log messages sent to the terminal when a [terminal monitor](#) command is used.

**Syntax** `default log monitor`

**Default** All messages are sent to the terminal when a [terminal monitor](#) command is used.

**Mode** Global Configuration

**Example** To restore the log monitor to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log monitor
```

**Related  
Commands** [log monitor \(filter\)](#)  
[log monitor exclude](#)  
[show log config](#)  
[terminal monitor](#)

# default log permanent

**Overview** This command restores the default settings for the permanent log stored in NVS. By default, the size of the permanent log is 50 kB and it accepts messages with the severity level of `warnings` and above.

**Syntax** `default log permanent`

**Default** The permanent log is enabled by default.

**Mode** Global Configuration

**Example** To restore the permanent log to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log permanent
```

**Related Commands**

- [clear log permanent](#)
- [log permanent](#)
- [log permanent \(filter\)](#)
- [log permanent exclude](#)
- [log permanent size](#)
- [show log config](#)
- [show log permanent](#)

# log buffered

**Overview** This command configures the device to store log messages in RAM. Messages stored in RAM are not retained on the device over a restart. Once the buffered log reaches its configured maximum allowable size old messages will be deleted to make way for new ones.

**Syntax** `log buffered`  
`no log buffered`

**Default** The buffered log is configured by default.

**Mode** Global Configuration

**Examples** To configured the device to store log messages in RAM use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered
```

To configure the device to not store log messages in a RAM buffer use the following commands:

```
awplus# configure terminal
awplus(config)# no log buffered
```

**Related Commands**

- [clear log buffered](#)
- [default log buffered](#)
- [log buffered \(filter\)](#)
- [log buffered size](#)
- [log buffered exclude](#)
- [show log](#)
- [show log config](#)

# log buffered (filter)

**Overview** Use this command to create a filter to select messages to be sent to the buffered log. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

The **no** variant of this command removes the corresponding filter, so that the specified messages are no longer sent to the buffered log.

**Syntax** `log buffered [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log buffered [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Filter messages to the buffered log by severity level.                                                                                                                                                |
| <level>         | The minimum severity of message to send to the buffered log. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: |
| 0 emergencies   | System is unusable                                                                                                                                                                                    |
| 1 alerts        | Action must be taken immediately                                                                                                                                                                      |
| 2 critical      | Critical conditions                                                                                                                                                                                   |
| 3 errors        | Error conditions                                                                                                                                                                                      |
| 4 warnings      | Warning conditions                                                                                                                                                                                    |
| 5 notices       | Normal, but significant, conditions                                                                                                                                                                   |
| 6 informational | Informational messages                                                                                                                                                                                |
| 7 debugging     | Debug-level messages                                                                                                                                                                                  |
| program         | Filter messages to the buffered log by program. Include messages from a specified program in the buffered log.                                                                                        |
| <program-name>  | The name of a program to log messages from, either one of the following predefined program names (not case-sensitive), or another program name (case-sensitive) that you find in the log output:      |
| rip             | Routing Information Protocol (RIP)                                                                                                                                                                    |
| ripng           | Routing Information Protocol - next generation (RIPng)                                                                                                                                                |
| ospf            | Open Shortest Path First (OSPF)                                                                                                                                                                       |
| ospfv3          | Open Shortest Path First (OSPF) version 3 (OSPFv3)                                                                                                                                                    |
| rsvp            | Resource Reservation Protocol (RSVP)                                                                                                                                                                  |
| pim-dm          | Protocol Independent Multicast - Dense Mode (PIM-DM)                                                                                                                                                  |
| pim-sm          | Protocol Independent Multicast - Sparse Mode (PIM-SM)                                                                                                                                                 |

| Parameter     | Description                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------|
| pim-smv6      | PIM-SM version 6 (PIM-SMv6)                                                                                             |
| dot1x         | IEEE 802.1X Port-Based Access Control                                                                                   |
| lacp          | Link Aggregation Control Protocol (LACP)                                                                                |
| stp           | Spanning Tree Protocol (STP)                                                                                            |
| rstp          | Rapid Spanning Tree Protocol (RSTP)                                                                                     |
| mstp          | Multiple Spanning Tree Protocol (MSTP)                                                                                  |
| imi           | Integrated Management Interface (IMI)                                                                                   |
| imish         | Integrated Management Interface Shell (IMISH)                                                                           |
| epsr          | Ethernet Protection Switched Rings (EPSR)                                                                               |
| rmon          | Remote Monitoring                                                                                                       |
| loopprot      | Loop Protection                                                                                                         |
| poe           | Power-inline (Power over Ethernet)                                                                                      |
| dhcpcsn       | DHCP snooping (DHPCPSN)                                                                                                 |
| facility      | Filter messages to the buffered log by syslog facility.                                                                 |
| <facility>    | Specify one of the following syslog facilities to include messages from in the buffered log:                            |
| kern          | Kernel messages                                                                                                         |
| user          | Random user-level messages                                                                                              |
| mail          | Mail system                                                                                                             |
| daemon        | System daemons                                                                                                          |
| auth          | Security/authorization messages                                                                                         |
| syslog        | Messages generated internally by syslogd                                                                                |
| lpr           | Line printer subsystem                                                                                                  |
| news          | Network news subsystem                                                                                                  |
| uucp          | UUCP subsystem                                                                                                          |
| cron          | Clock daemon                                                                                                            |
| authpriv      | Security/authorization messages (private)                                                                               |
| ftp           | FTP daemon                                                                                                              |
| msgtext       | Select messages containing a certain text string.                                                                       |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** By default the buffered log has a filter to select messages whose severity level is “notices (5)” or higher. This filter may be removed using the **no** variant of this command.

**Mode** Global Configuration

**Examples** To add a filter to send all messages generated by EPSR that have a severity of **notices** or higher to the buffered log, use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered level notices program epsr
```

To add a filter to send all messages containing the text "Bridging initialization" to the buffered log, use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered msgtext Bridging initialization
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to the buffered log, use the following commands:

```
awplus# configure terminal
awplus(config)# no log buffered level notices program epsr
```

To remove a filter that sends all messages containing the text "Bridging initialization" to the buffered log, use the following commands:

```
awplus# configure terminal
awplus(config)# no log buffered msgtext Bridging initialization
```

# log buffered exclude

**Overview** Use this command to exclude specified log messages from the buffered log. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log buffered exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log buffered exclude [level <level>] [program  
<program-name>] [facility <facility>] [msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Exclude messages of the specified severity level.                                                                                                                           |
| <level>         | The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:     |
| 0 emergencies   | System is unusable                                                                                                                                                          |
| 1 alerts        | Action must be taken immediately                                                                                                                                            |
| 2 critical      | Critical conditions                                                                                                                                                         |
| 3 errors        | Error conditions                                                                                                                                                            |
| 4 warnings      | Warning conditions                                                                                                                                                          |
| 5 notices       | Normal, but significant, conditions                                                                                                                                         |
| 6 informational | Informational messages                                                                                                                                                      |
| 7 debugging     | Debug-level messages                                                                                                                                                        |
| program         | Exclude messages from a specified program.                                                                                                                                  |
| <program-name>  | The name of a program. Either one of the following predefined program names (not case-sensitive), or another program name (case-sensitive) that you find in the log output. |
| rip             | Routing Information Protocol (RIP)                                                                                                                                          |
| ripng           | Routing Information Protocol - next generation (RIPng)                                                                                                                      |
| ospf            | Open Shortest Path First (OSPF)                                                                                                                                             |
| ospfv3          | Open Shortest Path First (OSPF) version 3 (OSPFv3)                                                                                                                          |
| rsvp            | Resource Reservation Protocol (RSVP)                                                                                                                                        |
| pim-dm          | Protocol Independent Multicast - Dense Mode (PIM-DM)                                                                                                                        |

| Parameter     | Description                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------|
| pim-sm        | Protocol Independent Multicast - Sparse Mode (PIM-SM)                                                                   |
| pim-smv6      | PIM-SM version 6 (PIM-SMv6)                                                                                             |

| mstp          | Multiple Spanning Tree Protocol (MSTP)                                                                                  |
| imi           | Integrated Management Interface (IMI)                                                                                   |
| imish         | Integrated Management Interface Shell (IMISH)                                                                           |
| epsr          | Ethernet Protection Switched Rings (EPSR)                                                                               |
| rmon          | Remote Monitoring                                                                                                       |
| loopprot      | Loop Protection                                                                                                         |
| poe           | Power-inline (Power over Ethernet)                                                                                      |
| dhcpcsn       | DHCP snooping (DHPCSN)                                                                                                  |
| facility      | Exclude messages from a syslog facility.                                                                                |
| <facility>    | Specify one of the following syslog facilities to exclude messages from:                                                |
| kern          | Kernel messages                                                                                                         |
| user          | Random user-level messages                                                                                              |
| mail          | Mail system                                                                                                             |
| daemon        | System daemons                                                                                                          |
| auth          | Security/authorization messages                                                                                         |
| syslog        | Messages generated internally by syslogd                                                                                |
| lpr           | Line printer subsystem                                                                                                  |
| news          | Network news subsystem                                                                                                  |
| uucp          | UUCP subsystem                                                                                                          |
| cron          | Clock daemon                                                                                                            |
| authpriv      | Security/authorization messages (private)                                                                               |
| ftp           | FTP daemon                                                                                                              |
| msgtext       | Exclude messages containing a certain text string.                                                                      |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string "example of irrelevant message", use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered exclude msgtext example of
irrelevant message
```

**Related  
Commands**

- clear log buffered
- default log buffered
- log buffered
- log buffered (filter)
- log buffered size
- show log
- show log config

# log buffered size

**Overview** This command configures the amount of memory that the buffered log is permitted to use. Once this memory allocation has been filled old messages will be deleted to make room for new messages.

**Syntax** `log buffered size <50-250>`

| Parameter                   | Description                      |
|-----------------------------|----------------------------------|
| <code>&lt;50-250&gt;</code> | Size of the RAM log in kilobytes |

**Mode** Global Configuration

**Example** To allow the buffered log to use up to 100 kB of RAM use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered size 100
```

**Related Commands**

- `clear log buffered`
- `default log buffered`
- `log buffered`
- `log buffered (filter)`
- `log buffered exclude`
- `show log`
- `show log config`

# log console

**Overview** This command configures the device to send log messages to consoles. The console log is configured by default to send messages to the device's main console port.

Use the **no** variant of this command to configure the device not to send log messages to consoles.

**Syntax** `log console`  
`no log console`

**Mode** Global Configuration

**Examples** To configure the device to send log messages use the following commands:

```
awplus# configure terminal
awplus(config)# log console
```

To configure the device not to send log messages in all consoles use the following commands:

```
awplus# configure terminal
awplus(config)# no log console
```

**Related Commands** [default log console](#)  
[log console \(filter\)](#)  
[log console exclude](#)  
[show log config](#)

# log console (filter)

**Overview** This command creates a filter to select messages to be sent to all consoles when the **log console** command is given. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

**Syntax** `log console [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log console [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Filter messages by severity level.                                                                                                                                                               |
| <level>         | The minimum severity of message to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:                |
| 0 emergencies   | System is unusable                                                                                                                                                                               |
| 1 alerts        | Action must be taken immediately                                                                                                                                                                 |
| 2 critical      | Critical conditions                                                                                                                                                                              |
| 3 errors        | Error conditions                                                                                                                                                                                 |
| 4 warnings      | Warning conditions                                                                                                                                                                               |
| 5 notices       | Normal, but significant, conditions                                                                                                                                                              |
| 6 informational | Informational messages                                                                                                                                                                           |
| 7 debugging     | Debug-level messages                                                                                                                                                                             |
| program         | Filter messages by program. Include messages from a specified program.                                                                                                                           |
| <program-name>  | The name of a program to log messages from, either one of the following predefined program names (not case-sensitive), or another program name (case-sensitive) that you find in the log output: |
| rip             | Routing Information Protocol (RIP)                                                                                                                                                               |
| ripng           | Routing Information Protocol - next generation (RIPng)                                                                                                                                           |
| ospf            | Open Shortest Path First (OSPF)                                                                                                                                                                  |
| ospfv3          | Open Shortest Path First (OSPF) version 3 (OSPFv3)                                                                                                                                               |
| rsvp            | Resource Reservation Protocol (RSVP)                                                                                                                                                             |
| pim-dm          | Protocol Independent Multicast - Dense Mode (PIM-DM)                                                                                                                                             |
| pim-sm          | Protocol Independent Multicast - Sparse Mode (PIM-SM)                                                                                                                                            |
| pim-smv6        | PIM-SM version 6 (PIM-SMv6)                                                                                                                                                                      |
| dot1x           | IEEE 802.1X Port-Based Access Control                                                                                                                                                            |
| lACP            | Link Aggregation Control Protocol (LACP)                                                                                                                                                         |

| Parameter     | Description                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------|
| stp           | Spanning Tree Protocol (STP)                                                                                            |
| rstp          | Rapid Spanning Tree Protocol (RSTP)                                                                                     |
| mstp          | Multiple Spanning Tree Protocol (MSTP)                                                                                  |
| imi           | Integrated Management Interface (IMI)                                                                                   |
| imish         | Integrated Management Interface Shell (IMISH)                                                                           |
| epsr          | Ethernet Protection Switched Rings (EPSR)                                                                               |
| rmon          | Remote Monitoring                                                                                                       |
| loopprot      | Loop Protection                                                                                                         |
| poe           | Power-inline (Power over Ethernet)                                                                                      |

| facility      | Filter messages by syslog facility.                                                                                     |
| <facility>    | Specify one of the following syslog facilities to include messages from:                                                |
| kern          | Kernel messages                                                                                                         |
| user          | Random user-level messages                                                                                              |
| mail          | Mail system                                                                                                             |
| daemon        | System daemons                                                                                                          |
| auth          | Security/authorization messages                                                                                         |
| syslog        | Messages generated internally by syslogd                                                                                |
| lpr           | Line printer subsystem                                                                                                  |
| news          | Network news subsystem                                                                                                  |
| uucp          | UUCP subsystem                                                                                                          |
| cron          | Clock daemon                                                                                                            |
| authpriv      | Security/authorization messages (private)                                                                               |
| ftp           | FTP daemon                                                                                                              |
| msgtext       | Select messages containing a certain text string.                                                                       |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** By default the console log has a filter to select messages whose severity level is `critical` or higher. This filter may be removed using the **no** variant of this command. This filter may be removed and replaced by filters that are more selective.

**Mode** Global Configuration

**Examples** To create a filter to send all messages containing the text "Bridging initialization" to console instances where the **log console** command has been entered, use the following commands:

```
awplus# configure terminal
awplus(config)# log console msgtext "Bridging initialization"
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to consoles, use the following commands:

```
awplus# configure terminal
awplus(config)# no log console level notices program epsr
```

To remove a default filter that includes sending **critical**, **alert** and **emergency** level messages to the console, use the following commands:

```
awplus# configure terminal
awplus(config)# no log console level critical
```

- [log console](#)
- [log console exclude](#)
- [show log config](#)

# log console exclude

**Overview** Use this command to prevent specified log messages from being sent to the console, when console logging is turned on. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log console exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`  
`no log console exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Exclude messages of the specified severity level.                                                                                                                           |
| <level>         | The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:     |
| 0 emergencies   | System is unusable                                                                                                                                                          |
| 1 alerts        | Action must be taken immediately                                                                                                                                            |
| 2 critical      | Critical conditions                                                                                                                                                         |
| 3 errors        | Error conditions                                                                                                                                                            |
| 4 warnings      | Warning conditions                                                                                                                                                          |
| 5 notices       | Normal, but significant, conditions                                                                                                                                         |
| 6 informational | Informational messages                                                                                                                                                      |
| 7 debugging     | Debug-level messages                                                                                                                                                        |
| program         | Exclude messages from a specified program.                                                                                                                                  |
| <program-name>  | The name of a program. Either one of the following predefined program names (not case-sensitive), or another program name (case-sensitive) that you find in the log output. |
| rip             | Routing Information Protocol (RIP)                                                                                                                                          |
| ripng           | Routing Information Protocol - next generation (RIPng)                                                                                                                      |
| ospf            | Open Shortest Path First (OSPF)                                                                                                                                             |
| ospfv3          | Open Shortest Path First (OSPF) version 3 (OSPFv3)                                                                                                                          |
| rsvp            | Resource Reservation Protocol (RSVP)                                                                                                                                        |

| Parameter     | Description                                                                                                             |

| loopprot      | Loop Protection                                                                                                         |
| poe           | Power-inline (Power over Ethernet)                                                                                      |
| dhcpcsn       | DHCP snooping (DHPCSN)                                                                                                  |
| facility      | Exclude messages from a syslog facility.                                                                                |
| <facility>    | Specify one of the following syslog facilities to exclude messages from:                                                |
| kern          | Kernel messages                                                                                                         |
| user          | Random user-level messages                                                                                              |
| mail          | Mail system                                                                                                             |
| daemon        | System daemons                                                                                                          |
| auth          | Security/authorization messages                                                                                         |
| syslog        | Messages generated internally by syslogd                                                                                |
| lpr           | Line printer subsystem                                                                                                  |
| news          | Network news subsystem                                                                                                  |
| uucp          | UUCP subsystem                                                                                                          |
| cron          | Clock daemon                                                                                                            |
| authpriv      | Security/authorization messages (private)                                                                               |
| ftp           | FTP daemon                                                                                                              |
| msgtext       | Exclude messages containing a certain text string.                                                                      |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
awplus(config)# log console exclude msgtext example of
irrelevant message
```

**Related  
Commands**

- default log console

- log console (filter)
- show log config

# log email

**Overview** This command configures the device to send log messages to an email address. The email address is specified in this command.

**Syntax** `log email <email-address>`

| Parameter                          | Description                               |
|------------------------------------|-------------------------------------------|
| <code>&lt;email-address&gt;</code> | The email address to send log messages to |

**Default** By default no filters are defined for email log targets. Filters must be defined before messages will be sent.

**Mode** Global Configuration

**Example** To have log messages emailed to the email address `admin@alliedtelesis.com` use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@alliedtelesis.com
```

- [log email \(filter\)](#)
- [log email exclude](#)
- [log email time](#)
- [show log config](#)

# log email (filter)

**Overview** This command creates a filter to select messages to be sent to an email address. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

The **no** variant of this command configures the device to no longer send log messages to a specified email address. All configuration relating to this log target will be removed.

**Syntax** `log email <email-address> [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log email <email-address> [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |               |                                    |          |                                                        |            |                                 |          |                                                    |            |                                      |           |                                                      |                 |                        |             |                      |

| uucp          | UUCP subsystem                                                                                                          |
| cron          | Clock daemon                                                                                                            |
| authpriv      | Security/authorization messages (private)                                                                               |
| ftp           | FTP daemon                                                                                                              |
| msgtext       | Select messages containing a certain text string.                                                                       |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

## Mode Global Configuration

**Examples** To create a filter to send all messages generated by EPSR that have a severity of **notices** or higher to the email address admin@homebase.com, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@homebase.com level notices
program epsr
```

To create a filter to send all messages containing the text "Bridging initialization", to the email address admin@homebase.com, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@homebase.com msgtext "Bridging
initialization"
```

To create a filter to send messages with a severity level of **informational** and above to the email address admin@alliedtelesis.com, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@alliedtelesis.com level
informational
```

To stop the device emailing log messages emailed to the email address admin@alliedtelesis.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no log email admin@homebase.com
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to the email address admin@homebase.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no log email admin@homebase.com level notices
program epsr
```

To remove a filter that sends messages with a severity level of **informational** and above to the email address admin@alliedtelesis.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no log email admin@alliedtelesis.com level
informational
```

- [log email](#)
- [log email exclude](#)
- [log email time](#)
- [show log config](#)

# log email exclude

**Overview** Use this command to prevent specified log messages from being emailed, when the device is configured to send log messages to an email address. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log email exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`  
`no log email exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Exclude messages of the specified severity level.                                                                                                                           |
| <level>         | The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:     |
| 0 emergencies   | System is unusable                                                                                                                                                          |
| 1 alerts        | Action must be taken immediately                                                                                                                                            |
| 2 critical      | Critical conditions                                                                                                                                                         |

| imish         | Integrated Management Interface Shell (IMISH)                                                                           |
| epsr          | Ethernet Protection Switched Rings (EPSR)                                                                               |
| rmon          | Remote Monitoring                                                                                                       |
| loopprot      | Loop Protection                                                                                                         |
| poe           | Power-inline (Power over Ethernet)                                                                                      |
| dhcpsn        | DHCP snooping (DHCP SN)                                                                                                 |
| facility      | Exclude messages from a syslog facility.                                                                                |
| <facility>    | Specify one of the following syslog facilities to exclude messages from:                                                |
| kern          | Kernel messages                                                                                                         |
| user          | Random user-level messages                                                                                              |
| mail          | Mail system                                                                                                             |
| daemon        | System daemons                                                                                                          |
| auth          | Security/authorization messages                                                                                         |
| syslog        | Messages generated internally by syslogd                                                                                |
| lpr           | Line printer subsystem                                                                                                  |
| news          | Network news subsystem                                                                                                  |
| uucp          | UUCP subsystem                                                                                                          |
| cron          | Clock daemon                                                                                                            |
| authpriv      | Security/authorization messages (private)                                                                               |
| ftp           | FTP daemon                                                                                                              |
| msgtext       | Exclude messages containing a certain text string.                                                                      |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# log email exclude msgtext example of irrelevant  
message
```

# log email time

**Overview** This command configures the time used in messages sent to an email address. If the syslog server is in a different time zone to your device then the time offset can be configured using either the **utc-offset** parameter option keyword or the **local-offset** parameter option keyword, where **utc-offset** is the time difference from UTC (Universal Time, Coordinated) and **local-offset** is the difference from local time.

**Syntax** `log email <email-address> time {local|local-offset|utc-offset {plus|minus}<0-24>}`

| Parameter       | Description                                                                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <email-address> | The email address to send log messages to                                                                                                                                                                      |
| time            | Specify the time difference between the email recipient and the device you are configuring.                                                                                                                    |
| local           | The device is in the same time zone as the email recipient                                                                                                                                                     |
| local-offset    | The device is in a different time zone to the email recipient. Use the <b>plus</b> or <b>minus</b> keywords and specify the difference (offset) from local time of the device to the email recipient in hours. |
| utc-offset      | The device is in a different time zone to the email recipient. Use the <b>plus</b> or <b>minus</b> keywords and specify the difference (offset) from UTC time of the device to the email recipient in hours.   |
| plus            | Negative offset (difference) from the device to the email recipient.                                                                                                                                           |
| minus           | Positive offset (difference) from the device to the email recipient.                                                                                                                                           |
| <0-24>          | World Time zone offset in hours                                                                                                                                                                                |

**Default** The default is **local** time.

**Mode** Global Configuration

**Usage** Use the **local** option if the email recipient is in the same time zone as this device. Messages will display the time as on the local device when the message was generated.

Use the **offset** option if the email recipient is in a different time zone to this device. Specify the time offset of the email recipient in hours. Messages will display the time they were generated on this device but converted to the time zone of the email recipient.

**Examples** To send messages to the email address `test@home.com` in the same time zone as the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@base.com time local 0
```

To send messages to the email address `admin@base.com` with the time information converted to the time zone of the email recipient, which is 3 hours ahead of the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@base.com time local-offset plus
3
```

To send messages to the email address `user@remote.com` with the time information converted to the time zone of the email recipient, which is 3 hours behind the device's UTC time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log email user@remote.com time utc-offset minus
3
```

# log facility

**Overview** Use this command to specify an outgoing syslog facility. This determines where the syslog server will store the log messages.

Use the **no** variant of this command to remove the facility.

**Syntax** `log facility`  
{kern|user|mail|daemon|auth|syslog|lpr|news|uucp|cron|authpriv|ftp|local0|local1|local2|local3|local4|local5|local6|local7}  
`no log facility`

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| kern      | Kernel messages                                    |
| user      | User-level messages                                |
| mail      | Mail system                                        |
| daemon    | System daemons                                     |
| auth      | Security/authorization messages                    |
| syslog    | Messages generated internally by the syslog daemon |
| lpr       | Line printer subsystem                             |

**Default** None (the outgoing syslog facility depends on the log message)

**Mode** Global Configuration

**Example** To specify a facility of local0, use the following commands:

```
awplus# configure terminal
awplus(config)# log facility local0
```

**Related  
Commands** [show log config](#)

# log host

**Overview** This command configures the device to send log messages to a remote syslog server via UDP port 514. The IP address of the remote server must be specified. By default no filters are defined for remote syslog servers. Filters must be defined before messages will be sent.

Use the **no** variant of this command to stop sending log messages to the remote syslog server.

**Syntax** `log host <ipv4-addr>|<ipv6-addr> [secure]`  
`no log host <ipv4-addr>|<ipv6-addr>`

| Parameter                      | Description                                                            |
|--------------------------------|------------------------------------------------------------------------|
| <code>&lt;ipv4-addr&gt;</code> | Specify the source IPv4 address, in dotted decimal notation (A.B.C.D). |
| <code>&lt;ipv6-addr&gt;</code> | Specify the source IPv6 address, in X:X::X:X notation.                 |
| <code>secure</code>            | Optional value to create a secure log destination                      |

**Mode** Global Configuration

**Usage** Use the optional **secure** parameter to configure a secure syslog host. For secure hosts, syslog over TLS is used to encrypt the logs. The certificate received from the remote log server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

The remote server may also request that a certificate is transmitted from the local device. In this situation the first trustpoint added to the syslog application will be transmitted to the remote server.

**Examples** To configure the device to send log messages to a remote secure syslog server with IP address 10.32.16.99 use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.99 secure
```

To stop the device from sending log messages to the remote syslog server with IP address 10.32.16.99 use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.99
```

**Related Commands** [default log host](#)  
[log host \(filter\)](#)  
[log host exclude](#)  
[log host source](#)

log host time  
log trustpoint  
show log config

# log host (filter)

**Overview** This command creates a filter to select messages to be sent to a remote syslog server. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a substring within the message or a combination of some or all of these.

The **no** variant of this command configures the device to no longer send log messages to a remote syslog server. The IP address of the syslog server must be specified. All configuration relating to this log target will be removed.

**Syntax** `log host <ip-addr> [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log host <ip-addr> [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |               |                                    |          |                                                        |            |                                 |          |                                                    |            |                                      |           |                                                      |                 |                                                       |             |                      |

| ftp           | FTP daemon                                                                                                              |
| msgtext       | Select messages containing a certain text string.                                                                       |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

## Mode Global Configuration

**Examples** To create a filter to send all messages generated by EPSR that have a severity of **notices** or higher to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 level notices program epsr
```

To create a filter to send all messages containing the text "Bridging initialization", to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 msgtext "Bridging
initialization"
```

To create a filter to send messages with a severity level of **informational** and above to the syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 level informational
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.21 level notices program
epsr
```

To remove a filter that sends all messages containing the text "Bridging initialization", to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.21 msgtext "Bridging
initialization"
```

To remove a filter that sends messages with a severity level of **informational** and above to the syslog server with IP address 10.32.16.21, use the following commands:

```
awplusawpluls# configure terminal
awplus(config)# no log host 10.32.16.21 level informational
```

# log host exclude

**Overview** Use this command to prevent specified log messages from being sent to the remote syslog server, when **log host** is enabled. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log host exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`  
`no log host exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Exclude messages of the specified severity level.                                                                                                                           |
| <level>         | The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:     |
| 0 emergencies   | System is unusable                                                                                                                                                          |
| 1 alerts        | Action must be taken immediately                                                                                                                                            |
| 2 critical      | Critical conditions                                                                                                                                                         |
| 3 errors        | Error conditions                                                                                                                                                            |
| 4 warnings      | Warning conditions                                                                                                                                                          |
| 5 notices       | Normal, but significant, conditions                                                                                                                                         |
| 6 informational | Informational messages                                                                                                                                                      |
| 7 debugging     | Debug-level messages                                                                                                                                                        |
| program         | Exclude messages from a specified program.                                                                                                                                  |
| <program-name>  | The name of a program. Either one of the following predefined program names (not case-sensitive), or another program name (case-sensitive) that you find in the log output. |
| rip             | Routing Information Protocol (RIP)                                                                                                                                          |
| ripng           | Routing Information Protocol - next generation (RIPng)                                                                                                                      |
| ospf            | Open Shortest Path First (OSPF)                                                                                                                                             |
| ospfv3          | Open Shortest Path First (OSPF) version 3 (OSPFv3)                                                                                                                          |
| rsvp            | Resource Reservation Protocol (RSVP)                                                                                                                                        |

| Parameter     | Description                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------|
| pim-dm        | Protocol Independent Multicast - Dense Mode (PIM-DM)                                                                    |
| pim-sm        | Protocol Independent Multicast - Sparse Mode (PIM-SM)                                                                   |
| pim-smv6      | PIM-SM version 6 (PIM-SMv6)                                                                                             |
| dot1x         | IEEE 802.1X Port-Based Access Control                                                                                   |
| lacp          | Link Aggregation Control Protocol (LACP)                                                                                |
| stp           | Spanning Tree Protocol (STP)                                                                                            |
| rstp          | Rapid Spanning Tree Protocol (RSTP)                                                                                     |
| mstp          | Multiple Spanning Tree Protocol (MSTP)                                                                                  |
| imi           | Integrated Management Interface (IMI)                                                                                   |
| imish         | Integrated Management Interface Shell (IMISH)                                                                           |
| epsr          | Ethernet Protection Switched Rings (EPSR)                                                                               |
| rmon          | Remote Monitoring                                                                                                       |
| loopprot      | Loop Protection                                                                                                         |
| poe           | Power-inline (Power over Ethernet)                                                                                      |
| dhcpcsn       | DHCP snooping (DHPCSN)                                                                                                  |
| facility      | Exclude messages from a syslog facility.                                                                                |
| <facility>    | Specify one of the following syslog facilities to exclude messages from:                                                |
| kern          | Kernel messages                                                                                                         |
| user          | Random user-level messages                                                                                              |
| mail          | Mail system                                                                                                             |
| daemon        | System daemons                                                                                                          |
| auth          | Security/authorization messages                                                                                         |
| syslog        | Messages generated internally by syslogd                                                                                |
| lpr           | Line printer subsystem                                                                                                  |
| news          | Network news subsystem                                                                                                  |
| uucp          | UUCP subsystem                                                                                                          |
| cron          | Clock daemon                                                                                                            |
| authpriv      | Security/authorization messages (private)                                                                               |
| ftp           | FTP daemon                                                                                                              |
| msgtext       | Exclude messages containing a certain text string.                                                                      |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# log host exclude msgtext example of irrelevant  
message
```

**Related  
Commands**

default log host

log host

log host (filter)

log host source

log host time

show log config

# log host source

**Overview** Use this command to specify a source interface or IP address for the device to send syslog messages from. You can specify any one of an interface name, an IPv4 address or an IPv6 address.

This is useful if the device can reach the syslog server via multiple interfaces or addresses and you want to control which interface/address the device uses.

Use the **no** variant of this command to stop specifying a source interface or address.

**Syntax** `log host source {<interface-name>|<ipv4-addr>|<ipv6-addr>}`  
`no log host source`

| Parameter                           | Description                                                                                   |
|-------------------------------------|-----------------------------------------------------------------------------------------------|
| <code>&lt;interface-name&gt;</code> | Specify the source interface name. You can enter a VLAN, eth interface or loopback interface. |
| <code>&lt;ipv4-addr&gt;</code>      | Specify the source IPv4 address, in dotted decimal notation (A.B.C.D).                        |
| <code>&lt;ipv6-addr&gt;</code>      | Specify the source IPv6 address, in X:X::X:X notation.                                        |

**Default** None (no source is configured)

**Mode** Global Configuration

**Example** To send syslog messages from 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# log host source 192.168.1.1
```

- [log host \(filter\)](#)
- [log host exclude](#)
- [log host time](#)
- [show log config](#)

# log host time

**Overview** This command configures the time used in messages sent to a remote syslog server. If the syslog server is in a different time zone to your device then the time offset can be configured using either the **utc-offset** parameter option keyword or the **local-offset** parameter option keyword, where **utc-offset** is the time difference from UTC (Universal Time, Coordinated) and **local-offset** is the difference from local time.

**Syntax** `log host <email-address> time {local|local-offset|utc-offset {plus|minus} <0-24>}`

| Parameter       | Description                                                                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <email-address> | The email address to send log messages to                                                                                                                                                                      |
| time            | Specify the time difference between the email recipient and the device you are configuring.                                                                                                                    |
| local           | The device is in the same time zone as the email recipient                                                                                                                                                     |
| local-offset    | The device is in a different time zone to the email recipient. Use the <b>plus</b> or <b>minus</b> keywords and specify the difference (offset) from local time of the device to the email recipient in hours. |
| utc-offset      | The device is in a different time zone to the email recipient. Use the <b>plus</b> or <b>minus</b> keywords and specify the difference (offset) from UTC time of the device to the email recipient in hours.   |
| plus            | Negative offset (difference) from the device to the syslog server.                                                                                                                                             |
| minus           | Positive offset (difference) from the device to the syslog server.                                                                                                                                             |
| <0-24>          | World Time zone offset in hours                                                                                                                                                                                |

**Default** The default is **local** time.

**Mode** Global Configuration

**Usage** Use the **local** option if the remote syslog server is in the same time zone as the device. Messages will display the time as on the local device when the message was generated.

Use the **offset** option if the email recipient is in a different time zone to this device. Specify the time offset of the remote syslog server in hours. Messages will display the time they were generated on this device but converted to the time zone of the remote syslog server.

**Examples** To send messages to the remote syslog server with the IP address 10.32.16.21 in the same time zone as the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 time local 0
```

To send messages to the remote syslog server with the IP address 10.32.16.12 with the time information converted to the time zone of the remote syslog server, which is 3 hours ahead of the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.12 time local-offset plus 3
```

To send messages to the remote syslog server with the IP address 10.32.16.02 with the time information converted to the time zone of the email recipient, which is 3 hours behind the device's UTC time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.02 time utc-offset minus 3
```

Commands**

[default log host](#)

[log host](#)

[log host \(filter\)](#)

[log host exclude](#)

[log host source](#)

[show log config](#)

# log monitor (filter)

**Overview** This command creates a filter to select messages to be sent to the terminal when the **terminal monitor** command is given. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

**Syntax** `log monitor [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log monitor [level <level>] [program <program-name>]`  
`[facility <facility>] [msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |               |                                    |          |                                                        |            |                                 |          |                                                    |            |                                      |           |                                                      |                 |                                                       |             |                             |       |                                       |

| auth          | Security/authorization messages                                                                                         |
| syslog        | Messages generated internally by syslogd                                                                                |
| lpr           | Line printer subsystem                                                                                                  |
| news          | Network news subsystem                                                                                                  |
| uucp          | UUCP subsystem                                                                                                          |
| cron          | Clock daemon                                                                                                            |
| authpriv      | Security/authorization messages (private)                                                                               |
| ftp           | FTP daemon                                                                                                              |
| msgtext       | Select messages containing a certain text string.                                                                       |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** By default there is a filter to select all messages. This filter may be removed and replaced by filters that are more selective.

**Mode** Global Configuration

**Examples** To create a filter to send all messages that are generated by authentication and have a severity of **info** or higher to terminal instances where the terminal monitor command has been given, use the following commands:

```
awplus# configure terminal
awplus(config)# log monitor level info program auth
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to the terminal, use the following commands:

```
awplus# configure terminal
awplus(config)# no log monitor level notices program epsr
```

To remove a default filter that includes sending everything to the terminal, use the following commands:

```
awplus# configure terminal
awplus(config)# no log monitor level debugging
```

**Related  
Commands**

- [default log monitor](#)
- [log monitor exclude](#)
- [show log config](#)
- [terminal monitor](#)

# log monitor exclude

**Overview** Use this command to prevent specified log messages from being displayed on a terminal, when **terminal monitor** is enabled. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log console exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log console exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Exclude messages of the specified severity level.                                                                                                                           |
| <level>         | The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:     |
| 0 emergencies   | System is unusable                                                                                                                                                          |
| 1 alerts        | Action must be taken immediately                                                                                                                                            |
| 2 critical      | Critical conditions                                                                                                                                                         |
| 3 errors        | Error conditions                                                                                                                                                            |
| 4 warnings      | Warning conditions                                                                                                                                                          |
| 5 notices       | Normal, but significant, conditions                                                                                                                                         |
| 6 informational | Informational messages                                                                                                                                                      |
| 7 debugging     | Debug-level messages                                                                                                                                                        |
| program         | Exclude messages from a specified program.                                                                                                                                  |
| <program-name>  | The name of a program. Either one of the following predefined program names (not case-sensitive), or another program name (case-sensitive) that you find in the log output. |
| rip             | Routing Information Protocol (RIP)                                                                                                                                          |
| ripng           | Routing Information Protocol - next generation (RIPng)                                                                                                                      |
| ospf            | Open Shortest Path First (OSPF)                                                                                                                                             |
| ospfv3          | Open Shortest Path First (OSPF) version 3 (OSPFv3)                                                                                                                          |
| rsvp            | Resource Reservation Protocol (RSVP)                                                                                                                                        |

| Parameter     | Description                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------|
| pim-dm        | Protocol Independent Multicast - Dense Mode (PIM-DM)                                                                    |
| pim-sm        | Protocol Independent Multicast - Sparse Mode (PIM-SM)                                                                   |
| pim-smv6      | PIM-SM version 6 (PIM-SMv6)                                                                                             |
| dot1x         | IEEE 802.1X Port-Based Access Control                                                                                   |
| lacp          | Link Aggregation Control Protocol (LACP)                                                                                |
| stp           | Spanning Tree Protocol (STP)                                                                                            |
| rstp          | Rapid Spanning Tree Protocol (RSTP)                                                                                     |
| mstp          | Multiple Spanning Tree Protocol (MSTP)                                                                                  |
| imi           | Integrated Management Interface (IMI)                                                                                   |
| imish         | Integrated Management Interface Shell (IMISH)                                                                           |
| epsr          | Ethernet Protection Switched Rings (EPSR)                                                                               |
| rmon          | Remote Monitoring                                                                                                       |
| loopprot      | Loop Protection                                                                                                         |
| poe           | Power-inline (Power over Ethernet)                                                                                      |
| dhcpcsn       | DHCP snooping (DHPCSN)                                                                                                  |
| facility      | Exclude messages from a syslog facility.                                                                                |
| <facility>    | Specify one of the following syslog facilities to exclude messages from:                                                |
| kern          | Kernel messages                                                                                                         |
| user          | Random user-level messages                                                                                              |
| mail          | Mail system                                                                                                             |
| daemon        | System daemons                                                                                                          |
| auth          | Security/authorization messages                                                                                         |
| syslog        | Messages generated internally by syslogd                                                                                |
| lpr           | Line printer subsystem                                                                                                  |
| news          | Network news subsystem                                                                                                  |
| uucp          | UUCP subsystem                                                                                                          |
| cron          | Clock daemon                                                                                                            |
| authpriv      | Security/authorization messages (private)                                                                               |
| ftp           | FTP daemon                                                                                                              |
| msgtext       | Exclude messages containing a certain text string.                                                                      |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
awplus(config)# log monitor exclude msgtext example of
irrelevant message
```

**Related  
Commands** [default log monitor](#)  
[log monitor \(filter\)](#)  
[show log config](#)  
[terminal monitor](#)

# log permanent

**Overview** This command configures the device to send permanent log messages to non-volatile storage (NVS) on the device. The content of the permanent log is retained over a reboot. Once the permanent log reaches its configured maximum allowable size old messages will be deleted to make way for new messages.

The **no** variant of this command configures the device not to send any messages to the permanent log. Log messages will not be retained over a restart.

**Syntax** `log permanent`  
`no log permanent`

**Mode** Global Configuration

**Examples** To enable permanent logging use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent
```

To disable permanent logging use the following commands:

```
awplus# configure terminal
awplus(config)# no log permanent
```

**Related Commands**

- `clear log permanent`
- `default log permanent`
- `log permanent (filter)`
- `log permanent exclude`
- `log permanent size`
- `show log config`
- `show log permanent`

# log permanent (filter)

**Overview** This command creates a filter to select messages to be sent to the permanent log. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

The **no** variant of this command removes the corresponding filter, so that the specified messages are no longer sent to the permanent log.

**Syntax** `log permanent [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log permanent [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Filter messages sent to the permanent log by severity level.                                                                                                                                     |
| <level>         | The minimum severity of message to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:                |
| 0 emergencies   | System is unusable                                                                                                                                                                               |
| 1 alerts        | Action must be taken immediately                                                                                                                                                                 |
| 2 critical      | Critical conditions                                                                                                                                                                              |
| 3 errors        | Error conditions                                                                                                                                                                                 |
| 4 warnings      | Warning conditions                                                                                                                                                                               |
| 5 notices       | Normal, but significant, conditions                                                                                                                                                              |
| 6 informational | Informational messages                                                                                                                                                                           |
| 7 debugging     | Debug-level messages                                                                                                                                                                             |
| program         | Filter messages by program. Include messages from a specified program.                                                                                                                           |
| <program-name>  | The name of a program to log messages from, either one of the following predefined program names (not case-sensitive), or another program name (case-sensitive) that you find in the log output: |
| rip             | Routing Information Protocol (RIP)                                                                                                                                                               |
| ripng           | Routing Information Protocol - next generation (RIPng)                                                                                                                                           |
| ospf            | Open Shortest Path First (OSPF)                                                                                                                                                                  |
| ospfv3          | Open Shortest Path First (OSPF) version 3 (OSPFv3)                                                                                                                                               |
| rsvp            | Resource Reservation Protocol (RSVP)                                                                                                                                                             |
| pim-dm          | Protocol Independent Multicast - Dense Mode (PIM-DM)                                                                                                                                             |
| pim-sm          | Protocol Independent Multicast - Sparse Mode (PIM-SM)                                                                                                                                            |
| pim-smv6        | PIM-SM version 6 (PIM-SMv6)                                                                                                                                                                      |

| Parameter     | Description                                                                                                             |

| auth          | Security/authorization messages                                                                                         |
| syslog        | Messages generated internally by syslogd                                                                                |
| lpr           | Line printer subsystem                                                                                                  |
| news          | Network news subsystem                                                                                                  |
| uucp          | UUCP subsystem                                                                                                          |
| cron          | Clock daemon                                                                                                            |
| authpriv      | Security/authorization messages (private)                                                                               |
| ftp           | FTP daemon                                                                                                              |
| msgtext       | Select messages containing a certain text string.                                                                       |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** By default the buffered log has a filter to select messages whose severity level is `notices` (5) or higher. This filter may be removed using the **no** variant of this command.

**Mode** Global Configuration

**Examples** To create a filter to send all messages generated by EPSR that have a severity of notices or higher to the permanent log use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent level notices program epsr
```

To create a filter to send all messages containing the text "Bridging initialization", to the permanent log use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent msgtext Bridging initialization
```

[show log permanent](#)

# log permanent exclude

**Overview** Use this command to prevent specified log messages from being sent to the permanent log. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log permanent exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log permanent exclude [level <level>] [program  
<program-name>] [facility <facility>] [msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Exclude messages of the specified severity level.                                                                                                                           |
| <level>         | The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:     |
| 0 emergencies   | System is unusable                                                                                                                                                          |
| 1 alerts        | Action must be taken immediately                                                                                                                                            |
| 2 critical      | Critical conditions                                                                                                                                                         |
| 3 errors        | Error conditions                                                                                                                                                            |
| 4 warnings      | Warning conditions                                                                                                                                                          |
| 5 notices       | Normal, but significant, conditions                                                                                                                                         |
| 6 informational | Informational messages                                                                                                                                                      |
| 7 debugging     | Debug-level messages                                                                                                                                                        |
| program         | Exclude messages from a specified program.                                                                                                                                  |
| <program-name>  | The name of a program. Either one of the following predefined program names (not case-sensitive), or another program name (case-sensitive) that you find in the log output. |
| rip             | Routing Information Protocol (RIP)                                                                                                                                          |
| ripng           | Routing Information Protocol - next generation (RIPng)                                                                                                                      |
| ospf            | Open Shortest Path First (OSPF)                                                                                                                                             |

| auth          | Security/authorization messages                                                                                         |
| syslog        | Messages generated internally by syslogd                                                                                |
| lpr           | Line printer subsystem                                                                                                  |
| news          | Network news subsystem                                                                                                  |
| uucp          | UUCP subsystem                                                                                                          |
| cron          | Clock daemon                                                                                                            |
| authpriv      | Security/authorization messages (private)                                                                               |
| ftp           | FTP daemon                                                                                                              |
| msgtext       | Exclude messages containing a certain text string.                                                                      |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string "example of irrelevant message", use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent exclude msgtext example of
irrelevant message
```

**Related  
Commands**

- clear log permanent
- default log permanent
- log permanent
- log permanent (filter)
- log permanent size
- show log config
- show log permanent

# log permanent size

**Overview** This command configures the amount of memory that the permanent log is permitted to use. Once this memory allocation has been filled old messages will be deleted to make room for new messages.

**Syntax** `log permanent size <50-250>`

| Parameter                   | Description                            |
|-----------------------------|----------------------------------------|
| <code>&lt;50-250&gt;</code> | Size of the permanent log in kilobytes |

**Mode** Global Configuration

**Example** To allow the permanent log to use up to 100 kB of NVS use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent size 100
```

**Related Commands**

- `clear log permanent`
- `default log permanent`
- `log permanent`
- `log permanent (filter)`
- `log permanent exclude`
- `show log config`
- `show log permanent`

# log-rate-limit nsm

**Overview** This command limits the number of log messages generated by the device for a given interval.

Use the **no** variant of this command to revert to the default number of log messages generated by the device of up to 200 log messages per second.

**Syntax** `log-rate-limit nsm messages <message-limit> interval  
<time-interval>`  
`no log-rate-limit nsm`

| Parameter                          | Description                                                                                                                                                                    |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;message-limit&gt;</code> | <code>&lt;1-65535&gt;</code><br>The number of log messages generated by the device.                                                                                            |
| <code>&lt;time-interval&gt;</code> | <code>&lt;0-65535&gt;</code><br>The time period for log message generation in 1/100 seconds.<br>If an interval of 0 is specified then no log message rate limiting is applied. |

**Default** By default, the device will allow 200 log messages to be generated per second.

**Mode** Global Configuration

**Usage** Previously, if the device received a continuous stream of IGMP packets with errors, such as when a packet storm occurs because of a network loop, then the device generates a lot of log messages using more and more memory, which may ultimately cause the device to shutdown. This log rate limiting feature constrains the rate that log messages are generated by the device.

Note that if within the given time interval, the number of log messages exceeds the limit, then any excess log messages are discarded. At the end of the time interval, a single log message is generated indicating that log messages were discarded due to the log rate limit being exceeded.

Thus if the expectation is that there will be a lot of discarded log messages due to log rate limiting, then it is advisable to set the time interval to no less than 100, which means that there would only be one log message, indicating log excessive log messages have been discarded.

**Examples** To limit the device to generate up to 300 log messages per second, use the following commands:

```
awplus# configure terminal
awplus(config)# log-rate-limit nsm messages 300 interval 100
```

To return the device the default setting, to generate up to 200 log messages per second, use the following commands:

```
awplus# configure terminal  
awplus(config)# no log-rate-limit nsm
```

# log trustpoint

**Overview** This command adds one or more trustpoints to be used with the syslog application. Multiple trustpoints may be specified, or the command may be executed multiple times, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

**Syntax** `log trustpoint [<trustpoint-list>]`  
`no log trustpoint [<trustpoint-list>]`

| Parameter         | Description                                             |
|-------------------|---------------------------------------------------------|
| <trustpoint-list> | Specify one or more trustpoints to be added or deleted. |

**Default** No trustpoints are created by default.

**Mode** Global Configuration

**Usage** The device certificate associated with first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If no trustpoints are specified in the command, the trustpoint list will be unchanged.

If **no log trustpoint** is issued without specifying any trustpoints, then all trustpoints will be disassociated from the application.

**Example** You can add multiple trustpoints by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# log trustpoint trustpoint_1
awplus(config)# log trustpoint trustpoint_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config)# log trustpoint trustpoint_2 trustpoint_3
```

Disassociate all trustpoints from the syslog application using the command:

```
awplus(config)# log trustpoint trustpoint_2 trustpoint_3
```

**Related Commands** [log host](#)  
[show log config](#)

# show counter log

**Overview** This command displays log counter information.

**Syntax** `show counter log`

**Mode** User Exec and Privileged Exec

**Example** To display the log counter information, use the command:

```
awplus# show counter log
```

**Output** Figure 8-1: Example output from the **show counter log** command

|                   |            |
|-------------------|------------|
| Log counters      |            |
| Total Received    | ..... 2328 |
| Total Received P0 | ..... 0    |
| Total Received P1 | ..... 0    |
| Total Received P2 | ..... 1    |
| Total Received P3 | ..... 9    |
| Total Received P4 | ..... 32   |
| Total Received P5 | ..... 312  |
| Total Received P6 | ..... 1602 |
| Total Received P7 | ..... 372  |

**Table 1:** Parameters in output of the **show counter log** command

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| Total Received    | Total number of messages received by the log             |
| Total Received P0 | Total number of Priority 0 (Emergency) messages received |
| Total Received P1 | Total number of Priority 1 (Alert) messages received     |
| Total Received P2 | Total number of Priority 2 (Critical) messages received  |
| Total Received P3 | Total number of Priority 3 (Error) messages received     |
| Total Received P4 | Total number of Priority 4 (Warning) messages received   |
| Total Received P5 | Total number of Priority 5 (Notice) messages received    |
| Total Received P6 | Total number of Priority 6 (Info) messages received      |
| Total Received P7 | Total number of Priority 7 (Debug) messages received     |

**Related Commands** [show log config](#)

# show exception log

**Overview** This command displays the contents of the exception log.

**Syntax** show exception log

**Mode** User Exec and Privileged Exec

**Example** To display the exception log, use the command:

```
awplus# show exception log
```

**Output** Figure 8-2: Example output from the **show exception log** command on a device

```
awplus#show exception log

# show log

**Overview** This command displays the contents of the buffered log.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show log [tail [<10-250>]]`

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| tail      | Display only the latest log entries.          |
| <10-250>  | Specify the number of log entries to display. |

**Default** By default the entire contents of the buffered log is displayed.

**Mode** User Exec, Privileged Exec and Global Configuration

**Usage** If the optional **tail** parameter is specified only the latest 10 messages in the buffered log are displayed. A numerical value can be specified after the **tail** parameter to select how many of the latest messages should be displayed.  
The **show log** command is only available to users at privilege level 7 and above. To set a user's privilege level, use the command:

```
awplus(config)# username <name> privilege <1-15>
```

**Examples** To display the contents of the buffered log use the command:

```
awplus# show log
```

To display the 10 latest entries in the buffered log use the command:

```
awplus# show log tail 10
```

**Output** Figure 8-3: Example output from the **show log** command

```
awplus#show log

# show log config

**Overview** This command displays information about the logging system. This includes the configuration of the various log destinations, buffered, permanent, syslog servers (hosts) and email addresses. This also displays the latest status information for each of these destinations.

**Syntax** `show log config`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the logging configuration use the command:

```
awplus# show log config
```

**Output** Figure 8-4: Example output from the **show log config** command

In the above example the '\*' next to filter 1 in the buffered log configuration indicates that this is the default filter. The permanent log has had its default filter removed, so none of the filters are marked with '\*'.

**NOTE:** Terminal log and console log cannot be set at the same time. If console logging is enabled then the terminal logging is turned off.

# show log permanent

**Overview** This command displays the contents of the permanent log.

**Syntax** `show log permanent [<stack-ID>] [tail [<10-250>]]`

| Parameter  | Description                                   |
|------------|-----------------------------------------------|
| <stack-ID> | Stack member number, from 1 to 8.             |
| tail       | Display only the latest log entries.          |
| <10-250>   | Specify the number of log entries to display. |

**Default** If the optional **tail** parameter is specified only the latest 10 messages in the permanent log are displayed. A numerical value can be specified after the **tail** parameter to select how many of the latest messages should be displayed.

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the permanent log of stack member 2, use the command:

```
awplus# show log permanent 2
```

**Output** Figure 8-5: Example output from the **show log permanent** command

```
awplus#show log permanent 2

Stack member 2:

# Scripting Commands

## Introduction

**Overview** This chapter provides commands used for command scripts.

- Command List**
- [“activate”](#) on page 380
  - [“echo”](#) on page 381
  - [“wait”](#) on page 382

# activate

**Overview** This command activates a script file.

**Syntax** `activate [background] <script>`

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>background</code>     | Activate a script to run in the background. A process that is running in the background will operate as a separate task, and will not interrupt foreground processing. Generally, we recommend running short, interactive scripts in the foreground and longer scripts in the background. The default is to run the script in the foreground. |
| <code>&lt;script&gt;</code> | The file name of the script to activate. The script is a command script consisting of commands documented in this software reference. Note that you must use either a <b>.scp</b> or a <b>.sh</b> filename extension for a valid script text file, as described below in the usage section for this command.                                  |

**Mode** Privileged Exec

**Usage** When a script is activated, the privilege level is set to 1 enabling User Exec commands to run in the script. If you need to run Privileged Exec commands in your script you need to add an [enable \(Privileged Exec mode\)](#) command to the start of your script. If you need to run Global Configuration commands in your script you need to add a [configure terminal](#) command after the **enable** command at the start of your script.

The **activate** command executes the script in a new shell. A [terminal length](#) shell command, such as **terminal length 0** may also be required to disable a delay that would pause the display.

A script must be a text file with a filename extension of either **.sh** or **.scp** only for the AlliedWare Plus™ CLI to activate the script file. The **.sh** filename extension indicates the file is an ASH script, and the **.scp** filename extension indicates the file is an AlliedWare Plus™ script.

**Examples** To activate a command script to run as a background process, use the command:

```
awplus# activate background test.scp
```

**Related Commands**

- [configure terminal](#)
- [echo](#)
- [enable \(Privileged Exec mode\)](#)
- [wait](#)

# echo

**Overview** This command echoes a string to the terminal, followed by a blank line.

**Syntax** `echo <line>`

| Parameter                 | Description        |
|---------------------------|--------------------|
| <code>&lt;line&gt;</code> | The string to echo |

**Mode** User Exec and Privileged Exec

**Usage** This command may be useful in CLI scripts, to make the script print user-visible comments.

**Example** To echo the string `Hello World` to the console, use the command:  
`awplus# echo Hello World`

## Output

```
Hello World
```

**Related  
Commands** [activate](#)  
[wait](#)

# wait

**Overview** This command pauses execution of the active script for the specified period of time.

**Syntax** `wait <delay>`

| Parameter                  | Description                                                    |
|----------------------------|----------------------------------------------------------------|
| <code>&lt;delay&gt;</code> | <code>&lt;1-65335&gt;</code> Specify the time delay in seconds |

**Default** No wait delay is specified by default to pause script execution.

**Mode** Privileged Exec (when executed from a script not directly from the command line)

**Usage** Use this command to pause script execution in an **.scp** (AlliedWare Plus™ script) or an **.sh** (ASH script) file executed by the [activate](#) command. The script must contain an **enable** command, because the **wait** command is only executed in the Privileged Exec mode.

**Example** See an **.scp** script file extract below that will show port counters for interface port1.0.1 over a 10 second interval:

```
enable

show interface port1.0.1

wait 10

show interface port1.0.1
```

**Related Commands** [activate](#)  
[echo](#)  
[enable \(Privileged Exec mode\)](#)

# Interface Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure and display interfaces.

- Command List**
- “[description \(interface\)](#)” on page 384
  - “[interface \(to configure\)](#)” on page 385
  - “[mru](#)” on page 387
  - “[mtu](#)” on page 389
  - “[show interface](#)” on page 391
  - “[show interface brief](#)” on page 394
  - “[show interface memory](#)” on page 395
  - “[show interface status](#)” on page 397
  - “[shutdown](#)” on page 399

# description (interface)

**Overview** Use this command to add a description to a specific port or interface.

**Syntax** `description <description>`

| Parameter                        | Description                             |
|----------------------------------|-----------------------------------------|
| <code>&lt;description&gt;</code> | Text describing the specific interface. |

**Mode** Interface Configuration

**Example** The following example uses this command to describe the device that a switch port is connected to.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# description Boardroom PC
```

# interface (to configure)

**Overview** Use this command to select one or more interfaces to configure.

**Syntax** `interface <interface-list>`  
`interface lo`

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;interface-list&gt;</code> | <p>The interfaces or ports to configure.</p> <p>An interface-list can be:</p> <ul style="list-style-type: none"><li>• an interface such as a VLAN (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.0.6</code>), a static channel group (e.g. <code>sa2</code>) or a dynamic (LACP) channel group (e.g. <code>po2</code>)</li><li>• a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.0.1-1.0.6</code>, or <code>sa1-2</code>, or <code>po1-2</code></li><li>• a comma-separated list of the above; e.g. <code>port1.0.1,port1.0.4-1.0.6</code>. Do not mix interface types in a list</li></ul> <p>The specified interfaces must exist.</p> |
| <code>lo</code>                     | The local loopback interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Usage** A local loopback interface is one that is always available for higher layer protocols to use and advertise to the network. Although a local loopback interface is assigned an IP address, it does not have the usual requirement of connecting to a lower layer physical entity. This lack of physical attachment creates the perception of a local loopback interface always being accessible via the network.

Local loopback interfaces can be utilized by a number of protocols for various purposes. They can be used to improve access to the device and also increase its reliability, security, scalability and protection. In addition, local loopback interfaces can add flexibility and simplify management, information gathering and filtering.

One example of this increased reliability is for OSPF to advertise a local loopback interface as an interface-route into the network irrespective of the physical links that may be “up” or “down” at the time. This provides a higher probability that the routing traffic will be received and subsequently forwarded.

**Mode** Global Configuration

**Example** The following example shows how to enter Interface mode to configure `vlan1`. Note how the prompt changes.

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)#
```

The following example shows how to enter Interface mode to configure the local loopback interface.

```
awplus# configure terminal
awplus(config)# interface lo
awplus(config-if)#
```

- [show interface](#)
- [show interface brief](#)

## mru

**Overview** Use this command to set the Maximum Receive Unit (MRU) size for switch ports, where MRU is the maximum frame size (excluding headers) that switch ports can receive. For more information, see the [Switching Feature Overview and Configuration Guide](#).

Use the **no** variant of this command to remove a previously specified Maximum Receive Unit (MRU) size for switch ports, and restore the default MRU size (1500 bytes) for switch ports.

**NOTE:** The figure of 1500 bytes specifies the payload only. For an IEEE 802.1q frame, provision is made (internally) for the following additional components:

- Source and Destination addresses
- EtherType field
- Priority and VLAN tag fields
- FCS

These additional components increase the frame size internally to 1522 bytes.

**Syntax** `mru <mru-size>`  
`no mru`

| Parameter                     | Description                                                                                                                                                  |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;mru-size&gt;</code> | <code>&lt;68-16357&gt;</code><br>Specifies the Maximum Receive Unit (MRU) size in bytes, where 1500 bytes is the default Ethernet MRU size for an interface. |

**Default** The default MRU size is 1500 bytes for switch ports.

**Mode** Interface Configuration for switch ports.

**Usage** Note that [show interface](#) output will only show MRU size for switch ports.

**Examples** To configure an MRU of 16357 bytes on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# mru 16357
```

To configure an MRU of 1500 bytes on port1.0.2 to port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.4
awplus(config-if)# mru 1500
```

To restore the MRU size of 1500 bytes on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no mru
```

**Related  
Commands**   [show interface](#)

## mtu

**Overview** Use this command to set the Maximum Transmission Unit (MTU) size for VLANs, where MTU is the maximum packet size that VLANs can transmit. The MTU size setting is applied to both IPv4 and IPv6 packet transmission.

Use the **no** variant of this command to remove a previously specified Maximum Transmission Unit (MTU) size for VLANs, and restore the default MTU size (1500 bytes) for VLANs.

**Syntax** `mtu <68-1582>`  
`no mtu`

**Default** The default MTU size is 1500 bytes for VLAN interfaces.

**Mode** Interface Configuration for VLAN interfaces.

**Usage** If a device receives an IPv4 packet for Layer 3 switching to another VLAN with an MTU size smaller than the packet size, and if the packet has the '**don't fragment**' bit set, then the device will send an ICMP '**destination unreachable**' (3) packet type and a '**fragmentation needed and DF set**' (4) code back to the source. For IPv6 packets bigger than the MTU size of the transmitting VLAN interface, an ICMP '**packet too big**' (ICMP type 2 code 0) message is sent to the source.

Note that [show interface](#) output will only show MTU size for VLAN interfaces.

**Examples** To configure an MTU size of 1500 bytes on interface `vlan2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# mtu 1500
```

To configure an MTU size of 1500 bytes on interfaces `vlan2` to `vlan4`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# mtu 1500
```

To restore the MTU size to the default MTU size of 1500 bytes on `vlan2`, use the commands

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no mtu
```

To restore the MTU size to the default MTU size of 1500 bytes on `vlan2` and `vlan4`, use the commands

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no mtu
```

**Related  
Commands** [show interface](#)

# show interface

**Overview** Use this command to display interface configuration and status.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show interface [<interface-list>]`  
`show interface lo`

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;interface-list&gt;</code> | <p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"><li>• an interface such as a VLAN (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.0.6</code>), a static channel group (e.g. <code>sa2</code>) or a dynamic (LACP) channel group (e.g. <code>po2</code>)</li><li>• a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.0.1-1.0.6</code>, or <code>sa1-2</code>, or <code>po1-2</code></li><li>• a comma-separated list of the above; e.g. <code>port1.0.1,port1.0.4-1.0.6</code>. Do not mix interface types in a list</li></ul> <p>The specified interfaces must exist.</p> |
| <code>lo</code>                     | The local loopback interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Mode** User Exec and Privileged Exec

**Usage** Note that the output displayed with this command will show MTU (Maximum Transmission Unit) size for VLAN interfaces, and MRU (Maximum Received Unit) size for switch ports.

**Example** To display configuration and status information for all interfaces, use the command:

```
awplus# show interface
```

Figure 10-1: Example output from the **show interface** command

```
awplus#show interface
Interface port1.0.1
  Scope: both
  Link is UP, administrative state is UP
  Thrash-limiting
    Status Not Detected, Action link-down, Timeout 60(s)
  Hardware is Ethernet, address is 0000.cd24.daeb
  index 5001 metric 1 mru 1500
  <UP,BROADCAST,RUNNING,MULTICAST>
  current duplex full, current speed 1000
  configured duplex auto, configured speed auto, configured polarity auto
  current ecofriendly lpi
  configured ecofriendly lpi
  SNMP link-status traps: Sending (Suppressed after 20 traps in 60 sec.)
    input packets 2396, bytes 324820, dropped 0, multicast packets 2370
    output packets 73235, bytes 406566, multicast packets 7321 broadcast packets 7
  Time since last state change: 0 days 16:35:52
...
```

To display configuration and status information for interface **lo**, use the command:

```
awplus# show interface lo
```

Figure 10-2: Example output from the **show interface lo** command

```
awplus#show interface lo
Interface lo
  Scope: both
  Link is UP, administrative state is UP
  Hardware is Loopback
  index 1 metric 1
  <UP,LOOPBACK,RUNNING>
  SNMP link-status traps: Disabled
    input packets 0, bytes 0, dropped 0, multicast packets 0
    output packets 0, bytes 0, multicast packets 0 broadcast packets 0
  Time since last state change: 69 days 01:28:47
```

To display configuration and status information for interfaces **vlan1** and **vlan2**, use the command:

```
awplus# show interface vlan1,vlan2
```

Figure 10-3: Example output from the **show interface vlan1,vlan2** command

```
awplus#show interface vlan1,vlan2
Interface vlan1
  Scope: both
  Link is UP, administrative state is UP
  Hardware is VLAN, address is 0015.77e9.5c50
  IPv4 address 192.168.1.1/24 broadcast 192.168.1.255
  index 201 metric 1 mtu 1500
  arp ageing timeout 300
  <UP,BROADCAST,RUNNING,MULTICAST>
  SNMP link-status traps: Disabled
  Bandwidth 1g
    input packets 295606, bytes 56993106, dropped 5, multicast packets 156
    output packets 299172, bytes 67379392, multicast packets 0 broadcast packets 0
  Time since last state change: 0 days 14:22:39

Interface vlan2
  Scope: both
  Link is DOWN, administrative state is UP
  Hardware is VLAN, address is 0015.77e9.5c50
  IPv4 address 192.168.2.1/24 broadcast 192.168.2.255
  Description: ip_phone_vlan
  index 202 metric 1 mtu 1500
  arp ageing timeout 300
  <UP,BROADCAST,MULTICAST>
  SNMP link-status traps: Disabled
  Bandwidth 1g
    input packets 0, bytes 0, dropped 0, multicast packets 0
    output packets 90, bytes 4244, multicast packets 0 broadcast packets 0
  Time since last state change: 0 days 14:22:39
```

# show interface brief

**Overview** Use this command to display brief interface, configuration, and status information, including provisioning information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show interface brief`

**Mode** User Exec and Privileged Exec

**Output** Figure 10-4: Example output from the **show interface brief** command

```
awplus#show int brief
Interface      Status      Protocol
port1.0.1      admin up    down
port1.0.2      admin up    down
port1.0.3      admin up    down
port1.0.4      admin up    down
port1.0.5      admin up    down
port1.0.6      admin up    running
lo             admin up    running
vlan1          admin up    down
vlan2          admin up    down
```

**Table 1:** Parameters in the output of the **show interface brief** command

| Parameter | Description                                                                               |
|-----------|-------------------------------------------------------------------------------------------|
| Interface | The name or type of interface.                                                            |
| Status    | The administrative state. This can be either <b>admin up</b> or <b>admin down</b> .       |
| Protocol  | The link state. This can be either <b>down</b> , <b>running</b> , or <b>provisioned</b> . |

**Related Commands** [show interface](#)  
[show interface memory](#)

# show interface memory

**Overview** This command displays the shared memory used by either all interfaces, or the specified interface or interfaces. The output is useful for diagnostic purposes by Allied Telesis authorized service personnel.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show interface memory`  
`show interface <port-list> memory`

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port-list> | Display information about only the specified port or ports. The port list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.0.4), a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4, or sa1-2, or po1-2)</li><li>• a comma-separated list of ports and port ranges (e.g. port1.0.1,port1.0.4-1.0.6). Do not mix switch ports, static channel groups, and dynamic (LACP) channel groups in the same list.</li></ul> |

**Mode** User Exec and Privileged Exec

**Example** To display the shared memory used by all interfaces, use the command:

```
awplus# show interface memory
```

To display the shared memory used by port1.0.1 and port1.0.5 to port1.0.6, use the command:

```
awplus# show interface port1.0.1,port1.0.5-1.0.6 memory
```

**Output** Figure 10-5: Example output from the **show interface memory** command

```
awplus#show interface memory
Vlan blocking state shared memory usage
-----
```

| Interface | shmid   | Bytes Used | nattch | Status |
|-----------|---------|------------|--------|--------|
| port1.0.1 | 393228  | 512        | 1      |        |
| port1.0.2 | 458766  | 512        | 1      |        |
| port1.0.3 | 360459  | 512        | 1      |        |
| port1.0.4 | 524304  | 512        | 1      |        |

**Related  
Commands**

- [show interface brief](#)
- [show interface status](#)
- [show interface switchport](#)

# show interface status

**Overview** Use this command to display the status of the specified interface or interfaces. Note that when no interface or interfaces are specified then the status of all interfaces on the device are shown.

**Syntax** `show interface [<port-list>] status`

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port-list> | The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>a switch port (e.g. port1.0.6), a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po2)</li><li>a continuous range of ports separated by a hyphen, e.g. port1.0.1-1.0.6, or sa1-2, or po1-2</li><li>a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.4-1.0.6. Do not mix switch ports, static channel groups, and dynamic (LACP) channel groups in the same list</li></ul> |

**Examples** To display the status of ports 1.0.1 to 1.0.4, use the commands:

```
awplus# show interface port1.0.1-1.0.4 status
```

**Table 2:** Example output from the **show interface <port-list> status** command

| awplus#show interface port1.0.1-1.0.4 status |      |            |      |        |       |            |
|----------------------------------------------|------|------------|------|--------|-------|------------|
| Port                                         | Name | Status     | Vlan | Duplex | Speed | Type       |
| port1.0.1                                    |      | notconnect | 1    | auto   | auto  | 1000BASE-T |
| port1.0.2                                    |      | notconnect | 1    | auto   | auto  | 1000BASE-T |
| port1.0.3                                    |      | notconnect | 1    | auto   | auto  | 1000BASE-T |
| port1.0.4                                    |      | notconnect | 1    | auto   | auto  | 1000BASE-T |

To display the status of all ports, use the commands:

```
awplus# show interface status
```

**Table 3:** Example output from the **show interface status** command

| awplus#sho int status |              |           |       |        |        |            |
|-----------------------|--------------|-----------|-------|--------|--------|------------|
| Port                  | Name         | Status    | Vlan  | Duplex | Speed  | Type       |
| port1.0.1             | Trunk_Net    | connected | trunk | a-full | a-1000 | 1000BaseTX |
| port1.0.2             | Access_Net1  | connected | 5     | full   | 1000   | 1000BaseTX |
| port1.0.3             | Access_Net1  | disabled  | 5     | auto   | auto   | 1000BaseTX |
| port1.0.4             | Access_Net2  | connected | 6     | auto   | auto   | 1000BaseTX |
| port1.0.5             | Private_Prom | connected | 10    | auto   | auto   | 1000BaseTX |
| port1.0.6             | Private_Net1 | connected | 10,11 | auto   | auto   | 1000BaseTX |
| ...                   |              |           |       |        |        |            |

**Table 4:** Parameters in the output from the **show interface status** command

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port      | Name/Type of the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Name      | Description of the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Status    | The administrative and operational status of the interface; one of: <ul style="list-style-type: none"> <li>disabled: the interface is administratively down.</li> <li>connect: the interface is operationally up.</li> <li>notconnect: the interface is operationally down.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Vlan      | VLAN type or VLAN IDs associated with the port: <ul style="list-style-type: none"> <li>When the VLAN mode is trunk, it displays <b>trunk</b> (it does not display the VLAN IDs).</li> <li>When the VLAN mode is access, it displays the VLAN ID.</li> <li>When the VLAN mode is private promiscuous, it displays the primary VLAN ID if it has one, and <b>promiscuous</b> if it does not have a VLAN ID.</li> <li>When the VLAN mode is private host, it displays the primary and secondary VLAN IDs.</li> <li>When the port is an Eth port, it displays <b>none</b>: there is no VLAN associated with it.</li> <li>When the VLAN is dynamically assigned, it displays the current dynamically assigned VLAN ID (not the access VLAN ID), or <b>dynamic</b> if it has multiple VLANs dynamically assigned.</li> </ul> |
| Duplex    | The actual duplex mode of the interface, preceded by <b>a-</b> if it has autonegotiated this duplex mode. If the port is disabled or not connected, it displays the configured duplex setting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Speed     | The actual link speed of the interface, preceded by <b>a-</b> if it has autonegotiated this speed. If the port is disabled or not connected, it displays the configured speed setting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Type      | The type of interface, e.g. 1000BaseTX. For SFP bays, it displays <b>Unknown</b> if it does not recognize the type of SFP installed, or <b>Not present</b> if an SFP is not installed or is faulty.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Related Commands** [show interface](#)  
[show interface memory](#)

# shutdown

**Overview** This command shuts down the selected interface. This administratively disables the link and takes the link down at the physical (electrical) layer.

Use the **no** variant of this command to disable this function and therefore to bring the link back up again.

**Syntax** shutdown  
no shutdown

**Mode** Interface Configuration

**Usage** If you shutdown an aggregator, the device shows the admin status of the aggregator and its component ports as “admin down”. While the aggregator is down, the device accepts **shutdown** and **no shutdown** commands on component ports, but these have no effect on port status. Ports will not come up again while the aggregator is down.

**Example** To shut down port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# shutdown
```

To bring up port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no shutdown
```

To shut down vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# shutdown
```

To bring up vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no shutdown
```

# Port Mirroring and Remote Mirroring Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Port Mirroring and Remote Mirroring (also known as RSPAN).

For more information, see the [Mirroring Feature Overview and Configuration Guide](#).

- Command List**

  - “[vlan mode remote-mirror-vlan](#)” on page 410

# mirror interface

**Overview** Use this command to define a mirror port and mirrored (monitored) ports and direction of traffic to be mirrored. The port for which you enter interface mode will be the mirror port.

The destination port is removed from all VLANs, and no longer participates in other switching.

Use the **no** variant of this command to disable port mirroring by the destination port on the specified source port.

Use the **none** variant of this command when using copy-to-mirror ACL and QoS commands.

**Syntax** `mirror interface <source-port-list> direction  
{both|receive|transmit}  
  
mirror interface none  
  
no mirror interface <source-port-list>  
  
no mirror interface none`

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;source-port-list&gt;</code> | The source switch ports to mirror. A port-list can be: <ul style="list-style-type: none"><li>• a port (e.g. port1.0.2)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-1.0.2</li><li>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.4-1.0.6</li></ul> The source port list cannot include dynamic or static channel groups (link aggregators).                                                                                                                                   |
| <code>direction</code>                | Specifies whether to mirror traffic that the source port receives, transmits, or both.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>both</code>                     | Mirroring traffic both received and transmitted by the source port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>receive</code>                  | Mirroring traffic received by the source port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>transmit</code>                 | Mirroring traffic transmitted by the source port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>none</code>                     | Specify this parameter for use with the ACL (Access Control List) <b>access-list</b> and QoS (Quality of Service) default action commands when used with the <b>copy-to-mirror</b> parameter option, so you can specify the destination port (the analyzer port) for the traffic without specifying a source mirror port. See the ACL commands <a href="#">access-list (hardware IP numbered)</a> and <a href="#">access-list (hardware MAC numbered)</a> , and the QoS command <a href="#">default-action</a> for further information. |

**Mode** Interface Configuration

**Usage** Use this command to send traffic to another device connected to the mirror port for monitoring.

For more information, see the [Mirroring Feature Overview and Configuration Guide](#).

A mirror port cannot be associated with a VLAN. If a switch port is configured to be a mirror port, it is automatically removed from any VLAN it was associated with.

This command can only be applied to a single mirror (destination) port, not to a range of ports, nor to a static or dynamic channel group. Do not apply multiple interfaces with an interface command before issuing the mirror interface command. One interface may have multiple mirror interfaces.

Access control lists can be used to mirror a subset of traffic from the mirrored port by using the copy-to-mirror parameter in hardware ACL commands.

**Example** To mirror traffic received and transmitted on port1.0.4 and port1.0.5 to destination port1.0.3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# mirror interface port1.0.4,port1.0.5
direction both
```

To enable use with the [access-list \(hardware IP numbered\)](#) ACL and [default-action](#) QoS commands to destination port1.0.3 without specifying a source port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# mirror interface none
```

To mirror TCP traffic to analyzer port1.0.1 if it is received or transmitted on port 1.0.2, use the sample configuration snippet below:

```
awplus#show running-config

mls qos enable
access-list 3000 copy-to-mirror tcp any any
!
interface port1.0.1
 mirror interface none
!
interface port1.0.2
 access-group 3000
```

**Related Commands** [access-list \(hardware IP numbered\)](#)  
[access-list \(hardware MAC numbered\)](#)  
[default-action](#)

# remote-mirror interface

**Overview** Use this command on the source device to specify the source port whose traffic is to be remote-mirrored (monitored), and the remote mirroring VLAN ID these mirrored frames will be tagged with when they egress from the source device. The port for which Interface Configuration mode is entered is the port via which the mirrored traffic egresses the source device towards the remote destination device.

Use the **no** variant of this command to disable remote mirroring of the specified mirrored port by the egress (destination) port on the source device.

**Syntax**

```
remote-mirror interface <port-list> direction  
{both|receive|transmit} vlan <2-4090> [priority <0-7>]  
  
remote-mirror interface none vlan <2-4090> [priority <0-7>]  
  
no remote-mirror interface <port-list> [direction  
{receive|transmit}]  
  
no remote-mirror interface none
```

| Parameter   | Description                                                                                                                                                                                                                                                                                                                               |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port-list> | The ports from which to mirror traffic. A port-list can be: <ul style="list-style-type: none"><li>• a port (e.g. port1.0.2)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-1.0.2 or port1.0.1-port1.0.24</li><li>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.4-1.0.6</li></ul> |
| direction   | Specifies whether to mirror traffic that the source port receives, transmits, or both.                                                                                                                                                                                                                                                    |
| both        | Mirroring traffic both received and transmitted by the source port.                                                                                                                                                                                                                                                                       |
| receive     | Mirroring traffic received by the source port.                                                                                                                                                                                                                                                                                            |
| transmit    | Mirroring traffic transmitted by the source port.                                                                                                                                                                                                                                                                                         |
| 2-4090      | The VLAN ID of the remote mirroring VLAN that this mirrored traffic is to be tagged with at the egress port on the source device.                                                                                                                                                                                                         |
| priority    | The 802.1p priority tag to apply to mirrored packets.                                                                                                                                                                                                                                                                                     |

**Default** No ports are set to be remote mirrored by default.

**Mode** Interface Configuration

**Usage** To prevent unwanted processing of mirrored traffic, we recommend configuring remote monitoring on the receiving device before configuring it on the source device.

This command can only be used to configure a single egress port on the source device, not a range of egress ports. Do not use the **interface** command with multiple interfaces before using this **remote-mirror interface** command. One egress (destination) port on the source device can transmit mirrored frames from up to four remote mirrored (source) ports.

The egress port on the source device can be associated with other VLANs in addition to the remote mirror VLAN, so it can function as an uplink for traffic from multiple VLANs. This command does not change the VLAN associations of the mirrored ports.

Only one port on the device can be configured as either a mirror port for port mirroring (**mirror interface** command) or as an egress port on the source device for remote mirroring (**remote-mirror interface** command).

All mirrored ports on a single device must use the same remote mirror VLAN and priority.

Access control lists can be used to mirror a subset of traffic from the mirrored port by using the copy-to-mirror parameter in hardware ACL commands.

**Example** To configure the source device to send all the traffic that it receives on remote-mirrored port 1.0.5 out egress port 1.0.1 tagged with remote mirroring VLAN ID 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# remote-mirror interface port1.0.5 direction
receive vlan 2
```

To stop port 1.0.1 remote-mirroring traffic received on mirrored port 1.0.5, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no remote-mirror interface port1.0.5
direction receive
```

# show mirror

**Overview** Use this command to display the status of all mirrored ports.

**Syntax** `show mirror`

**Mode** User Exec and Privileged Exec

**Example** To display the status of all mirrored ports, use the following command:

```
awplus# show mirror
```

**Output** Figure 11-1: Example output from the **show mirror** command

```
Mirror Test Port Name: port1.0.1
Mirror option: Enabled
Mirror direction: both
Monitored Port Name: port1.0.2
Mirror Test Port Name: port1.0.3
Mirror option: Enabled
Mirror direction: receive
Monitored Port Name: port1.0.4
Mirror Test Port Name: port1.0.3
Mirror option: Enabled
Mirror direction: receive
Monitored Port Name: port1.0.1
Mirror Test Port Name: port1.0.1
Mirror option: Enabled
Mirror direction: receive
Monitored Port Name: port1.0.3
Mirror Test Port Name: port1.0.1
Mirror option: Enabled
Mirror direction: transmit
Monitored Port Name: port1.0.4
```

# show mirror interface

**Overview** Use this command to display port mirroring configuration for a mirrored (monitored) switch port.

**Syntax** `show mirror interface <port>`

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| <port>    | The monitored switch port to display information about. |

**Mode** User Exec, Privileged Exec and Interface Configuration

**Example** To display port mirroring configuration for the `port1.0.4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# show mirror interface port1.0.4
```

**Output** Figure 11-2: Example output from the **show mirror interface** command

```
Mirror Test Port Name: port1.0.3
Mirror option: Enabled
Mirror direction: both
Monitored Port Name: port1.0.4
```

# show remote-mirror

**Overview** Use this command to display information for remote-mirroring.

**Syntax** `show remote-mirror`

**Mode** User Exec

**Example** To display information about remote mirroring, use the command:

```
awplus# show remote-mirror
```

**Output** Figure 11-3: Example output from **show remote-mirror**

```
awplus#show remote-mirror
Remote mirror information:
Remote mirror destination:
  Port: port1.0.3
  VLAN: 259
  User priority: 0

Monitored ports:
  port1.0.1
  direction: both

Remote mirror egress ports:

Remote mirror VLANs:
  VLAN 259
```

Table 11-1: Parameters in the output from **show remote-mirror**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote mirror destination | On the source device, this displays information about: <ul style="list-style-type: none"><li>the egress port for the mirrored traffic on the source device</li><li>the remote mirroring VLAN ID this traffic is tagged with on egress</li><li>the user priority this traffic is tagged with on egress</li></ul>                                                              |
| Monitored ports           | On the source device, this displays: <ul style="list-style-type: none"><li>the ports being mirrored (monitored)</li><li>the direction—whether both received traffic, transmitted traffic or both are mirrored</li><li>'none (via ACL)' if it is configured with the command <b>remote-mirror interface none</b> to allow ACLs to select the traffic to be mirrored</li></ul> |

Table 11-1: Parameters in the output from **show remote-mirror** (cont.)

| Parameter                  | Description                                                                                                                                                                                                                |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote mirror egress ports | On the destination device, this displays : <ul style="list-style-type: none"><li>• the remote mirror egress ports</li><li>• the remote mirror VLANs they are associated with</li></ul>                                     |
| Remote mirror VLANs        | On source, destination and intermediate devices, this displays a list of any VLANs configured in remote mirror VLAN mode. To see a list of the ports associated with these VLANs, use the command <b>show vlan brief</b> . |

**Related Commands**

- [remote-mirror interface](#)
- [switchport remote-mirror-egress](#)
- [vlan mode remote-mirror-vlan](#)

# switchport remote-mirror-egress

**Overview** Use this command on the device receiving remote mirrored traffic to set the remote mirroring egress port for the specified remote mirroring VLAN. This port removes the remote mirror VLAN tagging before transmitting the mirrored traffic. Ingress traffic on this port is disabled.

Use the **no** variant of this command to reset the port to no longer function as a remote mirror egress port.

**Syntax** `switchport remote-mirror-egress vlan <vlan-id>`  
`no switchport remote-mirror-egress`

| Parameter | Description                                                                           |
|-----------|---------------------------------------------------------------------------------------|
| <vlan-id> | The port will transmit the mirrored traffic it receives from this remote mirror VLAN. |

**Default** There is no remote mirror egress port by default.

**Mode** Interface Configuration for a switch port

**Usage** To prevent unwanted processing of mirrored traffic, we recommend configuring remote monitoring on the receiving device before configuring it on the source device.

This command would typically be used for the port that transmits the remote-mirrored traffic to a device that will analyze it. The port effectively functions as an access port in the remote mirror VLAN, with the added feature of not allowing ingress traffic on the port.

**Example** To set port 1.0.1 on the destination device as the remote mirror egress port for mirrored traffic that is tagged with VLAN ID 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport remote-mirror-egress vlan 2
```

To unset port 1.0.1 as a remote mirror egress port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no switchport remote-mirror-egress
```

**Related Commands** [remote-mirror interface](#)  
[show remote-mirror](#)  
[vlan mode remote-mirror-vlan](#)

# vlan mode remote-mirror-vlan

**Overview** Use this command to create a single VLAN or a range of VLANs in remote mirror mode to be used for remote mirroring.

Use the **no** variant of this command to remove the remote mirror VLAN from the VLAN database and its configurations.

**Syntax** `vlan [<vid>|<vid-range>] mode remote-mirror-vlan`  
`no vlan [<vid>|<vid-range>]`

| Parameter   | Description                                                         |
|-------------|---------------------------------------------------------------------|
| <vid>       | The VLAN ID of the remote mirroring VLAN to be created.             |
| <vid-range> | The range of VLAN IDs for the remote mirroring VLANs to be created. |

**Default** There is no remote mirror VLAN by default.

**Mode** VLAN Configuration

**Usage** This remote mirror VLAN needs to be configured on the remote mirroring source device, the destination (receiving) device, and any devices in between that are to forward the mirrored traffic. We recommend configuring this on the receiving device and intermediate devices before configuring the source device.

The remote mirror VLAN operates in a special mode— all traffic on the remote mirror VLAN is flooded, and no learning or CPU processing is done for packets in the VLAN. BPDU packets (link-local packets used to control features like spanning tree or AMF) are dropped on remote mirror VLANs.

Disabling the remote-mirroring VLAN on the source switch does not prevent the mirrored packets from being sent with the remote-mirror VLAN tag. To stop the mirroring, the command **no remote-mirror interface** must be used.

**Example** To create a VLAN with VLAN ID 3 in remote mirror VLAN mode, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 3 mode remote-mirror-vlan
```

To remove the remote mirror VLAN with ID 3, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no vlan 3
```

# Interface Testing Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used for testing interfaces.

- Command List**
- “[clear test interface](#)” on page 413
  - “[service test](#)” on page 414
  - “[test interface](#)” on page 415

# clear test interface

**Overview** This command clears test results and counters after issuing a test interface command. Test results and counters must be cleared to issue subsequent test interface commands later on.

**Syntax** `clear test interface {<port-list>|all}`

| Parameter   | Description                                                                                                                                                                                                                                                                                                                 |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port-list> | The ports to test. A port-list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.0.6)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-port1.0.6</li><li>• a comma-separated list of the above, e.g. port1.0.1,port1.0.5-1.0.6</li></ul> The specified ports must exist. |
| all         | All interfaces                                                                                                                                                                                                                                                                                                              |

**Mode** Privileged Exec

**Examples** To clear the counters for port1.0.1 use the command:

```
awplus# clear test interface port1.0.1
```

To clear the counters for all interfaces use the command:

```
awplus# clear test interface all
```

**Related Commands** [test interface](#)

# service test

**Overview** This command puts the device into the interface testing state, ready to begin testing. After entering this command, enter Interface Configuration mode for the desired interfaces and enter the command [test interface](#).

Do not test interfaces on a device that is part of a live network—disconnect the device first.

Use the **no** variant of this command to stop the test service.

**Syntax** `service test`  
`no service test`

**Mode** Global Configuration

**Example** To put the device into a test state, use the command:

```
awplus(config)# service test
```

**Related  
Commands** [test interface](#)

# test interface

**Overview** This command starts a test on a port or all ports or a selected range or list of ports.

Use the **no** variant of this command to disable this function. The test duration can be configured by specifying the time in minutes after specifying a port or ports to test.

For an example of all the commands required to test switch ports, see the Examples section in this command. To test the Eth port, set its speed to 100 by using the command **speed 100**.

**NOTE:** Do not run test interface on live networks because this will degrade network performance.

**Syntax** test interface {<port-list>|all} [time{<1-60>|cont}]  
no test interface {<port-list>|all}

| Parameter   | Description                                                                                                                                                                                                                                                                                                                 |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port-list> | The ports to test. A port-list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.0.6)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-port1.0.6</li><li>• a comma-separated list of the above, e.g. port1.0.1,port1.0.5-1.0.6</li></ul> The specified ports must exist. |
| all         | All ports                                                                                                                                                                                                                                                                                                                   |
| time        | Keyword entered prior to the value for the time duration of the interface test.                                                                                                                                                                                                                                             |
| <1-60>      | Specifies duration of time to test the interface or interfaces in minutes (from a minimum of 1 minute to a maximum of 60 minutes). The default is 4 minutes.                                                                                                                                                                |
| cont        | Specifies continuous interface testing until canceled with command negation.                                                                                                                                                                                                                                                |

**Mode** Privileged Exec

**Example** To test the switch ports in VLAN 1, install loopbacks in the ports, and enter the following commands:

```
awplus(config)# service test
awplus(config)# no spanning-tree rstp enable bridge-forward
awplus(config)# interface vlan1
awplus(config-if)# shutdown
awplus(config-if)# end
awplus# test interface all
```

To see the output, use the commands:

```
awplus# show test
awplus# show test count
```

To start the test on all interfaces for 1 minute use the command:

```
awplus# test interface all time 1
```

- ["undebg platform packet"](#) on page 482

# backpressure

**Overview** This command provides a method of applying flow control to ports running in half duplex mode. The setting will only apply when the link is in the half-duplex state.

You can disable backpressure on an interface using the **off** parameter or the **no** variant of this command.

**Syntax** `backpressure {on|off}`  
`no backpressure`

| Parameters | Description                        |
|------------|------------------------------------|
| on         | Enables half-duplex flow control.  |
| off        | Disables half-duplex flow control. |

**Default** Backpressure is turned off by default. You can determine whether an interface has backpressure enabled by viewing the running-config output; **backpressure on** is shown for interfaces if this feature is enabled.

**Mode** Interface Configuration

**Usage** The backpressure feature enables half duplex Ethernet ports to control traffic flow during congestion by preventing further packets arriving. Back pressure utilizes a pre-802.3x mechanism in order to apply Ethernet flow control to switch ports that are configured in the half duplex mode.

The flow control applied by the [flowcontrol \(switch port\)](#) command operates only on full-duplex links, whereas back pressure operates only on half-duplex links.

If a port has insufficient capacity to receive further frames, the device will simulate a collision by transmitting a CSMA/CD jamming signal from this port until the buffer empties. The jamming signal causes the sending device to stop transmitting and wait a random period of time, before retransmitting its data, thus providing time for the buffer to clear. Although this command is only valid for switch ports operating in half-duplex mode the remote device (the one sending the data) can be operating in the full duplex mode.

To see the currently-negotiated duplex mode for ports whose links are up, use the command [show interface](#). To see the configured duplex mode (when different from the default), use the command [show running-config](#).

**Examples** To enable back pressure flow control on interfaces `port1.0.1-port1.0.2` enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.2
awplus(config-if)# backpressure on
```

To disable back pressure flow control on interface `port1.0.2` enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# backpressure off
```

**Validation  
Commands**    `show running-config`  
                  `show interface`

**Related  
Commands**    `duplex`

# clear loop-protection counters

**Overview** Use this command to clear the counters for the Loop Protection counters.

**Syntax** `clear loop-protection [interface <port-list>] counters`

| Parameters  | Description                                     |
|-------------|-------------------------------------------------|
| interface   | The interface whose counters are to be cleared. |
| <port-list> | A port, a port range, or an aggregated link.    |

**Mode** Privileged Exec

**Examples** To clear the counter information for all interfaces:

```
awplus# clear loop-protection counters
```

To clear the counter information for a single port:

```
awplus# clear loop-protection interface port1.0.1 counters
```

# clear mac address-table dynamic

**Overview** Use this command to clear the filtering database of all entries learned for a selected MAC address, an MSTP instance, a switch port interface or a VLAN interface.

**Syntax** `clear mac address-table dynamic [address <mac-address>|interface <port> [instance <inst>]|vlan <vid>]`

| Parameter     | Description                                                                                  |
|---------------|----------------------------------------------------------------------------------------------|
| address       | Specify a MAC (Media Access Control) address to be cleared from the filtering database.      |
| <mac-address> | Enter a MAC address to be cleared from the database in the format HHHH.HHHH.HHHH.            |
| interface     | Specify a switch port to be cleared from the filtering database.                             |
| instance      | Specify an MSTP (Multiple Spanning Tree) instance to be cleared from the filtering database. |
| <inst>        | Enter an MSTP instance in the range 1 to 63 to be cleared from the filtering database.       |
| vlan          | Specify a VLAN to be cleared from the filtering database.                                    |
| <vid>         | Enter a VID (VLAN ID) in the range 1 to 4094 to be cleared from the filtering database.      |

**Mode** Privileged Exec

**Usage** Use this command with options to clear the filtering database of all entries learned for a given MAC address, interface or VLAN. Use this command without options to clear any learned entries.

Use the optional `instance` parameter to clear the filtering database entries associated with a specified MSTP instance. Note that you must first specify a switch port interface before you can specify an MSTP instance.

Compare this usage and operation with the [clear mac address-table static](#) command. Note that an MSTP instance cannot be specified with the command **clear mac address-table static**.

**Examples** This example shows how to clear all dynamically learned filtering database entries for all interfaces, addresses, VLANs.

```
awplus# clear mac address-table dynamic
```

This example shows how to clear all dynamically learned filtering database entries when learned through device operation for the MAC address 0000.5E00.5302.

```
awplus# clear mac address-table dynamic address 0000.5E00.5302
```

This example shows how to clear all dynamically learned filtering database entries when learned through device operation for a given MSTP instance 1 on switch port interface port1.0.2.

```
awplus# clear mac address-table dynamic interface port1.0.2  
instance 1
```

**Related  
Commands**

[clear mac address-table static](#)  
[show mac address-table](#)

# clear mac address-table static

**Overview** Use this command to clear the filtering database of all statically configured entries for a selected MAC address, interface, or VLAN.

**Syntax** `clear mac address-table static [address <mac-address>|interface <port>|vlan <vid>]`

| Parameter     | Description                                                                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| address       | The MAC address whose entries are to be cleared from the filtering database.                                                                                                                             |
| <mac-address> | Specifies the MAC (Media Access Control) address to be cleared from. Enter this address in the format HHHH.HHHH.HHHH.                                                                                    |
| interface     | Specify the interface from which statically configured entries are to be cleared.                                                                                                                        |
| <port>        | Specify the switch port from which address entries will be cleared. This can be a single switch port, (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |
| vlan          | A VLAN whose statically configured entries are to be cleared.                                                                                                                                            |
| <vid>         | Specifies the VLAN ID whose statically configured entries are to be cleared.                                                                                                                             |

**Mode** Privileged Exec

**Usage** Use this command with options to clear the filtering database of all entries made from the CLI for a given MAC address, interface or VLAN. Use this command without options to clear any entries made from the CLI.

Compare this usage with [clear mac address-table dynamic](#) command.

**Examples** This example shows how to clear all filtering database entries configured through the CLI.

```
awplus# clear mac address-table static
```

This example shows how to clear all filtering database entries for a specific interface configured through the CLI.

```
awplus# clear mac address-table static interface port1.0.3
```

This example shows how to clear filtering database entries configured through the CLI for the mac address 0000.5E00.5302.

```
awplus# clear mac address-table static address 0000.5E00.5302
```

**Related Commands** [clear mac address-table dynamic](#)  
[mac address-table static](#)  
[show mac address-table](#)

# clear port counter

**Overview** Use this command to clear the packet counters of the port.

**Syntax** `clear port counter [<port>]`

| Parameter | Description              |
|-----------|--------------------------|
| <port>    | The port number or range |

**Mode** Privileged Exec

**Example** To clear the packet counter for `port1.0.1`, use the command:

```
awplus# clear port counter port1.0.1
```

**Related  
Commands** [show platform port](#)

# clear port-security intrusion

**Overview** Use this command to clear the history of the port-security intrusion list on all ports, or an individual port. If a port is not specified, the intrusion lists of all ports are cleared. This command does not clear any MAC addresses the device has already learned on the ports. If you want to clear MAC addresses on a switch port from the filtering database, you can use the [clear mac address-table dynamic](#) command or the [clear mac address-table static](#) command.

**Syntax** `clear port-security intrusion [interface <port>]`

| Parameter | Description                                                                                                                                                                                                                          |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port>    | Specify the switch port from which the history of violated address entries will be cleared. The port can be a single switch port, (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |

**Mode** Privileged Exec

**Examples** To see the port-security status on port1.0.1, use the following command:

```
awplus# show port-security interface port1.0.1
```

**Table 1:** Example output from the **show port-security interface** command

```
awplus#show port-security interface port1.0.1
Port Security configuration
-----
Security Enabled : YES
Port Status : ENABLED
Violation Mode : TRAP
Aging : OFF
Maximum MAC Addresses : 1
Total MAC Addresses : 1
Lock Status : LOCKED
Security Violation Count : 1
Last Violation Source Address : 801f.0200.19da
```

To see the intrusion list on port1.0.1, use the following command:

```
awplus# show port-security intrusion interface port1.0.1
```

**Table 2:** Example output from the **show port-security intrusion** command

```
awplus#show port-security intrusion interface port1.0.1
Port Security Intrusion List
-----
Interface: port1.0.1      - 1 intrusion(s) detected
801f.0200.19da
```

To clear the history of port-security intrusion list on port1.0.1, use the following command:

```
awplus# clear port-security intrusion interface port1.0.1
```

To see the port-security status on port1.0.1, use the following command:

```
awplus# show port-security interface port1.0.1
```

**Table 3:** Example output from the **show port-security interface** command

```
awplus#show port-security interface port1.0.1
Port Security configuration
-----
Security Enabled : YES
Port Status : ENABLED
Violation Mode : TRAP
Aging : OFF
Maximum MAC Addresses : 1
Total MAC Addresses : 1
Lock Status : LOCKED
Security Violation Count : 0
Last Violation Source Address : None
```

**NOTE:** Note that the port status is still locked while the history of port violation is cleared from the database.

To see the intrusion list on port1.0.1, use the following command:

```
awplus# show port-security intrusion interface port1.0.1
```

**Table 4:** Example output from the **show port-security intrusion** command

```
awplus#show port-security intrusion interface port1.0.1
Port Security Intrusion List
-----
Interface: port1.0.1      - no intrusions detected
```

**Related  
Commands**

- show port-security interface
- show port-security intrusion
- switchport port-security
- switchport port-security aging
- switchport port-security maximum
- switchport port-security violation

# debug loopprot

**Overview** This command enables Loop Protection debugging.  
The **no** variant of this command disables Loop Protection debugging.

**Syntax** `debug loopprot {info|msg|pkt|state|nsm|all}`  
`no debug loopprot {info|msg|pkt|state|nsm|all}`

| Parameter | Description                                                                    |
|-----------|--------------------------------------------------------------------------------|
| info      | General Loop Protection information.                                           |
| msg       | Received and transmitted Loop Detection Frames (LDFs).                         |
| pkt       | Echo raw ASCII display of received and transmitted LDF packets to the console. |
| state     | Loop Protection states transitions.                                            |
| nsm       | Network Service Module information.                                            |
| all       | All debugging information.                                                     |

**Mode** Privileged Exec and Global Configuration

**Example** To enable debug for all state transitions, use the command:

```
awplus# debug loopprot state
```

**Related Commands** [show debugging loopprot](#)  
[undebug loopprot](#)

# debug platform packet

**Overview** This command enables platform to CPU level packet debug functionality on the device.

Use the **no** variant of this command to disable platform to CPU level packet debug. If the result means both send and receive packet debug are disabled, then any active timeout will be canceled.

**Syntax** `debug platform packet [recv] [send] [sflow] [timeout <timeout>]  
[vlan <vlan-id>|all]`  
`no debug platform packet [recv] [send]`

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| recv      | Debug packets received.                            |
| send      | Debug packets sent.                                |
| sflow     | Debug sFlow packets.                               |
| timeout   | Stop debug after a specified time.                 |
| <timeout> | <0-3600>The timeout period, specified in seconds.  |
| vlan      | Limit debug to a single VLAN ID specified.         |
| <vlan-id> | <1-4094> The VLAN ID to limit the debug output on. |
| all       | Debug all VLANs (default setting).                 |

**Default** A 5 minute timeout is configured by default if no other timeout duration is specified.

**Mode** Privileged Exec and Global Configuration

**Usage** This command can be used to trace packets sent and received by the CPU. If a timeout is not specified, then a default 5 minute timeout will be applied.  
If a timeout of 0 is specified, packet debug will be generated until the **no** variant of this command is used or another timeout value is specified. The timeout value applies to both send and receive debug and is updated whenever the **debug platform packet** command is used.

**Examples** To enable both receive and send packet debug for the default timeout of 5 minutes, enter:

```
awplus# debug platform packet
```

To enable receive packet debug for 10 seconds, enter:

```
awplus# debug platform packet recv timeout 10
```

To enable packet debug for sFlow packets only for the default timeout of 5 minutes, enter:

```
awplus# debug platform packet sflow
```

To enable send packet debug with no timeout, enter:

```
awplus# debug platform packet send timeout 0
```

To enable VLAN packet debug for VLAN 2 with a timeout duration of 3 minutes, enter:

```
awplus# debug platform packet vlan 2 timeout 150
```

To disable receive packet debug, enter:

```
awplus# no debug platform packet recv
```

[undebbug platform packet](#)

# duplex

**Overview** This command changes the duplex mode for the specified port.

To see the currently-negotiated duplex mode for ports whose links are up, use the command [show interface](#). To see the configured duplex mode (when different from the default), use the command [show running-config](#).

**Syntax** duplex {auto|full|half}

| Parameter | Description                       |
|-----------|-----------------------------------|
| auto      | Auto-negotiate duplex mode.       |
| full      | Operate in full duplex mode only. |
| half      | Operate in half duplex mode only. |

**Default** By default, ports auto-negotiate duplex mode (except for 100Base-FX ports which do not support auto-negotiation, so default to full duplex mode).

**Mode** Interface Configuration

**Usage** Switch ports in a static or dynamic (LACP) channel group must have the same port speed and be in full duplex mode. Once switch ports have been aggregated into a channel group, you can set the duplex mode of all the switch ports in the channel group by applying this command to the channel group.

**Examples** To specify full duplex for port1.0.4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# duplex full
```

To specify half duplex for port1.0.4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# duplex half
```

To auto-negotiate duplex mode for port1.0.4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# duplex auto
```

# flowcontrol (switch port)

**Overview** Use this command to enable flow control, and configure the flow control mode for the switch port.

Use the **no** variant of this command to disable flow control for the specified switch port.

**Syntax** `flowcontrol {send|receive} {off|on}`  
`no flowcontrol`

| Parameter | Description                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| receive   | When the port receives pause frames, it temporarily stops (pauses) sending traffic.                                                                  |
| on        | Enable the specified flow control.                                                                                                                   |
| off       | Disable the specified flow control.                                                                                                                  |
| send      | When the port is congested (receiving too much traffic), it sends pause frames to request the other end to temporarily stop (pause) sending traffic. |

**Default** By default, flow control is disabled.

**Mode** Interface Configuration

**Usage** The flow control mechanism specified by 802.3x is only for full duplex links. It operates by sending PAUSE frames to the link partner to temporarily suspend transmission on the link

Flow control enables connected Ethernet ports to control traffic rates during congestion by allowing congested nodes to pause link operation at the other end. If one port experiences congestion, and cannot receive any more traffic, it notifies the other port to stop sending until the condition clears. When the local device detects congestion at its end, it notifies the remote device by sending a pause frame. On receiving a pause frame, the remote device stops sending data packets, which prevents loss of data packets during the congestion period.

Flow control is not recommended when running QoS or ACLs, because the complex queuing, scheduling, and filtering configured by QoS or ACLs may be slowed by applying flow control.

For half-duplex links, an older form of flow control known as backpressure is supported. See the related [backpressure](#) command.

For flow control on async serial (console) ports, see the [flowcontrol hardware \(asyn/console\)](#) command.

**Examples**

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# flowcontrol receive on
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# flowcontrol send on
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# flowcontrol receive off
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# flowcontrol send off
```

**Validation Commands** [show running-config](#)

**Related Commands** [backpressure](#)

# linkflap action

**Overview** Use this command to detect flapping on all ports. If more than 15 flaps occur in less than 15 seconds the flapping port will shut down.

Use the **no** variant of this command to disable flapping detection at this rate.

**Syntax** linkflap action [shutdown]  
no linkflap action

| Parameter | Description                       |
|-----------|-----------------------------------|
| linkflap  | Global setting for link flapping. |
| action    | Specify the action for port.      |
| shutdown  | Shutdown the port.                |

**Default** Linkflap action is disabled by default.

**Mode** Global Configuration

**Example** To enable the linkflap action command on the device, use the following commands:

```
awplus# configure terminal  
awplus(config)# linkflap action shutdown
```

# loop-protection loop-detect

**Overview** Use this command to enable the loop-protection loop-detect feature and configure its parameters.

Use the **no** variant of this command to disable the loop-protection loop-detect feature.

**Syntax** `loop-protection loop-detect [ldf-interval <period>]  
[ldf-rx-window <frames>] [fast-block]`  
`no loop-protection loop-detect`

| Parameter                   | Description                                                                                                              |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <code>ldf-interval</code>   | The time (in seconds) between successive loop-detect frames being sent.                                                  |
| <code>&lt;period&gt;</code> | Specify a period between 1 and 600 seconds. The default is 10 seconds.                                                   |
| <code>ldf-rx-window</code>  | The number of transmitted loop detect frames whose details are held for comparing with frames arriving at the same port. |
| <code>&lt;frames&gt;</code> | Specify a value for the window size between 1 and 5 frames. The default is 3 frames.                                     |
| <code>[fast-block]</code>   | The fast-block blocks transmitting port to keep partial connectivity.                                                    |

**Default** The loop-protection loop-detect feature is disabled by default. The default interval is 10 seconds, and the default window size is 3 frames.

**Mode** Global Configuration

**Usage** See the “Loop Protection” section in the [Switching Feature Overview and Configuration Guide](#) for relevant conceptual, configuration, and overview information prior to applying this command.

**Example** To enable the loop-detect mechanism on the switch, and generate loop-detect frames once every 5 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# loop-protection loop-detect ldf-interval 5
```

**Related Commands** [loop-protection action](#)  
[loop-protection timeout](#)  
[show loop-protection](#)  
[thrash-limiting](#)

# loop-protection action

**Overview** Use this command to specify the protective action to apply when a network loop is detected on an interface.

Use the **no** variant of this command to reset the loop protection actions to the default action, vlan-disable, on an interface.

**Syntax** `loop-protection action`  
`{link-down|log-only|port-disable|vlan-disable|none}`  
`no loop-protection action`

| Parameter    | Description                                                                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| link-down    | Block all traffic on a port (or aggregated link) that detected the loop, and take <b>down</b> the link.                                                                 |
| log-only     | Details of loop conditions are logged. No action is applied to the port (or aggregated link).                                                                           |
| port-disable | Block all traffic on interface for which the loop occurred, but keep the link in the <b>up</b> state.                                                                   |
| vlan-disable | Block all traffic for the VLAN on which the loop traffic was detected. Note that setting this parameter will also enable ingress filtering. This is the default action. |
| none         | Applies no protective action.                                                                                                                                           |

**Default** `loop-protection action vlan-disable`

**Mode** Interface Configuration

**Usage** See the “Loop Protection” section in the [Switching Feature Overview and Configuration Guide](#) for relevant conceptual, configuration, and overview information prior to applying this command.

**Example** To disable the interface `port1.0.4` and bring the link down when a network loop is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# loop-protection action link-down
```

**Related Commands** [loop-protection loop-detect](#)  
[loop-protection timeout](#)  
[show loop-protection](#)  
[thrash-limiting](#)

# loop-protection action-delay-time

**Overview** Use this command to sets the loop protection action delay time for an interface to specified values in seconds. The action delay time specifies the waiting period for the action.

Use the **no** variant of this command to reset the loop protection action delay time for an interface to default.

**Syntax** `loop-protection action-delay-time <0-86400>`  
`no loop-protection action`

| Parameter                    | Description                                              |
|------------------------------|----------------------------------------------------------|
| <code>&lt;0-86400&gt;</code> | Time in seconds; 0 means action delay timer is disabled. |

**Default** Action delay timer is disabled by default.

**Mode** Interface Configuration

**Example** To configure a loop protection action delay time of 10 seconds on port 1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# loop-protection action-delay-time 10
```

**Related Commands** [show loop-protection](#)

# loop-protection timeout

**Overview** Use this command to specify the Loop Protection recovery action duration on an interface.

Use the **no** variant of this command to set the loop protection timeout to the default.

**Syntax** `loop-protection timeout <duration>`  
`no loop-protection timeout`

| Parameter                     | Description                                                                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;duration&gt;</code> | The time (in seconds) for which the configured action will apply before being disabled. This duration can be set between 0 and 86400 seconds (24 hours). The set of 0 means infinity so timeout does not expire. |

**Default** The default is 7 seconds.

**Mode** Interface Configuration

**Usage** See the “Loop Protection” section in the [Switching Feature Overview and Configuration Guide](#) for relevant conceptual, configuration, and overview information prior to applying this command.

**Example** To configure a loop protection action timeout of 10 seconds for `port1.0.4`, use the command:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# loop-protection timeout 10
```

**Related Commands** [loop-protection loop-detect](#)  
[loop-protection action](#)  
[show loop-protection](#)  
[thrash-limiting](#)

# mac address-table acquire

**Overview** Use this command to enable MAC address learning on the device.

Use the **no** variant of this command to disable learning.

**Syntax** `mac address-table acquire`  
`no mac address-table acquire`

**Default** Learning is enabled by default for all instances.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# mac address-table acquire`

# mac address-table ageing-time

**Overview** Use this command to specify an ageing-out time for a learned MAC address. The learned MAC address will persist for at least the specified time.

The **no** variant of this command will reset the ageing-out time back to the default of 300 seconds (5 minutes).

**Syntax** `mac address-table ageing-time <ageing-timer> none`  
`no mac address-table ageing-time`

| Parameter                         | Description                                                           |
|-----------------------------------|-----------------------------------------------------------------------|
| <code>&lt;ageing-timer&gt;</code> | <code>&lt;10-1000000&gt;</code> The number of seconds of persistence. |
| <code>none</code>                 | Disable learned MAC address timeout.                                  |

**Default** The default ageing time is 300 seconds.

**Mode** Global Configuration

**Examples** The following commands specify various ageing timeouts on the device:

```
awplus# configure terminal
awplus(config)# mac address-table ageing-time 1000
awplus# configure terminal
awplus(config)# mac address-table ageing-time none
awplus# configure terminal
awplus(config)# no mac address-table ageing-time
```

# mac address-table logging

**Overview** Use this command to create log entries when the content of the FDB (forwarding database) changes. Log messages are produced when a MAC address is added to or removed from the FDB.

**CAUTION:** *MAC address table logging may impact the performance of the switch. Only enable it when necessary as a debug tool.*

Use the **no** variant of this command to stop creating log entries when the content of the FDB changes.

**Syntax** `mac address-table logging`  
`no mac address-table logging`

**Default** MAC address table logging is disabled by default.

**Mode** User Exec/Privileged Exec

**Usage** When MAC address table logging is enabled, the switch produces the following messages:

| Change      | Message format                 | Example                                   |
|-------------|--------------------------------|-------------------------------------------|
| MAC added   | MAC add <mac> <port> <vlan>    | MAC add eccd.6db5.68a7 port1.0.1 vlan2    |
| MAC removed | MAC remove <mac> <port> <vlan> | MAC remove eccd.6db5.68a7 port1.0.1 vlan2 |

Note that rapid changes may not be logged. For example, if an entry is added and then removed within a few seconds, those actions may not be logged.

To see whether MAC address table logging is enabled, use the command [show running-config](#).

**Example** To create log messages when the content of the FDB changes, use the command:

```
awplus# mac address-table logging
```

**Related Commands** [show running-config](#)

# mac address-table static

**Overview** Use this command to statically configure the MAC address-table to forward or discard frames with a matching destination MAC address.

**Syntax** `mac address-table static <mac-addr> {forward|discard} interface <port> [vlan <vid>]`  
`no mac address-table static <mac-addr> {forward|discard} interface <port> [vlan <vid>]`

| Parameter  | Description                                                                                                                                                             |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <mac-addr> | The destination MAC address in HHHH . HHHH . HHHH format.                                                                                                               |
| <port>     | The port to display information about. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |
| <vid>      | The VLAN ID. If you do not specify a VLAN, its value defaults to vlan 1.                                                                                                |

**Mode** Global Configuration

**Usage** The **mac address-table static** command is only applicable to Layer 2 switched traffic within a single VLAN. Do not apply the **mac address-table static** command to Layer 3 switched traffic passing from one VLAN to another VLAN. Frames will not be discarded across VLANs because packets are routed across VLANs. This command only works on Layer 2 traffic.

**Example** `awplus# configure terminal`  
`awplus(config)# mac address-table static 2222.2222.2222 forward`  
`interface port1.0.4 vlan 3`

**Related Commands** [clear mac address-table static](#)  
[show mac address-table](#)

# mac address-table thrash-limit

**Overview** Use this command to set the thrash limit on the device or stack.

Thrashing occurs when a MAC address table rapidly “flips” its mapping of a single MAC address between two subnets, usually as a result of a network loop.

Use the **no** variant of this command to disable thrash limiting.

**Syntax** `mac address-table thrash-limit <rate>`  
`no mac address-table thrash-limit`

| Parameter                 | Description                                                                                                                                                                                                      |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;rate&gt;</code> | sets the maximum thrash rate at which limiting is applied. This rate can be set between 5 and 255 MAC thrashing flips per second. Once the thrash limit rate is reached, the port is considered to be thrashing. |

**Default** No thrash limiting

**Mode** Global Configuration

**Usage** Use this command to limit thrashing on the selected port range.

**Example** To apply a thrash limit of 100 MAC address flips per second:

```
awplus# configure terminal
awplus(config)# mac address-table thrash-limit 100
```

**Related Commands** [show mac address-table thrash-limit](#)

# platform hwfilter-size

**Overview** You can use this command to control the configuration of hardware Access Control Lists (ACLs), which determines the total available number and functionality of hardware ACLs.

For this command to take effect, you need to reboot the affected service.

One cannot attach an IPv6 ACL to a port if the ACL contains a specified source or destination IPv6 address or both and the **hw-filter size** setting is **ipv4-limited-ipv6**. If you do so, a diagnostic message will be generated.

**Syntax** `platform hwfilter-size {ipv4-limited-ipv6|ipv4-full-ipv6}`

| Parameter         | Description                                                                                                                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| hwfilter-size     | Configure hardware ACLs command.                                                                                                                                                                                                             |
| ipv4-full-ipv6    | Configure hardware ACLs to filter IPv4 traffic, MAC addresses and IPv6 traffic, including filtering on source or destination IPv6 addresses, or both; however, this will reduce the total number of filters available in the hardware table. |
| ipv4-limited-ipv6 | Configure hardware ACLs to filter IPv4 traffic, MAC addresses and IPv6 traffic. Source or destination IPv6 addresses or both are not filtered.                                                                                               |

**Default** The default mode is **ipv4-limited-ipv6**.

**Mode** Global Configuration

**Example** To configure hardware ACLs to filter IPv4 and IPv6 traffic, use the following commands:

```
awplus# configure terminal
awplus(config)# platform hwfilter-size ipv4-full-ipv6
```

**Related Commands** [show platform](#)  
[ipv6 access-list \(named\)](#)

# platform load-balancing

**Overview** This command selects which address fields are used as inputs into the load balancing algorithm for aggregated links. The output from this algorithm is used to select which individual path a given packet will traverse within an aggregated link.

The **no** variant of this command applies its default setting.

**Syntax** `platform load-balancing {src-dst-mac|src-dst-ip}`  
`no platform load-balancing`

| Parameter   | Description                                                                                                                                                                                                                        |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| src-dst-mac | Include the source and destination MAC addresses (Layer 2)                                                                                                                                                                         |
| src-dst-ip  | Include the source and destination IP addresses (Layer 3) and UDP/TCP source and destination ports.<br>If you choose this option, the algorithm will use MAC addresses to calculate load balancing for Layer 2 and non-IP packets. |

**Default** The default is **src-dst-ip**.

**Mode** Global configuration

**Examples** To set the load balancing algorithm to include only Layer 2 MAC addresses, enter:

```
awplus# configure terminal
awplus(config)# platform load-balancing src-dst-mac
```

To set the load balancing algorithm to include only Layer 3 IP addresses and L4 ports, enter:

```
awplus# configure terminal
awplus(config)# platform load-balancing src-dst-ip
```

**Related  
Commands** [show platform](#)

# platform stop-unreg-mc-flooding

**Overview** If a multicast stream is arriving at a network device, and that network device has received no IGMP reports that request the receipt of the stream, then that stream is referred to as "unregistered". IGMP snooping actively prevents the flooding of unregistered streams to all ports in the VLAN on which the stream is received. However, there are brief moments at which this prevention is not in operation, and an unregistered stream may be briefly flooded. This command stops this flooding during even those brief periods when IGMP snooping is not explicitly preventing the flooding.

Use the **no** variant of this command to revert to default behavior and disable this feature.

**NOTE:** *This command should not be used within any IPv6 networks. IPv6 neighbor discovery operation is inhibited by this feature.*

This command does not affect the flooding of Local Network Control Block IPv4 multicast packets in the address range 224.0.0.1 to 224.0.0.255 (224.0.0/24). Such packets will continue to be uninterruptedly flooded, as they need to be.

**Syntax** `platform stop-unreg-mc-flooding`  
`no platform stop-unreg-mc-flooding`

**Default** This feature is disabled by default.

**Mode** Global Configuration

**Usage** This command stops the periodic flooding of unknown or unregistered multicast packets when the Group Membership interval timer expires and there are no subscribers to a multicast group. If there is multicast traffic in a VLAN without subscribers, multicast traffic temporarily floods out of the VLAN when the Group Membership interval timer expires, which happens when the switch does not get replies from Group Membership queries.

This command also stops the initial flood of multicast packets that happens when a new multicast source starts to send traffic. This flooding lasts until snooping realises that this the multicast group is arriving at the switch, and puts an entry into hardware to prevent it from being flooded.

This command is useful in networks where low-performance devices are attached. The operation of such devices can be impaired by them receiving unnecessary streams of traffic. For example, in sites where IP cameras are in use, the flooding of video streams to a whole VLAN can send enough traffic to the cameras to cause interruption of their video streaming.

**Output** Do not use this command in IPv6 networks. The following console message is displayed after entering this command to warn you of this:

```
% WARNING: IPv6 will not work with this setting enabled
% Please consult the documentation for more information
```

**Examples** To enable this feature and stop multicast packet flooding, use the following commands:

```
awplus# configure terminal
awplus(config)# platform stop-unreg-mc-flooding
```

To disable this feature and allow multicast packet flooding, use the following commands:

```
awplus# configure terminal
awplus(config)# no platform stop-unreg-mc-flooding
```

**Related  
Commands** [show platform](#)  
[show running-config](#)

# polarity

**Overview** This command sets the MDI/MDIX polarity on a copper-based switch port.

**Syntax** `polarity {auto|mdi|mdix}`

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| mdi       | Sets the polarity to MDI (medium dependent interface).                       |
| mdix      | Sets the polarity to MDI-X (medium dependent interface crossover).           |
| auto      | The switch port sets the polarity automatically. This is the default option. |

**Default** By default, switch ports set the polarity automatically (**auto**).

**Mode** Interface Configuration

**Usage** We recommend the default **auto** setting for MDI/MDIX polarity. Polarity applies to copper 10BASE-T, 100BASE-T, and 1000BASE-T switch ports; It does not apply to fiber ports. See the “MDI/MDIX Connection Modes” section in the [Switching Feature Overview and Configuration Guide](#) for more information.

**Example** To set the polarity for `port1.0.6` to fixed MDI mode, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.6
awplus(config-if)# polarity mdi
```

# show debugging loopprot

**Overview** This command shows Loop Protection debugging information.

**Syntax** `show debugging loopprot`

**Mode** User Exec and Privileged Exec

**Example** To display the enabled Loop Protection debugging modes, use the command:

```
awplus# show debugging loopprot
```

**Related  
Commands** [debug loopprot](#)

# show debugging platform packet

**Overview** This command shows platform to CPU level packet debugging information.

**Syntax** show debugging platform packet

**Mode** User Exec and Privileged Exec

**Example** To display the platform packet debugging information, use the command:

```
awplus# show debugging platform packet
```

**Related  
Commands** [debug platform packet](#)  
[undebg platform packet](#)

# show flowcontrol interface

**Overview** Use this command to display flow control information.

**Syntax** `show flowcontrol interface <port>`

| Parameter | Description                                     |
|-----------|-------------------------------------------------|
| <port>    | Specifies the name of the port to be displayed. |

**Mode** User Exec and Privileged Exec

**Example** To display the flow control for the `port1.0.5`, use the command:

```
awplus# show flowcontrol interface port1.0.5
```

**Output** Figure 13-1: Example output from the **show flowcontrol interface** command for a specific interface

| Port      | Send<br>admin | FlowControl<br>oper | Receive<br>admin | FlowControl<br>oper | RxPause | TxPause |
|-----------|---------------|---------------------|------------------|---------------------|---------|---------|
| port1.0.5 | on            | on                  | on               | on                  | 0       | 0       |

# show interface err-disabled

**Overview** Use this command to show the ports which have been dynamically shut down by protocols running on the device and the protocols responsible for the shutdown.

**Syntax** `show interface [<interface-range> err-disabled]`

| Parameter         | Description                                        |
|-------------------|----------------------------------------------------|
| <interface-range> | Interface range                                    |
| err-disabled      | Brief summary of interfaces shut down by protocols |

**Mode** User Exec and Privileged Exec

**Example** To show which protocols have shut down ports, use the commands:

```
awplus# show interface err-disabled
```

**Output** Figure 13-2: Example output from **show interface err-disabled**

|                                    |                 |
|------------------------------------|-----------------|
| awplus#show interface err-disabled |                 |
| Interface                          | Reason          |
| port1.0.1                          | loop protection |
| port1.0.2                          | loop protection |

# show interface switchport

**Overview** Use this command to show VLAN information about each switch port.

**Syntax** `show interface switchport`

**Mode** User Exec and Privileged Exec

**Example** To display VLAN information about each switch port, enter the command:

```
awplus# show interface switchport
```

**Output** Figure 13-3: Example output from the **show interface switchport** command

```
Interface name      : port1.0.1
Switchport mode    : access
Ingress filter      : enable
Acceptable frame types : all
Default Vlan       : 2
Configured Vlans    : 2

Interface name      : port1.0.2
Switchport mode    : trunk
Ingress filter      : enable
Acceptable frame types : all
Default Vlan       : 1
Configured Vlans    : 1 4 5 6 7 8
...
```

**Related Commands** [show interface memory](#)

# show loop-protection

**Overview** Use this command to display the current loop protection setup for the device.

**Syntax** `show loop-protection [interface <port-list>] [counters]`

| Parameter   | Description                                       |
|-------------|---------------------------------------------------|
| interface   | The interface selected for display.               |
| <port-list> | A port, a port range, or an aggregated link.      |
| counters    | Displays counter information for loop protection. |

**Mode** User Exec and Privileged Exec

**Usage** This command is used to display the current configuration and operation of the Loop Protection feature

**Examples** To display the current configuration status, use the command:

```
awplus# show loop-protection
```

Figure 13-4: Example output from the **show loop-protection** command

```
awplus#show loop-protection
```

|                |          |

# show mac address-table

**Overview** Use this command to display the mac address-table for all configured VLANs.

**Syntax** show mac address-table

**Mode** User Exec and Privileged Exec

**Usage** The **show mac address-table** command is only applicable to view a mac address-table for Layer 2 switched traffic within VLANs.

**Example** To display the mac address-table, use the following command:

```
awplus# show mac address-table
```

**Output** See the below sample output captured when there was no traffic being switched:

```
awplus#show mac address-table
```

| VLAN | Port    | MAC            | State  |
|------|---------|----------------|--------|
| 1    | unknown | 0000.cd28.0752 | static |
| ARP  | -       | 0000.cd00.0000 | static |

See the sample output captured when packets were switched and mac addresses were learned:

```
awplus#show mac address-table
```

| VLAN | Port      | MAC            | State   |
|------|-----------|----------------|---------|
| 1    | unknown   | 0000.cd28.0752 | static  |
| 1    | port1.0.6 | 0030.846e.9bf4 | dynamic |
| 1    | port1.0.4 | 0030.846e.bac7 | dynamic |
| ARP  | -         | 0000.cd00.0000 | static  |

Note the new mac addresses learned for port1.0.4 and port1.0.6 added as dynamic entries.

Note the first column of the output below shows VLAN IDs if multiple VLANs are configured:

```
awplus#show mac address-table
```

| VLAN | Port      | MAC            | State   |
|------|-----------|----------------|---------|
| 1    | unknown   | 0000.cd28.0752 | static  |
| 1    | port1.0.4 | 0030.846e.bac7 | dynamic |
| 2    | unknown   | 0000.cd28.0752 | static  |
| 2    | port1.0.6 | 0030.846e.9bf4 | dynamic |
| ARP  | -         | 0000.cd00.0000 | static  |

Also note manually configured static mac-addresses are shown to the right of the type column:

```
awplus(config)#mac address-table static 0000.1111.2222 for int  
port1.0.3 vlan 2  
awplus(config)#end  
awplus#  
awplus#show mac address-table
```

| VLAN | Port      | MAC            | State   |
|------|-----------|----------------|---------|
| 1    | unknown   | 0000.cd28.0752 | static  |
| 1    | port1.0.2 | 0030.846e.bac7 | dynamic |
| 2    | port1.0.3 | 0000.1111.2222 | static  |
| 2    | unknown   | 0000.cd28.0752 | static  |
| 2    | port1.0.5 | 0030.846e.9bf4 | dynamic |
| ARP  | -         | 0000.cd00.0000 | static  |

# show mac address-table thrash-limit

**Overview** Use this command to display the current thrash limit set for all interfaces on the device.

**Syntax** `show mac address-table thrash-limit`

**Mode** User Exec and Privileged Exec

**Example** To display the current, use the following command:

```
awplus# show mac address-table thrash-limit
```

**Output** Figure 13-6: Example output from the **show mac address-table thrash-limit** command

```
% Thrash-limit 7 movements per second
```

**Related Commands** [mac address-table thrash-limit](#)

# show platform

**Overview** This command displays the settings configured by using the **platform** commands.

**Syntax** `show platform`

**Mode** Privileged Exec

**Usage** This command displays the settings in the running config. For changes in some of these settings to take effect, the device must be rebooted with the new settings in the startup config.

**Example** To check the settings configured with **platform** commands on the device, use the following command:

```
awplus# show platform
```

**Output** Figure 13-7: Example output from the **show platform** command

```
awplus#show platform

MAC vlan hashing algorithm      crc32l
L3 hashing algorithm           crc32l
stop-unreg-mc-flooding         off
Vlan-stacking TPID             0x8100
Hardware Filter Size           ipv4-limited-ipv6
```

**Table 5:** Parameters in the output of the **show platform** command

| Parameter                  | Description                                                                                                                                                                                                                                                               |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAC vlan hashing algorithm | The MAC VLAN hash-key-generating algorithm (set with the <a href="#">platform mac-vlan-hashing-algorithm</a> command). The default algorithm is crc32l. The algorithm may need to be changed in rare circumstances in which hash collisions occur.                        |
| L3 hashing algorithm       | The L3 VLAN hash-key-generating algorithm (set with the <a href="#">platform l3-vlan-hashing-algorithm</a> command). The default algorithm is crc32l. The algorithm may need to be changed in rare circumstances in which hash collisions occur.                          |
| Load Balancing             | Which packet fields are used in the channel load balancing algorithm (set with the <a href="#">platform load-balancing</a> command).                                                                                                                                      |
| stop-unreg-mc-flooding     | Whether the stop-unreg-mc-flooding feature is on or off (set with the <a href="#">platform stop-unreg-mc-flooding</a> command). This feature prevents flooding of unregistered multicast packets in the occasional situations in which IGMP snooping does not prevent it. |

**Table 5:** Parameters in the output of the **show platform** command (cont.)

| Parameter            | Description                                                                                                                                                          |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Vlan-stacking TPID   | The value of the TPID set in the Ethernet type field when a frame has a double VLAN tag.                                                                             |
| Hardware Filter Size | Whether hardware ACLs can filter on IPv6 addresses (ipv4-full-ipv6) or not (ipv4-limited-ipv6). This is set with the <a href="#">platform hwfilter-size</a> command. |

# show platform classifier statistics utilization brief

**Overview** This command displays the number of used entries available for various platform functions, and the percentage that number of entries represents of the total available.

**Syntax** `show platform classifier statistics utilization brief`

**Mode** Privileged Exec

**Example** To display the platform classifier utilization statistics, use the following command:  
`awplus# show platform classifier statistics utilization brief`

**Output** Figure 13-8: Output from the **show platform classifier statistics utilization brief** command

```
awplus#show platform classifier statistics utilization brief

[Instance 0]
Number of Entries:
Policy Type      Group ID      Used / Total
-----
ACL              1476395009    0 / 118 ( 0%)
Web Auth         Inactive       0 / 0 ( 0%)
QoS              0 / 128 ( 0%)
```

**Related Commands** [show platform](#)

# show platform port

**Overview** This command displays the various port registers or platform counters for specified switchports.

**Syntax** `show platform port [<port-list>|counters]`

| Parameter   | Description                                                                                                                                                                                                                                                                      |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port-list> | The ports to display information about. A port-list can be: <ul style="list-style-type: none"><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-1.0.6</li><li>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.4-1.0.6.</li></ul> |
| counters    | Show the platform counters.                                                                                                                                                                                                                                                      |

**Mode** Privileged Exec

**Examples** To display port registers for port1.0.1 and port1.0.2 use the following command:

```
awplus# show platform port port1.0.1-port1.0.2
```

To display platform counters for port1.0.1 and port1.0.2 use the following command:

```
awplus# show platform port port1.0.1-port1.0.2 counters
```

**Output** Figure 13-9: Example output from the **show platform port** command

```
awplus#show platform port port1.0.1
Phy register value for port1.0.1 (ifindex: 5001)

**Table 6:** Parameters in the output from the **show platform port** command

| Parameter                                                   | Description                                                    |
|-------------------------------------------------------------|----------------------------------------------------------------|
| <b>Ethernet MAC counters</b>                                |                                                                |
| Combined receive/transmit packets by size (octets) counters | Number of packets in each size range received and transmitted. |
| 64                                                          | Number of 64 octet packets received and transmitted.           |
| 65 - 127                                                    | Number of 65 - 127 octet packets received and transmitted.     |
| 128 - 255                                                   | Number of 128 - 255 octet packets received and transmitted.    |

**Table 6:** Parameters in the output from the **show platform port** command

| Parameter               | Description                                                                                    |
|-------------------------|------------------------------------------------------------------------------------------------|
| 256 - 511               | Number of 256 - 511 octet packets received and transmitted.                                    |
| 512 - 1023              | Number of 512 - 1023 octet packets received and transmitted.                                   |
| 1024 - MaxPktSz         | Number of packets received and transmitted with size 1024 octets to the maximum packet length. |
| 1519 - 1522             | Number of 1519 - 1522 octet packets received and transmitted.                                  |
| 1519 - 2047             | Number of 1519 - 2047 octet packets received and transmitted.                                  |
| 2048 - 4095             | Number of 2048 - 4095 octet packets received and transmitted.                                  |
| 4096 - 9216             | Number of 4096 - 9216 octet packets received and transmitted.                                  |
| <b>General Counters</b> |                                                                                                |
| Receive                 | Counters for traffic received.                                                                 |
| Octets                  | Number of octets received.                                                                     |
| Pkts                    | Number of packets received.                                                                    |
| FCSErrors               | Number of FCS (Frame Check Sequence) error events received.                                    |
| UnicastPkts             | Number of unicast packets received.                                                            |
| MulticastPkts           | Number of multicast packets received.                                                          |
| BroadcastPkts           | Number of broadcast packets received.                                                          |
| PauseMACCtlFrms         | Number of Pause MAC Control Frames received.                                                   |
| OversizePkts            | Number of oversize packets received.                                                           |
| Fragments               | Number of fragments received.                                                                  |
| Jabbers                 | Number of jabber frames received.                                                              |
| UnsupportOpcode         | Number of MAC Control frames with unsupported opcode received.                                 |
| AlignmentErrors         | Receive Alignment Error Frame Counter.                                                         |
| SysErDurCarrier         | Receive Code Error Counter.                                                                    |

**Table 6:** Parameters in the output from the **show platform port** command

| Parameter                     | Description                                     |
|-------------------------------|-------------------------------------------------|
| CarrierSenseErr               | Receive False Carrier Counter.                  |
| UndersizePkts                 | Number of undersized packets received.          |
| Transmit                      | Counters for traffic transmitted.               |
| Octets                        | Number of octets transmitted.                   |
| Pkts                          | Number of packets transmitted.                  |
| UnicastPkts                   | Number of unicast packets transmitted.          |
| MulticastPkts                 | Number of multicast packets transmitted.        |
| BroadcastPkts                 | Number of broadcast packets transmitted.        |
| PauseMACCtlFrms               | Number of Pause MAC Control Frames transmitted. |
| OversizePkts                  | Number of oversize packets transmitted.         |
| FrameWDeferrdTx               | Transmit Single Deferral Frame counter.         |
| FrmWExcesDefer                | Transmit Multiple Deferral Frame counter.       |
| SingleCollsnFrm               | Transmit Single Collision Frame counter.        |
| MultCollsnFrm                 | Transmit Multiple Collision Frame counter.      |
| LateCollisions                | Transmit Late Collision Frame counter.          |
| ExcessivCollsns               | Transmit Excessive Collision Frame counter.     |
| Collisions                    | Transmit Total Collision counter                |
| <b>Layer 3 Counters</b>       |                                                 |
| ifInUcastPkts                 | Inbound interface Unicast counter.              |
| ifInDiscards                  | Inbound interface Discarded Packets counter.    |
| ipInHdrErrors                 | Inbound interface Header Errors counter.        |
| ifOutUcastPkts                | Outbound interface Unicast counter.             |
| ifOutErrors                   | Outbound interface Error counter.               |
| <b>Miscellaneous Counters</b> |                                                 |
| DropEvents                    | Drop Event counter                              |
| ifOutDiscards                 | Outbound interface Discarded Packets counter.   |
| MTUExcdDiscard                | Receive MTU Check Error Frame Counter           |

# show port-security interface

**Overview** Use this command to show the current port-security configuration and the switch port status.

**Syntax** `show port-security interface <port>`

| Parameter | Description                                                                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port>    | The port to display information about. The port may be a switch port (e.g. <code>port1.0.4</code> ), a static channel group (e.g. <code>sa3</code> ), or a dynamic (LACP) channel group (e.g. <code>po4</code> ). |

**Mode** Privileged Exec

**Example** To see the port-security status on port1.0.1, use the following command:

```
awplus# show port-security interface port1.0.1
```

**Output** Figure 13-10: Example output from the **show port-security interface** command

|                               |            |
|-------------------------------|------------|
| Port Security configuration   |            |
| Security Enabled              | : YES      |
| Port Status                   | : ENABLED  |
| Violation Mode                | : TRAP     |
| Aging                         | : OFF      |
| Maximum MAC Addresses         | : 3        |
| Total MAC ddresses            | : 1        |
| Lock Status                   | : UNLOCKED |
| Security Violation Count      | : 0        |
| Last Violation Source Address | : None     |

# show port-security intrusion

**Overview** Use this command to show the intrusion list. If the port is not specified, the entire intrusion table is shown.

**Syntax** `show port-security intrusion [interface <port>]`

| Parameter | Description                                                                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface | Specify a port                                                                                                                                                          |
| <port>    | The port to display information about. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4). |

**Mode** Privileged Exec

**Example** To see the intrusion list on port1.0.1, use the following command:

```
awplus# show port-security intrusion interface port1.0.1
```

**Output** Figure 13-11: Example output from the **show port-security intrusion** command for port 1.0.1

```
Port Security Intrusion List
Interface: port1.0.1 -3 intrusion(s) detected
11-22-33-44-55-04 11-22-33-44-55-06 11-22-33-44-55-08
```

# show storm-control

**Overview** Use this command to display storm-control information for all interfaces or a particular interface.

**Syntax** `show storm-control [<port>]`

| Parameter | Description                                                                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port>    | The port to display information about. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |

**Mode** User Exec and Privileged Exec

**Example** To display storm-control information for port1.0.2, use the following command:

```
awplus# show storm-control port1.0.2
```

**Output** Figure 13-12: Example output from the **show storm-control** command for port1.0.2

| Port      | BcastLevel | McastLevel | DlfLevel |
|-----------|------------|------------|----------|
| port1.0.2 | 40. 0%     | 100. 0%    | 100. 0%  |

**Related Commands** [storm-control level](#)

# speed

**Overview** This command changes the speed of the specified port. You can optionally specify the speed or speeds that get autonegotiated, so autonegotiation is only attempted at the specified speeds.

To see the currently-negotiated speed for ports whose links are up, use the [show interface](#) command. To see the configured speed (when different from the default), use the [show running-config](#) command.

**Syntax** `speed {10|100|auto [10][100]}`

The following table shows the speed options for each type of port.

| Port type          | Speed Options (units are Mbps) |
|--------------------|--------------------------------|
| RJ-45 copper ports | auto (default)<br>10<br>100    |
| 100Mbps fiber SFPs | 100                            |

**Mode** Interface Configuration

**Default** By default, ports autonegotiate speed (except for 100Base-FX ports which do not support auto-negotiation, so default to 100Mbps).

**Usage** Switch ports in a static or dynamic (LACP) channel group must have the same port speed and be in full duplex mode. Once switch ports have been aggregated into a channel group, you can set the speed of all the switch ports in the channel group by applying this command to the channel group.

**NOTE:** *If multiple speeds are specified after the auto option to autonegotiate speeds, then the device only attempts autonegotiation at those specified speeds.*

**Examples** To set the speed of a copper port to 10Mbps, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# speed 10
```

To return the port to auto-negotiating its speed, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# speed auto
```

To set the port to auto-negotiate its speed at 10Mbps and 100Mbps, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# speed auto 10 100
```

To set the port to auto-negotiate its speed at 100Mbps only, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# speed auto 100
```

# storm-control level

**Overview** Use this command to specify the speed limiting level for broadcasting, multicast, or destination lookup failure (DLF) traffic for the port. Storm-control limits the selected traffic type to the specified percentage of the maximum port speed.

Use the **no** variant of this command to disable storm-control for broadcast, multicast or DLF traffic.

**Syntax** `storm-control {broadcast|multicast|dlf} level <level>`  
`no storm-control {broadcast|multicast|dlf} level`

| Parameter | Description                                                                                                                        |
|-----------|------------------------------------------------------------------------------------------------------------------------------------|
| <level>   | <0-100> Specifies the percentage of the maximum port speed allowed for broadcast, multicast or destination lookup failure traffic. |
| broadcast | Applies the storm-control to broadcast frames.                                                                                     |
| multicast | Applies the storm-control to multicast frames.                                                                                     |
| dlf       | Applies the storm-control to destination lookup failure traffic.                                                                   |

**Default** By default, storm-control is disabled.

**Mode** Interface Configuration

**Usage** Flooding techniques are used to block the forwarding of unnecessary flooded traffic. A packet storm occurs when a large number of broadcast packets are received on a port. Forwarding these packets can cause the network to slow down or time out.

**Example** To limit broadcast traffic on port1.0.2 to 30% of the maximum port speed, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# storm-control broadcast level 30
```

**Related Commands** [show storm-control](#)

# switchport port-security

**Overview** Use this command to enable the port-security feature. This feature is also known as the port-based learn limit. It allows the user to set the maximum number of MAC addresses that each port can learn.

Use the **no** variant of this command to disable the port-security feature.

**Syntax** `switchport port-security`  
`no switchport port-security`

**Mode** Interface Configuration

**Examples** To enable the port-security feature on port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# switchport port-security
```

To disable the port-security feature on port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no switchport port-security
```

- [switchport port-security violation](#)

# switchport port-security aging

**Overview** Use this command to set MAC addresses that have been learned by port security to age out.

Use the **no** variant of this command to set the MAC addresses to not age out.

**Syntax** `switchport port-security aging`  
`no switchport port-security aging`

**Mode** Interface Configuration

**Examples** To set port1.0.4 so that the MAC addresses that have been learned by port security age out, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# switchport port-security aging
```

To stop the MAC addresses that have been learned by port security from aging out on port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no switchport port-security aging
```

**Related Commands**

- `switchport port-security`
- `switchport port-security maximum`
- `switchport port-security violation`

# switchport port-security maximum

**Overview** Use this command to set the maximum number of MAC addresses that each port can learn.

Use the **no** variant of this command to unset the maximum number of MAC addresses that each port can learn. This is same as setting the maximum number to 0. This command also resets the intrusion list table.

If a new MAC is seen on a port with port security enabled and the MAC is statically configured for another port, a violation is triggered. The maximum learn limit will be ignored and the specified intrusion action for the port will be carried out.

**Syntax** `switchport port-security maximum <0-256>`  
`no switchport port-security maximum`

| Parameter       | Description                                       |
|-----------------|---------------------------------------------------|
| maximum <0-256> | Specify the maximum number of addresses to learn. |

**Mode** Interface Configuration

**Examples** To learn 3 MAC addresses on port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# switchport port-security maximum 3
```

To remove the MAC learning limit on port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no switchport port-security maximum
```

- [switchport port-security aging](#)
- [switchport port-security violation](#)

# switchport port-security violation

**Overview** Use this command to set the action taken on a switch port when the port exceeds the learning limits. The port action can be either **shutdown**, **restrict** or **protect**. If **shutdown** is set, the physical link will be disabled and "shutdown" will be shown in the config. If **restrict** is set, the packet from the un-authorized MAC will be discarded and SNMP TRAP will be generated to alert management. If **protect** is set, the packet will simply be discarded by the packet processor silently.

Use the **no** variant of this command to set the violation action to default. The default violation action is protect.

**Syntax** `switchport port-security violation {shutdown|restrict|protect}`  
`no switchport port-security violation`

| Parameter | Description                      |
|-----------|----------------------------------|
| shutdown  | Disable the port.                |
| restrict  | Alert the network administrator. |
| protect   | Discard the packet.              |

**Mode** Interface Configuration

**Examples** To set the action to be shutdown on port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# switchport port-security violation shutdown
```

To set the port-security action to the default (protect) on port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no switchport port-security violation
```

# thrash-limiting

**Overview** Sets and configures the thrash limit action that will be applied to any port on the device when a thrashing condition is detected. The thrash-limiting timeout specifies the time, in seconds, for which the thrash action is employed.

**Syntax**

```
thrash-limiting {[action  
{learn-disable|link-down|port-disable|vlan-disable|none}}  
[timeout <0-86400>]}  
  
no thrash-limiting {action|timeout}
```

| Parameter     | Description                                                                                       |
|---------------|---------------------------------------------------------------------------------------------------|
| action        | The mac thrashing detected action. The default is vlan-disable.                                   |
| learn-disable | Disable mac address learning                                                                      |
| link-down     | Block all traffic on an interface - link down                                                     |
| port-disable  | Block all traffic on an interface - link remains up                                               |
| vlan-disable  | Block all traffic on a vlan. Note that setting this parameter will also enable ingress filtering. |
| none          | No thrash action                                                                                  |
| timeout       | Set the duration for the thrash action                                                            |
| <0-86400>     | The duration of the applied thrash action in seconds. The default is 1 seconds.                   |

**Default** The default action is learn-disable.

**Mode** Interface Configuration

**Usage** See the “Thrash Limiting” section in the [Switching Feature Overview and Configuration Guide](#) for relevant conceptual, configuration, and overview information prior to applying this command.

**Examples** To set the action to learn disable for port1.0.4, use the following commands:

```
awplus# configure terminal  
awplus(config)# interface port1.0.4  
awplus(config-if)# thrash-limiting action learn-disable
```

To block all traffic on a vlan, use the following command:

```
awplus# configure terminal  
awplus(config)# thrash-limiting action vlan-disable
```

To set the thrash limiting timeout to 5 seconds, use the following command:

```
awplus(config-if)# thrash-limiting timeout 5
```

To set the thrash limiting action to its default, use the following command:

```
awplus(config-if)# no thrash-limiting action
```

To set the thrash limiting timeout to its default, use the following command:

```
awplus(config-if)# no thrash-limiting timeout
```

# port-vlan-forwarding-priority

**Overview** Use this command to specify which protocol has the highest priority for controlling transitions from blocking to forwarding traffic. This command prioritizes switch port forwarding mode control, when more than one of EPSR, Loop Protection, and MAC thrashing protection protocols are used on the switch.

EPSR, Loop Protection and MAC Thrashing use the same mechanism to block or forward traffic. This command specifies either EPSR or Loop Protection as the highest priority protocol. Setting the priority stops contention between protocols.

For more information, see the Usage section below.

**CAUTION:** The **loop-protection** and **none** parameter options must not be set on an EPSR master node. Use the *epsr* parameter option on an EPSR master node instead. Setting this command incorrectly on an EPSR master node could cause unexpected broadcast storms.

Use the **no** variant of this command to restore the default highest priority protocol back to the default of EPSR.

For more information about EPSR, see the [EPSR Feature Overview and Configuration Guide](#).

**Syntax** `port-vlan-forwarding-priority {epsr|loop-protection|none}`  
`no port-vlan-forwarding-priority`

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>epsr</code>            | Sets EPSR as the highest priority protocol. Use this parameter on an EPSR master node to avoid unexpected broadcast storms.                                                                                                                                                                                                                                   |
| <code>loop-protection</code> | Sets Loop Protection as the highest priority protocol. Note that this option must not be set on an EPSR master node. Use the <code>epsr</code> parameter option on an EPSR master node to avoid unexpected broadcast storms.                                                                                                                                  |
| <code>none</code>            | Sets the protocols to have equal priority. This was the previous behavior before this command was added, and allows protocols to override each other to set a port to forwarding a VLAN. Note that this option must not be set on a EPSR master node. Use the <code>epsr</code> parameter option on an EPSR master node to avoid unexpected broadcast storms. |

**Default** By default, the highest priority protocol is EPSR

**Mode** Global Configuration

**Usage** Only one of EPSR, Loop Protection and MAC Thrashing protection usually needs to be configured on a switch, because they perform similar functions—each prevents network loops by blocking a selected port for each (loop-containing) VLAN.

However, if more than one of these three features is configured on a switch, you can use this command to prioritize either EPSR or Loop Protection when their effects on a port would conflict and override each other. Without this command, each protocol could set a port to forwarding for a VLAN, sometimes overriding the previous setting by another protocol to block the port. This could sometimes lead to unexpected broadcast storms.

This command means that, when a protocol is set to have the highest priority over a data VLAN on a port, it will not allow other protocols to put that port-vlan into a forwarding state if the highest priority protocol blocked it.

The priority mechanism is only used for blocking-to-forwarding transitions; protocols remain independent on the forwarding-to-blocking transitions.

For example, with an EPSR master node in a two-node ESPR ring with the following settings:

- The EPSR master node primary port is configured to switchport interface port1.0.1
- The EPSR master node secondary port is configured to switchport interface port1.0.2
- The EPSR master node control VLAN is configured to VLAN interface vlan10
- The EPSR master node has a first data VLAN configured to VLAN interface vlan20
- The EPSR master node has a second data VLAN configured to VLAN interface vlan30.

Initially, the EPSR ring is complete, with port1.0.2 blocking data VLANs vlan20 and vlan30 and some broadcast traffic flowing through. If the user removes vlan30 from EPSR, a storm is created on vlan30. MAC thrashing protection detects it and blocks vlan30.

Then after the storm has stopped, MAC thrashing protection sets it to forwarding again and it keeps oscillating between forwarding and blocking. In the meantime, the user adds back vlan30 to EPSR as a data VLAN and EPSR blocks it on port1.0.2.

If the priority is set to none (**port-vlan-forwarding-priority none**), MAC thrashing protection notices that the storm has stopped again and decides to put vlan30 on port1.0.2 into forwarding state. This overrides what EPSR requires for this port-VLAN and creates a storm.

If the priority is set to EPSR or default (**port-vlan-forwarding-priority epsr**), MAC thrashing protection notices that the storm has stopped again and attempts to put vlan30 on port1.0.2 into forwarding state. The higher priority protocol (EPSR) is blocking the VLAN on this port, so it stays blocking and no storm occurs.

**Example** To prioritize EPSR over Loop Protection or MAC Thrashing protection settings, so that Loop Protection or MAC Thrashing protection cannot set a port to the forwarding state a VLAN if EPSR has set it to the blocking state, use the commands:

```
awplus# configure terminal
awplus(config)# port-vlan-forwarding-priority epsr
```

To prioritize Loop Protection over EPSR or MAC Thrashing protection settings, so that EPSR or MAC Thrashing protection cannot set a port to the forwarding state a VLAN if Loop Protection has set it to the blocking state, use the commands:

```
awplus# configure terminal
awplus(config)# port-vlan-forwarding-priority loop-protection
```

To set EPSR, Loop Protection, and MAC Thrashing protection protocols to have equal priority for port forwarding and blocking, which allows the protocols to override each other to set a port to the forwarding or blocking states, use the commands:

```
awplus# configure terminal
awplus(config)# port-vlan-forwarding-priority none
```

To restore the default highest priority protocol back to the default of EPSR, use the commands:

```
awplus# configure terminal
awplus(config)# no port-vlan-forwarding-priority
```

**Related Commands**    [show port-vlan-forwarding-priority](#)

# private-vlan

**Overview** Use this command to create a private VLAN. Private VLANs can be either primary or secondary. Secondary VLANs can be either community or isolated.

Use the **no** variant of this command to remove the specified private VLAN.

For more information, see the [VLAN Feature Overview and Configuration Guide](#).

**Syntax** `private-vlan <vlan-id> {community|isolated|primary}`  
`no private-vlan <vlan-id> {community|isolated|primary}`

| Parameter | Description                                                                    |
|-----------|--------------------------------------------------------------------------------|
| <vlan-id> | VLAN ID in the range <2-4094> for the VLAN which is to be made a private VLAN. |
| community | Community VLAN.                                                                |
| isolated  | Isolated VLAN.                                                                 |
| primary   | Primary VLAN.                                                                  |

**Mode** VLAN Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 2 name vlan2 state enable
awplus(config-vlan)# vlan 3 name vlan3 state enable
awplus(config-vlan)# vlan 4 name vlan4 state enable
awplus(config-vlan)# private-vlan 2 primary
awplus(config-vlan)# private-vlan 3 isolated
awplus(config-vlan)# private-vlan 4 community
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no private-vlan 2 primary
awplus(config-vlan)# no private-vlan 3 isolated
awplus(config-vlan)# no private-vlan 4 community
```

# private-vlan association

**Overview** Use this command to associate a secondary VLAN to a primary VLAN. Only one isolated VLAN can be associated to a primary VLAN. Multiple community VLANs can be associated to a primary VLAN.

Use the **no** variant of this command to remove association of all the secondary VLANs to a primary VLAN.

For more information, see the [VLAN Feature Overview and Configuration Guide](#).

**Syntax** `private-vlan <primary-vlan-id> association {add  
<secondary-vlan-id>|remove <secondary-vlan-id>}  
no private-vlan <primary-vlan-id> association`

| Parameter           | Description                                                   |
|---------------------|---------------------------------------------------------------|
| <primary-vlan-id>   | VLAN ID of the primary VLAN.                                  |
| <secondary-vlan-id> | VLAN ID of the secondary VLAN (either isolated or community). |

**Mode** VLAN Configuration

**Examples** The following commands associate primary VLAN 2 with secondary VLAN 3:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# private-vlan 2 association add 3
```

The following commands remove the association of primary VLAN 2 with secondary VLAN 3:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# private-vlan 2 association remove 3
```

The following commands remove all secondary VLAN associations of primary VLAN 2:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no private-vlan 2 association
```

# show port-vlan-forwarding-priority

**Overview** Use this command to display the highest priority protocol that controls port-vlan forwarding or blocking traffic. This command displays whether EPSR or Loop Protection is set as the highest priority for determining whether a port forwards a VLAN, as set by the [port-vlan-forwarding-priority](#) command.

For more information about EPSR, see the [EPSR Feature Overview and Configuration Guide](#).

**Syntax** `show port-vlan-forwarding-priority`

**Mode** Privileged Exec

**Example** To display the highest priority protocol, use the command:

```
awplus# show port-vlan-forwarding-priority
```

**Output** Figure 14-1: Example output from the **show port-vlan-forwarding-priority** command

```
Port-vlan Forwarding Priority: EPSR
```

**Related Commands** [port-vlan-forwarding-priority](#)

# show interface switchport vlan translation

**Overview** Use this command to display VLAN translation information for some or all interfaces.

**Syntax** `show interface switchport vlan translation interface [<int>]`

| Parameter                          | Description                                                                                                                                                                     |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>interface &lt;int&gt;</code> | The interface to display information about. An interface can be a switch port (e.g. port1.0.6), a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po2). |

**Mode** User Exec/Privileged Exec

**Example** To display VLAN translation information for port1.0.1, use the command:

```
awplus# show interface switchport vlan translation port1.0.1
```

**Output** Figure 14-2: Example output from **show interface switchport vlan translation port1.0.1**

```
awplus#show interface switchport vlan translation port1.0.1

Interface: port1.0.1
VLAN on Wire      VLAN
-----
1649              100
default           drop
```

Table 14-1: Parameters in the output from **show interface switchport vlan translation**

| Parameter    | Description                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------|
| Interface    | The interface on which VLAN-IDs will be translated                                                                         |
| VLAN on Wire | VLAN-ID of the packet as it will be seen on the wire                                                                       |
| VLAN         | VLAN-ID of the VLAN as it was assigned when the VLAN was created                                                           |
| default      | The action taken on inbound tagged packets that do not match a VLAN translation entry; either <b>drop</b> or <b>accept</b> |

**Related Commands** [switchport vlan translation](#)  
[switchport vlan translation default drop](#)

# show vlan

**Overview** Use this command to display information about a particular VLAN by specifying its VLAN ID. Selecting **all** will display information for all the VLANs configured.

**Syntax** `show vlan`  
`{all|brief|dynamic|static|auto|static-ports|<1-4094>}`

| Parameter    | Description                                                  |
|--------------|--------------------------------------------------------------|
| <1-4094>     | Display information about the VLAN specified by the VLAN ID. |
| all          | Display information about all VLANs on the device.           |
| brief        | Display information about all VLANs on the device.           |
| dynamic      | Display information about all VLANs learned dynamically.     |
| static       | Display information about all statically configured VLANs.   |
| auto         | Display information about all auto-configured VLANs.         |
| static-ports | Display static egress/forbidden ports.                       |

**Mode** User Exec and Privileged Exec

**Example** To display information about VLAN 2, use the command:

```
awplus# show vlan 2
```

**Output** Figure 14-3: Example output from the **show vlan** command

| VLAN ID                  | Name     | Type   | State  | Member ports                                           |
|--------------------------|----------|--------|--------|--------------------------------------------------------|
| (u)-Untagged, (t)-Tagged |          |        |        |                                                        |

**Related Commands** [vlan](#)

# show vlan classifier group

**Overview** Use this command to display information about all configured VLAN classifier groups or a specific group.

**Syntax** `show vlan classifier group [<1-16>]`

| Parameter | Description                      |
|-----------|----------------------------------|
| <1-16>    | VLAN classifier group identifier |

**Mode** User Exec and Privileged Exec

**Usage** If a group ID is not specified, all configured VLAN classifier groups are shown. If a group ID is specified, a specific configured VLAN classifier group is shown.

**Example** To display information about VLAN classifier group 1, enter the command:

```
awplus# show vlan classifier group 1
```

**Related Commands** [vlan classifier group](#)

# show vlan classifier group interface

**Overview** Use this command to display information about a single switch port interface for all configured VLAN classifier groups.

**Syntax** `show vlan classifier group interface <switch-port>`

| Parameter                        | Description                                                   |
|----------------------------------|---------------------------------------------------------------|
| <code>&lt;switch-port&gt;</code> | Specify the switch port interface classifier group identifier |

**Mode** User Exec and Privileged Exec

**Usage** All configured VLAN classifier groups are shown for a single interface.

**Example** To display VLAN classifier group information for switch port interface `port1.0.2`, enter the command:

```
awplus# show vlan classifier group interface port1.0.2
```

**Output** Figure 14-4: Example output from the **show vlan classifier group interface port1.0.1** command:

```
vlan classifier group 1 interface port1.0.1
```

**Related Commands** [vlan classifier group](#)  
[show vlan classifier interface group](#)

# show vlan classifier interface group

**Overview** Use this command to display information about all interfaces configured for a VLAN group or all the groups.

**Syntax** `show vlan classifier interface group [<1-16>]`

| Parameter | Description                                |
|-----------|--------------------------------------------|
| <1-16>    | VLAN classifier interface group identifier |

**Mode** User Exec and Privileged Exec

**Usage** If a group ID is not specified, all interfaces configured for all VLAN classifier groups are shown. If a group ID is specified, the interfaces configured for this VLAN classifier group are shown.

**Example** To display information about all interfaces configured for all VLAN groups, enter the command:

```
awplus# show vlan classifier interface group
```

To display information about all interfaces configured for VLAN group 1, enter the command:

```
awplus# show vlan classifier interface group 1
```

**Output** Figure 14-5: Example output from the **show vlan classifier interface group** command

```
vlan classifier group 1 interface port1.0.1
vlan classifier group 1 interface port1.0.2
vlan classifier group 2 interface port1.0.3
vlan classifier group 2 interface port1.0.4
```

**Output** Figure 14-6: Example output from the **show vlan classifier interface group 1** command

```
vlan classifier group 1 interface port1.0.1
vlan classifier group 1 interface port1.0.2
```

**Related Commands** [vlan classifier group](#)  
[show vlan classifier group interface](#)

# show vlan classifier rule

**Overview** Use this command to display information about all configured VLAN classifier rules or a specific rule.

**Syntax** `show vlan classifier rule [<1-256>]`

| Parameter | Description                     |
|-----------|---------------------------------|
| <1-256>   | VLAN classifier rule identifier |

**Mode** User Exec and Privileged Exec

**Usage** If a rule ID is not specified, all configured VLAN classifier rules are shown. If a rule ID is specified, a specific configured VLAN classifier rule is shown.

**Example** To display information about VLAN classifier rule 1, enter the command:

```
awplus# show vlan classifier rule 1
```

**Output** Figure 14-7: Example output from the **show vlan classifier rule1** command

```
vlan classifier group 1 add rule 1
```

**Related Commands**

- [vlan classifier activate](#)
- [vlan classifier rule ipv4](#)
- [vlan classifier rule proto](#)

# show vlan private-vlan

**Overview** Use this command to display the private VLAN configuration and associations.

**Syntax** `show vlan private-vlan`

**Mode** User Exec and Privileged Exec

**Example** To display the private VLAN configuration and associations, enter the command:

```
awplus# show vlan private-vlan
```

**Output** Figure 14-8: Example output from the **show vlan private-vlan** command

|                               |           |           |            |
|-------------------------------|-----------|-----------|------------|
| awplus#show vlan private-vlan |           |           |            |
| PRIMARY                       | SECONDARY | TYPE      | INTERFACES |
| -----                         | -----     | -----     | -----      |
| 2                             | 3         | isolated  |            |
| 2                             | 4         | community |            |
|                               | 8         | isolated  |            |

**Related Commands** [private-vlan](#)  
[private-vlan association](#)

# switchport access vlan

**Overview** Use this command to change the port-based VLAN of the current port.

Use the **no** variant of this command to change the port-based VLAN of this port to the default VLAN, vlan1.

**Syntax** `switchport access vlan <vlan-id>`  
`no switchport access vlan`

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| <vlan-id> | <1-4094> The port-based VLAN ID for the port. |

**Default** Reset the default VLAN 1 to specified switchports using the negated form of this command.

**Mode** Interface Configuration

**Usage** Any untagged frame received on this port will be associated with the specified VLAN.

**Examples** To change the port-based VLAN to VLAN 3 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport access vlan 3
```

To reset the port-based VLAN to the default VLAN 1 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport access vlan
```

**Related Commands** [show interface switchport](#)  
[show vlan](#)

# switchport enable vlan

**Overview** This command enables the VLAN on the port manually once disabled by certain actions, such as QSP (QoS Storm Protection) or EPSR (Ethernet Protection Switching Ring). Note that if the VID is not given, all disabled VLANs are re-enabled.

**Syntax** `switchport enable vlan [<1-4094>]`

| Parameter                   | Description                      |
|-----------------------------|----------------------------------|
| <code>vlan</code>           | Re-enables the VLAN on the port. |
| <code>&lt;1-4094&gt;</code> | VLAN ID.                         |

**Mode** Interface Configuration

**Example** To re-enable the port1.0.1 from VLAN 1:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport enable vlan 1
```

**Related Commands** [show mls qos interface storm-status](#)  
[storm-window](#)

# switchport mode access

**Overview** Use this command to set the switching characteristics of the port to access mode. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

**Syntax** `switchport mode access [ingress-filter {enable|disable}]`

| Parameter                   | Description                                                                               |
|-----------------------------|-------------------------------------------------------------------------------------------|
| <code>ingress-filter</code> | Set the ingress filtering for the received frames.                                        |
| <code>enable</code>         | Turn on ingress filtering for received frames. This is the default.                       |
| <code>disable</code>        | Turn off ingress filtering to accept frames that do not meet the classification criteria. |

**Default** By default, ports are in access mode with ingress filtering on.

**Usage** Use access mode to send untagged frames only.

**Mode** Interface Configuration

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access ingress-filter enable
```

**Validation Command** `show interface switchport`

# switchport mode private-vlan

**Overview** Use this command to make a Layer 2 port a private VLAN host port or a promiscuous port.

Use the **no** variant of this command to remove the configuration.

**Syntax** `switchport mode private-vlan {host|promiscuous}`  
`no switchport mode private-vlan {host|promiscuous}`

| Parameter   | Description                                                                                                                                                                                                                                                                    |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host        | This port type can communicate with all other host ports assigned to the same community VLAN, but it cannot communicate with the ports in the same isolated VLAN. All communications outside of this VLAN must pass through a promiscuous port in the associated primary VLAN. |
| promiscuous | A promiscuous port can communicate with all interfaces, including the community and isolated ports within a private VLAN.                                                                                                                                                      |

**Mode** Interface Configuration

**Examples** `awplus# configure terminal`  
`awplus(config)# interface port1.0.2`  
`awplus(config-if)# switchport mode private-vlan host`  
`awplus(config)# interface port1.0.3`  
`awplus(config-if)# switchport mode private-vlan promiscuous`  
`awplus(config)# interface port1.0.4`  
`awplus(config-if)# no switchport mode private-vlan promiscuous`

**Related Commands** [switchport private-vlan mapping](#)

# switchport mode private-vlan trunk promiscuous

**Overview** Use this command to enable a port in trunk mode to be promiscuous port for isolated VLANs.

Use the **no** variant of this command to remove a port in trunk mode as a promiscuous port for isolated VLANs. You must first remove the secondary port, or ports, in trunk mode associated with the promiscuous port with the **no switchport mode private-vlan trunk secondary** command.

**Syntax** `switchport mode private-vlan trunk promiscuous group <group-id>`  
`no switchport mode private-vlan trunk promiscuous`

| Parameter                     | Description                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;group-id&gt;</code> | The group ID is a numeric value in the range 1 to 32 that is used to associate the promiscuous port with secondary ports. |

**Default** By default, a port in trunk mode is disabled as a promiscuous port.

**Mode** Interface Configuration

**Usage** A port must be put in trunk mode with [switchport mode trunk](#) command before it can be enabled as a promiscuous port.

To add VLANs to be trunked over the promiscuous port, use the [switchport trunk allowed vlan](#) command. These VLANs can be isolated VLANs, or non-private VLANs.

To configure the native VLAN for the promiscuous port, use the [switchport trunk native vlan](#) command. The native VLAN can be an isolated VLAN, or a non-private VLAN.

When you enable a promiscuous port, all of the secondary port VLANs associated with the promiscuous port via the group ID number must be added to the promiscuous port. In other words, the set of VLANs on the promiscuous port must be a superset of all the VLANs on the secondary ports within the group.

**Examples** To create the isolated VLANs 2, 3 and 4 and then enable port1.0.2 in trunk mode as a promiscuous port for these VLANs with the group ID of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 2-4
awplus(config-vlan)# private-vlan 2 isolated
awplus(config-vlan)# private-vlan 3 isolated
awplus(config-vlan)# private-vlan 4 isolated
awplus(config-vlan)# exit
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan add 2-4
awplus(config-if)# switchport mode private-vlan trunk
promiscuous group 3
```

To remove port1.0.2 in trunk mode as a promiscuous port for a private VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport mode private-vlan trunk
promiscuous
```

Note that you must remove the secondary port or ports enabled as trunk ports that are associated with the promiscuous port before removing the promiscuous port.

**Related Commands**

- [switchport mode private-vlan trunk secondary](#)
- [switchport mode trunk](#)
- [switchport trunk allowed vlan](#)
- [switchport trunk native vlan](#)
- [show vlan private-vlan](#)

# switchport mode private-vlan trunk secondary

**Overview** Use this command to enable a port in trunk mode to be a secondary port for isolated VLANs.

Use the **no** variant of this command to remove a port in trunk mode as a secondary port for isolated VLANs.

**Syntax** `switchport mode private-vlan trunk secondary group <group-id>`  
`no switchport mode private-vlan trunk secondary`

| Parameter                     | Description                                                                                                                |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;group-id&gt;</code> | The group ID is a numeric value in the range 1 to 32 that is used to associate a secondary port with its promiscuous port. |

**Default** By default, a port in trunk mode is disabled as a secondary port.

When a port in trunk mode is enabled to be a secondary port for isolated VLANs, by default it will have a native VLAN of **none**(no native VLAN specified).

**Mode** Interface Configuration

**Usage** A port must be put in trunk mode with [switchport mode trunk](#) command before the port is enabled as a secondary port in trunk mode.

To add VLANs to be trunked over the secondary port use the [switchport trunk allowed vlan](#) command. These must be isolated VLANs and must exist on the associated promiscuous port.

To configure the native VLAN for the secondary port, use the [switchport trunk native vlan](#) command. The native VLAN must be an isolated VLAN and must exist on the associated promiscuous port.

**Examples** To create isolated private VLAN 2 and then enable port1.0.3 in trunk mode as a secondary port for the this VLAN with the group ID of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 2
awplus(config-vlan)# private-vlan 2 isolated
awplus(config-vlan)# exit
awplus(config)# interface port1.0.3
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan add 2
awplus(config-if)# switchport mode private-vlan trunk secondary
group 3
```

To remove port1.0.3 in trunk mode as a secondary port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# no switchport mode private-vlan trunk
secondary
```

**Related Commands**

- [switchport mode private-vlan trunk promiscuous](#)
- [switchport mode trunk](#)
- [switchport trunk allowed vlan](#)
- [switchport trunk native vlan](#)
- [show vlan private-vlan](#)

# switchport mode trunk

**Overview** Use this command to set the switching characteristics of the port to trunk. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

**Syntax** `switchport mode trunk [ingress-filter {enable|disable}]`

| Parameter                   | Description                                                                               |
|-----------------------------|-------------------------------------------------------------------------------------------|
| <code>ingress-filter</code> | Set the ingress filtering for the frames received.                                        |
| <code>enable</code>         | Turn on ingress filtering for received frames. This is the default.                       |
| <code>disable</code>        | Turn off ingress filtering to accept frames that do not meet the classification criteria. |

**Default** By default, ports are in access mode, are untagged members of the default VLAN (vlan1), and have ingress filtering on.

**Mode** Interface Configuration

**Usage** A port in trunk mode can be a tagged member of multiple VLANs, and an untagged member of one native VLAN.

To configure which VLANs this port will trunk for, use the [switchport trunk allowed vlan](#) command.

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# switchport mode trunk ingress-filter enable
```

**Validation Command** [show interface switchport](#)

# switchport private-vlan host-association

**Overview** Use this command to associate a primary VLAN and a secondary VLAN to a host port. Only one primary and secondary VLAN can be associated to a host port.

Use the **no** variant of this command to remove the association.

**Syntax** `switchport private-vlan host-association <primary-vlan-id> add <secondary-vlan-id>`  
`no switchport private-vlan host-association`

| Parameter                              | Description                                                   |
|----------------------------------------|---------------------------------------------------------------|
| <code>&lt;primary-vlan-id&gt;</code>   | VLAN ID of the primary VLAN.                                  |
| <code>&lt;secondary-vlan-id&gt;</code> | VLAN ID of the secondary VLAN (either isolated or community). |

**Mode** Interface Configuration

**Examples** `awplus# configure terminal`  
`awplus(config)# interface port1.0.2`  
`awplus(config-if)# switchport private-vlan host-association 2`  
`add 3`  
`awplus# configure terminal`  
`awplus(config)# interface port1.0.2`  
`awplus(config-if)# no switchport private-vlan host-association`

# switchport private-vlan mapping

**Overview** Use this command to associate a primary VLAN and a set of secondary VLANs to a promiscuous port.

Use the **no** variant of this to remove all the association of secondary VLANs to primary VLANs for a promiscuous port.

**Syntax**

```
switchport private-vlan mapping <primary-vlan-id> add  
<secondary-vid-list>  
  
switchport private-vlan mapping <primary-vlan-id> remove  
<secondary-vid-list>  
  
no switchport private-vlan mapping
```

| Parameter            | Description                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <primary-vlan-id>    | VLAN ID of the primary VLAN.                                                                                                      |
| <secondary-vid-list> | VLAN ID of the secondary VLAN (either isolated or community), or a range of VLANs, or a comma-separated list of VLANs and ranges. |

**Mode** Interface Configuration

**Usage** This command can be applied to a switch port or a static channel group, but not a dynamic (LACP) channel group. LACP channel groups (dynamic/LACP aggregators) cannot be promiscuous ports in private VLANs.

**Examples**

```
awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# switchport private-vlan mapping 2 add 3-4  
awplus(config-if)# switchport private-vlan mapping 2 remove 3-4  
awplus(config-if)# no switchport private-vlan mapping
```

**Related Commands** [switchport mode private-vlan](#)

# switchport trunk allowed vlan

**Overview** Use this command to add VLANs to be trunked over this switch port. Traffic for these VLANs can be sent and received on the port.

Use the **no** variant of this command to reset switching characteristics of a specified interface to negate a trunked configuration specified with **switchport trunk allowed vlan** command.

**Syntax**

```
switchport trunk allowed vlan all
switchport trunk allowed vlan none
switchport trunk allowed vlan add <vid-list>
switchport trunk allowed vlan remove <vid-list>
switchport trunk allowed vlan except <vid-list>
no switchport trunk
```

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| all        | Allow all VLANs to transmit and receive through the port.                                                                                                                                                                                                                                                                                                                                                                                    |
| none       | Allow no VLANs to transmit and receive through the port.                                                                                                                                                                                                                                                                                                                                                                                     |
| add        | Add a VLAN to transmit and receive through the port. Only use this parameter if a list of VLANs are already configured on a port.                                                                                                                                                                                                                                                                                                            |
| remove     | Remove a VLAN from transmit and receive through the port. Only use this parameter if a list of VLANs are already configured on a port.                                                                                                                                                                                                                                                                                                       |
| except     | All VLANs, except the VLAN for which the VID is specified, are part of its port member set. Only use this parameter to remove VLANs after either this parameter or the <b>all</b> parameter have added VLANs to a port.                                                                                                                                                                                                                      |
| <vid-list> | <2-4094> The ID of the VLAN or VLANs that will be added to, or removed from, the port. A single VLAN, VLAN range, or comma-separated VLAN list can be set.<br>For a VLAN range, specify two VLAN numbers: lowest, then highest number in the range, separated by a hyphen.<br>For a VLAN list, specify the VLAN numbers separated by commas. Do not enter spaces between hyphens or commas when setting parameters for VLAN ranges or lists. |

**Default** By default, ports are untagged members of the default VLAN (vlan1).

**Mode** Interface Configuration

**Usage** The **all** parameter sets the port to be a tagged member of all the VLANs configured on the device. The **none** parameter removes all VLANs from the port's tagged member set. The **add** and **remove** parameters will add and remove VLANs to and from the port's member set. See the note below about restrictions when using the **add**, **remove**, **except**, and **all** parameters.

**NOTE:** Only use the **add** or the **remove** parameters with this command if a list of VLANs are configured on a port. Only use the **except** parameter to remove VLANs after either the **except** or the **all** parameters have first been used to add a list of VLANs to a port.

Remove VLAN 3 by re-entering the **except** parameter with the list of VLANs to remove, instead of using the **remove** parameter, as shown in the command example below:

```
awplus# configure terminal
awplus(config)# interface port1.0.6
awplus(config-if)# switchport trunk allowed vlan except 3,4
```

Then the configuration is changed after entering the above commands to remove VLAN 3:

```
awplus#show running-config

!

interface port1.0.6
switchport
switchport mode trunk
switchport trunk allowed vlan except 3-4
```

To add a VLAN, where the configuration for port1.0.6 shows the below output:

```
awplus#show running-config

!

interface port1.0.6
switchport
switchport mode trunk
switchport trunk allowed vlan except 3-5
```

Add VLAN 4 by re-entering the **except** parameter with a list of VLANs to exclude, instead of using the **add** parameter to include VLAN 4, as shown in the command example below:

```
awplus# configure terminal
awplus(config)# interface port1.0.5
awplus(config-if)# switchport trunk allowed vlan except 3,5
```

The configuration is changed after entering the above commands to add VLAN 4:

```
awplus#show running-config

!

interface port1.0.5
switchport
switchport mode trunk
switchport trunk allowed vlan except 3,5
```

**Examples** The following shows adding a single VLAN to the port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk allowed vlan add 2
```

The following shows adding a range of VLANs to the port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk allowed vlan add 2-4
```

The following shows adding a list of VLANs to the port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk allowed vlan add 2,3,4
```

# switchport trunk native vlan

**Overview** Use this command to configure the native VLAN for this port. The native VLAN is used for classifying the incoming untagged packets. Use the **none** parameter with this command to remove the native VLAN from the port and set the acceptable frame types to vlan-tagged only.

Use the **no** variant of this command to revert the native VLAN to the default VLAN ID 1. Command negation removes tagged VLANs, and sets the native VLAN to the default VLAN.

**Syntax** `switchport trunk native vlan {<vid>|none}`  
`no switchport trunk native vlan`

| Parameter | Description                                                                                                                                                                                                                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <vid>     | The ID of the VLAN that will be used to classify the incoming untagged packets, in the range 2-2094. The VLAN ID must be a part of the VLAN member set of the port.                                                                                                                                |
| none      | No native VLAN specified. This option removes the native VLAN from the port and sets the acceptable frame types to vlan-tagged only. Note: Use the <b>no</b> variant of this command to revert to the default VLAN 1 as the native VLAN for the specified interface switchport - not <b>none</b> . |

**Default** VLAN 1 (the default VLAN), which is reverted to using the **no** form of this command.

**Mode** Interface Configuration

**Examples** The following commands show configuration of VLAN 2 as the native VLAN for port1.0.2:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk native vlan 2
```

The following commands show the removal of the native VLAN for interface port1.0.2:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk native vlan none
```

The following commands revert the native VLAN to the default VLAN 1 for interface port1.0.2:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport trunk native vlan
```

# switchport vlan translation

- Overview** Use this command to create a VLAN translation entry on an interface. The translation entry translates a packet's VLAN-ID as seen on the wire.
- Use the **no** variant of this command to remove all translation entries or a specific entry.
- This command can be applied to a switch port or a static channel group, or a dynamic (LACP) channel group. The interface must be in a mode that supports tagged packets.

**Syntax** `switchport vlan translation vlan <wire-vid> vlan <vid>`  
`no switchport vlan translation [all|vlan <wire-vid>]`

| Parameter                          | Description                                                       |
|------------------------------------|-------------------------------------------------------------------|
| <code>vlan &lt;wire-vid&gt;</code> | VLAN-ID of the packet as you want it to be seen on the wire.      |
| <code>vlan &lt;vid&gt;</code>      | VLAN-ID of the VLAN as it was assigned when the VLAN was created. |
| <code>all</code>                   | Delete all translation entries.                                   |

**Default** None (by default, no translation entries exist)

**Mode** Interface Configuration for a switch port or a static channel group, or a dynamic (LACP) channel group. The interface must be in a mode that supports tagged packets.

**Example** To translate VLAN100 to VLAN200 on port 1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport vlan translation vlan 200 vlan 100
```

**Related Commands** [show interface switchport vlan translation](#)  
[switchport vlan translation default drop](#)

# switchport vlan translation default drop

**Overview** Use this command to configure a default behavior of dropping inbound tagged packets that have a VLAN-ID that does not match any entries in the VLAN translation table for an interface.

Use the **no** variant of this command to stop dropping non-matching inbound packets and let them be accepted as is for further processing.

**Syntax** `switchport vlan translation default drop`  
`no switchport vlan translation default drop`

**Default** Do not drop packets

**Mode** Interface Configuration for a switch port or a static channel group, or a dynamic (LACP) channel group. The interface must be in a mode that supports tagged packets.

**Example** To drop inbound tagged packets arriving at port1.0.1 unless they match a VLAN translation entry, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport vlan translation default drop
```

To accept inbound tagged packets arriving at port1.0.1 regardless of whether they match a VLAN translation entry, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no switchport vlan translation default drop
```

**Related Commands** [show interface switchport vlan translation](#)  
[switchport vlan translation default drop](#)

# switchport voice dscp

**Overview** Use this command for a specific port to configure the Layer 3 DSCP value advertised when the transmission of LLDP-MED Network Policy TLVs for voice devices is enabled. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified DSCP value.

Use the **no** variant of this command to reset the DSCP value to the default, 0.

**Syntax** `switchport voice dscp <0-63>`  
`no switchport voice dscp`

| Parameter | Description                          |
|-----------|--------------------------------------|
| dscp      | Specify a DSCP value for voice data. |
| <0-63>    | DSCP value.                          |

**Default** A DSCP value of 0 will be advertised.

**Mode** Interface Configuration

**Usage** LLDP-MED advertisements including Network Policy TLVs are transmitted via a port if:

- LLDP is enabled (`lldp run` command)
- Voice VLAN is configured for the port (`switchport voice vlan` command)
- The port is configured to transmit LLDP advertisements—enabled by default (`lldp transmit receive` command)
- The port is configured to transmit Network Policy TLVs—enabled by default (`lldp med-tlv-select` command)
- There is an LLDP-MED device connected to the port

**Example** To tell IP phones connected to `port1.0.5` to send voice data with DSCP value 27, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.5
awplus(config-if)# switchport voice dscp 27
```

**Related Commands** `lldp med-tlv-select`  
`show lldp`  
`switchport voice vlan`

# switchport voice vlan

**Overview** Use this command to configure the Voice VLAN tagging advertised when the transmission of LLDP-MED Network Policy TLVs for voice endpoint devices is enabled. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified tagging. This command also sets the ports to be spanning tree edge ports, that is, it enables spanning tree portfast on the ports.

Use the **no** variant of this command to remove LLDP-MED network policy configuration for voice devices connected to these ports. This does not change the spanning tree edge port status.

**Syntax** `switchport voice vlan [<vid>|dot1p|dynamic|untagged]`  
`no switchport voice vlan`

| Parameter | Description                                                                                                                                                                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <vid>     | VLAN identifier, in the range 1 to 4094.                                                                                                                                                                                                      |
| dot1p     | The IP phone should send User Priority tagged packets, that is, packets in which the tag contains a User Priority value, and a VID of 0. (The User Priority tag is also known as the 802.1p priority tag, or the Class of Service (CoS) tag.) |
| dynamic   | The VLAN ID with which the IP phone should send tagged packets will be assigned by RADIUS authentication.                                                                                                                                     |
| untagged  | The IP phone should send untagged packets.                                                                                                                                                                                                    |

**Default** By default, no Voice VLAN is configured, and therefore no network policy is advertised for voice devices.

**Mode** Interface Configuration

**Usage** LLDP-MED advertisements including Network Policy TLVs are transmitted via a port if:

- LLDP is enabled ([lldp run](#) command)
- Voice VLAN is configured for the port using this command ([switchport voice vlan](#))
- The port is configured to transmit LLDP advertisements—enabled by default ([lldp transmit receive](#) command)
- The port is configured to transmit Network Policy TLVs—enabled by default ([lldp med-tlv-select](#) command)
- There is an LLDP-MED device connected to the port.

To set the priority value to be advertised for tagged frames, use the [switchport voice vlan priority](#) command.

If the Voice VLAN details are to be assigned by RADIUS, then the RADIUS server must be configured to send the attribute “Egress-VLANID (56)” or “Egress-VLAN-Name (58)” in the RADIUS Accept message when authenticating a phone attached to this port.

To set these attributes on the local RADIUS server, use the [egress-vlan-id](#) command or the [egress-vlan-name](#) command.

For more information about configuring authentication for Voice VLAN, see the [LLDP Feature Overview and Configuration Guide](#).

If the ports have been set to be edge ports by the [switchport voice vlan](#) command, the **no** variant of this command will leave them unchanged as edge ports. To set them back to their default non-edge port configuration, use the [spanning-tree edgeport \(RSTP and MSTP\)](#) command.

**Examples** To tell IP phones connected to `port1.0.5` to send voice data tagged for VLAN 10, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.5
awplus(config-if)# switchport voice vlan 10
```

To tell IP phones connected to ports 1.0.2-1.0.6 to send priority tagged packets (802.1p priority tagged with VID 0, so that they will be assigned to the port VLAN) use the following commands. The priority value is 5 by default, but can be configured with the [switchport voice vlan priority](#) command.

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.6
awplus(config-if)# switchport voice vlan dot1p
```

To dynamically configure the VLAN ID advertised to IP phones connected to `port1.0.1` based on the VLAN assigned by RADIUS authentication (with RADIUS attribute “Egress- VLANID” or “Egress-VLAN-Name” in the RADIUS accept packet), use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport voice vlan dynamic
```

To remove the Voice VLAN, and therefore disable the transmission of LLDP-MED network policy information for voice devices on `port1.0.6`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.6
awplus(config-if)# no switchport voice vlan
```

# switchport voice vlan priority

**Overview** Use this command to configure the Layer 2 user priority advertised when the transmission of LLDP-MED Network Policy TLVs for voice devices is enabled. This is the priority in the User Priority field of the IEEE 802.1Q VLAN tag, also known as the Class of Service (CoS), or 802.1p priority. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified priority.

**Syntax** `switchport voice vlan priority <0-7>`  
`no switchport voice vlan priority`

| Parameter                | Description                                   |
|--------------------------|-----------------------------------------------|
| <code>priority</code>    | Specify a user priority value for voice data. |
| <code>&lt;0-7&gt;</code> | Priority value.                               |

**Default** By default, the Voice VLAN user priority value is 5.

**Mode** Interface Configuration

**Usage** LLDP-MED advertisements including Network Policy TLVs are transmitted via a port if:

- LLDP is enabled ([lldp run](#) command)
- Voice VLAN is configured for the port ([switchport voice vlan](#) command)
- The port is configured to transmit LLDP advertisements—enabled by default ([lldp transmit receive](#) command)
- The port is configured to transmit Network Policy TLVs—enabled by default ([lldp med-tlv-select](#) command)
- There is an LLDP-MED device connected to the port.

To set the Voice VLAN tagging to be advertised, use the [switchport voice vlan](#) command.

**Example** To remove the Voice VLAN, and therefore disable the transmission of LLDP-MED network policy information for voice devices on `port1.0.6`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.6
awplus(config-if)# no switchport voice vlan
```

**Related Commands** [lldp med-tlv-select](#)  
[show lldp](#)  
[switchport voice vlan](#)

# vlan

**Overview** This command creates VLANs, assigns names to them, and enables or disables them. Disabling the VLAN causes all forwarding over the specified VLAN ID to cease. Enabling the VLAN allows forwarding of frames on the specified VLAN.

The **no** variant of this command destroys the specified VLANs or returns their MTU to the default.

**Syntax** `vlan <vid> [name <vlan-name>] [state {enable|disable}]`  
`vlan <vid-range> [state {enable|disable}]`  
`vlan {<vid>|<vlan-name>} [mtu <mtu-value>]`  
`no vlan {<vid>|<vid-range>} [mtu]`

| Parameter   | Description                                                                                               |
|-------------|-----------------------------------------------------------------------------------------------------------|
| <vid>       | The VID of the VLAN to enable or disable, in the range 1-4094.                                            |
| <vlan-name> | The ASCII name of the VLAN. Maximum length: 32 characters.                                                |
| <vid-range> | Specifies a range of VLAN identifiers.                                                                    |
| <mtu-value> | Specifies the Maximum Transmission Unit (MTU) size in bytes, in the range 68 to 1500 bytes, for the VLAN. |
| enable      | Puts the VLAN into an enabled state.                                                                      |
| disable     | Puts the VLAN into a disabled state.                                                                      |

**Default** By default, VLANs are enabled when they are created.

**Mode** VLAN Configuration

**Examples** To enable vlan 45, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 45 name accounts state enable
```

To destroy vlan 45, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no vlan 45
```

**Related Commands** [mtu](#)  
[vlan database](#)  
[show vlan](#)

# vlan classifier activate

**Overview** Use this command in Interface Configuration mode to associate a VLAN classifier group with the switch port.

Use the **no** variant of this command to remove the VLAN classifier group from the switch port.

**Syntax** `vlan classifier activate <vlan-class-group-id>`  
`no vlan classifier activate <vlan-class-group-id>`

| Parameter                                | Description                                                     |
|------------------------------------------|-----------------------------------------------------------------|
| <code>&lt;vlan-class-group-id&gt;</code> | Specify a VLAN classifier group identifier in the range <1-16>. |

**Mode** Interface Configuration mode for a switch port or link aggregator.

**Usage** See the protocol-based VLAN configuration example in the [VLAN Feature Overview and Configuration Guide](#) for configuration details.

**Example** To associate VLAN classifier group 3 with switch port1.0.3, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# vlan classifier activate 3
```

To remove VLAN classifier group 3 from switch port1.0.3, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# no vlan classifier activate 3
```

**Related Commands** [show vlan classifier rule](#)

[vlan classifier rule proto](#)

# vlan classifier group

**Overview** Use this command to create a group of VLAN classifier rules. The rules must already have been created.

Use the **no** variant of this command to delete a group of VLAN classifier rules.

**Syntax** `vlan classifier group <1-16> {add|delete} rule  
<vlan-class-rule-id>  
no vlan classifier group <1-16>`

| Parameter            | Description                          |
|----------------------|--------------------------------------|
| <1-16>               | VLAN classifier group identifier     |
| add                  | Add the rule to the group.           |
| delete               | Delete the rule from the group.      |
| <vlan-class-rule-id> | The VLAN classifier rule identifier. |

**Mode** Global Configuration

**Example** `awplus# configure terminal  
awplus(config)# vlan classifier group 3 add rule 5`

**Related  
Commands** [show vlan classifier rule](#)  
[vlan classifier activate](#)  
[vlan classifier rule ipv4](#)  
[vlan classifier rule proto](#)

# vlan classifier rule ipv4

**Overview** Use this command to create an IPv4 subnet-based VLAN classifier rule and map it to a specific VLAN. Use the **no** variant of this command to delete the VLAN classifier rule.

**Syntax** `vlan classifier rule <1-256> ipv4 <ip-addr/prefix-length> vlan <1-4094>`  
`no vlan classifier rule <1-256>`

| Parameter               | Description                                                                    |
|-------------------------|--------------------------------------------------------------------------------|
| <1-256>                 | Specify the VLAN Classifier Rule identifier.                                   |
| <ip-addr/prefix-length> | Specify the IP address and prefix length.                                      |
| <1-4094>                | Specify a VLAN ID to which an untagged packet is mapped in the range <1-4094>. |

**Mode** Global Configuration

**Usage** If the source IP address matches the IP subnet specified in the VLAN classifier rule, the received packets are mapped to the specified VLAN.

**NOTE:** The subnet VLAN classifier only matches IPv4 packets. It does not match ARP packets. To ensure ARP traffic is classified into the correct subnet VLAN, you can use a hardware based policy map that sends ARP packets to the CPU, which will then process them appropriately. This means that if you use subnet-based VLANs, you should also configure the following:

**NOTE:** The policy map should be applied to each port that uses a subnet based VLAN using the service-policy input command:

**Example** `awplus# configure terminal`  
`awplus(config)# vlan classifier rule 3 ipv4 3.3.3.3/8 vlan 5`

**Related Commands** [show vlan classifier rule](#)  
[vlan classifier activate](#)  
[vlan classifier rule proto](#)

## vlan classifier rule proto

**Overview** Use this command to create a protocol type-based VLAN classifier rule, and map it to a specific VLAN. See the published IANA EtherType IEEE 802 numbers here:

[www.iana.org/assignments/ieee-802-numbers/ieee-802-numbers.txt](http://www.iana.org/assignments/ieee-802-numbers/ieee-802-numbers.txt).

Instead of a protocol name the decimal value of the protocol's EtherType can be entered. The EtherType field is a two-octet field in an Ethernet frame. It is used to show which protocol is encapsulated in the payload of the Ethernet frame. Note that EtherTypes in the IANA 802 numbers are given as hexadecimal values.

The **no** variant of this command removes a previously set rule.

**Syntax**

```
vlan classifier rule <1-256> proto <protocol> encap  
{ethv2|nosnapllc|snapllc} vlan <1-4094>  
  
no vlan classifier rule <1-256>
```

| Parameter                   | Description                                                                                          |
|-----------------------------|------------------------------------------------------------------------------------------------------|
| <1-256>                     | VLAN Classifier identifier                                                                           |
| proto                       | Protocol type                                                                                        |
| <protocol>                  | Specify a protocol either by its decimal number (0-65535) or by one of the following protocol names: |
| [arp 2054]                  | Address Resolution protocol                                                                          |
| [atalkaarp 33011]           | Appletalk AARP protocol                                                                              |
| [atalkddp 32923]            | Appletalk DDP protocol                                                                               |
| [atmmulti 34892]            | MultiProtocol Over ATM protocol                                                                      |
| [atmtransport 34948]        | Frame-based ATM Transport protocol                                                                   |
| [dec 24576]                 | DEC Assigned protocol                                                                                |
| [deccustom 24582]           | DEC Customer use protocol                                                                            |
| [decdiagnostics 24581]      | DEC Systems Comms Arch protocol                                                                      |
| [decdnadumpload 24577]      | DEC DNA Dump/Load protocol                                                                           |
| [decdnareMOTEconsole 24578] | DEC DNA Remote Console protocol                                                                      |
| [decdnarouting 24579]       | DEC DNA Routing protocol                                                                             |
| [declat 24580]              | DEC LAT protocol                                                                                     |

| Parameter            | Description                                                                   |

| [ipx 33079]          | IPX protocol                                                                  |
| [netbeui 61680]      | IBM NETBIOS/NETBEUI protocol                                                  |
| [netbeui 61681]      | IBM NETBIOS/NETBEUI protocol                                                  |
| [pppdiscovery 34915] | PPPoE discovery protocol                                                      |
| [pppsession 34916]   | PPPoE session protocol                                                        |
| [rarp 32821]         | Reverse Address Resolution protocol                                           |
| [x25 2056]           | CCITT.25 protocol                                                             |
| [xeroxaddrtrans 513] | Xerox PUP Address Translation protocol                                        |
| [xeroxpup 512]       | Xerox PUP protocol                                                            |
| ethv2                | Ethernet Version 2 encapsulation                                              |
| nosnapllc            | LLC without SNAP encapsulation                                                |
| snapllc              | LLC SNAP encapsulation                                                        |
| <1-4094>             | Specify a VLAN ID to which an untagged packet is mapped in the range <1-4094> |

**Mode** Global Configuration

**Usage** If the protocol type matches the protocol specified in the VLAN classifier rule, the received packets are mapped to the specified VLAN. Ethernet Frame Numbers may be entered in place of the protocol names listed. For a full list please refer to the IANA list online:  
[www.iana.org/assignments/ieee-802-numbers/ieee-802-numbers.txt](http://www.iana.org/assignments/ieee-802-numbers/ieee-802-numbers.txt)

**Example**   awplus# configure terminal

```
awplus(config)# vlan classifier rule 1 proto x25 encaps ethv2
vlan 2

awplus(config)# vlan classifier rule 2 proto 512 encaps ethv2
vlan 2

awplus(config)# vlan classifier rule 3 proto 2056 encaps ethv2
vlan 2

awplus(config)# vlan classifier rule 4 proto 2054 encaps ethv2
vlan 2
```

**Validation  
Output**   awplus# show vlan classifier rule

```
vlan classifier rule 16 proto rarp encaps ethv2 vlan 2

vlan classifier rule 8 proto encaps ethv2 vlan 2

vlan classifier rule 4 proto arp encaps ethv2 vlan 2

vlan classifier rule 3 proto xeroxpup encaps ethv2 vlan 2
vlan classifier rule 2 proto ip encaps ethv2 vlan 2
vlan classifier rule 1 proto ipv6 encaps ethv2 vlan 2
```

**Related  
Commands**   show vlan classifier rule

              vlan classifier activate

              vlan classifier group

# vlan database

**Overview** Use this command to enter the VLAN Configuration mode.

**Syntax** `vlan database`

**Mode** Global Configuration

**Usage** Use this command to enter the VLAN configuration mode. You can then add or delete a VLAN, or modify its values.

**Example** In the following example, note the change to VLAN configuration mode from Configure mode:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)#
```

**Related  
Commands** [vlan](#)

## vlan mode stack-local-vlan

**Overview** This command enables you to create stack-local-VLANs and use ICMP to monitor and diagnose issues within specific members of the stack. When a VLAN is added using this method, all its traffic will be trapped to and processed by the CPU of the specific local stack member, rather than the CPU of the stack master.

**Syntax** `vlan <vid> mode stack-local-vlan <member-id>`  
`no vlan <vid>`

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <vid>                 | The VID of the VLAN to be created in the range 2-4094. We recommend that the first stack-local-vlan be assigned the number 4001 for the first stack member, then incremented by one for each stack member. For example, a stack of four members would be assigned the following VID numbers: <ul style="list-style-type: none"><li>• stack member one: VID 4001</li><li>• stack member two: VID 4002</li><li>• stack member three: VID 4003</li><li>• stack member four: VID 4004</li></ul> |
| mode stack-local-vlan | Specifies that the new VLAN will function as a stack-local-VLAN.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <member-id>           | Specifies the new stack member ID. Enter a decimal number in the range 1-8.                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Default** By default, VLANs are automatically enabled as they are added.

**Mode** VLAN Configuration

**Usage** If IGMP snooping is operating on a stack-local-VLAN, the device will try to process some multicast traffic via that VLAN, if it is connected to a Microsoft Windows PC.

To avoid this, we recommend disabling IGMP snooping on stack-local-VLANs, by using the command **no ip igmp snooping**.

**Examples** To add a stack-local-VLAN with the VID of 4002 and assign it to stack member 2, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 4002 mode stack-local-vlan 2
awplus(config-vlan)# exit
awplus(config)# interface vlan4002
awplus(config-if)# no ip igmp snooping
```

To remove VLAN 4002, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no vlan 4002
```

# Spanning Tree Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure RSTP, STP or MSTP. For information about spanning trees, including configuration procedures, see the [STP Feature Overview and Configuration Guide](#).

# clear spanning-tree statistics

**Overview** Use this command to clear all the STP BPDU (Bridge Protocol Data Unit) statistics.

**Syntax** `clear spanning-tree statistics`  
`clear spanning-tree statistics [instance <mstp-instance>]`  
`clear spanning-tree statistics [interface <port> [instance <mstp-instance>]]`

| Parameter       | Description                                                                                                                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port>          | The port to clear STP BPDU statistics for. The port may be a switch port (e.g. <code>port1.0.4</code> ), a static channel group (e.g. <code>sa2</code> ), or a dynamic (LACP) channel group (e.g. <code>po2</code> ). |
| <mstp-instance> | The MSTP instance (MSTI - Multiple Spanning Tree Instance) to clear MSTP BPDU statistics.                                                                                                                             |

**Mode** User Exec and Privileged Exec

**Usage** Use this command with the **instance** parameter in MSTP mode. Specifying this command with the **interface** parameter only not the instance parameter will work in STP and RSTP mode.

**Examples** `awplus# clear spanning-tree statistics`  
`awplus# clear spanning-tree statistics instance 1`  
`awplus# clear spanning-tree statistics interface port1.0.2`  
`awplus# clear spanning-tree statistics interface port1.0.2 instance 1`

# clear spanning-tree detected protocols (RSTP and MSTP)

**Overview** Use this command to clear the detected protocols for a specific port, or all ports.  
Use this command in RSTP or MSTP mode only.

**Syntax** `clear spanning-tree detected protocols [interface <port>]`

| Parameter | Description                                                                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port>    | The port to clear detected protocols for. The port may be a switch port (e.g. <code>port1.0.4</code> ), a static channel group (e.g. <code>sa2</code> ), or a dynamic (LACP) channel group (e.g. <code>po2</code> ). |

**Mode** Privileged Exec

**Example** `awplus# clear spanning-tree detected protocols`

# debug mstp (RSTP and STP)

**Overview** Use this command to enable debugging for the configured spanning tree mode, and echo data to the console, at various levels. Note that although this command uses the keyword **mstp** it displays debugging output for RSTP and STP protocols as well the MSTP protocol.

Use the **no** variant of this command to disable spanning tree debugging.

**Syntax**

```
debug mstp {all|cli|protocol [detail]|timer [detail]}
debug mstp {packet {rx|tx} [decode] [interface <interface>]}
debug mstp {topology-change [interface <interface>]}
no debug mstp {all|cli|protocol [detail]|timer [detail]}
no debug mstp {packet {rx|tx} [decode] [interface <interface>]}
no debug mstp {topology-change [interface <interface>]}
```

| Parameter       | Description                                                             |
|-----------------|-------------------------------------------------------------------------|
| all             | Echoes all spanning tree debugging levels to the console.               |
| cli             | Echoes spanning tree commands to the console.                           |
| packet          | Echoes spanning tree packets to the console.                            |
| rx              | Received packets.                                                       |
| tx              | Transmitted packets.                                                    |
| protocol        | Echoes protocol changes to the console.                                 |
| timer           | Echoes timer information to the console.                                |
| detail          | Detailed output.                                                        |
| decode          | Interprets packet contents                                              |
| topology-change | Interprets topology change messages                                     |
| interface       | Keyword before <interface> placeholder to specify an interface to debug |
| <interface>     | Placeholder used to specify the name of the interface to debug.         |

**Mode** Privileged Exec and Global Configuration mode

**Usage 1** Use the **debug mstp topology-change interface** command to generate debugging messages when the device receives an indication of a topology change in a BPDU from another device. The debugging can be activated on a per-port basis. Although this command uses the keyword **mstp**, it displays debugging output for RSTP and STP protocols as well as the MSTP protocol.

Due to the likely volume of output, these debug messages are best viewed using the [terminal monitor](#) command before issuing the relevant **debug mstp**

command. The default terminal monitor filter will select and display these messages. Alternatively, the messages can be directed to any of the other log outputs by adding a filter for the MSTP application using [log buffered \(filter\)](#) command:

```
awplus# configure terminal
awplus(config)# log buffered program mstp
```

### Output 1

```
awplus#terminal monitor
awplus#debug mstp topology-change interface port1.0.4
10:09:09 awplus MSTP[1409]: Topology change rcvd on port1.0.4 (internal)
10:09:09 awplus MSTP[1409]: Topology change rcvd on MSTI 1 port1.0.4
aawplus#debug mstp topology-change interface port1.0.6
10:09:29 awplus MSTP[1409]: Topology change rcvd on port1.0.6 (external)
10:09:29 awplus MSTP[1409]: Topology change rcvd on MSTI 1 port1.0.6
```

**Usage 2** Use the **debug mstp packet rx|tx decode interface** command to generate debugging messages containing the entire contents of a BPDU displayed in readable text for transmitted and received xSTP BPDUs. The debugging can be activated on a per-port basis and transmit and receive debugging is controlled independently. Although this command uses the keyword **mstp**, it displays debugging output for RSTP and STP protocols as well as the MSTP protocol.

Due to the likely volume of output, these debug messages are best viewed using the [terminal monitor](#) command before issuing the relevant **debug mstp** command. The default terminal monitor filter will select and display these messages. Alternatively, the messages can be directed to any of the other log outputs by adding a filter for the MSTP application using the [log buffered \(filter\)](#) command:

```
awplus(config)# log buffered program mstp
```

**Output 2** In MSTP mode - an MSTP BPDU with 1 MSTI:

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.0.4
17:23:42 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - start
17:23:42 awplus MSTP[1417]: Protocol version: MSTP, BPDU type: RST
17:23:42 awplus MSTP[1417]: CIST Flags: Agree Forward Learn role=Desig
17:23:42 awplus MSTP[1417]: CIST root id      : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST ext pathcost : 0
17:23:42 awplus MSTP[1417]: CIST reg root id  : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST port id     : 8001 (128:1)
17:23:42 awplus MSTP[1417]: msg age: 0 max age: 20 hellotime: 2 fwd delay: 15
17:23:42 awplus MSTP[1417]: Version 3 length : 80
17:23:42 awplus MSTP[1417]: Format id        : 0
17:23:42 awplus MSTP[1417]: Config name      : test
17:23:42 awplus MSTP[1417]: Revision level   : 0
17:23:42 awplus MSTP[1417]: Config digest    : 3ab68794d602fdf43b21c0b37ac3bca8
17:23:42 awplus MSTP[1417]: CIST int pathcost : 0
17:23:42 awplus MSTP[1417]: CIST bridge id    : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST hops remaining : 20
17:23:42 awplus MSTP[1417]: MSTI flags        : Agree Forward Learn role=Desig
17:23:42 awplus MSTP[1417]: MSTI reg root id  : 8001:0000cd1000fe
17:23:42 awplus MSTP[1417]: MSTI pathcost     : 0
17:23:42 awplus MSTP[1417]: MSTI bridge priority : 32768 port priority : 128
17:23:42 awplus MSTP[1417]: MSTI hops remaining : 20
17:23:42 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - finish
```

In STP mode transmitting a TCN BPDU:

```
awplus#terminal monitor
awplus#debug mstp packet tx decode interface port1.0.4
17:28:09 awplus MSTP[1417]: port1.0.4 xSTP BPDU tx - start
17:28:09 awplus MSTP[1417]: Protocol version: STP, BPDU type: TCN
17:28:09 awplus MSTP[1417]: port1.0.4 xSTP BPDU tx - finish
```

In STP mode receiving an STP BPDU:

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.0.4
17:31:36 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - start
17:31:36 awplus MSTP[1417]: Protocol version: STP, BPDU type: Config
17:31:36 awplus MSTP[1417]: Flags: role=none
17:31:36 awplus MSTP[1417]: Root id          : 8000:0000cd1000fe
17:31:36 awplus MSTP[1417]: Root pathcost    : 0
17:31:36 awplus MSTP[1417]: Bridge id       : 8000:0000cd1000fe
17:31:36 awplus MSTP[1417]: Port id        : 8001 (128:1)
17:31:36 awplus MSTP[1417]: msg age: 0 max age: 20 hellotime: 2 fwd delay: 15
17:31:36 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - finish
```

In RSTP mode receiving an RSTP BPDU:

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.0.4
awplus#17:30:17 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - start
17:30:17 awplus MSTP[1417]: Protocol version: RSTP, BPDU type: RST
17:30:17 awplus MSTP[1417]: CIST Flags: Forward Learn role=Desig
17:30:17 awplus MSTP[1417]: CIST root id      : 8000:0000cd1000fe
17:30:17 awplus MSTP[1417]: CIST ext pathcost : 0
17:30:17 awplus MSTP[1417]: CIST reg root id  : 8000:0000cd1000fe
17:30:17 awplus MSTP[1417]: CIST port id     : 8001 (128:1)
17:30:17 awplus MSTP[1417]: msg age: 0 max age: 20 hellotime: 2 fwd delay: 15
17:30:17 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - finish
```

### Examples

```
awplus# debug mstp all
awplus# debug mstp cli
awplus# debug mstp packet rx
awplus# debug mstp protocol detail
awplus# debug mstp timer
awplus# debug mstp packet rx decode interface port1.0.2
awplus# debug mstp packet tx decode interface port1.0.6
```

### Related Commands

[terminal monitor](#)

[undebug mstp](#)

# instance priority (MSTP)

**Overview** Use this command to set the priority for this device to become the root bridge for the specified MSTI (Multiple Spanning Tree Instance).

Use this command for MSTP only.

Use the **no** variant of this command to restore the root bridge priority of the device for the instance to the default.

**Syntax** `instance <instance-id> priority <priority>`  
`no instance <instance-id> priority`

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;instance-id&gt;</code> | Specify an MSTP instance in the range 1-15.                                                                                                                                                                                                                                                                                                                              |
| <code>&lt;priority&gt;</code>    | Specify the root bridge priority for the device for the MSTI in the range <0-61440>. Note that a lower priority number indicates a greater likelihood of the device becoming the root bridge. The priority values can be set only in increments of 4096. If you specify a number that is not a multiple of 4096, it will be rounded down. The default priority is 32768. |

**Default** The default priority value for all instances is 32768.

**Mode** MST Configuration

**Usage** MSTP lets you distribute traffic more efficiently across a network by blocking different links for different VLANs. You do this by making different devices into the root bridge for each MSTP instance, so that each instance blocks a different link.

If all devices have the same root bridge priority for the instance, MSTP selects the device with the lowest MAC address to be the root bridge. Give the device a higher priority for becoming the root bridge for a particular instance by assigning it a lower priority number, or vice versa.

**Examples** To set the root bridge priority for MSTP instance 2 to be the highest (0), so that it will be the root bridge for this instance when available, use the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# instance 2 priority 0
```

To reset the root bridge priority for instance 2 to the default (32768), use the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# no instance 2 priority
```

**Related  
Commands**

- region (MSTP)
- revision (MSTP)
- show spanning-tree mst config
- spanning-tree mst instance
- spanning-tree mst instance priority

## instance vlan (MSTP)

**Overview** Use this command to create an MST Instance (MSTI), and associate the specified VLANs with it. An MSTI is a spanning tree instance that exists within an MST region (MSTR).

When a VLAN is associated with an MSTI the member ports of the VLAN are automatically configured to send and receive spanning-tree information for the associated MSTI. You can disable this automatic configuration of member ports of the VLAN to the associated MSTI by using a **no spanning-tree mst instance** command to remove the member port from the MSTI.

Use the **instance vlan** command for MSTP only.

Use the **no** variant of this command to remove the specified VLANs from the MSTI.

**Syntax** `instance <instance-id> vlan <vid-list>`  
`no instance <instance-id> vlan <vid-list>`

| Parameter     | Description                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <instance-id> | Specify an MSTP instance in the range 1-15.                                                                                                                                                           |
| <vid-list>    | Specify one or more VLAN identifiers (VID) to be associated with the MSTI specified. This can be a single VID in the range 1-4094, or a hyphen-separated range or a comma-separated list of VLAN IDs. |

**Mode** MST Configuration

**Usage** The VLANs must be created before being associated with an MST instance (MSTI). If the VLAN range is not specified, the MSTI will not be created.

This command removes the specified VLANs from the CIST and adds them to the specified MSTI. If you use the **no** variant of this command to remove the VLAN from the MSTI, it returns it to the CIST. To move a VLAN from one MSTI to another, you must first use the **no** variant of this command to return it to the CIST.

Ports in these VLANs will remain in the control of the CIST until you associate the ports with the MSTI using the [spanning-tree mst instance](#) command.

**Example** To associate VLAN 30 with MSTI 2, use the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mode mstp
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# instance 2 vlan 30
```

**Related  
Commands**

- region (MSTP)
- revision (MSTP)
- show spanning-tree mst config
- spanning-tree mst instance
- vlan

## region (MSTP)

**Overview** Use this command to assign a name to the device's MST Region. MST Instances (MSTI) of a region form different spanning trees for different VLANs.

Use this command for MSTP only.

Use the **no** variant of this command to remove this region name and reset it to the default.

**Syntax** `region <region-name>`  
`no region`

| Parameter                        | Description                                                                                                           |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <code>&lt;region-name&gt;</code> | Specify the name of the region, up to 32 characters. Valid characters are upper-case, lower-case, digits, underscore. |

**Default** By default, the region name is My Name.

**Mode** MST Configuration

**Usage** The region name, the revision number, and the digest of the VLAN to MSTI configuration table must be the same on all devices that are intended to be in the same MST region.

**Example**

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# region ATL
```

**Related Commands** [revision \(MSTP\)](#)  
[show spanning-tree mst config](#)

## revision (MSTP)

**Overview** Use this command to specify the MST revision number to be used in the configuration identifier.

Use this command for MSTP only.

**Syntax** `revision <revision-number>`

| Parameter                            | Description                                   |
|--------------------------------------|-----------------------------------------------|
| <code>&lt;revision-number&gt;</code> | <code>&lt;0-65535&gt;</code> Revision number. |

**Default** The default of revision number is 0.

**Mode** MST Configuration

**Usage** The region name, the revision number, and the digest of the VLAN to MSTI configuration table must be the same on all devices that are intended to be in the same MST region.

**Example**

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# revision 25
```

**Related Commands**

- [region \(MSTP\)](#)
- [show spanning-tree mst config](#)
- [instance vlan \(MSTP\)](#)

# show debugging mstp

**Overview** Use this command to show the MSTP debugging options set.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging mstp`

**Mode** User Exec and Privileged Exec mode

**Example** To display the MSTP debugging options set, enter the command:

```
awplus# show debugging mstp
```

**Output** Figure 15-1: Example output from **show debugging mstp**

```
MSTP debugging status:
MSTP receiving packet debugging is on
```

**Related Commands** [debug mstp \(RSTP and STP\)](#)

# show spanning-tree

**Overview** Use this command to display detailed spanning tree information on the specified port or on all ports. Use this command for RSTP, MSTP or STP.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show spanning-tree [interface <port-list>]`

| Parameter                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>interface</code>         | Display information about the following port only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>&lt;port-list&gt;</code> | The ports to display information about. A port-list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.0.6) a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-1.0.4, or sa1-2, or po1-2</li><li>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.4-1.0.6. Do not mix switch ports, static channel groups, and dynamic (LACP) channel groups in the same list</li></ul> |

**Mode** User Exec and Privileged Exec

**Usage** Note that any list of interfaces specified must not span any interfaces that are not installed.

A topology change counter has been included for RSTP and MSTP. You can see the topology change counter for RSTP by using the **show spanning-tree** command. You can see the topology change counter for MSTP by using the **show spanning-tree mst instance** command.

**Example** To display spanning tree information about port1.0.3, use the command:

```
awplus# show spanning-tree interface port1.0.3
```

**Output** Figure 15-2: Example output from **show spanning-tree** in RSTP mode

```
awplus#show spanning-tree

# show spanning-tree brief

**Overview** Use this command to display a summary of spanning tree status information on all ports. Use this command for RSTP, MSTP or STP.

**Syntax** `show spanning-tree brief`

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| brief     | A brief summary of spanning tree information. |

**Mode** User Exec and Privileged Exec

**Usage** Note that any list of interfaces specified must not span any interfaces that are not installed.

A topology change counter has been included for RSTP and MSTP. You can see the topology change counter for RSTP by using the **show spanning-tree** command. You can see the topology change counter for MSTP by using the **show spanning-tree mst instance** command.

**Example** To display a summary of spanning tree status information, use the command:

```
awplus# show spanning-tree brief
```

**Output** Figure 15-4: Example output from **show spanning-tree brief**

|                                                                        |                   |         |            |            |
|------------------------------------------------------------------------|-------------------|---------|------------|------------|
| Default: Bridge up - Spanning Tree Enabled                             |                   |         |            |            |
| Default: Root Path Cost 40000 - Root Port 4501 - Bridge Priority 32768 |                   |         |            |            |
| Default: Root Id 8000:0000cd250001                                     |                   |         |            |            |
| Default: Bridge Id 8000:0000cd296eb1                                   |                   |         |            |            |
| Port                                                                   | Designated Bridge | Port Id | Role       | State      |

# show spanning-tree mst detail interface

**Overview** This command displays detailed information about the specified switch port, and the MST instances associated with it.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show spanning-tree mst detail interface <port>`

| Parameter | Description                                                                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port>    | The port to display information about. The port may be a switch port (e.g. <code>port1.0.4</code> ), a static channel group (e.g. <code>sa2</code> ), or a dynamic (LACP) channel group (e.g. <code>po2</code> ). |

**Mode** User Exec, Privileged Exec and Interface Configuration

**Example** To display detailed information about `port1.0.3` and the instances associated with it, enter the command:

```
awplus# show spanning-tree mst detail interface port1.0.3
```

**Output** Figure 15-8: Example output from **show spanning-tree mst detail interface**

```

# show spanning-tree mst instance

**Overview** This command displays detailed information for the specified instance, and all switch ports associated with that instance.

A topology change counter has been included for RSTP and MSTP. You can see the topology change counter for RSTP by using the [show spanning-tree](#) command. You can see the topology change counter for MSTP by using the **show spanning-tree mst instance** command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show spanning-tree mst instance <instance-id>`

| Parameter     | Description                                 |
|---------------|---------------------------------------------|
| <instance-id> | Specify an MSTP instance in the range 1-15. |

**Mode** User Exec, Privileged Exec, and Interface Configuration

**Example** To display detailed information for **instance 2**, and all switch ports associated with that instance, use the command:

```
awplus# show spanning-tree mst instance 2
```

**Output** Figure 15-9: Example output from **show spanning-tree mst instance**

```
% 1: MSTI Root Path Cost 0 - MSTI Root Port 0 - MSTI Bridge Priority 32768
% 1: MSTI Root Id 80020000cd24ff2d
% 1: MSTI Bridge Id 80020000cd24ff2d
% port1.0.2: Port 5002 - Id 838a - Role Disabled - State Discarding
% port1.0.2: Designated Internal Path Cost 0 - Designated Port Id 838a

%
```

# show spanning-tree mst instance interface

**Overview** This command displays detailed information for the specified MST (Multiple Spanning Tree) instance, and the specified switch port associated with that MST instance.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show spanning-tree mst instance <instance-id> interface <port>`

| Parameter     | Description                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <instance-id> | Specify an MSTP instance in the range 1-15.                                                                                                                             |
| <port>        | The port to display information about. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |

**Mode** User Exec, Privileged Exec, and Interface Configuration

**Example** To display detailed information for instance 2, interface port1.0.2, use the command:

```
awplus# show spanning-tree mst instance 2 interface port1.0.2
```

**Output** Figure 15-10: Example output from **show spanning-tree mst instance**

```
% 1: MSTI Root Path Cost 0 - MSTI Root Port 0 - MSTI Bridge Priority 32768

# show spanning-tree mst interface

**Overview** This command displays the number of instances created, and VLANs associated with it for the specified switch port.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show spanning-tree mst interface <port>`

| Parameter | Description                                                                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port>    | The port to display information about. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |

**Mode** User Exec, Privileged Exec, and Interface Configuration

**Example** To display detailed information about each instance, and all interfaces associated with them, for port1.0.4, use the command:

```
awplus# show spanning-tree mst interface port1.0.4
```

**Output** Figure 15-11: Example output from **show spanning-tree mst interface**

```
% 1: Bridge up - Spanning Tree Enabled

# show spanning-tree mst detail interface

**Overview** This command displays detailed information about the specified switch port, and the MST instances associated with it.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show spanning-tree mst detail interface <port>`

| Parameter | Description                                                                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port>    | The port to display information about. The port may be a switch port (e.g. <code>port1.0.4</code> ), a static channel group (e.g. <code>sa2</code> ), or a dynamic (LACP) channel group (e.g. <code>po2</code> ). |

**Mode** User Exec, Privileged Exec and Interface Configuration

**Example** To display detailed information about `port1.0.3` and the instances associated with it, enter the command:

```
awplus# show spanning-tree mst detail interface port1.0.3
```

**Output** Figure 15-12: Example output from **show spanning-tree mst detail interface**

**Related Commands** [show spanning-tree statistics](#)

# show spanning-tree vlan range-index

**Overview** Use this command to display information about MST (Multiple Spanning Tree) instances and the VLANs associated with them including the VLAN range-index value for the device.

**Syntax** `show spanning-tree vlan range-index`

**Mode** Privileged Exec

**Example** To display information about MST instances and the VLANs associated with them for the device, including the VLAN range-index value, use the following command:

```
awplus# show spanning-tree vlan range-index
```

**Output** Figure 15-17: Example output from **show spanning-tree vlan range-index**

```
awplus#show spanning-tree vlan range-index
% MST Instance  VLAN      RangeIdx
%           1         1         1%
```

**Related Commands** [show spanning-tree statistics](#)

# spanning-tree autoedge (RSTP and MSTP)

**Overview** Use this command to enable the autoedge feature on the port.

The autoedge feature allows the port to automatically detect that it is an edge port. If it does not receive any BPDUs in the first three seconds after linkup, enabling, or entering RSTP or MSTP mode, it sets itself to be an edgeport and enters the forwarding state.

Use this command for RSTP or MSTP.

Use the **no** variant of this command to disable this feature.

**Syntax** `spanning-tree autoedge`  
`no spanning-tree autoedge`

**Default** Disabled

**Mode** Interface Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# interface port1.0.3`  
`awplus(config-if)# spanning-tree autoedge`

**Related Commands** [spanning-tree edgeport \(RSTP and MSTP\)](#)

## spanning-tree bpdudata-bbox="165 159 883 205" data-label="Text"> **Overview** Use this command in Global Configuration mode to configure BPDU (Bridge Protocol Data Unit) discarding or forwarding, with STP (Spanning Tree Protocol) disabled on the switch.

See the Usage note about disabling Spanning Tree before using this command, and using this command to forward unsupported BPDUs unchanged for unsupported STP Protocols.

There is not a **no** variant for this command. Instead, apply the `discard` parameter to reset it back to the default then re-enable STP with **spanning-tree enable** command.

**Syntax** `spanning-tree bpdudata-bbox="263 388 892 628" data-label="Table">

| Parameter                                                                                     | Description                                                                                                    |
|-----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <code>bpdudata-bbox="404 466 478 479" data-label="Text"&gt;<p><code>discard</code></p></code> | Discards all ingress STP BPDU frames.                                                                          |
| <code>forward</code>                                                                          | Forwards any ingress STP BPDU packets to all ports, regardless of any VLAN membership.                         |
| <code>forward-untagged-vlan</code>                                                            | Forwards any ingress STP BPDU frames to all ports that are untagged members of the ingress port's native VLAN. |
| <code>forward-vlan</code>                                                                     | Forwards any ingress STP BPDU frames to all ports that are tagged members of the ingress port's native VLAN.   |`

**Default** The discard parameter is enabled by default.

**Mode** Global Configuration

**Usage** You must first disable Spanning Tree with the `spanning-tree enable` command before you can use this command to then configure BPDU discarding or forwarding.

This command enables the switch to forward unsupported BPDUs with an unsupported Spanning Tree Protocol, such as proprietary STP protocols with unsupported BPDUs, by forwarding BPDU (Bridge Protocol Data Unit) frames unchanged through the switch.

When you want to revert to default behavior on the switch, issue a **spanning-tree bdpudata-bbox="102 941 213 954" data-label="Page-Footer">

C613-50103-01 REV C**

**Examples** To enable STP BPDU discard in Global Configuration mode with STP disabled, which discards all ingress STP BPDU frames, enter the commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree stp enable
awplus(config)# spanning-tree bpdu discard
```

To enable STP BPDU forward in Global Configuration mode with STP disabled, which forwards any ingress STP BPDU frames to all ports regardless of any VLAN membership, enter the commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree stp enable
awplus(config)# spanning-tree bpdu forward
```

To enable STP BPDU forwarding for untagged frames in Global Configuration mode with STP disabled, which forwards any ingress STP BPDU frames to all ports that are untagged members of the ingress port's native VLAN, enter the commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree stp enable
awplus(config)# spanning-tree bpdu forward-untagged-vlan
```

To enable STP BPDU forwarding for tagged frames in Global Configuration mode with STP disabled, which forwards any ingress STP BPDU frames to all ports that are tagged members of the ingress port's native VLAN, enter the commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree stp enable
awplus(config)# spanning-tree bpdu forward-vlan
```

To reset STP BPDU back to the default `discard` parameter and re-enable STP on the switch, enter the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree bpdu discard
awplus(config)# spanning-tree stp enable
```

**Related  
Commands** [show spanning-tree](#)  
[spanning-tree enable](#)

# spanning-tree cisco-interoperability (MSTP)

**Overview** Use this command to enable/disable Cisco-interoperability for MSTP.  
Use this command for MSTP only.

**Syntax** `spanning-tree cisco-interoperability {enable|disable}`

| Parameter | Description                              |
|-----------|------------------------------------------|
| enable    | Enable Cisco interoperability for MSTP.  |
| disable   | Disable Cisco interoperability for MSTP. |

**Default** If this command is not used, Cisco interoperability is disabled.

**Mode** Global Configuration

**Usage** For compatibility with certain Cisco devices, all devices in the switched LAN running the AlliedWare Plus™ Operating System must have Cisco-interoperability enabled. When the AlliedWare Plus Operating System is interoperating with Cisco, the only criteria used to classify a region are the region name and revision level. VLAN to instance mapping is not used to classify regions when interoperating with Cisco.

**Examples** To enable Cisco interoperability on a Layer 2 device:

```
awplus# configure terminal
awplus(config)# spanning-tree cisco-interoperability enable
```

To disable Cisco interoperability on a Layer 2 device:

```
awplus# configure terminal
awplus(config)# spanning-tree cisco-interoperability disable
```

# spanning-tree edgeport (RSTP and MSTP)

**Overview** Use this command to set a port as an edge-port.

Use this command for RSTP or MSTP.

This command has the same effect as the [spanning-tree portfast \(STP\)](#) command, but the configuration displays differently in the output of some show commands.

Use the **no** variant of this command to set a port to its default state (not an edge-port).

**Syntax** `spanning-tree edgeport`  
`no spanning-tree edgeport`

**Default** Not an edge port.

**Mode** Interface Configuration

**Usage** Use this command on a switch port connected to a LAN that has no other bridges attached. If a BPDU is received on the port that indicates that another bridge is connected to the LAN, then the port is no longer treated as an edge port.

**Example** `awplus# configure terminal`  
`awplus(config)# interface port1.0.2`  
`awplus(config-if)# spanning-tree edgeport`

**Related Commands** [spanning-tree autoedge \(RSTP and MSTP\)](#)

# spanning-tree enable

**Overview** Use this command in Global Configuration mode to enable the specified spanning tree protocol for all switch ports. Note that this must be the spanning tree protocol that is configured on the device by the [spanning-tree mode](#) command.

Use the **no** variant of this command to disable the configured spanning tree protocol. This places all switch ports in the forwarding state.

**Syntax** `spanning-tree {mstp|rstp|stp} enable`  
`no spanning-tree {mstp|rstp|stp} enable`

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| mstp      | Enables or disables MSTP (Multiple Spanning Tree Protocol). |
| rstp      | Enables or disables RSTP (Rapid Spanning Tree Protocol).    |
| stp       | Enables or disables STP (Spanning Tree Protocol).           |

**Default** RSTP is enabled by default for all switch ports.

**Mode** Global Configuration

**Usage** With no configuration, spanning tree is enabled, and the spanning tree mode is set to RSTP. To change the mode, see [spanning-tree mode](#) command.

**Examples** To enable STP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree stp enable
```

To disable STP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree stp enable
```

To enable MSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mstp enable
```

To disable MSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree mstp enable
```

To enable RSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree rstp enable
```

To disable RSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
```

```
awplus(config)# no spanning-tree rstp enable
```

**Related  
Commands**

[spanning-tree bpdu](#)

[spanning-tree mode](#)

# spanning-tree errdisable-timeout enable

**Overview** Use this command to enable the errdisable-timeout facility, which sets a timeout for ports that are disabled due to the BPDU guard feature.

Use this command for RSTP or MSTP.

Use the **no** variant of this command to disable the errdisable-timeout facility.

**Syntax** `spanning-tree errdisable-timeout enable`  
`no spanning-tree errdisable-timeout enable`

**Default** By default, the errdisable-timeout is disabled.

**Mode** Global Configuration

**Usage** The BPDU guard feature shuts down the port on receiving a BPDU on a BPDU-guard enabled port. This command associates a timer with the feature such that the port is re-enabled without manual intervention after a set interval. This interval can be configured by the user using the [spanning-tree errdisable-timeout interval](#) command.

**Example** `awplus# configure terminal`  
`awplus(config)# spanning-tree errdisable-timeout enable`

**Related Commands** [show spanning-tree](#)  
[spanning-tree errdisable-timeout interval](#)  
[spanning-tree portfast bpdu-guard](#)

# spanning-tree errdisable-timeout interval

**Overview** Use this command to specify the time interval after which a port is brought back up when it has been disabled by the BPDU guard feature.

Use this command for RSTP or MSTP.

**Syntax** `spanning-tree errdisable-timeout interval <10-1000000>`  
`no spanning-tree errdisable-timeout interval`

| Parameter                       | Description                                         |
|---------------------------------|-----------------------------------------------------|
| <code>&lt;10-1000000&gt;</code> | Specify the errdisable-timeout interval in seconds. |

**Default** By default, the port is re-enabled after 300 seconds.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# spanning-tree errdisable-timeout interval 34`

**Related Commands** [show spanning-tree](#)  
[spanning-tree errdisable-timeout enable](#)  
[spanning-tree portfast bpdu-guard](#)

# spanning-tree force-version

**Overview** Use this command in Interface Configuration mode for a switch port interface only to force the protocol version for the switch port. Use this command for RSTP or MSTP only.

**Syntax** `spanning-tree force-version <version>`  
`no spanning-tree force-version`

| Parameter | Description                                                                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <version> | <0-3> Version identifier.                                                                                                                                                              |
| 0         | Forces the port to operate in STP mode.                                                                                                                                                |
| 1         | Not supported.                                                                                                                                                                         |
| 2         | Forces the port to operate in RSTP mode. If it receives STP BPDUs, it can automatically revert to STP mode.                                                                            |
| 3         | Forces the port to operate in MSTP mode (this option is only available if MSTP mode is configured). If it receives RSTP or STP BPDUs, it can automatically revert to RSTP or STP mode. |

**Default** By default, no version is forced for the port. The port is in the spanning tree mode configured for the device, or a lower version if it automatically detects one.

**Mode** Interface Configuration mode for a switch port interface only.

**Examples** Set the value to enforce the spanning tree protocol (STP):

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree force-version 0
```

Set the default protocol version:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree force-version
```

**Related Commands** [show spanning-tree](#)

# spanning-tree forward-time

**Overview** Use this command to set the forward delay value. Use the **no** variant of this command to reset the forward delay value to the default setting of 15 seconds.

The **forward delay** sets the time (in seconds) to control how fast a port changes its spanning tree state when moving towards the forwarding state. If the mode is set to STP, the value determines how long the port stays in each of the listening and learning states which precede the forwarding state. If the mode is set to RSTP or MSTP, this value determines the maximum time taken to transition from discarding to learning and from learning to forwarding.

This value is used only when the device is acting as the root bridge. Devices not acting as the Root Bridge use a dynamic value for the **forward delay** set by the root bridge. The **forward delay**, **max-age**, and **hello time** parameters are interrelated.

**Syntax** `spanning-tree forward-time <forward-delay>`  
`no spanning-tree forward-time`

| Parameter                          | Description                                                     |
|------------------------------------|-----------------------------------------------------------------|
| <code>&lt;forward-delay&gt;</code> | <code>&lt;4-30&gt;</code> The forwarding time delay in seconds. |

**Default** The default is 15 seconds.

**Mode** Global Configuration

**Usage** The allowable range for forward-time is 4-30 seconds.

The **forward delay**, **max-age**, and **hello time** parameters should be set according to the following formula, as specified in IEEE Standard 802.1d:

$2 \times (\text{forward delay} - 1.0 \text{ seconds}) \geq \text{max-age}$

$\text{max-age} \geq 2 \times (\text{hello time} + 1.0 \text{ seconds})$

**Example** `awplus# configure terminal`  
`awplus(config)# spanning-tree forward-time 6`

**Related Commands** `show spanning-tree`  
`spanning-tree forward-time`  
`spanning-tree hello-time`  
`spanning-tree mode`

# spanning-tree guard root

**Overview** Use this command in Interface Configuration mode for a switch port only to enable the Root Guard feature for the switch port. The root guard feature disables reception of superior BPDUs. You can use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to disable the root guard feature for the port.

**Syntax** `spanning-tree guard root`  
`no spanning-tree guard root`

**Mode** Interface Configuration mode for a switch port interface only.

**Usage** The Root Guard feature makes sure that the port on which it is enabled is a designated port. If the Root Guard enabled port receives a superior BPDU, it goes to a Listening state (for STP) or discarding state (for RSTP and MSTP).

**Example** `awplus# configure terminal`  
`awplus(config)# interface port1.0.2`  
`awplus(config-if)# spanning-tree guard root`

# spanning-tree hello-time

**Overview** Use this command to set the hello-time. This sets the time in seconds between the transmission of device spanning tree configuration information when the device is the Root Bridge of the spanning tree or is trying to become the Root Bridge.

Use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to restore the default of the hello time.

**Syntax** `spanning-tree hello-time <hello-time>`  
`no spanning-tree hello-time`

| Parameter                       | Description                                                   |
|---------------------------------|---------------------------------------------------------------|
| <code>&lt;hello-time&gt;</code> | <code>&lt;1-10&gt;</code> The hello BPDU interval in seconds. |

**Default** Default is 2 seconds.

**Mode** Global Configuration and Interface Configuration for switch ports.

**Usage** The allowable range of values is 1-10 seconds.

The forward delay, max-age, and hello time parameters should be set according to the following formula, as specified in IEEE Standard 802.1d:

$$2 \times (\text{forward delay} - 1.0 \text{ seconds}) \geq \text{max-age}$$
$$\text{max-age} \geq 2 \times (\text{hello time} + 1.0 \text{ seconds})$$

**Example** `awplus# configure terminal`  
`awplus(config)# spanning-tree hello-time 3`

**Related Commands** [spanning-tree forward-time](#)  
[spanning-tree max-age](#)  
[show spanning-tree](#)

# spanning-tree link-type

**Overview** Use this command in Interface Configuration mode for a switch port interface only to enable or disable point-to-point or shared link types on the switch port.

Use this command for RSTP or MSTP only.

Use the **no** variant of this command to return the port to the default link type.

**Syntax** `spanning-tree link-type {point-to-point|shared}`  
`no spanning-tree link-type`

| Parameter      | Description               |
|----------------|---------------------------|
| shared         | Disable rapid transition. |
| point-to-point | Enable rapid transition.  |

**Default** The default link type is point-to-point.

**Mode** Interface Configuration mode for a switch port interface only.

**Usage** You may want to set link type to shared if the port is connected to a hub with multiple devices connected to it.

**Examples** `awplus# configure terminal`  
`awplus(config)# interface port1.0.2`  
`awplus(config-if)# spanning-tree link-type point-to-point`

# spanning-tree max-age

**Overview** Use this command to set the max-age. This sets the maximum age, in seconds, that dynamic spanning tree configuration information is stored in the device before it is discarded.

Use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to restore the default of max-age.

**Syntax** `spanning-tree max-age <max-age>`  
`no spanning-tree max-age`

| Parameter                    | Description                                             |
|------------------------------|---------------------------------------------------------|
| <code>&lt;max-age&gt;</code> | <code>&lt;6-40&gt;</code> The maximum time, in seconds. |

**Default** The default of spanning-tree max-age is 20 seconds.

**Mode** Global Configuration

**Usage** Max-age is the maximum time in seconds for which a message is considered valid. Configure this value sufficiently high, so that a frame generated by the root bridge can be propagated to the leaf nodes without exceeding the max-age.

The **forward delay**, **max-age**, and **hello time** parameters should be set according to the following formula, as specified in IEEE Standard 802.1d:

$2 \times (\text{forward delay} - 1.0 \text{ seconds}) \geq \text{max-age}$

$\text{max-age} \geq 2 \times (\text{hello time} + 1.0 \text{ seconds})$

**Example** `awplus# configure terminal`  
`awplus(config)# spanning-tree max-age 12`

**Related Commands** [show spanning-tree](#)  
[spanning-tree forward-time](#)  
[spanning-tree hello-time](#)

# spanning-tree max-hops (MSTP)

**Overview** Use this command to specify the maximum allowed hops for a BPDU in an MST region. This parameter is used by all the instances of the MST region.

Use the **no** variant of this command to restore the default.

Use this command for MSTP only.

**Syntax** `spanning-tree max-hops <hop-count>`  
`no spanning-tree max-hops <hop-count>`

| Parameter                      | Description                                                              |
|--------------------------------|--------------------------------------------------------------------------|
| <code>&lt;hop-count&gt;</code> | Specify the maximum hops the BPDU will be valid for in the range <1-40>. |

**Default** The default max-hops in a MST region is 20.

**Mode** Global Configuration

**Usage** Specifying the max hops for a BPDU prevents the messages from looping indefinitely in the network. The hop count is decremented by each receiving port. When a device receives an MST BPDU that has a hop count of zero, it discards the BPDU.

**Examples** `awplus# configure terminal`  
`awplus(config)# spanning-tree max-hops 25`  
`awplus# configure terminal`  
`awplus(config)# no spanning-tree max-hops`

# spanning-tree mode

**Overview** Use this command to change the spanning tree protocol mode on the device. The spanning tree protocol mode on the device can be configured to either STP, RSTP or MSTP.

**Syntax** `spanning-tree mode {stp|rstp|mstp}`

**Default** The default spanning tree protocol mode on the device is RSTP.

**Mode** Global Configuration

**Usage** With no configuration, the device will have spanning tree enabled, and the spanning tree mode will be set to RSTP. Use this command to change the spanning tree protocol mode on the device. MSTP is VLAN aware, but RSTP and STP are not VLAN aware. To enable or disable spanning tree operation, see the [spanning-tree enable](#) command.

**Examples** To change the spanning tree mode from the default of RSTP to MSTP, use the following commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mode mstp
```

**Related Commands** [spanning-tree enable](#)

# spanning-tree mst configuration

**Overview** Use this command to enter the MST Configuration mode to configure the Multiple Spanning-Tree Protocol.

**Syntax** `spanning-tree mst configuration`

**Mode** Global Configuration

**Examples** The following example uses this command to enter MST Configuration mode. Note the change in the command prompt.

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)#
```

# spanning-tree mst instance

**Overview** Use this command to assign a Multiple Spanning Tree instance (MSTI) to a switch port or channel group.

Note that ports are automatically configured to send and receive spanning-tree information for the associated MSTI when VLANs are assigned to MSTIs using the [instance vlan \(MSTP\)](#) command.

Use the **no** variant of this command in Interface Configuration mode to remove the MSTI from the specified switch port or channel group.

**Syntax** `spanning-tree mst instance <instance-id>`  
`no spanning-tree mst instance <instance-id>`

| Parameter     | Description                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <instance-id> | Specify an MSTP instance in the range 1-15. The MST instance must have already been created using the <a href="#">instance vlan (MSTP)</a> command. |

**Default** A port automatically becomes a member of an MSTI when it is assigned to a VLAN.

**Mode** Interface Configuration mode for a switch port or channel group.

**Usage** You can disable automatic configuration of member ports of a VLAN to an associated MSTI by using a **no spanning-tree mst instance** command to remove the member port from the MSTI. Use the **spanning-tree mst instance** command to add a VLAN member port back to the MSTI.

**Examples** To assign instance 3 to a switch port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3
```

To remove instance 3 from a switch port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3
```

**Related Commands** [instance vlan \(MSTP\)](#)

[spanning-tree mst instance restricted-tcn](#)

# spanning-tree mst instance path-cost

**Overview** Use this command to set the cost of a path associated with a switch port, for the specified MSTI.

This specifies the switch port's contribution to the cost of a path to the MSTI regional root via that port. This applies when the port is the root port for the MSTI.

Use the **no** variant of this command to restore the default cost value of the path.

**Syntax** `spanning-tree mst instance <instance-id> path-cost <path-cost>`  
`no spanning-tree mst instance <instance-id> path-cost`

| Parameter     | Description                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <instance-id> | Specify an MSTP instance in the range 1-15.                                                                                                                |
| <path-cost>   | Specify the cost of path in the range of <1-2000000000>, where a lower path-cost indicates a greater likelihood of the specific interface becoming a root. |

**Default** The default path cost values and the range of recommended path cost values depend on the port speed, as shown in the following table from the IEEE 802.1q-2003 standard.

| Port speed         | Default path cost | Recommended path cost range |
|--------------------|-------------------|-----------------------------|
| Less than 100 Kb/s | 200,000,000       | 20,000,000-200,000,000      |
| 1Mbps              | 20,000,000        | 2,000,000-20,000,000        |
| 10Mbps             | 2,000,000         | 200,000-2,000,000           |
| 100 Mbps           | 200,000           | 20,000-200,000              |
| 1 Gbps             | 20,000            | 2,000-20,000                |
| 10 Gbps            | 2,000             | 200-2,000                   |
| 100 Gbps           | 200               | 20-200                      |
| 1Tbps              | 20                | 2-200                       |
| 10 Tbps            | 2                 | 2-20                        |

**Mode** Interface Configuration mode for a switch port interface only.

**Usage** Before you can use this command to set a path-cost in a VLAN configuration, you must explicitly add an MST instance to a port using the [spanning-tree mst instance](#) command.

**Examples** To set a path cost of 1000 on instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 path-cost 1000
```

To return the path cost to its default value on instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3 path-cost
```

**Related  
Commands**

[instance vlan \(MSTP\)](#)  
[spanning-tree mst instance](#)  
[spanning-tree mst instance priority](#)  
[spanning-tree mst instance restricted-role](#)  
[spanning-tree mst instance restricted-tcn](#)

# spanning-tree mst instance priority

**Overview** Use this command in Interface Configuration mode for a switch port interface only to set the port priority for an MST instance (MSTI).

Use the **no** variant of this command to restore the default priority value (128).

**Syntax** `spanning-tree mst instance <instance-id> priority <priority>`  
`no spanning-tree mst instance <instance-id> [priority]`

| Parameter                        | Description                                                                                                                                   |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;instance-id&gt;</code> | Specify an MSTP instance in the range 1-15.                                                                                                   |
| <code>&lt;priority&gt;</code>    | This must be a multiple of 16 and within the range <0-240>. A lower priority indicates greater likelihood of the port becoming the root port. |

**Default** The default is 128.

**Mode** Interface Configuration mode for a switch port interface.

**Usage** This command sets the value of the priority field contained in the port identifier. The MST algorithm uses the port priority when determining the root port for the switch in the MSTI. The port with the lowest value has the highest priority, so it will be chosen as root port over a port that is equivalent in all other aspects but with a higher priority value.

**Examples** To set the priority to 112 on instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 priority 112
```

To return the priority to its default value of 128 on instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3 priority
```

**Related Commands**

- [instance vlan \(MSTP\)](#)
- [spanning-tree priority \(port priority\)](#)
- [spanning-tree mst instance](#)
- [spanning-tree mst instance path-cost](#)
- [spanning-tree mst instance restricted-role](#)
- [spanning-tree mst instance restricted-tcn](#)

# spanning-tree mst instance restricted-role

**Overview** Use this command in Interface Configuration mode for a switch port interface only to enable the restricted role for an MSTI (Multiple Spanning Tree Instance) on a switch port. Configuring the restricted role for an MSTI on a switch port prevents the switch port from becoming the root port in a spanning tree topology.

Use the **no** variant of this command to disable the restricted role for an MSTI on a switch port. Removing the restricted role for an MSTI on a switch port allows the switch port to become the root port in a spanning tree topology.

**Syntax** `spanning-tree mst instance <instance-id> restricted-role`  
`no spanning-tree mst instance <instance-id> restricted-role`

| Parameter     | Description                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <instance-id> | Specify an MSTP instance in the range 1-15. The MST instance must have already been created using the <a href="#">instance vlan (MSTP)</a> command. |

**Default** The restricted role for an MSTI instance on a switch port is disabled by default.

**Mode** Interface Configuration mode for a switch port interface only.

**Usage** The root port is the port providing the best path from the bridge to the root bridge. Use this command to disable a port from becoming a root port. Use the **no** variant of this command to enable a port to become a root port. See the [STP Feature Overview and Configuration Guide](#) for root port information.

**Examples** To prevent a switch port from becoming the root port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 restricted-role
```

To stop preventing the switch port from becoming the root port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3
restricted-role
```

**Related  
Commands**

- instance vlan (MSTP)
- spanning-tree priority (port priority)
- spanning-tree mst instance
- spanning-tree mst instance path-cost
- spanning-tree mst instance restricted-tcn

# spanning-tree mst instance restricted-tcn

**Overview** Use this command to prevent a switch port from propagating received topology change notifications and topology changes to other switch ports. This is named restricted TCN (Topology Change Notification). A TCN is a simple Bridge Protocol Data Unit (BPDU) that a bridge sends out to its root port to signal a topology change.

Use the **no** variant of this command to stop preventing the switch port from propagating received topology change notifications and topology changes to other switch ports for the specified MSTI (Multiple Spanning Tree Instance).

The restricted TCN setting applies only to the specified MSTI (Multiple Spanning Tree Instance).

**Syntax** `spanning-tree mst instance <instance-id> restricted-tcn`  
`no spanning-tree mst instance <instance-id> restricted-tcn`

| Parameter     | Description                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <instance-id> | Specify an MSTP instance in the range 1-15. The MST instance must have already been created using the <a href="#">instance vlan (MSTP)</a> command. |

**Default** Disabled. By default, switch ports propagate TCNs.

**Mode** Interface Configuration mode for a switch port interface only.

**Examples** To prevent a switch port from propagating received topology change notifications and topology changes to other switch ports, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 restricted-tcn
```

To stop preventing a switch port from propagating received topology change notifications and topology changes to other switch ports, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3
restricted-tcn
```

**Related Commands** [instance vlan \(MSTP\)](#)  
[spanning-tree priority \(port priority\)](#)  
[spanning-tree mst instance](#)  
[spanning-tree mst instance path-cost](#)  
[spanning-tree mst instance restricted-role](#)

## spanning-tree path-cost

**Overview** Use this command in Interface Configuration mode for a switch port interface only to set the cost of a path for the specified port. This value then combines with others along the path to the root bridge in order to determine the total cost path value from the particular port, to the root bridge. The lower the numeric value, the higher the priority of the path. This applies when the port is the root port.

Use this command for RSTP, STP or MSTP. When MSTP mode is configured, this will apply to the port's path cost for the CIST.

**Syntax** `spanning-tree path-cost <pathcost>`  
`no spanning-tree path-cost`

| Parameter                     | Description                                                            |
|-------------------------------|------------------------------------------------------------------------|
| <code>&lt;pathcost&gt;</code> | <code>&lt;1-2000000000&gt;</code> The cost to be assigned to the port. |

**Default** The default path cost values and the range of recommended path cost values depend on the port speed, as shown in the following table from the IEEE 802.1q-2003 and IEEE 802.1d-2004 standards.

| Port speed         | Default path cost | Recommended path cost range |
|--------------------|-------------------|-----------------------------|
| Less than 100 Kb/s | 200,000,000       | 20,000,000-200,000,000      |
| 1Mbps              | 20,000,000        | 2,000,000-20,000,000        |
| 10Mbps             | 2,000,000         | 200,000-2,000,000           |
| 100 Mbps           | 200,000           | 20,000-200,000              |
| 1 Gbps             | 20,000            | 2,000-20,000                |
| 10 Gbps            | 2,000             | 200-2,000                   |
| 100 Gbps           | 200               | 20-200                      |
| 1Tbps              | 20                | 2-200                       |
| 10 Tbps            | 2                 | 2-20                        |

**Mode** Interface Configuration mode for switch port interface only.

**Example** `awplus# configure terminal`  
`awplus(config)# interface port1.0.2`  
`awplus(config-if)# spanning-tree path-cost 123`

# spanning-tree portfast (STP)

**Overview** Use this command in Interface Configuration mode for a switch port interface only to set a port as an edge-port. The portfast feature enables a port to rapidly move to the forwarding state, without having first to pass through the intermediate spanning tree states. This command has the same effect as the [spanning-tree edgeport \(RSTP and MSTP\)](#) command, but the configuration displays differently in the output of some show commands.

**NOTE:** You can run either of two additional parameters with this command. To simplify the syntax these are documented as separate commands. See the following additional portfast commands:

- [spanning-tree portfast bpdu-filter](#) command
- [spanning-tree portfast bpdu-guard](#) command.

You can obtain the same effect by running the [spanning-tree edgeport \(RSTP and MSTP\)](#) command. However, the configuration output may display differently in some show commands.

Use the **no** variant of this command to set a port to its default state (not an edge-port).

**Syntax** `spanning-tree portfast`  
`no spanning-tree portfast`

**Default** Not an edge port.

**Mode** Interface Configuration mode for a switch port interface only.

**Usage** Portfast makes a port move from a blocking state to a forwarding state, bypassing both listening and learning states. The portfast feature is meant to be used for ports connected to end-user devices. Enabling portfast on ports that are connected to a workstation or server allows devices to connect to the network without waiting for spanning-tree to converge.

For example, you may need hosts to receive a DHCP address quickly and waiting for STP to converge would cause the DHCP request to time out. Ensure you do not use portfast on any ports connected to another device to avoid creating a spanning-tree loop on the network.

Use this command on a switch port that connects to a LAN with no other bridges attached. An edge port should never receive BPDUs. Therefore if an edge port receives a BPDU, the portfast feature takes one of three actions.

- Cease to act as an edge port and pass BPDUs as a member of a spanning tree network ([spanning-tree portfast \(STP\)](#) command disabled).
- Filter out the BPDUs and pass only the data and continue to act as a edge port ([spanning-tree portfast bpdu-filter](#) command enabled).
- Block the port to all BPDUs and data ([spanning-tree portfast bpdu-guard](#) command enabled).

**Example**    `awplus# configure terminal`  
              `awplus(config)# interface port1.0.2`  
              `awplus(config-if)# spanning-tree portfast`

**Related  
Commands**    `spanning-tree edgeport (RSTP and MSTP)`  
                  `show spanning-tree`  
                  `spanning-tree portfast bpdu-filter`  
                  `spanning-tree portfast bpdu-guard`

# spanning-tree portfast bpdu-filter

**Overview** This command sets the bpdu-filter feature and applies a filter to any BPDUs (Bridge Protocol Data Units) received. Enabling this feature ensures that configured ports will not transmit any BPDUs and will ignore (filter out) any BPDUs received. BPDU Filter is not enabled on a port by default.

Using the **no** variant of this command to turn off the bpdu-filter, but retain the port's status as an enabled port. If the port then receives a BPDU it will change its role from an **edge-port** to a **non edge-port**.

## Syntax (Global Configuration)

```
spanning-tree portfast bpdu-filter  
no spanning-tree portfast bpdu-filter
```

## Syntax (Interface Configuration)

```
spanning-tree portfast bpdu-filter {default|disable|enable}  
no spanning-tree portfast bpdu-filter
```

| Parameter   | Description                                                                                                                                                                               |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bpdu-filter | A port that has bpdu-filter enabled will not transmit any BPDUs and will ignore any BPDUs received. This port type has one of the following parameters (in Interface Configuration mode): |
| default     | Takes the setting that has been configured for the whole device, i.e. the setting made from the Global configuration mode.                                                                |
| disable     | Turns off BPDU filter.                                                                                                                                                                    |
| enable      | Turns on BPDU filter.                                                                                                                                                                     |

**Default** BPDU Filter is not enabled on any ports by default.

**Mode** Global Configuration and Interface Configuration

**Usage** This command filters the BPDUs and passes only data to continue to act as an edge port. Using this command in Global Configuration mode applies the portfast bpdu-filter feature to all ports on the device. Using it in Interface mode applies the feature to a specific port, or range of ports. The command will operate in both RSTP and MSTP networks.

Use the [show spanning-tree](#) command to display status of the bpdu-filter parameter for the switch ports.

**Example** To enable STP BPDU filtering in Global Configuration mode, enter the commands:

```
awplus# configure terminal  
awplus(config)# spanning-tree portfast bpdu-filter
```

To enable STP BPDU filtering in Interface Configuration mode, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree portfast bpdu-filter enable
```

**Related  
Commands**

[spanning-tree edgeport \(RSTP and MSTP\)](#)  
[show spanning-tree](#)  
[spanning-tree portfast \(STP\)](#)  
[spanning-tree portfast bpdu-guard](#)

# spanning-tree portfast bpduguard

**Overview** This command applies a BPDU (Bridge Protocol Data Unit) guard to the port. A port with the bpduguard feature enabled will block all traffic (BPDUs and user data), if it starts receiving BPDUs.

Use this command in Global Configuration mode to apply BPDU guard to all ports on the device. Use this command in Interface mode for an individual interface or a range of interfaces specified. BPDU Guard is not enabled on a port by default.

Use the **no** variant of this command to disable the BPDU Guard feature on a device in Global Configuration mode or to disable the BPDU Guard feature on a port in Interface mode.

## Syntax (Global Configuration)

```
spanning-tree portfast bpduguard  
no spanning-tree portfast bpduguard
```

## Syntax (Interface Configuration)

```
spanning-tree portfast bpduguard {default|disable|enable}  
no spanning-tree portfast bpduguard
```

| Parameter | Description                                                                                                                                                                        |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bpduguard | A port that has bpduguard turned on will enter the STP blocking state if it receives a BPDU. This port type has one of the following parameters (in Interface Configuration mode): |
| default   | Takes the setting that has been configured for the whole device, i.e. the setting made from the Global configuration mode.                                                         |
| disable   | Turns off BPDU guard.                                                                                                                                                              |
| enable    | Turns on BPDU guard and will also set the port as an edge port.                                                                                                                    |

**Default** BPDU Guard is not enabled on any ports by default.

**Mode** Global Configuration or Interface Configuration

**Usage** This command blocks the port(s) to all devices and data when enabled. BPDU Guard is a port-security feature that changes how a portfast-enabled port behaves if it receives a BPDU. When **bpduguard** is set, then the port shuts down if it receives a BPDU. It does not process the BPDU as it is considered suspicious. When **bpduguard** is not set, then the port will negotiate spanning-tree with the device sending the BPDUs. By default, bpduguard is not enabled on a port.

You can configure a port disabled by the bpduguard to re-enable itself after a specific time interval. This interval is set with the [spanning-tree errdisable-timeout interval](#) command. If you do not use the **errdisable-timeout** feature, then you will need to manually re-enable the port by using the **no shutdown** command.

Use the [show spanning-tree](#) command to display the device and port configurations for the BPDU Guard feature. It shows both the administratively configured and currently running values of bpdu-guard.

**Example** To enable STP BPDU guard in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree portfast bpdu-guard
```

To enable STP BPDU guard in Interface Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree portfast bpdu-guard enable
```

# spanning-tree priority (bridge priority)

**Overview** Use this command to set the bridge priority for the device. A lower priority value indicates a greater likelihood of the device becoming the root bridge.

Use this command for RSTP, STP or MSTP. When MSTP mode is configured, this will apply to the CIST.

Use the **no** variant of this command to reset it to the default.

**Syntax** `spanning-tree priority <priority>`  
`no spanning-tree priority`

| Parameter                     | Description                                                                                    |
|-------------------------------|------------------------------------------------------------------------------------------------|
| <code>&lt;priority&gt;</code> | <code>&lt;0-61440&gt;</code> The bridge priority, which will be rounded to a multiple of 4096. |

**Default** The default priority is 32678.

**Mode** Global Configuration

**Usage** To force a particular device to become the root bridge use a lower value than other devices in the spanning tree.

**Example** `awplus# configure terminal`  
`awplus(config)# spanning-tree priority 4096`

**Related Commands** [spanning-tree mst instance priority](#)  
[show spanning-tree](#)

# spanning-tree priority (port priority)

**Overview** Use this command in Interface Configuration mode for a switch port interface only to set the port priority for port. A lower priority value indicates a greater likelihood of the port becoming part of the active topology.

Use this command for RSTP, STP, or MSTP. When the device is in MSTP mode, this will apply to the CIST.

Use the **no** variant of this command to reset it to the default.

**Syntax** `spanning-tree priority <priority>`  
`no spanning-tree priority`

| Parameter                     | Description                                                                                      |
|-------------------------------|--------------------------------------------------------------------------------------------------|
| <code>&lt;priority&gt;</code> | <0-240>, in increments of 16. The port priority, which will be rounded down to a multiple of 16. |

**Default** The default priority is 128.

**Mode** Interface Configuration mode for a switch port interface only.

**Usage** To force a port to be part of the active topology (for instance, become the root port or a designated port) use a lower value than other ports on the device. (This behavior is subject to network topology, and more significant factors, such as bridge ID.)

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree priority 16
```

**Related Commands** [spanning-tree mst instance priority](#)  
[spanning-tree priority \(bridge priority\)](#)  
[show spanning-tree](#)

# spanning-tree restricted-role

**Overview** Use this command in Interface Configuration mode for a switch port interface only to restrict the port from becoming a root port.

Use the **no** variant of this command to disable the restricted role functionality.

**Syntax** `spanning-tree restricted-role`  
`no spanning-tree restricted-role`

**Default** The restricted role is disabled.

**Mode** Interface Configuration mode for a switch port interface only.

**Example** `awplus# configure terminal`  
`awplus(config)# interface port1.0.2`  
`awplus(config-if)# spanning-tree restricted-role`

# spanning-tree restricted-tcn

**Overview** Use this command in Interface Configuration mode for a switch port interface only to prevent TCN (Topology Change Notification) BPDUs (Bridge Protocol Data Units) from being sent on a port. If this command is enabled, after a topology change a bridge is prevented from sending a TCN to its designated bridge.

Use the **no** variant of this command to disable the restricted TCN functionality.

**Syntax** `spanning-tree restricted-tcn`  
`no spanning-tree restricted-tcn`

**Default** The restricted TCN is disabled.

**Mode** Interface Configuration mode for a switch port interface only.

**Example** `awplus# configure terminal`  
`awplus(config)# interface port1.0.2`  
`awplus(config-if)# spanning-tree restricted-tcn`

# spanning-tree transmit-holdcount

**Overview** Use this command to set the maximum number of BPDU transmissions that are held back.

Use the **no** variant of this command to restore the default transmit hold-count value.

**Syntax** `spanning-tree transmit-holdcount`  
`no spanning-tree transmit-holdcount`

**Default** Transmit hold-count default is 3.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# spanning-tree transmit-holdcount`

# undebbug mstp

**Overview** This command applies the functionality of the no `debug mstp` (RSTP and STP) command.

# 16

# Link Aggregation Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure a static channel group (static aggregator) and dynamic channel group (LACP channel group, etherchannel or LACP aggregator). Link aggregation is also sometimes referred to as channeling.

**NOTE:** *AlliedWare Plus™ supports IEEE 802.3ad link aggregation and uses the Link Aggregation Control Protocol (LACP). LACP does not interoperate with devices that use Port Aggregation Protocol (PAgP).*

*Link aggregation does not necessarily achieve exact load balancing across the links. The load sharing algorithm is designed to ensure that any given data flow always goes down the same link. It also aims to spread data flows across the links as evenly as possible.*

*Link aggregation hashes one or more of the source and destination MAC address, IP address and UDP/TCP ports to select a link on which to send a packet. So packet flow between a pair of hosts always takes the same link inside the Link Aggregation Group (LAG). The net effect is that the bandwidth for a given packet stream is restricted to the speed of one link in the LAG.*

*For example, for a 2 Gbps LAG that is a combination of two 1 Gbps ports, any one flow of traffic can only ever reach a maximum throughput of 1 Gbps. However, the hashing algorithm should spread the flows across the links so that when many flows are operating, the full 2 Gbps can be utilized.*

For a description of static and dynamic link aggregation (LACP), and configuration examples, see the [Link Aggregation Feature Overview and Configuration Guide](#).

# channel-group

**Overview** Use this command to either create a new dynamic channel group while at the same time adding a port to it, or to add a port to an existing dynamic channel group. Note that you must also set the LACP mode to be either active or passive.

You can create up to 32 dynamic (LACP) channel groups (and up to 96 static channel groups).

Use the **no** variant of this command to turn off link aggregation on the device port. You will be returned to Global Configuration mode from Interface Configuration mode.

**Syntax** `channel-group <dynamic-channel-group-number> mode {active|passive}`  
`no channel-group`

| Parameter                                         | Description                                                                                                                                                                                |
|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;dynamic-channel-group-number&gt;</code> | <code>&lt;1-32&gt;</code> Specify a dynamic channel group number for an LACP link. You can create up to 32 dynamic (LACP) channel groups (in addition to up to 96 static channel groups).  |
| <code>active</code>                               | Enables initiation of LACP negotiation on a port. The port will transmit LACP dialogue messages whether or not it receives them from the partner device.                                   |
| <code>passive</code>                              | Disables initiation of LACP negotiation on a port. The port will only transmit LACP dialogue messages if the partner device is transmitting them, i.e., the partner is in the active mode. |

**Mode** Interface Configuration

**Usage** All the device ports in a channel-group must belong to the same VLANs, have the same tagging status, and can only be operated on as a group. All device ports within a channel group must have the same port speed and be in full duplex mode.

Once the LACP channel group has been created, it is treated as a device port, and can be referred to in most other commands that apply to device ports.

To refer to an LACP channel group in other LACP commands, use the channel group number. To specify an LACP channel group (LACP aggregator) in other commands, prefix the channel group number with **po**. For example, 'po2' refers to the LACP channel group with channel group number 2.

For more information about LACP, see the [Link Aggregation Feature Overview and Configuration Guide](#) which is available on our website at [alliedtelesis.com](#).

**Examples** To add device port1.0.6 to a newly created LACP channel group 2 use the commands below:

```
awplus# configure terminal
awplus(config)# interface port1.0.6
awplus(config-if)# channel-group 2 mode active
```

To remove device port1.0.6 from any created LACP channel groups use the command below:

```
awplus# configure terminal
awplus(config)# interface port1.0.6
awplus(config-if)# no channel-group
```

To reference channel group 2 as an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface po2
awplus(config-if)#
```

**Related  
Commands**

- [show etherchannel summary](#)
- [show port etherchannel](#)

# clear lacp counters

**Overview** Use this command to clear all counters of all present LACP aggregators (channel groups) or a given LACP aggregator.

**Syntax** `clear lacp [<1-32>] counters`

| Parameter | Description           |
|-----------|-----------------------|
| <1-32>    | Channel-group number. |

**Mode** Privileged Exec

**Example** `awplus# clear lacp 2 counters`

# debug lacp

**Overview** Use this command to enable all LACP troubleshooting functions.

Use the **no** variant of this command to disable this function.

**Syntax** `debug lacp {all|cli|event|ha|packet|sync|timer[detail]}`  
`no debug lacp {all|cli|event|ha|packet|sync|timer[detail]}`

| Parameter | Description                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------|
| all       | Turn on all debugging for LACP.                                                                           |
| cli       | Specifies debugging for CLI messages.<br>Echoes commands to the console.                                  |
| event     | Specifies debugging for LACP events.<br>Echoes events to the console.                                     |
| ha        | Specifies debugging for HA (High Availability) events.<br>Echoes High Availability events to the console. |
| packet    | Specifies debugging for LACP packets.<br>Echoes packet contents to the console.                           |
| sync      | Specified debugging for LACP synchronization.<br>Echoes synchronization to the console.                   |
| timer     | Specifies debugging for LACP timer.<br>Echoes timer expiry to the console.                                |
| detail    | Optional parameter for LACP timer-detail.<br>Echoes timer start/stop details to the console.              |

**Mode** Privileged Exec and Global Configuration

**Examples** `awplus# debug lacp timer detail`  
`awplus# debug lacp all`

**Related Commands** [show debugging lacp](#)  
[undebug lacp](#)

# lacp global-passive-mode enable

**Overview** Use this command to enable LACP channel-groups to dynamically self-configure when they are connected to another device that has LACP channel-groups configured with Active Mode.

**Syntax** lacp global-passive-mode enable  
no lacp global-passive-mode enable

**Default** Enabled

**Mode** Global Configuration

**Usage** Do not mix LACP configurations (manual & dynamic). When LACP global passive mode is turned on (by using the **lacp global-passive-mode enable** command), we do not recommend using a mixed configuration in a LACP channel-group; i.e. some links are manually configured (by the **channel-group** command) and others are dynamically learned in the same channel-group.

**Example** To enable global passive mode for LACP channel groups, use the command:

```
awplus(config)# lacp global-passive-mode enable
```

To disable global passive mode for LACP channel groups, use the command:

```
awplus(config)# no lacp global-passive-mode enable
```

**Related Commands** [show etherchannel](#)  
[show etherchannel detail](#)

# lacp port-priority

**Overview** Use this command to set the priority of a device port. Ports are selected for aggregation based on their priority, with the higher priority (numerically lower) ports selected first.

Use the **no** variant of this command to reset the priority of port to the default.

**Syntax** `lacp port-priority <1-65535>`  
`no lacp port-priority`

| Parameter | Description                     |
|-----------|---------------------------------|
| <1-65535> | Specify the LACP port priority. |

**Default** The default is 32768.

**Mode** Interface Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# interface port1.0.5`  
`awplus(config-if)# lacp port-priority 34`

# lacp system-priority

**Overview** Use this command to set the system priority of a local system. This is used in determining the system responsible for resolving conflicts in the choice of aggregation groups.

Use the **no** variant of this command to reset the system priority of the local system to the default.

**Syntax** lacp system-priority <1-65535>  
no lacp system-priority

| Parameter | Description                                                          |
|-----------|----------------------------------------------------------------------|
| <1-65535> | LACP system priority. Lower numerical values have higher priorities. |

**Default** The default is 32768.

**Mode** Global Configuration

**Example** awplus# configure terminal  
awplus(config)# lacp system-priority 6700

# lacp timeout

**Overview** Use this command to set the short or long timeout on a port. Ports will time out of the aggregation if three consecutive updates are lost.

**Syntax** `lacp timeout {short|long}`

| Parameter | Description                                                            |
|-----------|------------------------------------------------------------------------|
| timeout   | Number of seconds before invalidating a received LACP data unit (DU).  |
| short     | LACP short timeout. The <b>short</b> timeout value is <b>1</b> second. |
| long      | LACP long timeout. The <b>long</b> timeout value is <b>30</b> seconds. |

**Default** The default is **long** timeout (30 seconds).

**Mode** Interface Configuration

**Usage** This command enables the device to indicate the rate at which it expects to receive LACPDU's from its neighbor.

If the timeout is set to **long**, then the device expects to receive an update every **30** seconds, and this will time a port out of the aggregation if no updates are seen for 90 seconds (i.e. 3 consecutive updates are lost).

If the timeout is set to **short**, then the device expects to receive an update every second, and this will time a port a port out of the aggregation if no updates are seen for 3 seconds (i.e. 3 consecutive updates are lost).

The device indicates its preference by means of the Timeout field in the Actor section of its LACPDUs. If the Timeout field is set to 1, then the device has set the **short** timeout. If the Timeout field is set to 0, then the device has set the **long** timeout.

Setting the **short** timeout enables the device to be more responsive to communication failure on a link, and does not add too much processing overhead to the device (1 packet per second).

**NOTE:** *It is not possible to configure the rate that the device sends LACPDUs; the device must send at the rate which the neighbor indicates it expects to receive LACPDUs.*

**Examples** The following commands set the LACP long timeout period for 30 seconds on port1.0.2.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# lacp timeout long
```

The following commands set the LACP short timeout for 1 second on port1.0.2.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# lacp timeout short
```

# platform load-balancing

**Overview** This command selects which address fields are used as inputs into the load balancing algorithm for aggregated links. The output from this algorithm is used to select which individual path a given packet will traverse within an aggregated link.

The **no** variant of this command applies its default setting.

**Syntax** `platform load-balancing {src-dst-mac|src-dst-ip}`  
`no platform load-balancing`

| Parameter   | Description                                                                                                                                                                                                                        |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| src-dst-mac | Include the source and destination MAC addresses (Layer 2)                                                                                                                                                                         |
| src-dst-ip  | Include the source and destination IP addresses (Layer 3) and UDP/TCP source and destination ports.<br>If you choose this option, the algorithm will use MAC addresses to calculate load balancing for Layer 2 and non-IP packets. |

**Default** The default is **src-dst-ip**.

**Mode** Global configuration

**Examples** To set the load balancing algorithm to include only Layer 2 MAC addresses, enter:

```
awplus# configure terminal
awplus(config)# platform load-balancing src-dst-mac
```

To set the load balancing algorithm to include only Layer 3 IP addresses and L4 ports, enter:

```
awplus# configure terminal
awplus(config)# platform load-balancing src-dst-ip
```

**Related Commands** [show platform](#)

# show debugging lacp

**Overview** Use this command to display the LACP debugging option set.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging lacp`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show debugging lacp`

**Output** Figure 16-1: Example output from the **show debugging lacp** command

```
LACP debugging status:
LACP timer debugging is on
LACP timer-detail debugging is on
LACP cli debugging is on
LACP packet debugging is on
LACP event debugging is on
LACP sync debugging is on
```

**Related  
Commands** [debug lacp](#)

# show diagnostic channel-group

**Overview** This command displays dynamic and static channel group interface status information. The output of this command is useful for Allied Telesis authorized service personnel for diagnostic purposes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show diagnostic channel-group`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show diagnostic channel-group`

**Output** Figure 16-2: Example output from the **show diagnostic channel-group** command

```
awplus#show diagnostic channel-group
```

|                                        |           |         |             |         |        |     |

**Commands**

# show etherchannel

**Overview** Use this command to display information about a LACP channel specified by the channel group number.

The command output also shows the thrash limiting status. If thrash limiting is detected and the **action** parameter of the [thrash-limiting](#) command is set to **vlan-disable**, the output will also show the VLANs on which thrashing is detected.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#), which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** `show etherchannel [<1-32>]`

| Parameter | Description           |
|-----------|-----------------------|
| <1-32>    | Channel-group number. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show etherchannel`

**Output** Figure 16-3: Example output from **show etherchannel**

```
awplus#show etherchannel
LAG Maximum      : 128
LAG Static  Maximum: 96
LAG Dynamic Maximum: 32
LAG Static  Count  : 0
LAG Dynamic Count  : 1
LAG Total   Count  : 1
Lacp Aggregator: pol
Member:
  port1.0.5
  port1.0.6
```

**Example** `awplus# show etherchannel 1`

**Output** Figure 16-4: Example output from **show etherchannel** for a particular channel

```
awplus#show etherchannel 1
Aggregator pol (4601)
Mac address: 00:00:00:00:00:00

  Link: port1.0.1 (IfIndex: 7007) synchronized
  Link: port1.0.2 (IfIndex: 8007) synchronized
  Link: port1.0.3 (IfIndex: 11007) synchronized
```

# show lacp sys-id

**Overview** Use this command to display the LACP system ID and priority.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#), which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** `show lacp sys-id`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show lacp sys-id`

**Output** Example output from **show lacp sys-id**

```
System Priority: 0x8000 (32768)
MAC Address: 0200.0034.5684
```

# show lacp-counter

**Overview** Use this command to display the packet traffic on all ports of all present LACP aggregators, or a given LACP aggregator.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#), which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** `show lacp-counter [<1-32>]`

| Parameter | Description           |
|-----------|-----------------------|
| <1-32>    | Channel-group number. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show lacp-counter 2`

**Output** Example output from **show lacp-counter**

|                                  |         |      |        |      |          |      |

# show static-channel-group

**Overview** Use this command to display all configured static channel groups and their corresponding member ports. Note that a static channel group is the same as a static aggregator.

The command output also shows the thrash limiting status. If thrash limiting is detected and the **action** parameter of the [thrash-limiting](#) command is set to **vlan-disable**, the output will also show the VLANs on which thrashing is detected.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#), which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** `show static-channel-group`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show static-channel-group`

**Output** Example output from **show static-channel-group**

```
% LAG Maximum      : 128
% LAG Static  Maximum: 96
% LAG Dynamic Maximum: 32
% LAG Static  Count  : 2
% LAG Dynamic Count  : 2
% LAG Total   Count  : 4
% Static Aggregator: sa2
% Member:
    port1.0.1
% Static Aggregator: sa3
% Member:
    port1.0.2
```

**Related Commands** [static-channel-group](#)

# static-channel-group

**Overview** Use this command to create a static channel group, or add a member port to an existing static channel group. Static channel groups are also known as static aggregators.

You can create up to 96 static channel groups (and up to 32 dynamic channel groups).

Use the **no** variant of this command to remove the device port from the static channel group.

**Syntax** `static-channel-group <static-channel-group-number>`  
`[member-filters]`  
  
`no static-channel-group`

| Parameter                                        | Description                                                                                                                                                                                                       |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;static-channel-group-number&gt;</code> | <1-96> Static channel group number.                                                                                                                                                                               |
| <code>member-filters</code>                      | Allow QoS and ACL settings to be configured on the aggregator's individual member ports, instead of the aggregator itself. This configuration is required when using QoS Storm Protection on a static aggregator. |

**Mode** Interface Configuration

**Usage** This command adds the device port to the static channel group with the specified channel group number. If the channel group does not exist, it is created, and the port is added to it. The **no** prefix detaches the port from the static channel group. If the port is the last member to be removed, the static channel group is deleted.

All the ports in a channel group must have the same VLAN configuration: they must belong to the same VLANs and have the same tagging status, and can only be operated on as a group.

Once the static channel group has been created, it is treated as a device port, and can be referred to in other commands that apply to device ports.

To refer to a static channel group in other static channel group commands, use the channel group number. To specify a static channel group in other commands, prefix the channel group number with **sa**. For example, 'sa2' refers to the static channel group with channel group number 2.

**Examples** To define static channel group 2 on a device port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# static-channel-group 2
```

To reference static channel group 2 as an interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface sa2
awplus(config-if)#
```

To make it possible to use QoS Storm Protection on static channel group 2 on port1.0.6, with an ACL named "test-acl", use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.6
awplus(config-if)# static-channel-group 2 member-filters
awplus(config-if)# access-group test-acl
```

**Related Commands** [show static-channel-group](#)

# undebbug lacp

**Overview** This command applies the functionality of the no `debug lacp` command.

# Power over Ethernet Commands

## Introduction

**Overview** This chapter contains an alphabetical list of commands used to configure Power over Ethernet (PoE). Each command contains a functional description and shows examples of configuration and output screens for show commands. These commands are only supported on PoE capable ports. An error message will display on the console if you enter a PoE command on a port that does not support PoE. The following documents offer further information for configuring PoE on AlliedWare Plus switches.

- the [PoE Feature Overview and Configuration\\_Guide](#).
- the [Support for Allied Telesis Enterprise\\_MIBs\\_in AlliedWare Plus](#), for information about which PoE MIB objects are supported.
- the [SNMP Feature Overview and Configuration\\_Guide](#), for information about SNMP traps.

Power over Ethernet (PoE) is a technology allowing devices such as security cameras to receive power over LAN cabling.

The Powered Device (PD) referred to throughout this chapter is a PoE or PoE+ powered device, such as an IP phone or a Wireless Access Point (WAP).

- Command List**

# clear power-inline counters interface

**Overview** This command will clear the counters from a specified port, a range of ports, or all ports on the switch. If no ports are entered then PoE counters for all ports are cleared. It will also clear all Power over Ethernet (PoE) counters supported by the Power Ethernet MIB (RFC 3621).

**Syntax** `clear power-inline counters interface [<port-list>]`

| Parameter                      | Description                                                 |
|--------------------------------|-------------------------------------------------------------|
| <code>&lt;port-list&gt;</code> | Selects the port or ports whose counters are to be cleared. |

**Mode** Privileged Exec

**Usage** The PoE counters are displayed with the [show power-inline counters](#) command.

**Examples** To clear the PoE counters for port1.0.2 only, use the following command:

```
awplus# clear power-inline counters interface port1.0.2
```

To clear the PoE counters for port1.0.5 through port1.0.8, use the following command:

```
awplus# clear power-inline counters interface  
port1.0.5-port1.0.8
```

To clear the PoE counters for all ports, use the following command:

```
awplus# clear power-inline counters interface
```

**Validation  
Commands** [show power-inline counters](#)

# debug power-inline

**Overview** This command enables debugging display for messages that are specific to Power over Ethernet (PoE).

Use the **no** variant of this command to disable the specified PoE debugging messages.

**Syntax** `debug power-inline [all|event|info|power]`  
`no debug power-inline [all|event|info|power]`

| Parameter | Description                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------|
| all       | Displays all (event, info, nsm, power) debug messages.                                                                           |
| event     | Displays event debug information, showing any error conditions that may occur during PoE operation.                              |
| info      | Displays informational level debug information, showing high-level essential debugging, such as information about message types. |
| power     | Displays power management debug information.                                                                                     |

**Default** No debug messages are enabled by default.

**Mode** Privileged Exec

**Usage** Use the [terminal monitor](#) command to display PoE debug messages on the console.

Use the [show debugging power-inline](#) command to show the PoE debug configuration.

**Examples** To enable PoE debugging and start the display of PoE event and info debug messages on the console, use the following commands:

```
awplus# terminal monitor
awplus# debug power-inline event info
```

To enable PoE debugging and start the display of all PoE debugging messages on the console, use the following commands:

```
awplus# terminal monitor
awplus# debug power-inline all
```

To stop the display of PoE info debug messages on the console, use the following command:

```
awplus# no debug power-inline info
```

To disable all PoE debugging and stop the display of any PoE debugging messages on the console, use the following command:

```
awplus# no debug power-inline all
```

**Related  
Commands** [show debugging power-inline](#)  
[terminal monitor](#)

# power-inline allow-legacy

**Overview** This command enables detection of pre-IEEE 802.3af Power Ethernet standard legacy Powered Devices (PDs).

The no variant of this command disables detection of pre-IEEE 802.3af Power Ethernet standard legacy Powered Devices (PDs).

**Syntax** `power-inline allow-legacy`  
`no power-inline allow-legacy`

**Default** Detection of legacy PDs is enabled on all ports

**Mode** Global Configuration

**Examples** To disable detection of legacy PDs, use the following commands:

```
awplus# configure terminal
awplus(config)# no power-inline allow-legacy
```

To enable detection of legacy PDs, use the following commands:

```
awplus# configure terminal
awplus(config)# power-inline allow-legacy
```

**Validation Commands** `show power-inline`  
`show running-config power-inline`

# power-inline description

**Overview** This command adds a description for a Powered Device (PD) connected to a PoE port.

The **no** variant of this command clears a previously entered description for a connected PD, resetting the PD description to the default (null).

**Syntax** `power-inline description <pd-description>`  
`no power-inline description`

| Parameter                           | Description                                                                                                             |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;pd-description&gt;</code> | Description of the PD connected to the PoE capable port (with a maximum 256 character string limit per PD description). |

**Default** No description for a connected PD is set by default.

**Mode** Interface Configuration

**Usage** Select a PoE port, a list of PoE ports, or a range of PoE ports with the preceding [interface \(to configure\)](#) command. If you specify a range or list of ports they must all be PoE capable ports.

**Examples** To add the description “Desk Phone” for a connected PD on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# power-inline description Desk Phone
```

To clear the description for the connected PD on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no power-inline description
```

**Related Commands** [show power-inline interface](#)  
[show running-config power-inline](#)

# power-inline enable

**Overview** This command enables Power over Ethernet (PoE) to detect a connected Powered Device (PD) and supply power.

The **no** variant of this command disables PoE functionality on the selected PoE port(s). No power is supplied to a connected PD after PoE is disabled on the selected PoE port(s).

Ports still provide Ethernet connectivity after PoE is disabled.

**Syntax** `power-inline enable`  
`no power-inline enable`

**Default** PoE is enabled by default on all ports

**Mode** Interface Configuration for one or more ports.

**Usage** No PoE log messages are generated for ports on which PoE is disabled.

**Examples** To disable PoE on port1.0.1 to port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# no power-inline enable
```

To enable PoE on port1.0.1 to port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# power-inline enable
```

# power-inline max

**Overview** This command sets the maximum power allocated to a Power over an Ethernet (PoE and PoE+) port. The amount of power actually supplied to the port depends on the power requirements of the connected PD. It is also a function of the total PoE power loading on the switch and the PoE priority set for the port by the [power-inline priority](#) command. However this command (power-inline max) does apply a maximum value to the power that the port is able to supply.

Note that the value set by this command will be the figure the switch will use when apportioning the power budget for its ports. For example, if 15.4 W is assigned to a port whose PD only consumes 5 W, the switch will reserve the full 15.4 W for this port when determining its total power PoE power requirement.

The **no** variant of this command sets the maximum power supplied to a PoE port to the default, which is set to the maximum power limit for the class of the connected Powered Device (PD).

**Syntax** `power-inline max <4000-30000>`  
`no power-inline max`

| Parameter                       | Description                                                  |
|---------------------------------|--------------------------------------------------------------|
| <code>&lt;4000-30000&gt;</code> | The maximum power supplied to a PoE port in milliwatts (mW). |

**Default** The switch supplies the maximum power limit for the class of the PD connected to the port by default.

**NOTE:** See the [PoE Feature Overview and Configuration Guide](#) for further information about power classes.

**Mode** Interface Configuration for one or more ports. If you specify a range or list of ports, they must all be PoE capable ports.

**Usage** In a stack of x310 series switches this command is supported on all PoE capable ports.

If you select a range of PoE ports in Interface Configuration mode before issuing this command, then each port in the range selected will have the same maximum power value configured. If the PoE port attempts to draw more than the maximum power, this is logged and all power is removed. Note that the value entered is rounded up to the next value supported by the hardware.

See the actual value used, as shown after command entry, in the sample console output below:

```
awplus#configure terminal  
  
awplus(config)#interface port1.0.1  
  
awplus(config-if)#power-line max 5300  
  
% The maximum power has been rounded to 5450mW in hardware.
```

See the [LLDP Feature Overview and Configuration Guide](#) for information about power monitoring at the PD.

Note the difference in power supplied from the PSE to the power available at the PD due to line loss.

See the [PoE Feature Overview and Configuration Guide](#) for further information about the difference between the power supplied from the PSE and the power available at the PD.

**Examples** To set the maximum power supplied to ports in the range port1.0.1 to port1.0.4 to 6450mW per port, use the following commands:

```
awplus# configure terminal  
  
awplus(config)# interface port1.0.2-port1.0.4  
  
awplus(config-if)# power-inline max 6450
```

To clear the user-configured maximum power supplied to port1.0.1, and revert to using the default maximum power, use the following commands:

```
awplus# configure terminal  
  
awplus(config)# interface port1.0.1  
  
awplus(config-if)# no power-inline max
```

**Related Commands** [show power-inline interface](#)  
[show running-config power-inline](#)

# power-inline priority

**Overview** This command sets the Power over Ethernet (PoE) priority level of a PoE port to one of three available priority levels:

- low
- high
- critical

The **no** variant of this command restores the PoE port priority to the default (low).

**Syntax** `power-inline priority {low|high|critical}`  
`no power-inline priority`

| Parameter | Description                                                                                                                                                                                                                                                              |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| low       | The lowest priority for a PoE enabled port (default). PoE ports set to <b>low</b> only receive power if all the PoE ports assigned to the other two levels are already receiving power.                                                                                  |
| high      | The second highest priority for a PoE enabled port. PoE ports set to <b>high</b> receive power only if all the ports set to <b>critical</b> are already receiving power.                                                                                                 |
| critical  | The highest priority for a PoE enabled port. PoE ports set to <b>critical</b> are guaranteed power before any ports assigned to the other two priority levels. Ports assigned to the other priority levels receive power only if all critical ports are receiving power. |

**Default** The default priority is **low** for all PoE ports

**Mode** Interface Configuration

**Usage** This command is supported on all PoE capable ports, whether operating as a stand-alone switch, or within a VCStack.

Select a PoE port, a list of PoE ports, or a range of PoE ports with the preceding [interface \(to configure\)](#) command. If you specify a range or list of ports they must all be PoE capable ports.

PoE ports with higher priorities are given power before PoE ports with lower priorities. If the priorities for two PoE ports are the same then the lower numbered PoE port is given power before the higher numbered PoE port.

See the [PoE Feature Overview and Configuration Guide](#) for further information about PoE priority.

**Examples** To set the priority level to high on port1.0.1 to port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# power-inline priority high
```

To reset the priority level to the default of low on port1.0.1 to port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# no power-inline priority
```

# power-inline usage-threshold

**Overview** This command sets the level at which the switch will issue a message that the power supplied to all Powered Devices (PDs) has reached a critical level of the nominal power rating for the switch. The level is set as a percentage of total available power.

The **no** variant of this command resets the notification usage-threshold to the default (80% of the nominal power rating).

**Syntax** `power-inline usage-threshold <1-99>`  
`no power-inline usage-threshold`

| Parameter | Description                                                  |
|-----------|--------------------------------------------------------------|
| <1-99>    | The usage-threshold percentage configured with this command. |

**Default** The default power usage threshold is 80% of the nominal power rating

**Mode** Global Configuration

**Usage** Use the [snmp-server enable trap](#) command to configure SNMP notification. An SNMP notification is sent when the usage-threshold, as configured in the example, is exceeded.

**Examples** To generate SNMP notifications when power supplied exceeds 70% of the nominal power rating, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap power-inline
awplus(config)# power-inline usage-threshold 70
```

To reset the notification threshold to the default (80% of the nominal power rating), use the following commands:

```
awplus# configure terminal
awplus(config)# no power-inline usage-threshold
```

**Related Commands** [snmp-server enable trap](#)  
[show power-inline interface](#)  
[show running-config power-inline](#)

# service power-inline

**Overview** This command enables Power over Ethernet (PoE) globally on the switch, for all PoE ports.

**Syntax** `service power-inline`  
`no service power-inline`

**Default** PoE functionality is enabled by default

**Mode** Global Configuration

**Usage** In a stack, issuing this command enables PoE globally for all PoE ports.  
In a stack configuration, only stack members containing PoE hardware will have PoE enabled by default in software.

**Examples** To disable PoE, use the following commands:

```
awplus# configure terminal  
awplus(config)# no service power-inline
```

To re-enable PoE, if PoE has been disabled, use the following commands:

```
awplus# configure terminal  
awplus(config)# service power-inline
```

**Related Commands** [show power-inline](#)  
[show running-config power-inline](#)

# show debugging power-inline

**Overview** This command displays Power over Ethernet (PoE) debug settings.

**Syntax** `show debugging power-inline`

**Mode** User Exec and Privileged Exec

**Example** To display PoE debug settings, use the following command:

```
awplus# show debugging power-inline
```

**Output** Figure 17-1: Example output from the **show debugging power-inline** command

```
awplus#show debugging power-inline
PoE Debugging status:
PoE Informational debugging is disabled
PoE Event debugging is disabled
PoE Power Management debugging is disabled

PoE NSM debugging is enabled
```

|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Operational Status        | The operational status of the PSU hardware when this command was issued: <ul style="list-style-type: none"> <li>• <b>On</b> if the PSU is installed and switched on.</li> <li>• <b>Off</b> when the PSU is switched off (an RPS may be connected to the switch to power PoE instead of the PSU).</li> <li>• <b>Fault</b> when there is an issue with the PSU hardware.</li> </ul>                                                                                                                                                                               |
| Power Usage Threshold (%) | The configured SNMP trap / log threshold, as configured from a <a href="#">power-inline usage-threshold</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Interface                 | The PoE port(s) in the format <code>portx.y.z</code> , where <code>x</code> is the device number, <code>y</code> is the module number within the device, and <code>z</code> is the PoE port number within the module.                                                                                                                                                                                                                                                                                                                                           |
| Admin                     | The administrative state of PoE on a PoE port, either <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Pri                       | The current PoE priorities for PoE ports, as configured from a <a href="#">power-inline priority</a> command: <ul style="list-style-type: none"> <li>• <b>Low</b> displays when the <code>low</code> parameter is issued. The lowest priority for a PoE enabled port (default).</li> <li>• <b>High</b> displays when the <code>high</code> parameter is issued. The second highest priority for a PoE enabled port.</li> <li>• <b>Crit</b> displays when the <code>critical</code> parameter is issued. The highest priority for a PoE enabled port.</li> </ul> |
| Oper                      | The current PoE port state when this command was issued: <ul style="list-style-type: none"> <li>• <b>Powered</b> displays when there is a PD connected and power is being supplied.</li> <li>• <b>Disabled</b> displays when supplying power would make the switch go over the power budget.</li> <li>• <b>Off</b> displays when PoE has been disabled for the PoE port.</li> <li>• <b>Fault</b> displays when a switch goes over its power allocation.</li> </ul>                                                                                              |
| Power                     | The power consumption in milliwatts (mW) for the PoE port when this command was entered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Device                    | The description of the connected PD device if a description has been added with the <a href="#">power-inline description</a> command. No description is shown for PDs not configured with the <a href="#">power-inline description</a> command.                                                                                                                                                                                                                                                                                                                 |

**Table 1:** Parameters in the **show power-inline** command output (cont.)

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Class     | The class of the connected PD, if power is being supplied to the PD.                                                                                                                                                                                                                                                                                                                                                                               |
| Max (mW)  | The power in milliwatts (mW) allocated for the PoE port. Additionally, note the following as displayed per PoE port: <ul style="list-style-type: none"><li>• <b>[U]</b> if the power limit for a port was user configured (with the <a href="#">power-inline max</a> command).</li><li>• <b>[L]</b> if the power limit for a port was supplied by LLDP.</li><li>• <b>[C]</b> if the power limit for a port was supplied by the PD class.</li></ul> |

**Related Commands**   [show power-inline counters](#)  
[show power-inline interface](#)

# show power-inline counters

**Overview** This command displays Power over Ethernet (PoE) event counters for ports on the Power Sourcing Equipment (PSE). The PoE event counters displayed can also be accessed by objects in the PoE MIB (RFC 3621). See [the MIB Objects Feature Overview and Configuration Guide](#) for information about which PoE MIB objects are supported.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show power-inline counters [<port-list>]`

| Parameter                      | Description                                                   |
|--------------------------------|---------------------------------------------------------------|
| <code>&lt;port-list&gt;</code> | Enter the PoE port(s) to display PoE event counters for them. |

**Mode** User Exec and Privileged Exec

**Examples** To display all PoE event counters for all PoE ports, use the command:

```
awplus# show power-inline counters
```

To display the PoE event counters for the port range 1.0.1 to 1.0.3, use the command:

```
awplus# show power-inline counters interface port1.0.1-1.0.3
```

**Output** Figure 17-3: Example output from the **show power-inline counters** command

```
awplus#show power-inline counters interface port1.0.4-port1.0.12
PoE Counters:
```

| Interface  | MPSAbsent | Overload | Short | Invalid | Denied |
|------------|-----------|----------|-------|---------|--------|
| port1.0.4  | 0         | 0        | 0     | 0       | 0      |
| port1.0.5  | 0         | 0        | 0     | 0       | 0      |
| port1.0.6  | 0         | 0        | 0     | 0       | 0      |
| port1.0.7  | 0         | 0        | 0     | 0       | 0      |
| port1.0.8  | 0         | 0        | 0     | 0       | 0      |
| port1.0.9  | 0         | 0        | 0     | 0       | 0      |
| port1.0.10 | 0         | 0        | 0     | 0       | 0      |
| port1.0.11 | 0         | 0        | 0     | 0       | 0      |
| port1.0.12 | 0         | 0        | 0     | 0       | 0      |

**Table 2:** Parameters in the **show power-inline counters** command output

| Parameter | Description                                                                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | The PoE port(s) in the format <code>portx.y.z</code> , where <code>x</code> is the device number, <code>y</code> is the module number within the device, and <code>z</code> is the PoE port number within the module.                 |
| MPSAbsent | The number of instances when the PoE MPS (Maintain Power Signature) signal has been lost. The PoE MPS signal is lost when a PD is disconnected from the PSE. Also increments <code>pethPsePortMPSAbsentCounter</code> in the PoE MIB. |
| Overload  | The number of instances when a PD exceeds its configured power limit (as configured by the <code>power-inline max</code> command). Also increments <code>pethPsePortOverLoadCounter</code> in the PoE MIB.                            |
| Short     | The number of short circuits that have happened with a PD. Also increments <code>pethPsePortShortCounter</code> in the PoE MIB.                                                                                                       |
| Invalid   | The number of times a PD with an Invalid Signature (where the PD has an open or short circuit, or is a legacy PD) is detected. Also increments <code>pethPseInvalidSignatureCounter</code> in the PoE MIB.                            |
| Denied    | The number of times a PD has been refused power due to power budget limitations for the PSE. Also increments <code>pethPsePortPowerDeniedCounter</code> in the PoE MIB.                                                               |

**Related Commands**

- `show power-inline`
- `show power-inline interface`

# show power-inline interface

**Overview** This command displays a summary of Power over Ethernet (PoE) information for specified ports. If no ports are specified then PoE information is displayed for all ports.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show power-inline interface [<port-list>]`

| Parameter   | Description                                                                   |
|-------------|-------------------------------------------------------------------------------|
| <port-list> | Enter the PoE port(s) to display PoE specific information in the show output. |

**Mode** User Exec and Privileged Exec

**Example** To display the PoE port-specific information for all PoE ports on the switch, use the following command:

```
awplus# show power-inline interface
```

To display the PoE port specific information for the port range 1.0.1 to 1.0.4, use the following command:

```
awplus# show power-inline interface port1.0.1-port1.0.4
```

**Output** Figure 17-4: Example output from the **show power-inline interface** command

| awplus#show power-inline interface port1.0.1-port1.0.4 |          |      |          |       |             |       |          |
|--------------------------------------------------------|----------|------|----------|-------|-------------|-------|----------|
| Interface                                              | Admin    | Pri  | Oper     | Power | Device      | Class | Max (mW) |
| port1.0.1                                              | Disabled | Low  | Disabled | 0     | n/a         | n/a   | n/a      |
| port1.0.2                                              | Enabled  | High | Powered  | 3840  | Desk Phone  | 1     | 5000 [U] |
| port1.0.3                                              | Enabled  | Crit | Powered  | 6720  | AccessPoint | 2     | 7000 [C] |
| port1.0.4                                              | Disabled | Low  | Disabled | 0     | n/a         | n/a   | n/a      |

**Table 3:** Parameters in the **show power-inline interface** command output

| Parameter | Description                                                                                                                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | The PoE port(s) in the format <code>portx.y.z</code> , where <code>x</code> is the device number, <code>y</code> is the module number within the device, and <code>z</code> is the PoE port number within the module. |
| Admin     | The administrative state of PoE on a PoE port, either <b>Enabled</b> or <b>Disabled</b> .                                                                                                                             |

**Table 3:** Parameters in the **show power-inline interface** command output

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pri       | <p>The current PoE priorities for PoE ports on the PSE, as configured from a <a href="#">power-inline priority</a> command:</p> <ul style="list-style-type: none"> <li>• <b>Low</b> displays when the <code>low</code> parameter is issued. The lowest priority for a PoE enabled port (default).</li> <li>• <b>High</b> displays when the <code>high</code> parameter is issued. The second highest priority for a PoE enabled port.</li> <li>• <b>Crit</b> displays when the <code>critical</code> parameter is issued. The highest priority for a PoE enabled port.</li> </ul> |
| Oper      | <p>The current PSE PoE port state when this command was issued:</p> <ul style="list-style-type: none"> <li>• <b>Powered</b> displays when there is a PD connected and power is being supplied from the PSE.</li> <li>• <b>Denied</b> displays when supplying power would make the PSE go over the power budget.</li> <li>• <b>Disabled</b> displays when the PoE port is administratively disabled.</li> <li>• <b>Off</b> displays when PoE has been disabled for the port.</li> <li>• <b>Fault</b> displays when a PSE goes over its power allocation.</li> </ul>                |
| Power     | The power consumption in milliwatts (mW) for the PoE port when this command was entered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Device    | The description of the connected PD device if a description has been added with the <a href="#">power-inline description</a> command. No description is shown for PDs not configured with the <a href="#">power-inline description</a> command.                                                                                                                                                                                                                                                                                                                                   |
| Class     | <p>The class of the connected PD, if power is being supplied to the PD from the PSE.</p> <p>See the <a href="#">PoE Feature Overview and Configuration Guide</a> for further information about power classes.</p>                                                                                                                                                                                                                                                                                                                                                                 |
| Max (mW)  | <p>The power in milliwatts (mW) allocated for the PoE port. Additionally, note the following as displayed per PoE port:</p> <ul style="list-style-type: none"> <li>• <b>[U]</b> if the power limit for a port was user configured (with the <b>power-inline max</b> command).</li> <li>• <b>[L]</b> if the power limit for a port was supplied by LLDP.</li> <li>• <b>[C]</b> if the power limit for a port was supplied by the PD class.</li> </ul>                                                                                                                              |

**Related Commands** [show power-inline](#)  
[show power-inline interface detail](#)

# show power-inline interface detail

**Overview** This command displays detailed information for one or more Power over Ethernet (PoE) ports.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show power-inline interface [<port-list>] detail`

| Parameter                      | Description                                                                          |
|--------------------------------|--------------------------------------------------------------------------------------|
| <code>&lt;port-list&gt;</code> | Enter the PoE port(s) to display information about only the specified port or ports. |

**Mode** User Exec and Privileged Exec

**Usage** The power allocated to each port is listed in the **Power allocated** row, and is limited by the maximum power per Powered Device (PD) class, or a user configured power limit.

**Examples** To display detailed PoE port specific information for the port range 1.0.1 to 1.0.3, use the command:

```
awplus# show power-inline interface port1.0.1-1.0.3 detail
```

**Output** Figure 17-5: Example output from the **show power-inline interface detail** command

```
awplus#show power-inline interface port1.0.1-1.0.2 detail
Interface port1.0.1
  Powered device type: Desk Phone #1
  PoE admin enabled
  Priority Low
  Detection status: Powered
  Current power consumption: 4800 mW
  Powered device class: 1
  Power allocated: 5000 mW (from configuration)
  Detection of legacy devices is disabled
  Powered pairs: Data
Interface port1.0.2
  Powered device type: Access Point #3
  PoE admin enabled
  Priority High
  Detection status: Powered
  Current power consumption: 6720 mW
  Powered device class: 2
  Power allocated: 7000 mW (from powered device class)
  Detection of legacy devices is enabled
  Powered pairs: Data
```

**Table 4:** Parameters in **show power-inline interface detail** command output

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                  | The PoE port(s) in the format <code>portx.y.z</code> , where <code>x</code> is the device number, <code>y</code> is the module number within the device, and <code>z</code> is the PoE port number within the module.                                                                                                                                                                                                                                                                                                                                       |
| Powered device type:       | The name of the PD, if connected and if power is being supplied to the PD from the PSE, configured with the <a href="#">power-inline description</a> command. <b>n/a</b> displays if a description has not been configured for the PD.                                                                                                                                                                                                                                                                                                                      |
| PoE admin                  | The administrative state of PoE on a PoE capable port, either <b>Enabled</b> or <b>Disabled</b> as configured from the <a href="#">power-inline enable</a> command or the <b>no power-inline enable</b> command respectively.                                                                                                                                                                                                                                                                                                                               |
| Priority                   | The PoE priority of a port, which is either <b>Low</b> , or <b>High</b> , or <b>Critical</b> , as configured by the <a href="#">power-inline priority</a> command.                                                                                                                                                                                                                                                                                                                                                                                          |
| Detection status:          | The current PSE PoE port state when this command was issued: <ul style="list-style-type: none"> <li>• <b>Powered</b> displays when there is a PD connected and power is being supplied from the PSE.</li> <li>• <b>Denied</b> displays when supplying power would make the PSE go over the power budget.</li> <li>• <b>Disabled</b> displays when the PoE port is administratively disabled.</li> <li>• <b>Off</b> displays when PoE has been disabled for the port.</li> <li>• <b>Fault</b> displays when a PSE goes over its power allocation.</li> </ul> |
| Current power consumption: | The power consumption for the PoE port when this command was entered. Note that the power consumption may have changed since the command was entered and the power is displayed.                                                                                                                                                                                                                                                                                                                                                                            |
| Powered device class:      | The class of the connected PD if connected, and if power is being supplied to the PD from the PSE.<br>See the <a href="#">PoE Feature Overview and Configuration Guide</a> for further information about power classes.                                                                                                                                                                                                                                                                                                                                     |
| Power allocated:           | The power in milliwatts (mW) allocated for the PoE port. Additionally, note the following as displayed per PoE port: <ul style="list-style-type: none"> <li>• <b>[U]</b> if the power limit for a port was user configured (with the <b>power-inline max</b> command).</li> <li>• <b>[L]</b> if the power limit for a port was supplied by LLDP.</li> <li>• <b>[C]</b> if the power limit for a port was supplied by the PD class.</li> </ul>                                                                                                               |

**Table 4:** Parameters in **show power-inline interface detail** command output

| Parameter                      | Description                                                                                                                                                                                                                                                                                                              |

- ["undebg ip packet interface"](#) on page 706

# arp-aging-timeout

**Overview** This command sets a timeout period on dynamic ARP entries associated with a specific interface. If your device stops receiving traffic for the host specified in a dynamic ARP entry, it deletes the ARP entry from the ARP cache after this timeout is reached.

Your device times out dynamic ARP entries to ensure that the cache does not fill with entries for hosts that are no longer active. Static ARP entries are not aged or automatically deleted.

By default the time limit for dynamic ARP entries is 300 seconds on all interfaces.

The **no** variant of this command sets the time limit to the default of 300 seconds.

**Syntax** `arp-aging-timeout <0-432000>`  
`no arp-aging timeout`

| Parameter                     | Description                    |
|-------------------------------|--------------------------------|
| <code>&lt;0-432000&gt;</code> | The timeout period in seconds. |

**Default** 300 seconds (5 minutes)

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the ARP entries on interface `vlan30` to time out after two minutes, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan30
awplus(config-if)# arp-aging-timeout 120
```

**Related  
Commands** [clear arp-cache](#)  
[show arp](#)

# arp-mac-disparity

**Overview** Use this command to enable the switch to support services like Microsoft Network Load Balancing (MS-NLB).

Such services use ARP with disparate MAC addresses to ensure that packets destined for a server cluster virtual address are sent to all servers in the cluster. Disparate MAC addresses mean that the MAC address in the “sender hardware address” field of an ARP reply is different to the MAC address in the “Source MAC address” field of the Ethernet header that the ARP packet is encapsulated in.

The **no** variant of this command reverts to the default behavior. See the Default section below for more information.

**Syntax** `arp-mac-disparity {multicast|multicast-igmp|unicast}`  
`no arp-mac-disparity {multicast|multicast-igmp|unicast}`

| Parameter      | Description                                                                                                                                                                                   |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| multicast      | Enables support of server clusters operating in multicast mode. Packets destined for the server cluster are flooded to all ports in the VLAN.                                                 |
| multicast-igmp | Enables support of server clusters operating in multicast/IGMP mode. In multicast/IGMP mode, the MS-NLB server cluster uses IGMP reports to forward server traffic to a limited set of ports. |
| unicast        | Enables support of server clusters operating in unicast mode. Packets destined for the server cluster are flooded to all ports in the VLAN.                                                   |

**Default** ARP-MAC disparity support is disabled and:

- If the disparate ARP has a multicast MAC address in the ARP reply, the switch drops the ARP reply and does not learn any associated addresses
- If the disparate ARP has a unicast MAC address in the ARP reply, the switch learns the address in the ARP reply. The learned ARP entry points to the single port that the ARP reply arrived on. Matching traffic will go out this port.

**Mode** Interface Configuration for a VLAN interface.

**Usage, multicast mode** When you are using **multicast** mode, you can limit the number of ports that packets are flooded to, instead of flooding to all ports in the VLAN. To do this, specify the list of ports when creating the ARP entry.

For example, to flood only port1.0.1 to port1.0.3, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# arp 10.10.1.100 010e.11ff.2222
port1.0.1-port1.0.3
```

### Usage, multicast igmp mode

Multicast-IGMP mode is enabled by using the command **arp-mac-disparity multicast-igmp**.

In this mode, the only difference to standard multicast mode is that the reception of IGMP reports now controls the ports to which the L3 switch floods traffic. That is, rather than simply flooding each packet destined for the NLB cluster IP address to all ports on the egress VLAN, those packets are only sent to the switchports in the VLAN that have received IGMP reports for the multicast group corresponding to the NLB cluster MAC address.

Like **arp-mac-disparity multicast**, the command **arp-mac-disparity multicast-igmp** puts the switch into a mode where it will accept disparate ARP responses. Similarly, upon receiving a disparate ARP response, an ARP entry is created for the IP/MAC in the content of the ARP packet. The difference with the **arp-mac-disparity multicast-igmp** command is that the egress port is set to the subset of ports in the VLAN that have received IGMP reports for the NLB cluster MAC address.

Note that the ARP entry is updated as ports join/leave the IGMP group. If no ports have received IGMP reports for the NLB cluster MAC address then the ARP entry will have no egress ports and will simply drop packets destined for the NLB cluster IP address.

Again, no FDB entry is created in response to receiving the ARP packet. However, since the NLB server is operating in multicast mode with the IGMP option set and is sending IGMP reports, an FDB entry will already exist for the IGMP group (and, as a result, the NLB cluster MAC address).

When the **arp-mac-disparity multicast-igmp** command is configured on the VLAN, ARP entries appear in the output of the command **show arp** like this:

| awplus#show arp |                |           |            |         |  |
|-----------------|----------------|-----------|------------|---------|--|
| IP Address      | MAC Address    | Interface | Port       | Type    |  |
| 10.100.0.56     | 0100.5e7f.0038 | vlan200   | igmp-group | dynamic |  |

**Examples** To enable support for MS-NLB in unicast mode on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# arp-mac-disparity unicast
```

To disable support for MS-NLB in unicast mode on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no arp-mac-disparity unicast
```

**Related  
Commands**

- arp (IP address MAC)
- clear arp-cache
- show arp

## arp (IP address MAC)

**Overview** This command adds a static ARP entry to the ARP cache. This is typically used to add entries for hosts that do not support ARP or to speed up the address resolution function for a host. The ARP entry must not already exist. Use the **alias** parameter to allow your device to respond to ARP requests for this IP address.

The **no** variant of this command removes the static ARP entry. Use the [clear arp-cache](#) command to remove the dynamic ARP entries in the ARP cache.

**Syntax** `arp <ip-addr> <mac-address> [<port-number>] [alias]`  
`no arp <ip-addr>`

| Parameter                        | Description                                                                                                                               |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-addr&gt;</code>     | The IPv4 address of the device you are adding as a static ARP entry.                                                                      |
| <code>&lt;mac-address&gt;</code> | The MAC address of the device you are adding as a static ARP entry, in hexadecimal notation with the format HHHH.HHHH.HHHH.               |
| <code>&lt;port-number&gt;</code> | The port number associated with the IP address. Specify this when the IP address is part of a VLAN.                                       |
| <code>alias</code>               | Allows your device to respond to ARP requests for the IP address. Proxy ARP must be enabled on the interface before using this parameter. |

**Mode** Global Configuration

**Examples** To add the IP address 10.10.10.9 with the MAC address 0010.2533.4655 into the ARP cache, and have your device respond to ARP requests for this address, use the commands:

```
awplus# configure terminal
awplus(config)# arp 10.10.10.9 0010.2355.4566 alias
```

**Related Commands** [arp-mac-disparity](#)  
[clear arp-cache](#)  
[ip proxy-arp](#)  
[show arp](#)

# arp log

**Overview** This command enables the logging of dynamic and static ARP entries in the ARP cache. The ARP cache contains mappings of device ports, VLAN IDs, and IP addresses to physical MAC addresses for hosts.

This command can display the MAC addresses in the ARP log either using the notation HHHH.HHHH.HHHH, or using the IEEE standard hexadecimal notation (HH-HH-HH-HH-HH-HH).

Use the **no** variant of this command to disable the logging of ARP entries.

**Syntax** `arp log [mac-address-format ieee]`  
`no arp log [mac-address-format ieee]`

| Parameter                            | Description                                                                                                                                    |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>mac-address-format ieee</code> | Display the MAC address in the standard IEEE format (HH-HH-HH-HH-HH-HH), instead of displaying the MAC address with the format HHHH.HHHH.HHHH. |

**Default** The ARP logging feature is disabled by default.

**Mode** Global Configuration

**Usage** You have the option to change how the MAC address is displayed in the ARP log message. The output can either use the notation HHHH.HHHH.HHHH or HH-HH-HH-HH-HH-HH.

Enter **arp log** to use HHHH.HHHH.HHHH notation.

Enter **arp log mac-address-format ieee** to use HH-HH-HH-HH-HH-HH notation.

Enter **no arp log mac-address-format ieee** to revert from HH-HH-HH-HH-HH-HH to HHHH.HHHH.HHHH.

Enter **no arp log** to disable ARP logging.

To display ARP log messages use the **show log | include ARP\_LOG** command.

**Examples** To enable ARP logging and specify that the MAC address in the log message is displayed in HHHH.HHHH.HHHH notation, use the following commands:

```
awplus# configure terminal
awplus(config)# arp log
```

To disable ARP logging on the device, use the following commands:

```
awplus# configure terminal
awplus(config)# no arp log
```

To enable ARP logging and specify that the MAC address in the log message is displayed in the standard IEEE format hexadecimal notation (HH-HH-HH-HH-HH-HH), use the following commands:

```
awplus# configure terminal
awplus(config)# arp log mac-address-format ieee
```

To leave ARP logging enabled, but stop using HH-HH-HH-HH-HH-HH format and use HHHH.HHHH.HHHH format instead, use the following commands:

```
awplus# configure terminal
awplus(config)# no arp log mac-address-format ieee
```

To display ARP log messages, use following command:

```
awplus# show log | include ARP_LOG
```

**Output** Figure 18-1: Output from **show log | include ARP\_LOG** after enabling ARP logging using **arp log**. Note that this output uses HHHH.HHHH.HHHH format.

```
awplus#configure terminal
awplus(config)#arp log
awplus(config)#exit
awplus#show log | include ARP_LOG

ARP_LOG <port-number> <vid> <operation> <MAC> <IP>
```

**Table 1:** Parameters in output of the **show log | include ARP\_LOG** command

| Parameter     | Description                                                                                                                                                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ARP_LOG       | Indicates that ARP log entry information follows.                                                                                                                                                                                                                                |
| <port-number> | Indicates device port number for the ARP log entry.                                                                                                                                                                                                                              |
| <vid>         | Indicates the VLAN ID for the ARP log entry.                                                                                                                                                                                                                                     |
| <operation>   | Indicates "add" if the ARP log entry displays an ARP addition. Indicates "del" if the ARP log entry displays an ARP deletion.                                                                                                                                                    |
| <MAC>         | Indicates the MAC address for the ARP log entry, either in the default hexadecimal notation (HHHH.HHHH.HHHH) or in the IEEE standard format hexadecimal notation (HH-HH-HH-HH-HH-HH) as specified with the <b>arp log</b> or the <b>arp log mac-address-format ieee</b> command. |
| <IP>          | Indicates the IP address for the ARP log entry.                                                                                                                                                                                                                                  |

**Related  
Commands**    [show log](#)  
                  [show running-config](#)

# arp opportunistic-nd

**Overview** This command changes the behavior for unsolicited ARP packet forwarding on the device.

Use this command to enable opportunistic neighbor discovery for the global ARP cache.

Use the **no** variant of this command to disable opportunistic neighbor discovery for the global ARP cache.

**Syntax** `arp opportunistic-nd`  
`no arp opportunistic-nd`

**Default** Opportunistic neighbor discovery is disabled by default.

**Mode** Global Configuration

**Usage** When opportunistic neighbor discovery is enabled, the device will reply to any received unsolicited ARP packets (but not gratuitous ARP packets). The source MAC address for the unsolicited ARP packet is added to the ARP cache, so the device forwards the ARP packet. When opportunistic neighbor discovery is disabled, the source MAC address for the ARP packet is not added to the ARP cache, so the ARP packet is not forwarded by the device.

**Examples** To enable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# arp opportunistic-nd
```

To disable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# no arp opportunistic-nd
```

**Related Commands** [ipv6 opportunistic-nd](#)  
[show arp](#)  
[show running-config interface](#)

# arp-reply-bc-dmac

**Overview** Use this command to allow processing of ARP replies that arrive with a broadcast destination MAC (ffff.ffff.ffff). This makes neighbors reachable if they send ARP responses that contain a broadcast destination MAC.

Use the **no** variant of this command to turn off processing of ARP replies that arrive with a broadcast destination MAC.

**Syntax** `arp-reply-bc-dmac`  
`no arp-reply-bc-dmac`

**Default** By default, this functionality is disabled.

**Mode** Interface Configuration for VLAN interfaces

**Example** To allow processing of ARP replies that arrive on VLAN2 with a broadcast destination MAC, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# arp-reply-bc-dmac
```

**Related  
Commands** `clear arp-cache`  
`show arp`

# clear arp-cache

**Overview** This command deletes dynamic ARP entries from the ARP cache. You can optionally specify the IPv4 address of an ARP entry to be cleared from the ARP cache.

**Syntax** `clear arp-cache [<ip-address>]`

| Parameter    | Description                                                                |
|--------------|----------------------------------------------------------------------------|
| <ip-address> | The IPv4 address of an ARP entry that is to be cleared from the ARP cache. |

**Mode** Privileged Exec

**Usage** To display the entries in the ARP cache, use the [show arp](#) command. To remove static ARP entries, use the no variant of the [arp \(IP address MAC\)](#) command.

**Example** To clear all dynamic ARP entries, use the command:

```
awplus# clear arp-cache
```

To clear all dynamic ARP entries associated with the IPv4 address 192.168.1.1, use the command:

```
awplus# clear arp-cache 192.168.1.1
```

**Related Commands**

- [arp \(IP address MAC\)](#)
- [show arp](#)

# debug ip packet interface

- Overview** The **debug ip packet interface** command enables IP packet debug and is controlled by the **terminal monitor** command.
- If the optional **icmp** keyword is specified then ICMP packets are shown in the output.
- The **no** variant of this command disables the **debug ip interface** command.

**Syntax** `debug ip packet interface {<interface-name>|all} [address <ip-address>|verbose|hex|arp|udp|tcp|icmp]`  
`no debug ip packet interface [<interface-name>]`

| Parameter    | Description                                                                                                                                                                                                            |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface>  | Specify a single Layer 3 interface name (not a range of interfaces)<br>This keyword can be specified as either all or as a single Layer 3 interface to show debugging for either all interfaces or a single interface. |
| all          | Specify all Layer 3 interfaces on the device.                                                                                                                                                                          |
| <ip-address> | Specify an IPv4 address.<br>If this keyword is specified, then only packets with the specified IP address as specified in the ip-address placeholder are shown in the output.                                          |
| verbose      | Specify <b>verbose</b> to output more of the IP packet.<br>If this keyword is specified then more of the packet is shown in the output.                                                                                |
| hex          | Specify <b>hex</b> to output the IP packet in hexadecimal.<br>If this keyword is specified, then the output for the packet is shown in hex.                                                                            |
| arp          | Specify <b>arp</b> to output ARP protocol packets.<br>If this keyword is specified, then ARP packets are shown in the output.                                                                                          |
| udp          | Specify <b>udp</b> to output UDP protocol packets.<br>If this keyword is specified then UDP packets are shown in the output.                                                                                           |
| tcp          | Specify <b>tcp</b> to output TCP protocol packets.<br>If this keyword is specified, then TCP packets are shown in the output.                                                                                          |
| icmp         | Specify <b>icmp</b> to output ICMP protocol packets.<br>If this keyword is specified, then ICMP packets are shown in the output.                                                                                       |

**Mode** Privileged Exec and Global Configuration

**Examples** To turn on ARP packet debugging on `vlan1`, use the command:

```
awplus# debug ip packet interface vlan1 arp
```

To turn on all packet debugging on all interfaces on the device, use the command:

```
awplus# debug ip packet interface all
```

To turn on TCP packet debugging on `vlan1` and IP address `192.168.2.4`, use the command:

```
awplus# debug ip packet interface vlan1 address 192.168.2.4 tcp
```

To turn off IP packet interface debugging on all interfaces, use the command:

```
awplus# no debug ip packet interface
```

To turn off IP packet interface debugging on interface `vlan2`, use the command:

```
awplus# no debug ip packet interface vlan2
```

**Related Commands**

- `no debug all`
- `show debugging ip dns forwarding`
- `tcpdump`
- `terminal monitor`
- `undebug ip packet interface`

# ip address (IP Addressing and Protocol)

**Overview** This command sets a static IP address on an interface.

The **no** variant of this command removes the IP address from the interface. You cannot remove the primary address when a secondary address is present.

**Syntax** `ip address <ip-addr/prefix-length> [secondary] [label <label>]`  
`no ip address [<ip-addr/prefix-length>] [secondary]`

| Parameter               | Description                                                                                                      |
|-------------------------|------------------------------------------------------------------------------------------------------------------|
| <ip-addr/prefix-length> | The IPv4 address and prefix length you are assigning to the interface.                                           |
| secondary               | Secondary IP address.                                                                                            |
| label                   | Adds a user-defined description of the secondary IP address.                                                     |
| <label>                 | A user-defined description of the secondary IP address. Valid characters are any printable character and spaces. |

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage** To set the primary IP address on the interface, specify only **ip address** <ip-address/m>. This overwrites any configured primary IP address. To add additional IP addresses on this interface, use the **secondary** parameter. You must configure a primary address on the interface before configuring a secondary address.

**NOTE:** Use **show running-config interface** not **show ip interface brief** when you need to view a secondary address configured on an interface. **show ip interface brief** will only show the primary address not a secondary address for an interface.

**Examples** To add the primary IP address 10.10.10.50/24 to the interface `vlan3`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip address 10.10.10.50/24
```

To add the secondary IP address 10.10.11.50/24 to the same interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip address 10.10.11.50/24 secondary
```

To add the IP address 10.10.11.50/24 to the local loopback interface `lo`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.11.50/24
```

**Related  
Commands**

- `interface (to configure)`
- `show ip interface`
- `show running-config interface`

# ip directed-broadcast

**Overview** Use this command to enable flooding of directed broadcast packets into a directly connected subnet. If this command is configured on a VLAN interface, then directed broadcasts received on other VLAN interfaces, destined for the subnet on this VLAN, will be flooded to the subnet broadcast address of this VLAN.

Use the **no** variant of this command to disable **ip directed-broadcast**. When this feature is disabled using the **no** variant of this command, directed broadcasts are not forwarded.

**Syntax** `ip directed-broadcast`  
`no ip directed-broadcast`

**Default** The **ip directed-broadcast** command is disabled by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage** IP directed-broadcast is enabled and disabled per VLAN interface. When enabled a directed broadcast packet is forwarded to an enabled VLAN interface if received on another subnet.

An IP directed broadcast is an IP packet whose destination address is a broadcast address for some IP subnet, but originates from a node that is not itself part of that destination subnet. When a directed broadcast packet reaches a device that is directly connected to its destination subnet, that packet is flooded as a broadcast on the destination subnet.

The **ip directed-broadcast** command controls the flooding of directed broadcasts when they reach target subnets. The command affects the final transmission of the directed broadcast on its destination subnet. It does not affect the transit unicast routing of IP directed broadcasts. If directed broadcast is enabled for an interface, incoming directed broadcast IP packets intended for the subnet assigned to interface will be flooded as broadcasts on that subnet.

If the **no ip directed-broadcast** command is configured for an interface, directed broadcasts destined for the subnet where the interface is attached will be dropped instead of broadcast.

**Examples** To enable the flooding of broadcast packets out via vlan2, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip directed-broadcast
```

To disable the flooding of broadcast packets via vlan2, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip directed-broadcast
```

**Related  
Commands**

- [ip forward-protocol udp](#)
- [ip helper-address](#)
- [show running-config](#)

# ip forward-protocol udp

**Overview** This command enables you to control which UDP broadcasts will be forwarded to the helper address(es). A UDP broadcast will only be forwarded if the destination UDP port number in the packet matches one of the port numbers specified using this command.

Refer to the IANA site ([www.iana.org](http://www.iana.org)) for a list of assigned UDP port numbers for protocols to forward using **ip forward-protocol udp**.

Use the **no** variant of this command to remove a port number from the list of destination port numbers that are used as the criterion for deciding if a given UDP broadcast should be forwarded to the IP helper address(es).

**Syntax** `ip forward-protocol udp <port>`  
`no ip forward-protocol udp <port>`

| Parameter | Description      |
|-----------|------------------|
| <port>    | UDP Port Number. |

**Default** The **ip forward-protocol udp** command is not enabled by default.

**Mode** Global Configuration

**Usage** Combined with the **ip helper-address** command in interface mode, the **ip forward-protocol udp** command in Global Configuration mode allows control of which protocols (destination port numbers) are forwarded. The **ip forward-protocol udp** command configures protocols for forwarding, and the **ip helper-address** command configures the destination address(es).

**NOTE:**

*The types of UDP broadcast packets that the device will forward are ONLY those specified by the **ip forward-protocol** command(s). There are no other UDP packet types that the IP helper process forwards by default.*

**NOTE:**

*The **ip forward-protocol udp** command does not support BOOTP / DHCP Relay. The **ip dhcp-relay** command must be used instead. For this reason, you may not configure UDP ports 67 and 68 with the **ip forward-protocol udp** command.*

See the [IP Feature Overview and Configuration Guide](#) for more information about DNS Relay.

**Examples** To configure forwarding of packets on a UDP port, use the following commands:

```
awplus# configure terminal
awplus(config)# ip forward-protocol udp <port>
```

To delete a UDP port from the UDP ports that the device forwards, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no ip forward-protocol udp <port>
```

**Related  
Commands**

[ip helper-address](#)

[ip directed-broadcast](#)

[show running-config](#)

# ip gratuitous-arp-link

**Overview** This command sets the Gratuitous ARP time limit for all switchports. The time limit restricts the sending of Gratuitous ARP packets to one Gratuitous ARP packet within the time in seconds.

**NOTE:** This command specifies time between sequences of Gratuitous ARP packets, and time between individual Gratuitous ARP packets occurring in a sequence, to allow legacy support for older devices and interoperation between other devices that are not ready to receive and forward data until several seconds after linkup.

Additionally, jitter has been applied to the delay following linkup, so Gratuitous ARP packets applicable to a given port are spread over a period of 1 second so are not all sent at once. Remaining Gratuitous ARP packets in the sequence occur after a fixed delay from the first one.

**Syntax** ip gratuitous-arp-link <0-300>  
no ip gratuitous-arp-link

| Parameter | Description                                                                                                                                                                                                                     |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-300>   | Specify the minimum time between sequences of Gratuitous ARPs and the fixed time between Gratuitous ARPs occurring in a sequence, in seconds.<br>0 disables the sending of Gratuitous ARP packets.<br>The default is 8 seconds. |

**Default** The default Gratuitous ARP time limit for all switchports is 8 seconds.

**Mode** Global Configuration

**Usage** Every switchport will send a sequence of 3 Gratuitous ARP packets to each VLAN that the switchport is a member of, whenever the switchport moves to the forwarding state. The first Gratuitous ARP packet is sent 1 second after the switchport becomes a forwarding switchport. The second and third Gratuitous ARP packets are each sent after the time period specified by the Gratuitous ARP time limit.

Additionally, the Gratuitous ARP time limit specifies the minimum time between the end of one Gratuitous ARP sequence and the start of another Gratuitous ARP sequence. When a link is flapping, the switchport's state is set to forwarding several times. The Gratuitous ARP time limit is imposed to prevent Gratuitous ARP packets from being sent undesirably often.

**Examples** To disable the sending of Gratuitous ARP packets, use the commands :

```
awplus# configure terminal
awplus(config)# ip gratuitous-arp-link 0
```

To restrict the sending of Gratuitous ARP packets to one every 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip gratuitous-arp-link 20
```

**Commands**

# ip helper-address

**Overview** This command adds a forwarding destination address for IP Helper to enable forwarding of User Datagram Protocol (UDP) broadcasts on an interface.

Use the **no** variant of this command to disable the forwarding of broadcast packets to specific addresses.

**Syntax** `ip helper-address <ip-addr>`  
`no ip helper-address <ip-addr>`

| Parameter | Description                                      |
|-----------|--------------------------------------------------|
| <ip-addr> | Forwarding destination IP address for IP Helper. |

**Default** The destination address for the **ip helper-address** command is not configured by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage** Combined with the [ip forward-protocol udp](#) command in global configuration mode, the **ip helper-address** command in interface mode allows control of which protocols (destination port numbers) are forwarded. The **ip forward-protocol udp** command configures protocols for forwarding, and the **ip helper-address** command configures the destination address(es).

The destination address can be a unicast address or a subnet broadcast address. The UDP destination port is configured separately with the **ip forward-protocol udp** command. If multiple destination addresses are registered then UDP packets are forwarded to each IP address added to an IP Helper. Up to 32 destination addresses may be added using IP Helper.

The device will only forward the types of UDP broadcast packets that are specified by the **ip forward-protocol** command(s). The device does not forward any other UDP packet types by default.

The **ip helper-address** command does not support BOOTP / DHCP Relay. The [service dhcp-relay](#) command must be used instead. For this reason, you may not configure UDP ports 67 and 68 with the **ip forward-protocol** command.

See the [IP Feature Overview and Configuration Guide](#) for more information about DHCP Relay.

**Examples** The following example defines IPv4 address 192.168.1.100 as an IP Helper destination address to which to forward UDP broadcasts received on vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip helper-address 192.168.1.100
```

The following example removes IPv4 address 192.168.1.100 as an IP Helper destination address to which to forward UDP broadcasts received on vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip helper-address 192.168.1.100
```

# ip limited-local-proxy-arp

**Overview** Use this command to enable local proxy ARP, but only for a specified set of IP addresses. This makes the device respond to ARP requests for those IP addresses when the addresses are reachable via the interface you are configuring.

To specify the IP addresses, use the command [local-proxy-arp](#).

Use the **no** variant of this command to disable limited local proxy ARP. This stops your device from intercepting and responding to ARP requests for the specified hosts. This allows the hosts to use MAC address resolution to communicate directly with one another.

**Syntax** `ip limited-local-proxy-arp`  
`no ip limited-local-proxy-arp`

**Default** Limited local proxy ARP is disabled by default.

**Mode** Interface Configuration

**Usage** This command allows you to stop MAC address resolution for specified hosts. Limited local proxy ARP works by intercepting ARP requests for the specified hosts and responding with your device's own MAC address details instead of the destination host's details. This stops hosts from learning the MAC address of the other hosts through ARP requests.

Limited local proxy ARP ensures that the specified devices cannot send traffic that bypasses Layer 3 routing on your device. This gives you control over which hosts may communicate with one another.

**Example** To enable limited local proxy ARP, so that the device makes ARP responses to ARP requests for specified addresses, when the ARP requests are received on VLAN2 and the addresses are routed out VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip limited-local-proxy-arp
```

**Related  
Commands** [ip local-proxy-arp](#)  
[local-proxy-arp](#)

# ip local-proxy-arp

**Overview** This command allows you to stop MAC address resolution between hosts within a private VLAN edge interface. Local Proxy ARP works by intercepting ARP requests between hosts within a subnet and responding with your device's own MAC address details instead of the destination host's details. This stops hosts from learning the MAC address of other hosts within its subnet through ARP requests.

Local Proxy ARP ensures that devices within a subnet cannot send traffic that bypasses Layer 3 routing on your device. This lets you monitor and filter traffic between hosts in the same subnet, and enables you to have control over which hosts may communicate with one another.

When Local Proxy ARP is operating on an interface, your device does not generate or forward any ICMP-Redirect messages on that interface. This command does not enable proxy ARP on the interface; see the [ip proxy-arp](#) command for more information on enabling proxy ARP.

The **no** variant of this command disables Local Proxy ARP to stop your device from intercepting and responding to ARP requests between hosts within a subnet. This allows the hosts to use MAC address resolution to communicate directly with one another. Local Proxy ARP is disabled by default.

**Syntax** `ip local-proxy-arp`  
`no ip local-proxy-arp`

**Default** Local proxy ARP is disabled by default

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To enable your device to apply Local Proxy ARP on the interface `vlan7`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan7
awplus(config-if)# ip local-proxy-arp
```

To disable your device to apply Local Proxy ARP on the interface `vlan7`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan7
awplus(config-if)# no ip local-proxy-arp
```

**Related Commands** [ip proxy-arp](#)  
[show arp](#)  
[show running-config](#)

# ip proxy-arp

**Overview** This command enables Proxy ARP responses to ARP requests on an interface. When enabled, your device intercepts ARP broadcast packets and substitutes its own physical address for that of the remote host. By responding to the ARP request, your device ensures that subsequent packets from the local host are directed to its physical address, and it can then forward these to the remote host.

Your device responds only when it has a specific route to the address being requested, excluding the interface route that the ARP request arrived from. It ignores all other ARP requests. See the [ip local-proxy-arp](#) command about enabling your device to respond to other ARP messages.

The **no** variant of this command disables Proxy ARP responses on an interface. Proxy ARP is disabled by default.

**Syntax** `ip proxy-arp`  
`no ip proxy-arp`

**Default** Proxy ARP is disabled by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To enable your device to Proxy ARP on the interface `vlan13`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan13
awplus(config-if)# ip proxy-arp
```

To disable your device to Proxy ARP on the interface `vlan13`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan13
awplus(config-if)# no ip proxy-arp
```

**Related Commands** [arp \(IP address MAC\)](#)  
[ip local-proxy-arp](#)  
[show arp](#)  
[show running-config](#)

# ip redirects

**Overview** This command enables the device to send ICMP redirects on one or more interfaces.

Use the **no** variant of this command to stop the device from sending ICMP redirects on one or more interfaces.

**Syntax** `ip redirects`  
`no ip redirects`

**Default** ICMP redirects are disabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage** ICMP redirect messages are used to notify hosts that a better route is available to a destination.

ICMP redirects are used when a packet is routed into the device on the same interface that the packet is routed out of the device. ICMP redirects are only sent to packet sources that are directly connected to the device.

**Examples** To enable the device to send ICMP redirects on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip redirects
```

To stop the device from sending ICMP redirects on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip redirects
```

# local-proxy-arp

**Overview** Use this command to specify an IP subnet for use with limited local proxy ARP. When limited local proxy ARP is enabled with the command [ip limited-local-proxy-arp](#), the device will respond to ARP requests for addresses in that subnet.

Use the **no** variant of this command to stop specifying a subnet for use with limited local proxy ARP.

**Syntax** `local-proxy-arp [<ip-add/mask>]`  
`no local-proxy-arp [<ip-add/mask>]`

| Parameter                        | Description                                                                                                                                 |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-add/mask&gt;</code> | The IP subnet to use with limited local proxy ARP, in dotted decimal format (A.B.C.D/M). To specify a single IP address, use a 32-bit mask. |

**Default** No subnets are specified for use with limited local proxy ARP.

**Mode** Global Configuration

**Example** To specify limited local proxy ARP for the address 172.22.0.3, use the following commands:

```
awplus# configure terminal
awplus(config)# local-proxy-arp 172.22.0.3/32
```

**Related Commands** [ip limited-local-proxy-arp](#)

# ip unreachables

**Overview** Use this command to enable ICMP (Internet Control Message Protocol) type 3, destination unreachable, messages.

Use the **no** variant of this command to disable destination unreachable messages. This prevents an attacker from using these messages to discover the topology of a network.

**Syntax** `ip unreachables`  
`no ip unreachables`

**Default** Destination unreachable messages are enabled by default.

**Mode** Global Configuration

**Usage** When a device receives a packet for a destination that is unreachable it returns an ICMP type 3 message, this message includes a reason code, as per the table below. An attacker can use these messages to obtain information regarding the topology of a network. Disabling destination unreachable messages, using the **no ip unreachables** command, secures your network against this type of probing.

**NOTE:** *Disabling ICMP destination unreachable messages breaks applications such as traceroute and Path MTU Discovery (PMTUD), which depend on these messages to operate correctly.*

Table 18-1: ICMP type 3 reason codes and description

| Code | Description [RFC]                                  |
|------|----------------------------------------------------|
| 0    | Network unreachable [RFC792]                       |
| 1    | Host unreachable [RFC792]                          |
| 2    | Protocol unreachable [RFC792]                      |
| 3    | Port unreachable [RFC792]                          |
| 4    | Fragmentation required, and DF flag set [RFC792]   |
| 5    | Source route failed [RFC792]                       |
| 6    | Destination network unknown [RFC1122]              |
| 7    | Destination host unknown [RFC1122]                 |
| 8    | Source host isolated [RFC1122]                     |
| 9    | Network administratively prohibited [RFC768]       |
| 10   | Host administratively prohibited [RFC869]          |
| 11   | Network unreachable for Type of Service [RFC908]   |
| 12   | Host unreachable for Type of Service [RFC938]      |
| 13   | Communication administratively prohibited [RFC905] |

Table 18-1: ICMP type 3 reason codes and description (cont.)

| Code | Description [RFC]                     |
|------|---------------------------------------|
| 14   | Host Precedence Violation [RFC1812]   |
| 15   | Precedence cutoff in effect [RFC1812] |

**Example** To disable destination unreachable messages, use the commands

```
awplus# configure terminal  
awplus(config)# no ip unreachable
```

To enable destination unreachable messages, use the commands

```
awplus# configure terminal  
awplus(config)# ip unreachable
```

# optimistic-nd

**Overview** Use this command to enable the optimistic neighbor discovery feature for both IPv4 and IPv6.

Use the **no** variant of this command to disable the optimistic neighbor discovery feature.

**Syntax** `optimistic-nd`  
`no optimistic-nd`

**Default** The optimistic neighbor discovery feature is enabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage** The optimistic neighbor discovery feature allows the device, after learning an IPv4 or IPv6 neighbor, to refresh the neighbor before the neighbor is deleted from the hardware L3 switching table. The neighbor is put into the 'stale' state in the software switching table if it is not refreshed, then the 'stale' neighbors are deleted from the hardware L3 switching table.

The optimistic neighbor discovery feature enables the device to sustain L3 traffic switching to a neighbor without interruption. Without the optimistic neighbor discovery feature enabled L3 traffic is interrupted when a neighbor is 'stale' and is then deleted from the L3 switching table.

If a neighbor receiving optimistic neighbor solicitations does not answer optimistic neighbor solicitations with neighbor advertisements, then the neighbor will be put into the 'stale' state, and subsequently deleted from both the software and the hardware L3 switching tables.

**Examples** To enable the optimistic neighbor discovery feature on `vlan100`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan100
awplus(config-if)# optimistic-nd
```

To disable the optimistic neighbor discovery feature on `vlan100`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan100
awplus(config-if)# no optimistic-nd
```

**Validation Commands** `show running-config`

# ping

**Overview** This command sends a query to another IPv4 host (send Echo Request messages).

**Syntax** ping [ip] <host> [broadcast] [df-bit {yes|no}] [interval <0-128>] [pattern <hex-data-pattern>] [repeat {<1-2147483647>|continuous}] [size <36-18024>] [source <ip-addr>] [timeout <1-65535>] [tos <0-255>]

| Parameter                  | Description                                                                                                                                                                                                          |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <host>                     | The destination IP address or hostname.                                                                                                                                                                              |
| broadcast                  | Allow pinging of a broadcast address.                                                                                                                                                                                |
| df-bit                     | Enable or disable the do-not-fragment bit in the IP header.                                                                                                                                                          |
| interval <0-128>           | Specify the time interval in seconds between sending ping packets. The default is 1. You can use decimal places to specify fractions of a second. For example, to ping every millisecond, set the interval to 0.001. |
| pattern <hex-data-pattern> | Specify the hex data pattern.                                                                                                                                                                                        |
| repeat                     | Specify the number of ping packets to send.                                                                                                                                                                          |
| <1-2147483647>             | Specify repeat count. The default is 5.                                                                                                                                                                              |
| continuous                 | Continuous ping                                                                                                                                                                                                      |
| size <36-18024>            | The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes).                                                                                                          |
| source <ip-addr>           | The IP address of a configured IP interface to use as the source in the IP header of the ping packet.                                                                                                                |
| timeout <1-65535>          | The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait.                                                 |
| tos <0-255>                | The value of the type of service in the IP header.                                                                                                                                                                   |

**Mode** User Exec and Privileged Exec

**Example** To ping the IP address 10.10.0.5 use the following command:

```
awplus# ping 10.10.0.5
```

# show arp

**Overview** Use this command to display entries in the ARP routing and forwarding table—the ARP cache contains mappings of IP addresses to physical addresses for hosts. To have a dynamic entry in the ARP cache, a host must have used the ARP protocol to access another host.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show arp [security [interface [<interface-list>]]`  
`show arp [statistics [detail][interface [<interface-list>]]`

**Mode** User Exec and Privileged Exec

**Usage** Running this command with no additional parameters will display all entries in the ARP routing and forwarding table.

**Example** To display all ARP entries in the ARP cache, use the following command:

```
awplus# show arp
```

**Output** Figure 18-3: Example output from the **show arp** command

```
awplus#show
arp
```

| IP Address    | MAC Address    | Interface | Port      | Type    |
|---------------|----------------|-----------|-----------|---------|
| 192.168.10.2  | 0015.77ad.fad8 | vlan1     | port1.0.1 | dynamic |
| 192.168.20.2  | 0015.77ad.fa48 | vlan2     | port1.0.2 | dynamic |
| 192.168.1.100 | 00d0.6b04.2a42 | vlan2     | port1.0.6 | static  |

**Table 19:** Parameters in the output of the **show arp** command

| Parameter   | Meaning                                                                                                                                                                                                |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address  | IP address of the network device this entry maps to.                                                                                                                                                   |
| MAC Address | Hardware address of the network device.                                                                                                                                                                |
| Interface   | Interface over which the network device is accessed.                                                                                                                                                   |
| Port        | Physical port that the network device is attached to.                                                                                                                                                  |
| Type        | Whether the entry is a static or dynamic entry. Static entries are added using the <a href="#">arp (IP address MAC)</a> command. Dynamic entries are learned from ARP request/reply message exchanges. |

# show debugging ip packet

**Overview** Use this command to show the IP interface debugging status. IP interface debugging is set using the **debug ip packet interface** command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show debugging ip packet

**Mode** User Exec and Privileged Exec

**Example** To display the IP interface debugging status when the terminal monitor off, use the command:

```
awplus# terminal no monitor
awplus# show debug ip packet
```

**Output** Figure 18-4: Example output from the **show debugging ip packet** command with **terminal monitor** off

```
awplus#terminal no monitor

awplus#show debug ip packet

IP debugging status:

interface all tcp (stopped)

interface vlan1 arp verbose (stopped)
```

**Example** To display the IP interface debugging status when the terminal monitor is on, use the command:

```
awplus# terminal monitor
awplus# show debug ip packet
```

**Output** Figure 18-5: Example output from the **show debugging ip packet** command with **terminal monitor** on

```
awplus#terminal monitor

awplus#show debug ip packet

IP debugging status:

interface all tcp (running)

interface vlan1 arp verbose (running)
```

**Related  
Commands**    [debug ip packet interface](#)  
[terminal monitor](#)

# show ip interface

**Overview** Use this command to display information about interfaces and the IP addresses assigned to them. To display information about a specific interface, specify the interface name with the command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip interface [<interface-list>] [brief]`

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface-list> | The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• an interface, e.g. <code>vlan2</code></li><li>• a continuous range of interfaces separated by a hyphen, e.g. <code>vlan2-8</code> or <code>vlan2-vlan5</code></li><li>• a comma-separated list of interfaces or interface ranges, e.g. <code>vlan2,vlan5,vlan8-10</code></li></ul> The specified interfaces must exist. |

**Mode** User Exec and Privileged Exec

**Examples** To show brief information for the assigned IP address for interface port1.0.2 use the command:

```
awplus# show ip interface port1.0.2 brief
```

To show the IP addresses assigned to vlan2 and vlan3, use the command:

```
awplus# show ip interface vlan2-3 brief
```

**Output** Figure 18-6: Example output from the **show ip interface brief** command

| Interface | IP-Address  | Status   | Protocol |
|-----------|-------------|----------|----------|
| port1.0.2 | unassigned  | admin up | down     |
| vlan1     | 192.168.1.1 | admin up | running  |
| vlan2     | 192.168.2.1 | admin up | running  |
| vlan3     | 192.168.3.1 | admin up | running  |
| vlan8     | unassigned  | admin up | down     |

# show ip sockets

**Overview** Use this command to display information about the IP or TCP sockets that are present on the device. It includes TCP, UDP listen sockets, displaying associated IP address and port.

The information displayed for established TCP sessions includes the remote IP address, port, and session state. Raw IP protocol listen socket information is also displayed for protocols such as VRRP and ICMP6, which are configured to receive IP packets with the associated protocol number.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip sockets`

**Mode** Privileged Exec

**Usage** Use this command to verify that the socket being used is opening correctly. If there is a local and remote endpoint, a connection is established with the ports indicated.

Note that this command does not display sockets that are used internally for exchanging data between the various processes that exist on the device and are involved in its operation and management. It only displays sockets that are present for the purposes of communicating with other external devices.

**Example** To display IP sockets currently present on the device, use the command:

```
awplus# show ip sockets
```

**Output** Figure 18-7: Example output from the **show ip sockets** command

|                                     |               |                |        |
|-------------------------------------|---------------|----------------|--------|

| Not showing<br><number><br>local<br>connections        | This field refers to established sessions between processes internal to the device, that are used in its operation and management. These sessions are not displayed as they are not useful to the user. <number> is some positive integer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Not showing<br><number><br>local<br>listening<br>ports | This field refers to listening sockets belonging to processes internal to the device, that are used in its operation and management. They are not available to receive data from other devices. These sessions are not displayed as they are not useful to the user. <number> is some positive integer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Typ                                                    | This column displays the type of the socket. Possible values for this column are:<br>tcp: IP Protocol 6<br>udp: IP Protocol 17<br>raw: Indicates that socket is for a non port-orientated protocol (i.e. a protocol other than TCP or UDP) where all packets of a specified IP protocol type are accepted. For raw socket entries the protocol type is indicated in subsequent columns.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Local<br>Address                                       | For TCP and UDP listening sockets this shows the destination IP address (either IPv4 or IPv6) and destination TCP or UDP port number for which the socket will receive packets. The address and port are separated by ':'. If the socket will accept packets addressed to any of the device's IP addresses, the IP address will be 0.0.0.0 for IPv4 or :: for IPv6. For active TCP sessions the IP address will display which of the devices addresses the session was established with. For raw sockets this displays the IP address and IP protocol for which the socket will accept IP packets. The address and protocol are separated by ':'. If the socket will accept packets addressed to any of the device's IP addresses, the IP address will be 0.0.0.0 for IPv4 and :: for IPv6. IP Protocol assignments are described at: <a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a> |

**Table 20:** Parameters in the output of the **show ip sockets** command (cont.)

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Address | For TCP and UDP listening sockets this shows the source IP address (either IPv4 or IPv6) and source TCP or UDP port number for which the socket will accept packets. The address and port are separated by ':'. If the socket will accept packets addressed from any IP address, the IP address will be 0.0.0.0 for IPv4 or :: for IPv6. This is the usual case for a listening socket. Normally for a listen socket any source port will be accepted. This is indicated by *. For active TCP sessions the IP address will display the remote address and port the session was established with. For raw sockets the entry in this column will be 0.0.0.0: or ::: for IPv4 and IPv6, respectively. |
| State          | <p>This column shows the state of the socket. For TCP sockets this shows the state of the TCP state machine. For UDP sockets this column is blank. For raw sockets it contains the IP protocol number. The possible TCP states are:</p> <p>LISTEN<br/> SYN-SENT<br/> SYN-RECEIVED<br/> ESTABLISHED<br/> FIN-WAIT-1<br/> FIN-WAIT-2<br/> CLOSE-WAIT<br/> CLOSING<br/> LAST-ACK<br/> TIME-WAIT<br/> CLOSED</p> <p>RFC793 contains the TCP state machine diagram with Section 3.2 describing each of the states.</p>                                                                                                                                                                                  |

# show ip traffic

**Overview** Use this command to display statistics regarding IP traffic sent and received by all interfaces on the device, showing totals for IP and IPv6 and then broken down into sub-categories such as TCP, UDP, ICMP and their IPv6 equivalents when appropriate.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip traffic`

**Mode** Privileged Exec

**Example** To display IP traffic statistics, use the command:

```
awplus# show ip traffic
```

**Output** Figure 18-8: Example output from the **show ip traffic** command

```
IP:
    261998 packets received
    261998 delivered
    261998 sent
    69721 multicast packets received
    69721 multicast packets sent
    23202841 bytes received
    23202841 bytes sent
    7669296 multicast bytes received
    7669296 multicast bytes sent
IPv6:
    28 packets discarded on transmit due to no route
ICMP6:
UDP6:
UDPLite6:
TCP:
    0 remote connections established
    40 local connections established
    7 remote listening ports
    7 local listening ports
    261 active connection openings
    247 passive connection openings
    14 connection attempts failed
    122535 segments received
    122535 segments transmitted
    14 resets transmitted
    227 TCP sockets finished time wait in fast timer
```

```

155 delayed acks sent
21187 headers predicted
736 pure ACKs
80497 pure ACKs predicted
UDP:
139468 datagrams received
139468 datagrams sent

**Table 21:** Parameters in the output of the **show ip traffic** command

| Parameter                              | Description                            |
|----------------------------------------|----------------------------------------|
| IPv4                                   | IPv4 counters                          |
| IPv6                                   | IPv6 counters                          |
| received packets with no route         | Received packets with no route         |
| truncated packets received             | Truncated packets received             |
| multicast packets received             | Multicast packets received             |
| multicast packets sent                 | Multicast packets sent                 |
| broadcast packets received             | Broadcast packets received             |
| broadcast packets sent                 | Broadcast packets sent                 |
| bytes received                         | Bytes received                         |
| bytes sent                             | Bytes sent                             |
| multicast bytes received               | Multicast bytes received               |
| multicast bytes sent                   | Multicast bytes sent                   |
| broadcast bytes received               | Broadcast bytes received               |
| broadcast bytes sent                   | Broadcast bytes sent                   |
| packets received                       | Packets received                       |
| packets received with invalid headers  | Packets received with invalid headers  |
| oversize packets received              | Oversize packets received              |
| packets received with no route         | Packets received with no route         |
| packets received with invalid address  | Packets received with invalid address  |
| packets received with unknown protocol | Packets received with unknown protocol |
| truncated packets received             | Truncated packets received             |
| received packets discarded             | Received packets discarded             |
| received packets delivered             | Received packets delivered             |
| forwarded packets transmitted          | Forwarded packets transmitted          |

**Table 21:** Parameters in the output of the **show ip traffic** command (cont.)

| Parameter                                     | Description                                   |
|-----------------------------------------------|-----------------------------------------------|
| packets transmitted                           | Packets transmitted                           |
| packets discarded on transmit                 | Packets discarded on transmit                 |
| packets discarded on transmit due to no route | Packets discarded on transmit due to no route |
| fragment reassembly timeouts                  | Fragment reassembly timeouts                  |
| fragment reassembly required                  | Fragment reassembly required                  |
| fragment reassembly OK                        | Fragment reassembly OK                        |
| fragment reassembly failures                  | Fragment reassembly failures                  |
| fragmentations succeeded                      | Fragmentations succeeded                      |
| fragmentations failed                         | Fragmentations failed                         |
| fragments created                             | Fragments created                             |
| ICMP6                                         | ICMPv6 counters                               |
| messages received                             | Messages received                             |
| errors received                               | Errors received                               |
| messages sent                                 | Messages sent                                 |
| TCP                                           | TCP counters                                  |
| remote connections established                | Remote connections established                |
| local connections established                 | Local connections established                 |
| remote listening ports                        | Remote listening ports                        |
| local listening ports                         | Local listening ports                         |
| active connection openings                    | Active connection openings                    |
| passive connection openings                   | Passive connection openings                   |
| connection attempts failed                    | Connection attempts failed                    |
| connection resets received                    | Connection resets received                    |
| segments received                             | Segments received                             |
| segments transmitted                          | Segments transmitted                          |
| retransmits                                   | Retransmits                                   |
| bad segments received                         | Bad segments received                         |
| resets transmitted                            | Resets transmitted                            |
| datagrams received                            | Datagrams received                            |
| received for unknown port                     | Received for unknown port                     |
| datagrams sent                                | Datagrams sent                                |
| syncookies sent                               | Syncookies sent                               |

**Table 21:** Parameters in the output of the **show ip traffic** command (cont.)

| Parameter                                    | Description                                                             |
|----------------------------------------------|-------------------------------------------------------------------------|
| syncookies received                          | Syncookies received                                                     |
| syncookies failed                            | Syncookies failed                                                       |
| embryonic resets                             | Embryonic resets                                                        |
| sockets pruned                               | Sockets pruned                                                          |
| ICMPs out of window                          | ICMPs out of window                                                     |
| ICMPs dropped due to lock                    | ICMPs dropped due to lock                                               |
| ARPs filtered                                | ARPs filtered                                                           |
| TCP sockets finished time wait in fast timer | TCP sockets finished time wait in fast timer                            |
| time wait sockets recycled by time stamp     | Time wait sockets recycled by time stamp                                |
| time wait sockets killed                     | Time wait sockets killed                                                |
| delayed acks sent                            | Delayed acks sent delayed acks further delayed because of locked socket |
| delayed acks lost                            | Delayed acks lost                                                       |
| listening socket overflows                   | Listening socket overflows                                              |
| listening socket drops                       | Listening socket drops                                                  |
| headers predicted                            | Headers predicted                                                       |
| pure ACKs                                    | Pure ACKs                                                               |
| pure ACKs predicted                          | Pure ACKs predicted                                                     |
| losses recovered by TCP Reno                 | Losses recovered by TCP Reno                                            |
| losses recovered by SACK                     | Losses recovered by SACK                                                |
| SACKs renegged                               | SACKs renegged                                                          |
| detected reordering by FACK                  | Detected reordering by FACK                                             |
| detected reordering by SACK                  | Detected reordering by SACK                                             |
| detected reordering by TCP Reno              | Detected reordering by TCP Reno                                         |
| detected reordering by sequence              | Detected reordering by sequence                                         |
| full undos                                   | Full undos                                                              |
| partial undos                                | Partial undos                                                           |
| SACK undos                                   | SACK undos                                                              |
| loss undos                                   | Loss undos                                                              |
| segments lost                                | Segments lost                                                           |
| lost retransmits                             | Lost retransmits                                                        |

**Table 21:** Parameters in the output of the **show ip traffic** command (cont.)

| Parameter                                   | Description                                 |
|---------------------------------------------|---------------------------------------------|
| TCP Reno failures                           | TCP Reno failures                           |
| SACK failures                               | SACK failures                               |
| loss failures                               | Loss failures                               |
| fast retransmits                            | Fast retransmits                            |
| forward retransmits                         | Forward retransmits                         |
| retransmits in slow start                   | Retransmits in slow start                   |
| timeouts                                    | Timeouts                                    |
| TCP Reno recovery failures                  | TCP Reno recovery failures                  |
| SACK recovery failures                      | SACK recovery failures                      |
| collapsed segments received                 | Collapsed segments received                 |
| DSACKs sent for old packets                 | DSACKs sent for old packets                 |
| DSACKs sent for out of order segments       | DSACKs sent for out of order segments       |
| DSACKs received                             | DSACKs received                             |
| DSACKs received for out of order segments   | DSACKs received for out of order segments   |
| connections reset due to unexpected SYN     | Connections reset due to unexpected SYN     |
| connections reset due to unexpected data    | Connections reset due to unexpected data    |
| connections reset due to early user close   | Connections reset due to early user close   |
| connections aborted due to lack of memory   | Connections aborted due to lack of memory   |
| connections aborted due to timeout          | Connections aborted due to timeout          |
| connections aborted due to lingering        | Connections aborted due to lingering        |
| connection aborts due to connection failure | Connection aborts due to connection failure |
| TCP memory pressure events                  | TCP memory pressure events                  |
| SACKs discarded                             | SACKs discarded                             |
| Old DSACKs ignored                          | Old DSACKs ignored                          |
| DSACKs ignored without undo                 | DSACKs ignored without undo                 |
| Spurious RTOs                               | Spurious RTOs                               |
| TCP MD5 Not Found                           | TCP MD5 Not Found                           |

**Table 21:** Parameters in the output of the **show ip traffic** command (cont.)

| Parameter                           | Description                         |
|-------------------------------------|-------------------------------------|
| TCP MD5 Unexpected                  | TCP MD5 Unexpected                  |
| TCP SACKs shifted                   | TCP SACKs shifted                   |
| TCP SACKs merged                    | TCP SACKs merged                    |
| TCP SACK shift fallback             | TCP SACK shift fallback             |
| UDP                                 | UDP Counters                        |
| UDPLite                             | UDPLite Counters                    |
| UDP6                                | UDIPv6 Counters                     |
| UDPLite6                            | UDPLitev6 Counters                  |
| datagrams received                  | Datagrams received                  |
| datagrams received for unknown port | Datagrams received for unknown port |

# tcpdump

**Overview** Use this command to start a tcpdump, which gives the same output as the Unix-like **tcpdump** command to display TCP/IP traffic. Press <ctrl> + c to stop a running tcpdump.

**Syntax** tcpdump <line>

| Parameter | Description                                                                                                                                                                          |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <line>    | Specify the dump options. For more information on the options for this placeholder see <a href="http://www.tcpdump.org/tcpdump_man.html">http://www.tcpdump.org/tcpdump_man.html</a> |

**Mode** Privileged Exec

**Example** To start a tcpdump running to capture IP packets, enter the command:

```
awplus# tcpdump ip
```

**Output** Figure 18-9: Example output from the **tcpdump** command

```
03:40:33.221337 IP 192.168.1.1 > 224.0.0.13: PIMv2, Hello,  
length: 34  
1 packets captured  
2 packets received by filter  
0 packets dropped by kernel
```

**Related Commands** [debug ip packet interface](#)

# traceroute

**Overview** Use this command to trace the route to the specified IPv4 host.

**Syntax** `traceroute {<ip-addr>|<hostname>}`

| Parameter                     | Description                                                             |
|-------------------------------|-------------------------------------------------------------------------|
| <code>&lt;ip-addr&gt;</code>  | The destination IPv4 address. The IPv4 address uses the format A.B.C.D. |
| <code>&lt;hostname&gt;</code> | The destination hostname.                                               |

**Mode** User Exec and Privileged Exec

**Example** `awplus# traceroute 10.10.0.5`

# undebug ip packet interface

**Overview** This command applies the functionality of the no [debug ip packet interface](#) command.

# 19

# Domain Name Service (DNS) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Domain Name Service (DNS) features, including the following:

- DNS client
- DNS forwarding (DNS relay)

For more information, see the [IP Feature Overview and Configuration Guide](#).

- Command List**
- “clear ip dns forwarding cache” on page 709
  - “debug ip dns forwarding” on page 710
  - “ip dns forwarding” on page 711
  - “ip dns forwarding cache” on page 712
  - “ip dns forwarding dead-time” on page 713
  - “ip dns forwarding retry” on page 714
  - “ip dns forwarding source-interface” on page 715
  - “ip dns forwarding timeout” on page 716
  - “ip domain-list” on page 717
  - “ip domain-lookup” on page 718
  - “ip domain-name” on page 719
  - “ip name-server” on page 720
  - “show debugging ip dns forwarding” on page 722
  - “show hosts” on page 723
  - “show ip dns forwarding” on page 724
  - “show ip dns forwarding cache” on page 725
  - “show ip dns forwarding server” on page 726

- [“show ip domain-list”](#) on page 727
- [“show ip domain-name”](#) on page 728
- [“show ip name-server”](#) on page 729

# clear ip dns forwarding cache

**Overview** Use this command to clear the DNS Relay name resolver cache.

**Syntax** `clear ip dns forwarding cache`

**Mode** Privileged Exec

**Examples** To clear all cached data, use the command:

```
awplus# clear ip dns forwarding cache
```

**Related  
Commands** [ip dns forwarding cache](#)

# debug ip dns forwarding

**Overview** Use this command to enable DNS Relay debugging.  
Use the **no** variant of this command to disable DNS Relay debugging.

**Syntax** `debug ip dns forwarding`  
`no debug ip dns forwarding`

**Default** DNS Relay debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable DNS forwarding debugging, use the commands:

```
awplus# debug ip dns forwarding
```

To disable DNS forwarding debugging, use the commands:

```
awplus# no debug ip dns forwarding
```

**Related Commands** [ip dns forwarding](#)  
[show debugging ip dns forwarding](#)

# ip dns forwarding

**Overview** Use this command to enable DNS Relay, the forwarding of incoming DNS queries for IP hostname-to-address translation.

Use the **no** variant of this command to disable the forwarding of incoming DNS queries for IP hostname-to-address translation.

**Syntax** `ip dns forwarding`  
`no ip dns forwarding`

**Default** The forwarding of incoming DNS query packets is disabled by default.

**Mode** Global Configuration

**Usage** DNS Relay requires that IP domain lookup is enabled. IP domain lookup is enabled by default, but if it has been disabled, you can re-enable it by using the command [ip domain-lookup](#).

See the [IP Feature Overview and Configuration Guide](#) for more information about DNS Relay. See the [ip dns forwarding dead-time](#) command used with this command.

**Examples** To enable the forwarding of incoming DNS query packets, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding
```

To disable the forwarding of incoming DNS query packets, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding
```

**Related Commands**

- [ip dns forwarding timeout](#)
- [ip name-server](#)
- [show ip dns forwarding](#)
- [show ip dns forwarding cache](#)
- [show ip dns forwarding server](#)

# ip dns forwarding cache

**Overview** Use this command to set the DNS Relay name resolver cache size and cache entry lifetime period. The DNS Relay name resolver cache stores the mappings between domain names and IP addresses.

Use the **no** variant of this command to set the default DNS Relay name resolver cache size and cache entry lifetime period.

Note that the lifetime period of the cache entry can be overwritten by the time-out period of the DNS reply from the DNS server if the time-out period of the DNS reply from the DNS server is smaller than the configured time-out period. The time-out period of the cache entry will only be used when the time-out period of the DNS reply from the DNS server is bigger than the time-out period configured on the device.

**Syntax** `ip dns forwarding cache [size <0-1000>] [timeout <60-3600>]`  
`no ip dns forwarding cache [size|timeout]`

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| <0-1000>  | Number of entries in the DNS Relay name resolver cache. |
| <60-3600> | Timeout value in seconds.                               |

**Default** The default cache size is 0 (no entries) and the default lifetime is 1800 seconds.

**Mode** Global Configuration

**Usage** See the [IP Feature Overview and Configuration Guide](#) for more information about DNS Relay.

**Examples** To set the cache size to 10 entries and the lifetime to 500 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding cache size 10 time 500
```

To set the cache size to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding cache size
```

**Related Commands**

- [clear ip dns forwarding cache](#)
- [debug ip dns forwarding](#)
- [ip dns forwarding](#)
- [show ip dns forwarding](#)
- [show ip dns forwarding cache](#)

# ip dns forwarding dead-time

**Overview** Use this command to set the time period in seconds when the device stops sending any DNS requests to an unresponsive server and all retries set using [ip dns forwarding retry](#) are used. This time period is the DNS forwarding dead-time. The device stops sending DNS requests at the DNS forwarding dead-time configured and when all of the retries are used.

Use the **no** variant of this command to restore the default DNS forwarding dead-time value of 3600 seconds.

**Syntax** `ip dns forwarding dead-time <60-43200>`  
`no ip dns forwarding retry`

| Parameter  | Description                                                                                                                         |
|------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <60-43200> | Set the DNS forwarding dead-time in seconds. At the dead-time set, the switch stops sending DNS requests to an unresponsive server. |

**Default** The default time to stop sending DNS requests to an unresponsive server is 3600 seconds.

**Mode** Global Configuration

**Usage** See the [IP Feature Overview and Configuration Guide](#) for more information about DNS Relay. See the [ip dns forwarding retry](#) command used with this command.

**Examples** To set the DNS forwarding retry count to 50 and to set the DNS forwarding dead-time to 1800 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding dead-time 1800
awplus(config)# ip dns forwarding retry 50
```

To reset the DNS retry count to the default of 2 and the DNS forwarding dead-time to the default of 3600, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding dead-time
awplus(config)# no ip dns forwarding retry
```

**Related Commands**

- [debug ip dns forwarding](#)
- [ip dns forwarding](#)
- [ip dns forwarding retry](#)
- [show ip dns forwarding](#)
- [show ip dns forwarding server](#)

# ip dns forwarding retry

**Overview** Use this command to set the number of times DNS Relay will retry to forward DNS queries. The device stops sending DNS requests to an unresponsive server at the time set using the [ip dns forwarding dead-time](#) command and when all of the retries are used.

Use the **no** variant of this command to set the number of retries to the default of 2.

**Syntax** `ip dns forwarding retry <0-100>`  
`no ip dns forwarding retry`

| Parameter | Description                                                          |
|-----------|----------------------------------------------------------------------|
| <0-100>   | Set the number of times DNS Relay will retry to forward a DNS query. |

**Default** The default number of retries is 2 DNS requests to an unresponsive server.

**Mode** Global Configuration

**Usage** See the [IP Feature Overview and Configuration Guide](#) for more information about DNS Relay. See the [ip dns forwarding dead-time](#) command used with this command.

**Examples** To set the DNS forwarding retry count to 50 and to set the DNS forwarding dead-time to 1800 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding retry 50
awplus(config)# ip dns forwarding dead-time 1800
```

To reset the DNS retry count to the default of 2 and the DNS forwarding dead-time to the default of 3600 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding retry
awplus(config)# no ip dns forwarding dead-time
```

**Related Commands** [debug ip dns forwarding](#)  
[ip dns forwarding](#)  
[ip dns forwarding dead-time](#)  
[show ip dns forwarding](#)

# ip dns forwarding source-interface

**Overview** Use this command to set the interface to use for forwarding and receiving DNS queries.

Use the **no** variant of this command to unset the interface used for forwarding and receiving DNS queries.

**Syntax** `ip dns forwarding source-interface <interface-name>`  
`no ip dns forwarding source-interface`

| Parameter        | Description                                        |
|------------------|----------------------------------------------------|
| <interface-name> | An alphanumeric string that is the interface name. |

**Default** The default is that no interface is set and the device selects the appropriate source IP address automatically.

**Mode** Global Configuration

**Usage** See the [IP Feature Overview and Configuration Guide](#) for more information about DNS Relay.

**Examples** To set `vlan1` as the source interface for relayed DNS queries, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding source-interface vlan1
```

To clear the source interface for relayed DNS queries, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding source-interface
```

**Related Commands** [debug ip dns forwarding](#)  
[ip dns forwarding](#)  
[show ip dns forwarding](#)

# ip dns forwarding timeout

**Overview** Use this command to set the time period for the DNS Relay to wait for a DNS response.

Use the **no** variant of this command to set the time period to wait for a DNS response to the default of 3 seconds.

**Syntax** `ip dns forwarding timeout <0-3600>`  
`no ip dns forwarding timeout`

| Parameter | Description               |
|-----------|---------------------------|
| <0-3600>  | Timeout value in seconds. |

**Default** The default timeout value is 3 seconds.

**Mode** Global Configuration

**Usage** See the [IP Feature Overview and Configuration Guide](#) for more information about DNS Relay.

**Examples** To set the timeout value to 12 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding timeout 12
```

To set the timeout value to the default of 3 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding timeout
```

**Related Commands** [debug ip dns forwarding](#)  
[ip dns forwarding](#)  
[show ip dns forwarding](#)

# ip domain-list

**Overview** This command adds a domain to the DNS list. Domains are appended to incomplete host names in DNS requests. Each domain in this list is tried in turn in DNS lookups. This list is ordered so that the first entry you create is checked first.

The **no** variant of this command deletes a domain from the list.

**Syntax** `ip domain-list <domain-name>`  
`no ip domain-list <domain-name>`

| Parameter                        | Description                               |
|----------------------------------|-------------------------------------------|
| <code>&lt;domain-name&gt;</code> | Domain string, for example "company.com". |

**Mode** Global Configuration

**Usage** If there are no domains in the DNS list, then your device uses the domain specified with the [ip domain-name](#) command. If any domain exists in the DNS list, then the device does not use the domain set using the **ip domain-name** command.

**Example** To add the domain `example.net` to the DNS list, use the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-list example.net
```

**Related Commands** [ip domain-lookup](#)  
[ip domain-name](#)  
[show ip domain-list](#)

# ip domain-lookup

**Overview** This command enables the DNS client on your device. This allows you to use domain names instead of IP addresses in commands. The DNS client resolves the domain name into an IP address by sending a DNS inquiry to a DNS server, specified with the [ip name-server](#) command.

The **no** variant of this command disables the DNS client. The client will not attempt to resolve domain names. You must use IP addresses to specify hosts in commands.

**Syntax** `ip domain-lookup`  
`no ip domain-lookup`

**Mode** Global Configuration

**Usage** The client is enabled by default. However, it does not attempt DNS inquiries unless there is a DNS server configured.

For more information about DNS clients, see the [IP Feature Overview and Configuration Guide](#).

If you are using DNS Relay (see the command [ip dns forwarding](#)), you must have IP domain lookup enabled.

**Examples** To enable the DNS client on your device, use the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-lookup
```

To disable the DNS client on your device, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip domain-lookup
```

**Related Commands** [ip domain-list](#)  
[ip domain-name](#)  
[ip name-server](#)  
[show hosts](#)  
[show ip name-server](#)

# ip domain-name

**Overview** This command sets a default domain for the DNS. The DNS client appends this domain to incomplete host-names in DNS requests.

The **no** variant of this command removes the domain-name previously set by this command.

**Syntax** `ip domain-name <domain-name>`  
`no ip domain-name <domain-name>`

| Parameter                        | Description                               |
|----------------------------------|-------------------------------------------|
| <code>&lt;domain-name&gt;</code> | Domain string, for example "company.com". |

**Mode** Global Configuration

**Usage** If there are no domains in the DNS list (created using the [ip domain-list](#) command) then your device uses the domain specified with this command. If any domain exists in the DNS list, then the device does not use the domain configured with this command.

When your device is using its DHCP client for an interface, it can receive Option 15 from the DHCP server. This option replaces the domain name set with this command.

**Example** To configure the domain name, enter the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-name company.com
```

**Related Commands** [ip domain-list](#)  
[show ip domain-list](#)  
[show ip domain-name](#)

# ip name-server

**Overview** This command adds IPv4 or IPv6 DNS server addresses. The DNS client on your device sends DNS queries to IP addresses in this list when trying to resolve a host name. Host names cannot be resolved until you have added at least one server to this list. A maximum of three name servers can be added to this list.

The **no** variant of this command removes the specified DNS name-server address.

**Syntax** `ip name-server <ip-addr>`  
`no ip name-server <ip-addr>`

| Parameter                    | Description                                                                                                                                                                                |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-addr&gt;</code> | The IP address of the DNS server that is being added to the name server list. The address is entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X:X for an IPv6 address. |

**Mode** Global Configuration

**Usage** To allow the device to operate as a DNS proxy, your device must have learned about a DNS name-server to forward requests to. Name-servers can be learned through the following means:

- Manual configuration, using the **ip name-server** command
- Learned from DHCP server with Option 6
- Learned over a PPP tunnel if the neighbor advertises the DNS server

This command is used to statically configure a DNS name-server for the device to use.

For more information about DHCP and DNS, see the [IP Feature Overview and Configuration Guide](#).

**Examples** To allow a device to send DNS queries to a DNS server with the IPv4 address 10.10.10.5, use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server 10.10.10.5
```

To enable your device to send DNS queries to a DNS server with the IPv6 address 2001:0db8:010d::1, use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server 2001:0db8:010d::1
```

**Related  
Commands**

- [ip domain-list](#)
- [ip domain-lookup](#)
- [ip domain-name](#)
- [show ip dns forwarding cache](#)
- [show ip name-server](#)

# show debugging ip dns forwarding

**Overview** Use this command to display the DNS Relay debugging status. DNS Relay debugging is set using the **debug ip dns forwarding** command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging ip dns forwarding`

**Mode** User Exec and Privileged Exec

**Example** To display the DNS Relay debugging status, use the command:

```
awplus# show debugging ip dns forwarding
```

**Output** Figure 19-1: Example output from the **show debugging ip dns forwarding** command

```
awplus#show debugging ip dns forwarding

DNS Relay debugging status:
  debugging is on
```

**Related Commands** [debug ip dns forwarding](#)

# show hosts

**Overview** This command shows the default domain, domain list, and name servers configured on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show hosts`

**Mode** User Exec and Privileged Exec

**Example** To display the default domain, use the command:

```
awplus# show hosts
```

**Output** Figure 19-2: Example output from the **show hosts** command

```
awplus#show hosts

Default domain is mycompany.com
Domain list: company.com
Name/address lookup uses domain service
Name servers are 10.10.0.2 10.10.0.88
```

**Related Commands**

- [ip domain-list](#)
- [ip domain-lookup](#)
- [ip domain-name](#)
- [ip name-server](#)

# show ip dns forwarding

**Overview** Use this command to display the DNS Relay status.

**Syntax** `show ip dns forwarding`

**Mode** User Exec and Privileged Exec

**Examples** To display the DNS Relay status, use the command:

```
awplus# show ip dns forwarding
```

**Output** Figure 19-3: Example output from the **show ip dns forwarding** command

```
awplus#show ip dns forwarding

Max-Retry      : 2
Timeout        : 3 second(s)
Dead-Time      : 3600 second(s)
Source-Interface: not specified
DNS Cache      : disabled
```

**Related Commands** [ip dns forwarding](#)

# show ip dns forwarding cache

**Overview** Use this command to display the DNS Relay name resolver cache.

**Syntax** `show ip dns forwarding cache`

**Mode** User Exec and Privileged Exec

**Example** To display the DNS Relay name resolver cache, use the command:

```
awplus# show ip dns forwarding cache
```

**Output** Figure 19-4: Example output from the **show ip dns forwarding cache** command

```
awplus#show ip dns forwarding cache
```

| Host             | Address         | Expires | Flags   |
|------------------|-----------------|---------|---------|
| www.example.com  | 172.16.1.1.     | 180     |         |
| mail.example.com | www.example.com | 180     | CNAME   |
| www.example.com  | 172.16.1.1.     | 180     | REVERSE |
| mail.example.com | 172.16.1.5.     | 180     |         |

**Related Commands** [ip dns forwarding cache](#)  
[ip name-server](#)

# show ip dns forwarding server

**Overview** Use this command to display the status of DNS forwarding name servers.

**Syntax** `show ip dns forwarding server`

| Parameter         | Description                     |
|-------------------|---------------------------------|
| forwarding server | The DNS forwarding name server. |

**Mode** User Exec and Privileged Exec

**Examples** To display the status of DNS Relay name servers, use the command:

```
awplus# show ip dns forwarding server
```

**Output** Figure 19-5: Example output from the **show ip dns forwarding server** command

|                                      |          |       |           |
|--------------------------------------|----------|-------|-----------|
| awplus#show ip dns forwarding server |          |       |           |
| Servers                              | Forwards | Fails | Dead-Time |
| 172.16.1.1                           | 12       | 0     | active    |
| 172.16.1.2                           | 6        | 3     | 3900      |

**Related Commands** [ip dns forwarding](#)  
[ip dns forwarding dead-time](#)

# show ip domain-list

**Overview** This command shows the domains configured in the domain list. The DNS client uses the domains in this list to append incomplete hostnames when sending a DNS inquiry to a DNS server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip domain-list`

**Mode** User Exec and Privileged Exec

**Example** To display the list of domains in the domain list, use the command:

```
awplus# show ip domain-list
```

**Output** Figure 19-6: Example output from the **show ip domain-list** command

```
awplus#show ip domain-list
alliedtelesis.com
mycompany.com
```

**Related Commands** [ip domain-list](#)  
[ip domain-lookup](#)

# show ip domain-name

**Overview** This command shows the default domain configured on your device. When there are no entries in the DNS list, the DNS client appends this domain to incomplete hostnames when sending a DNS inquiry to a DNS server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip domain-name`

**Mode** User Exec and Privileged Exec

**Example** To display the default domain configured on your device, use the command:

```
awplus# show ip domain-name
```

**Output** Figure 19-7: Example output from the **show ip domain-name** command

```
awplus#show ip domain-name  
alliedtelesis.com
```

**Related  
Commands** [ip domain-name](#)  
[ip domain-lookup](#)

# show ip name-server

**Overview** This command displays a list of IPv4 and IPv6 DNS server addresses that your device will send DNS requests to. This is a static list configured using the [ip name-server](#) command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip name-server`

**Mode** User Exec and Privileged Exec

**Example** To display the list of DNS servers that your device sends DNS requests to, use the command:

```
awplus# show ip name-server
```

**Output** Figure 19-8: Example output from the **show ip name-server** command

```
awplus# show ip name-server
10.10.0.123
10.10.0.124
2001:0db8:010d::1
```

# IPv6 Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure IPv6. For more information, see the [IPv6 Feature Overview and Configuration Guide](#).

- Command List**
- “clear ipv6 neighbors” on page 732
  - “ipv6 address” on page 733
  - “ipv6 address autoconfig” on page 735
  - “ipv6 enable” on page 737
  - “ipv6 forwarding” on page 739
  - “ipv6 multicast forward-slow-path-packet” on page 740
  - “ipv6 nd managed-config-flag” on page 741
  - “ipv6 nd minimum-ra-interval” on page 742
  - “ipv6 nd other-config-flag” on page 743
  - “ipv6 nd prefix” on page 744
  - “ipv6 nd ra-interval” on page 746
  - “ipv6 nd ra-lifetime” on page 747
  - “ipv6 nd rguard” on page 748
  - “ipv6 nd reachable-time” on page 750
  - “ipv6 nd retransmission-time” on page 751
  - “ipv6 nd suppress-ra” on page 752
  - “ipv6 neighbor” on page 753
  - “ipv6 opportunistic-nd” on page 754
  - “ipv6 route” on page 755

- [“ipv6 unreachable”](#) on page 756
- [“ping ipv6”](#) on page 757
- [“show ipv6 forwarding”](#) on page 758
- [“show ipv6 interface brief”](#) on page 759
- [“show ipv6 neighbors”](#) on page 760
- [“show ipv6 route”](#) on page 761
- [“show ipv6 route summary”](#) on page 763
- [“traceroute ipv6”](#) on page 764

# clear ipv6 neighbors

**Overview** Use this command to clear all dynamic IPv6 neighbor entries.

**Syntax** `clear ipv6 neighbors`

**Mode** Privileged Exec

**Example** `awplus# clear ipv6 neighbors`

# ipv6 address

**Overview** Use this command to set the IPv6 address of a VLAN interface and enable IPv6.

Use the optional **eui64** parameter to derive the interface identifier of the IPv6 address from the MAC address of the interface. Note that the MAC address of the default VLAN is applied if the interface does not have a MAC address of its own when specifying the **eui64** parameter.

Use the **no** variant of this command to remove the IPv6 address assigned and disable IPv6. Note that if no global addresses are left after removing the IPv6 address then IPv6 is disabled.

**Syntax** `ipv6 address <ipv6-addr/prefix-length> [eui64]`  
`no ipv6 address <ipv6-addr/prefix-length> [eui64]`

| Parameter                                    | Description                                                                                                                                                                                                             |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-addr/prefix-length&gt;</code> | Specifies the IPv6 address to be set. The IPv6 address uses the format X:X::X/X/Prefix-Length. The prefix-length is usually set between 0 and 64. Note that your switch will not accept prefix lengths greater than 64. |
| <code>eui64</code>                           | EUI-64 is a method of automatically deriving the lower 64 bits of an IPv6 address, based on the switch's MAC address. See the Usage section for more information.                                                       |

**Mode** Interface Configuration for a VLAN interface.

**Usage** If the **eui64** parameter is specified then the lower 64 bits of the IPv6 address are appended with the same address that would be acquired through stateless address autoconfiguration (SLAAC) if the device received an RA (Router Advertisement) specifying this prefix. See [ipv6 address autoconfig](#) for a detailed command description and examples to enable and disable SLAAC. For more information, see "IPv6 EUI-64 Addressing" in the [IPv6 Feature Overview and Configuration Guide](#).

Note that link-local addresses are retained in the system until they are negated by using the **no** variant of the command that established them. See the [ipv6 enable](#) command for more information.

Also note that the link-local address is retained in the system if the global address is removed using another command, which was not used to establish the link-local address. For example, if a link local address is established with the [ipv6 enable](#) command then it will not be removed using a **no ipv6 address** command.

**Examples** To assign the IPv6 address 2001:0db8::a2/64 to the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::a2/64
```

To remove the IPv6 address 2001:0db8::a2/64 from the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::a2/64
```

To assign the **eui64** derived address in the prefix 2001:db8::/48 to VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-fr-subif)# ipv6 address 2001:0db8::/48 eui64
```

To remove the **eui64** derived address in the prefix 2001:db8::/48 from VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-fr-subif)# no ipv6 address 2001:0db8::/48 eui64
```

**Related Commands**

- [ipv6 address autoconfig](#)
- [show running-config](#)
- [show ipv6 interface brief](#)
- [show ipv6 route](#)

# ipv6 address autoconfig

**Overview** Use this command to enable IPv6 stateless address autoconfiguration (SLAAC) for an interface. This configures an IPv6 address on an interface derived from the MAC address on the interface.

Use the **no** variant of this command to disable IPv6 SLAAC on an interface. Note that if no global addresses are left after removing all IPv6 autoconfigured addresses then IPv6 is disabled.

**Syntax** `ipv6 address autoconfig`  
`no ipv6 address autoconfig`

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command enables automatic configuration of IPv6 addresses using stateless autoconfiguration on an interface and enables IPv6, but does not enable IPv6 forwarding. See the [ipv6 forwarding](#) command for further description and examples.

IPv6 hosts can configure themselves when connected to an IPv6 network using ICMPv6 (Internet Control Message Protocol version 6) router discovery messages. Configured routers respond with a Router Advertisement (RA) containing configuration parameters for IPv6 hosts.

The SLAAC process derives the interface identifier of the IPv6 address from the MAC address of the interface. When applying SLAAC to an interface, note that the MAC address of the default VLAN is applied to the interface if the interface does not have its own MAC address.

If SLAAC is not suitable then a network can use stateful configuration with DHCPv6 (Dynamic Host Configuration Protocol version 6) Relay, or hosts can be configured statically. See [ip dhcp-relay server-address](#) for the DHCPv6 Relay server command description and examples. See the [IP Feature Overview and Configuration Guide](#) for more information about DNS Relay.

Note that link-local addresses are retained in the system until they are negated by using the no variant of the command that established them. See the [ipv6 enable](#) command for more information.

Also note that the link-local address is retained in the system if the global address is removed using another command that was not used to establish the link-local address. For example, if a link local address is established with the [ipv6 enable](#) command then it will not be removed using a **no ipv6 address** command.

**Examples** To enable SLAAC on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address autoconfig
```

To disable SLAAC on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address autoconfig
```

**Related  
Commands**

[ipv6 address](#)  
[ipv6 enable](#)  
[show ipv6 interface brief](#)  
[show ipv6 route](#)  
[show running-config](#)

# ipv6 enable

**Overview** Use this command to enable IPv6 on an interface without an IPv6 global address for the interface. This enables IPv6 with a IPv6 link-local address, not an IPv6 global address.

Use the no variant of this command to disable IPv6 on an interface without a global address. Note the **no** variant of this command does not operate on an interface with an IPv6 global address or an interface configured for IPv6 stateless address autoconfiguration (SLAAC).

**Syntax** `ipv6 enable`  
`no ipv6 enable`

**Mode** Interface Configuration for a VLAN interface.

**Usage** The `ipv6 enable` command automatically configures an IPv6 link-local address on the interface and enables the interface for IPv6 processing.

A link-local address is an IP (Internet Protocol) address that is only used for communications in the local network, or for a point-to-point connection. Routing does not forward packets with link-local addresses. IPv6 requires that a link-local address is assigned to each interface that has the IPv6 protocol enabled, and when addresses are assigned to interfaces for routing IPv6 packets.

Note that link-local addresses are retained in the system until they are negated by using the no variant of the command that established them.

Also note that the link-local address is retained in the system if the global address is removed using another command that was not used to establish the link-local address. For example, if a link local address is established with the `ipv6 enable` command then it will not be removed using a **no ipv6 address** command.

**Examples** To enable IPv6 with only a link-local IPv6 address on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
```

To disable IPv6 with only a link-local IPv6 address on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 enable
```

**Related  
Commands**

ipv6 address  
ipv6 address autoconfig  
show ipv6 interface brief  
show ipv6 route  
show running-config

# ipv6 forwarding

**Overview** Use this command to turn on IPv6 unicast routing for IPv6 packet forwarding.

Execute this command globally on your device prior to issuing [ipv6 enable](#) on individual interfaces.

Use this **no** variant of this command to turn off IPv6 unicast routing. Note IPv6 unicast routing is disabled by default.

**NOTE:** Use this command to enable IPv6 unicast routing before configuring either RIPng or OSPFv3 IPv6 routing protocols and static or multicast IPv6 routing.

IPv6 must be enabled on an interface with the [ipv6 enable](#) command, IPv6 forwarding must be enabled globally for routing IPv6 with the [ipv6 forwarding](#) command, and IPv6 multicasting must be enabled globally with the [ipv6 multicast-routing](#) command before using PIM-SMv6 commands.

**Syntax** `ipv6 forwarding`  
`no ipv6 forwarding`

**Mode** Global Configuration

**Default** IPv6 unicast forwarding is disabled by default.

**Usage** Enable IPv6 unicast forwarding globally for all interface on your device with this command. Use the **no** variant of this command to disable IPv6 unicast forwarding globally for all interfaces on your device.

IPv6 unicast forwarding allows devices to communicate with devices that are more than one hop away, providing that there is a route to the destination address. If IPv6 forwarding is not enabled then pings to addresses on devices that are more than one hop away will fail, even if there is a route to the destination address.

**Examples** To enable IPv6 unicast routing, use this command as shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
```

To disable IPv6 unicast routing, use the no variant of this command as shown below:

```
awplus# configure terminal
awplus(config)# no ipv6 forwarding
```

**Related Commands** [ipv6 enable](#)  
[ipv6 multicast-routing](#)

# ipv6 multicast forward-slow-path-packet

**Overview** Use this command to enable multicast packets to be forwarded to the CPU. Enabling this command will ensure that the layer L3 MTU is set correctly for each IP multicast group and will apply the value of the smallest MTU among the outgoing interfaces for the multicast group.

It will also ensure that a received packet that is larger than the MTU value will result in the generation of an ICMP Too Big message.

Use the **no** variant of this command to disable the above functionality.

**Syntax** `ipv6 multicast forward-slow-path-packet`  
`no ipv6 multicast forward-slow-path-packet`

**Default** Disabled.

**Mode** Privileged Exec

**Example** To enable the ipv6 multicast forward-slow-path-packet function, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast forward-slow-path-packet
```

**Related Commands** [show ipv6 forwarding](#)

# ipv6 nd managed-config-flag

**Overview** Use this command to set the managed address configuration flag, contained within the router advertisement field.

Setting this flag indicates the operation of a stateful autoconfiguration protocol such as DHCPv6 for address autoconfiguration, and that address information (i.e. the network prefix) and other (non-address) information can be requested from the device.

An unset flag enables hosts receiving the advertisements to use a stateless autoconfiguration mechanism to establish their IPv6 addresses. The default is flag unset.

Use the **no** variant of this command to reset this command to its default of, flag unset.

**Syntax** `ipv6 nd managed-config-flag`  
`no ipv6 nd managed-config-flag`

**Default** Unset

**Mode** Interface Configuration for a VLAN interface.

**Usage** Advertisement flags will not be transmitted unless you have applied the [ipv6 nd suppress-ra](#) command. This step is included in the example below.

**Example** To set the managed address configuration flag on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd managed-config-flag
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related Commands** [ipv6 nd suppress-ra](#)  
[ipv6 nd prefix](#)  
[ipv6 nd other-config-flag](#)

# ipv6 nd minimum-ra-interval

**Overview** Use this command in Interface Configuration mode to set a minimum Router Advertisement (RA) interval for a VLAN interface.

Use the **no** variant of this command in Interface Configuration mode to remove the minimum RA interval for a VLAN interface.

**Syntax** `ipv6 nd minimum-ra-interval <seconds>`  
`no ipv6 nd minimum-ra-interval [<seconds>]`

| Parameter                    | Description                                                                                                        |
|------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <code>&lt;seconds&gt;</code> | Specifies the number of seconds between IPv6 Router Advertisements (RAs). Valid values are from 3 to 1350 seconds. |

**Default** The RA interval for a VLAN interface is unset by default.

**Mode** Interface Configuration for a VLAN interface.

**Examples** To set the minimum RA interval for the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd minimum-ra-interval 60
```

To remove the minimum RA interval for the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd minimum-ra-interval 60
```

**Related Commands**

- [ipv6 nd ra-interval](#)
- [ipv6 nd suppress-ra](#)
- [ipv6 nd prefix](#)
- [ipv6 nd other-config-flag](#)

# ipv6 nd other-config-flag

**Overview** Use this command to set the **other** stateful configuration flag (contained within the router advertisement field) to be used for IPv6 address auto-configuration. This flag is used to request the router to provide information in addition to providing addresses.

**NOTE:**

*Setting the `ipv6 nd managed-config-flag` command implies that the `ipv6 nd other-config-flag` will also be set.*

Use **no** variant of this command to reset the value to the default.

**Syntax** `ipv6 nd other-config-flag`  
`no ipv6 nd other-config-flag`

**Default** Unset

**Mode** Interface Configuration for a VLAN interface.

**Usage** Advertisement flags will not be transmitted unless you have applied the `ipv6 nd suppress-ra` command. This step is included in the example below.

**Example** To set the IPv6 other-config-flag on the VLAN interface `vlan4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd other-config-flag
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related Commands** `ipv6 nd suppress-ra`  
`ipv6 nd prefix`  
`ipv6 nd managed-config-flag`

# ipv6 nd prefix

**Overview** Use this command in Interface Configuration mode for a VLAN interface to specify the IPv6 prefix information that is advertised by the router advertisement for IPv6 address auto-configuration.

Use the **no** parameter with this command to reset the IPv6 prefix for a VLAN interface in Interface Configuration mode.

**Syntax**

```
ipv6 nd prefix <ipv6-prefix/length>  
ipv6 nd prefix <ipv6-prefix/length> [<valid-lifetime>]  
ipv6 nd prefix <ipv6-prefix/length>  
<valid-lifetime><preferred-lifetime> [no-autoconfig]  
ipv6 nd prefix <ipv6-prefix/length>  
<valid-lifetime><preferred-lifetime> off-link [no-autoconfig]  
no ipv6 nd prefix [<ipv6-addr/prefix-length>|all]
```

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipv6-prefix/length> | The prefix to be advertised by the router advertisement message.<br>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64. The default is X:X::/64.                                                                                                                                                                                                                              |
| <valid-lifetime>     | The the period during which the specified IPv6 address prefix is valid. This can be set to a value between 0 and 4294967295 seconds. The default is 2592000 (30 days). Note that this period should be set to a value greater than that set for the prefix preferred-lifetime.                                                                                                                                                            |
| <preferred-lifetime> | Specifies the IPv6 prefix preferred lifetime. This is the period during which the IPv6 address prefix is considered a current (undeprecated) value. After this period, the command is still valid but should not be used in new communications. Set to a value between 0 and 4294967295 seconds. The default is 604800 seconds (7 days). Note that this period should be set to a value less than that set for the prefix valid-lifetime. |
| off-link             | Specify the IPv6 prefix off-link flag. The default is flag set.                                                                                                                                                                                                                                                                                                                                                                           |
| no-autoconfig        | Specify the IPv6 prefix no autoconfiguration flag. Setting this flag indicates that the prefix is not to be used for autoconfiguration. The default is flag set.                                                                                                                                                                                                                                                                          |
| all                  | Specify all IPv6 prefixes associated with the VLAN interface.                                                                                                                                                                                                                                                                                                                                                                             |

**Default** Valid-lifetime default is 2592000 seconds (30 days). Preferred-lifetime default is 604800 seconds (7 days).

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command specifies the IPv6 prefix flags that are advertised by the router advertisement message.

**Examples** The following example configures the device to issue router advertisements on the VLAN interface `vlan4`, and advertises the address prefix of `2001:0db8::/64`.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64
```

The following example configures the device to issue router advertisements on the VLAN interface `vlan4`, and advertises the address prefix of `2001:0db8::/64` with a valid lifetime of 10 days and a preferred lifetime of 5 days.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64 864000 432000
```

The following example configures the device to issue router advertisements on the VLAN interface `vlan4`, and advertises the address prefix of `2001:0db8::/64` with a valid lifetime of 10 days, a preferred lifetime of 5 days and no prefix used for autoconfiguration.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64 864000 43200
no-autoconfig
```

The following example resets router advertisements on the VLAN interface `vlan4`, so the address prefix of `2001:0db8::/64` is not advertised from the device.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd prefix 2001:0db8::/64
```

The following example resets all router advertisements on the VLAN interface `vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd prefix all
```

**Related  
Commands** [ipv6 nd suppress-ra](#)

# ipv6 nd ra-interval

**Overview** Use this command to specify the interval between IPv6 Router Advertisements (RA) transmissions.

Use **no** parameter with this command to reset the value to the default value (600 seconds).

**Syntax** `ipv6 nd ra-interval <seconds>`  
`no ipv6 nd ra-interval`

| Parameter                    | Description                                                                                                        |
|------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <code>&lt;seconds&gt;</code> | Specifies the number of seconds between IPv6 Router Advertisements (RAs). Valid values are from 4 to 1800 seconds. |

**Default** 600 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage** Advertisement flags will not be transmitted unless you have applied the [ipv6 nd suppress-ra](#) command as shown in the example below.

**Example** To set the advertisements interval on the VLAN interface `vlan4` to be 60 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd ra-interval 60
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related Commands** [ipv6 nd minimum-ra-interval](#)  
[ipv6 nd suppress-ra](#)  
[ipv6 nd prefix](#)

# ipv6 nd ra-lifetime

**Overview** Use this command to specify the time period that this router can usefully act as a default gateway for the network. Each router advertisement resets this time period.

Use **no** parameter with this command to reset the value to default.

**Syntax** `ipv6 nd ra-lifetime <seconds>`  
`no ipv6 nd ra-lifetime`

| Parameter                    | Description                                                                                                                                                                                              |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;seconds&gt;</code> | Time period in seconds. Valid values are from 0 to 9000. Note that you should set this time period to a value greater than the value you have set using the <a href="#">ipv6 nd ra-interval</a> command. |

**Default** 1800 seconds

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command specifies the lifetime of the current router to be announced in IPv6 Router Advertisements.

Advertisement flags will not be transmitted unless you have applied the [ipv6 nd suppress-ra](#) command. This instruction is included in the example shown below.

**Examples** To set the advertisement lifetime of 8000 seconds on the VLAN interface `vlan4`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd ra-lifetime 8000
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related Commands** [ipv6 nd suppress-ra](#)  
[ipv6 nd prefix](#)

# ipv6 nd raguard

**Overview** Use this command to apply the Router Advertisements (RA) Guard feature from the Interface Configuration mode for a device port. This blocks all RA messages received on a device port.

For more information about RA Guard, see the [IPv6 Feature Overview and Configuration Guide](#).

Use the **no** parameter with this command to disable RA Guard for a specified device port.

**Syntax** `ipv6 nd raguard`  
`no ipv6 nd raguard`

**Default** RA Guard is not enabled by default.

**Mode** Interface Configuration for a device port interface.

**Usage** Router Advertisements (RAs) are used by Routers to announce themselves on the link. Applying RA Guard to a device port disallows Router Advertisements and redirect messages. RA Guard blocks RAs from untrusted hosts. Blocking RAs stops untrusted hosts from flooding malicious RAs and stops any misconfigured hosts from disrupting traffic on the local network.

Enabling RA Guard on a port blocks RAs from a connected host and indicates the port and host are untrusted. Disabling RA Guard on a port allows RAs from a connected host and indicates the port and host are trusted. Ports and hosts are trusted by default to allow RAs.

**Example** To enable RA Guard on device ports `port1.0.2-1.0.12`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-1.0.12
awplus(config-if)# ipv6 nd raguard
```

To verify RA Guard is enabled on device port interface `port1.0.2`, use the command:

```
awplus# show running-config interface port1.0.2
```

To disable RA Guard on device ports `port1.0.2-1.0.12`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.12
awplus(config-if)# no ipv6 nd raguard
```

When RA Guard is disabled on a device port it is not displayed in **show running-config** output.

**Output** Example output from using **show running-config interface port1.0.2** to verify RA Guard:

```
!  
interface port1.0.2  
  switchport mode access  
  
  ipv6 nd raguard  
!
```

**Related Commands** [show running-config interface](#)

# ipv6 nd reachable-time

**Overview** Use this command to specify the reachable time in the router advertisement to be used for detecting reachability of the IPv6 neighbor.

Use the **no** variant of this command to reset the value to default.

**Syntax** `ipv6 nd reachable-time <milliseconds>`  
`no ipv6 nd reachable-time`

| Parameter      | Description                                                                                                                             |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <milliseconds> | Time period in milliseconds. Valid values are from 1000 to 3600000.<br>Setting this value to 0 indicates an unspecified reachable-time. |

**Default** 0 milliseconds

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command specifies the reachable time of the current router to be announced in IPv6 Router Advertisements.

Advertisement flags will not be transmitted unless you have applied the [ipv6 nd suppress-ra](#) command. This instruction is included in the example shown below.

**Example** To set the reachable-time in router advertisements on the VLAN interface `vlan4` to be 1800000 milliseconds, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ipv6 nd reachable-time 1800000
awplus(config-if)# no ipv6 nd suppress-ra
```

To reset the reachable-time in router advertisements on the VLAN interface `vlan4` to an unspecified reachable-time (0 milliseconds), enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd reachable-time
```

**Related Commands** [ipv6 nd suppress-ra](#)  
[ipv6 nd prefix](#)

# ipv6 nd retransmission-time

**Overview** Use this command to specify the advertised retransmission interval for Neighbor Solicitation in milliseconds between IPv6 Routers.

Use the **no** variant of this command to reset the retransmission time to the default (1 second).

**Syntax** `ipv6 nd retransmission-time <milliseconds>`  
`no ipv6 nd retransmission-time [<milliseconds>]`

| Parameter      | Description                                                         |
|----------------|---------------------------------------------------------------------|
| <milliseconds> | Time period in milliseconds. Valid values are from 1000 to 3600000. |

**Default** 1000 milliseconds (1 second)

**Mode** Interface Configuration for a VLAN interface.

**Examples** To set the retransmission-time of Neighbor Solicitation on the VLAN interface `vlan2` to be 800000 milliseconds, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd retransmission-time 800000
```

To reset the retransmission-time of Neighbor Solicitation on the VLAN interface `vlan2` to the default 1000 milliseconds (1 second), enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd retransmission-time
```

**Related Commands** [ipv6 nd suppress-ra](#)  
[ipv6 nd prefix](#)

# ipv6 nd suppress-ra

**Overview** Use this command to inhibit IPv6 Router Advertisement (RA) transmission for the current interface. Router advertisements are used when applying IPv6 stateless auto-configuration.

Use **no** parameter with this command to enable Router Advertisement transmission.

**Syntax** `ipv6 nd suppress-ra`  
`no ipv6 nd suppress-ra`

**Default** Router Advertisement (RA) transmission is suppressed by default.

**Mode** Interface Configuration for a VLAN interface.

**Example** To enable the transmission of router advertisements from the VLAN interface `vlan4` on the device, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related  
Commands** [ipv6 nd ra-interval](#)  
[ipv6 nd prefix](#)

# ipv6 neighbor

**Overview** Use this command to add a static IPv6 neighbor entry.  
Use the **no** variant of this command to remove a specific IPv6 neighbor entry.

**Syntax** `ipv6 neighbor <ipv6-address> <vlan-name> <mac-address>  
<port-list>`  
`no ipv6 neighbor <ipv6-address> <vlan-name> <port-list>`

| Parameter      | Description                                                                                |
|----------------|--------------------------------------------------------------------------------------------|
| <ipv6-address> | Specify the neighbor's IPv6 address in the format X:X::X:X.                                |
| <vlan-name>    | Specify the neighbor's VLAN name.                                                          |
| <mac-address>  | Specify the MAC hardware address in hexadecimal notation in the format HHHH . HHHH . HHHH. |
| <port-list>    | Specify the port number, or port range.                                                    |

**Mode** Global Configuration

**Usage** Use this command to clear a specific IPv6 neighbor entry. To clear all dynamic address entries, use the [clear ipv6 neighbors](#) command.

**Example** To create a static neighbor entry for IPv6 address 2001:0db8::a2, on vlan 4, MAC address 0000.cd28.0880, on port1.0.6, use the command:

```
awplus# configure terminal
awplus(config)# ipv6 neighbor 2001:0db8::a2 vlan4
0000.cd28.0880 port1.0.6
```

**Related Commands** [clear ipv6 neighbors](#)

# ipv6 opportunistic-nd

**Overview** Use this command to enable opportunistic neighbor discovery for the global IPv6 ND cache. Opportunistic neighbor discovery changes the behavior for unsolicited ICMPv6 ND packet forwarding on the device.

Use the **no** variant of this command to disable opportunistic neighbor discovery for the global IPv6 ND cache.

**Syntax** `ipv6 opportunistic-nd`  
`no ipv6 opportunistic-nd`

**Default** Opportunistic neighbor discovery is disabled by default.

**Mode** Global Configuration

**Usage** When opportunistic neighbor discovery is enabled, the device will reply to any received unsolicited ICMPv6 ND packets. The source MAC address for the unsolicited ICMPv6 ND packet is added to the IPv6 ND cache, so the device forwards the ICMPv6 ND packet. When opportunistic neighbor discovery is disabled, the source MAC address for the ICMPv6 packet is not added to the IPv6 ND cache, so the ICMPv6 ND packet is not forwarded by the device.

**Examples** To enable opportunistic neighbor discovery for the IPv6 ND cache, enter:

```
awplus# configure terminal
awplus(config)# ipv6 opportunistic-nd
```

To disable opportunistic neighbor discovery for the IPv6 ND cache, enter:

```
awplus# configure terminal
awplus(config)# no ipv6 opportunistic-nd
```

**Related Commands** [arp opportunistic-nd](#)  
[show ipv6 neighbors](#)  
[show running-config interface](#)

# ipv6 route

**Overview** This command adds a static IPv6 route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to advertise routes to neighbors and forward packets.

The **no** variant of this command removes the static route.

**Syntax** `ipv6 route <dest-prefix> <dest-prefix/length>  
{<gateway-ip>|<gateway-name>} [<distvalue>]`  
`no ipv6 route <dest-prefix> <dest-prefix/length>  
{<gateway-ip>|<gateway-name>} [<distvalue>]`

| Parameter                               | Description                                                                                                                                                 |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;dest-prefix/length&gt;</code> | Specifies the IP destination prefix. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.        |
| <code>&lt;gateway-ip&gt;</code>         | Specifies the IP gateway (or next hop) address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |
| <code>&lt;gateway-name&gt;</code>       | Specifies the name of the gateway (or next hop) interface.                                                                                                  |
| <code>&lt;distvalue&gt;</code>          | Specifies the administrative distance for the route. Valid values are from 1 to 255.                                                                        |

**Mode** Global Configuration

**Usage** Administrative distance can be modified so static routes do not take priority over other routes.

**Example** `awplus# configure terminal`  
`awplus(config)# ipv6 route 2001:0db8::1/128 vlan2 32`

**Validation Commands** `show running-config`  
`show ipv6 route`

# ipv6 unreachable

**Overview** Use this command to enable ICMPv6 (Internet Control Message Protocol version 6) type 1, destination unreachable, messages.

Use the **no** variant of this command to disable destination unreachable messages. This prevents an attacker from using these messages to discover the topology of a network.

**Syntax** `ipv6 unreachable`  
`no ipv6 unreachable`

**Default** Destination unreachable messages are enabled by default.

**Mode** Global Configuration

**Usage** When a device receives a packet for a destination that is unreachable it returns an ICMPv6 type 1 message. This message includes a reason code, as per the table below. An attacker can use these messages to obtain information regarding the topology of a network. Disabling destination unreachable messages, using the **no ipv6 unreachable** command, secures your network against this type of probing.

**NOTE:** *Disabling ICMPv6 destination unreachable messages breaks applications such as traceroute, which depend on these messages to operate correctly.*

Table 20-1: ICMPv6 type 1 reason codes and description

| Code | Description [RFC]                                                    |
|------|----------------------------------------------------------------------|
| 0    | No route to destination [RFC4443]                                    |
| 1    | Communication with destination administratively prohibited [RFC4443] |
| 2    | Beyond scope of source address [RFC4443]                             |
| 3    | Address unreachable [RFC4443]                                        |
| 4    | Port unreachable [RFC4443]                                           |
| 5    | Source address failed ingress/egress policy [RFC4443]                |
| 6    | Reject route to destination [RFC4443]                                |
| 7    | Error in Source Routing Header [RFC6554]                             |

**Example** To disable destination unreachable messages, use the commands

```
awplus# configure terminal
awplus(config)# no ipv6 unreachable
```

To enable destination unreachable messages, use the commands

```
awplus# configure terminal
awplus(config)# ipv6 unreachable
```

# ping ipv6

**Overview** This command sends a query to another IPv6 host (send Echo Request messages).

**NOTE:** Use of the interface parameter keyword, plus an interface or an interface range, with this command is only valid when pinging an IPv6 link local address.

**Syntax** `ping ipv6 {<host>|<ipv6-address>} [repeat {<1-2147483647>|continuous}] [size <10-1452>] [interface <interface-list>] [timeout <1-65535>]`

| Parameter                     | Description                                                                                                                                                          |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipv6-addr>                   | The destination IPv6 address. The IPv6 address uses the format X:X::X:X.                                                                                             |
| <hostname>                    | The destination hostname.                                                                                                                                            |
| repeat                        | Specify the number of ping packets to send.                                                                                                                          |
| <1-2147483647>                | Specify repeat count. The default is 5.                                                                                                                              |
| size <10-1452>                | The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes).                                                          |
| interface<br><interface-list> | The interface or range of configured IP interfaces to use as the source in the IP header of the ping packet.                                                         |
| timeout<br><1-65535>          | The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait. |
| repeat                        | Specify the number of ping packets to send.                                                                                                                          |
| <1-2147483647>                | Specify repeat count. The default is 5.                                                                                                                              |
| continuous                    | Continuous ping.                                                                                                                                                     |
| size <10-1452>                | The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes).                                                          |
| timeout<br><1-65535>          | The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# ping ipv6 2001:0db8::a2`

**Related Commands** [traceroute ipv6](#)

# show ipv6 forwarding

**Overview** Use this command to display IPv6 forwarding status.

**Syntax** `show ipv6 forwarding`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 forwarding`

**Output** Figure 20-1: Example output from the **show ipv6 forwarding** command

```
ipv6 forwarding is on
```

# show ipv6 interface brief

**Overview** Use this command to display brief information about interfaces and the IPv6 address assigned to them.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 interface [brief]`

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| brief     | Specify this optional parameter to display brief IPv6 interface information. |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ipv6 interface brief`

**Output** Figure 20-2: Example output from the **show ipv6 interface brief** command

|                                  |                             |          |          |
|----------------------------------|-----------------------------|----------|----------|
| awplus#show ipv6 interface brief |                             |          |          |
| Interface                        | IPv6-Address                | Status   | Protocol |
| lo                               | unassigned                  | admin up | running  |
| vlan1                            | 2001:db8::1/48              | admin up | down     |
|                                  | fe80::215:77ff:fee9:5c50/64 |          |          |

**Related Commands** [show interface brief](#)

# show ipv6 neighbors

**Overview** Use this command to display all IPv6 neighbors.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 neighbors`

**Mode** User Exec and Privileged Exec

# show ipv6 route

**Overview** Use this command to display the IPv6 routing table for a protocol or from a particular table.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 route`  
`[connected|database|ospf|rip|static|summary|<ipv6-address>|<ipv6-addr/prefix-length>]`

| Parameter            | Description                                                                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| connected            | Displays only the routes learned from connected interfaces.                                                                                                                        |
| database             | Displays only the IPv6 routing information extracted from the database.                                                                                                            |
| ospf                 | Displays only the routes learned from IPv6 Open Shortest Path First (OSPFv3).                                                                                                      |
| rip                  | Displays only the routes learned from IPv6 Routing Information Protocol (RIPng).                                                                                                   |
| static               | Displays only the IPv6 static routes you have configured.                                                                                                                          |
| summary              | Displays summary information from the IPv6 routing table.                                                                                                                          |
| <ipv6-address>       | Displays the routes for the specified address in the IP routing table. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |
| <ipv6-prefix/length> | Displays only the routes for the specified IP prefix.                                                                                                                              |

**Mode** User Exec and Privileged Exec

**Example 1** To display an IP route with all parameters turned on, use the following command:

```
awplus# show ipv6 route
```

**Output** Figure 20-3: Example output of the **show ipv6 route** command

```
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPFS    ::/0 [1/0]
via 2001::a:0:0:c0a8:a6, vlan10
C    2001:db8::a:0:0:0:0/64 via ::, vlan10
C    2001:db8::14:0:0:0:0/64 via ::, vlan20
C    2001:db8::0:0:0:0:0/64 via ::, vlan30
C    2001:db8::28:0:0:0:0/64 via ::, vlan40

S    ::/0 [1/0] via 2001::a:0:0:c0a8:a01 inactive, 6d22h12m
      [1/0] via 2001::fa:0:0:c0a8:fa01 inactive, 6d22h12m
```

# show ipv6 route summary

**Overview** Use this command to display the summary of the current NSM RIB entries.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 route summary`

**Mode** User Exec and Privileged Exec

**Example** To display IP route summary, use the following command:

```
awplus# show ipv6 route summary
```

**Output** Figure 20-5: Example output from the **show ipv6 route summary** command

|                                                          |          |
|----------------------------------------------------------|----------|
| IPv6 routing table name is Default-IPv6-Routing-Table(0) |          |
| IPv6 routing table maximum-paths is 4                    |          |
| RouteSource                                              | Networks |
| connected                                                | 4        |
| rip                                                      | 5        |
| Total                                                    | 9        |
| FIB                                                      | 5        |

**Related Commands** [show ip route database](#)

# traceroute ipv6

**Overview** Use this command to trace the route to the specified IPv6 host.

**Syntax** `traceroute ipv6 {<ipv6-addr>|<hostname>}`

| Parameter                      | Description                                                              |
|--------------------------------|--------------------------------------------------------------------------|
| <code>&lt;ipv6-addr&gt;</code> | The destination IPv6 address. The IPv6 address uses the format X:X::X:X. |
| <code>&lt;hostname&gt;</code>  | The destination hostname.                                                |

**Mode** User Exec and Privileged Exec

**Example** To run a traceroute for the IPv6 address 2001:0db8::a2, use the following command:

```
awplus# traceroute ipv6 2001:0db8::a2
```

# ip route

**Overview** This command adds a static route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to advertise routes to neighbors and forward packets.

The **no** variant of this command removes the static route from the RIB and FIB.

**Syntax** `ip route <subnet&mask> {<gateway-ip>|<interface>} [<distance>]`  
`no ip route <subnet&mask> {<gateway-ip>|<interface>} [<distance>]`

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <subnet&mask> | The IPv4 address of the destination subnet defined using either a prefix length or a separate mask specified in one of the following formats:<br><br>The IPv4 subnet address in dotted decimal notation followed by the subnet mask, also in dotted decimal notation.<br><br>The IPv4 subnet address in dotted decimal notation, followed by a forward slash, then the prefix length. |
| <gateway-ip>  | The IPv4 address of the gateway device.                                                                                                                                                                                                                                                                                                                                               |
| <interface>   | The interface that connects your device to the network. Enter the name of the VLAN or its VID. You can also enter 'null' as an interface. Specify a 'null' interface to add a null or blackhole route to the device.<br>The gateway IP address or the interface is required.                                                                                                          |
| <distance>    | The administrative distance for the static route in the range <1-255>. Static routes by default have an administrative distance of 1.                                                                                                                                                                                                                                                 |

**Mode** Global Configuration

**Default** The default administrative distance for a static route is 1 for priority over non-static routes.

**Usage** Administrative distance can be modified so static routes do not take priority over other routes.

Specify a 'Null' interface to add a null or blackhole route to the switch. A null or blackhole route is a routing table entry that does not forward packets, so any packets sent to it are dropped.

**Examples** To add the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at "10.10.0.2" with the default administrative distance, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0 255.255.255.0 10.10.0.2
```

To remove the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at "10.10.0.2" with the default administrative distance, use the commands:

```
awplus# configure terminal
awplus(config)# no ip route 192.168.3.0 255.255.255.0 10.10.0.2
```

To specify a null or blackhole route 192.168.4.0/24, so packets forwarded to this route are dropped, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.4.0/24 null
```

To add the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at "10.10.0.2" with an administrative distance of 128, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0 255.255.255.0 10.10.0.2
128
```

**Related  
Commands** [show ip route](#)  
[show ip route database](#)

# ipv6 route

**Overview** This command adds a static IPv6 route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to advertise routes to neighbors and forward packets.

The **no** variant of this command removes the static route.

**Syntax** `ipv6 route <dest-prefix> <dest-prefix/length>  
{<gateway-ip>|<gateway-name>} [<distvalue>]`  
`no ipv6 route <dest-prefix> <dest-prefix/length>  
{<gateway-ip>|<gateway-name>} [<distvalue>]`

| Parameter                               | Description                                                                                                                                                 |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;dest-prefix/length&gt;</code> | Specifies the IP destination prefix. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.        |
| <code>&lt;gateway-ip&gt;</code>         | Specifies the IP gateway (or next hop) address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |
| <code>&lt;gateway-name&gt;</code>       | Specifies the name of the gateway (or next hop) interface.                                                                                                  |
| <code>&lt;distvalue&gt;</code>          | Specifies the administrative distance for the route. Valid values are from 1 to 255.                                                                        |

**Mode** Global Configuration

**Usage** Administrative distance can be modified so static routes do not take priority over other routes.

**Example** `awplus# configure terminal`  
`awplus(config)# ipv6 route 2001:0db8::1/128 vlan2 32`

**Validation Commands** `show running-config`  
`show ipv6 route`

# max-fib-routes

**Overview** This command enables you to control the maximum number of FIB routes configured. It operates by providing parameters that enable you to configure preset maximums and warning message thresholds. The operation of these parameters is explained in the Parameter / Description table shown below.

**NOTE:** For static routes use the [max-static-routes](#) command.

Use the **no** variant of this command to set the maximum number of FIB routes to the default of 4294967294 FIB routes.

**Syntax** `max-fib-routes <1-4294967294> [<1-100>|warning-only]`  
`no max-fib-routes`

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>max-fib-routes</code>       | This is the maximum number of routes that can be stored in the device's Forwarding Information dataBase. In practice, other practical system limits would prevent this maximum being reached.                                                                                                                                                |
| <code>&lt;1-4294967294&gt;</code> | The allowable configurable range for setting the maximum number of FIB-routes.                                                                                                                                                                                                                                                               |
| <code>&lt;1-100&gt;</code>        | This parameter enables you to optionally apply a percentage value. This percentage will be based on the maximum number of FIB routes you have specified. This will cause a warning message to appear when your routes reach your specified percentage value. Routes can continue to be added until your configured maximum value is reached. |
| <code>warning-only</code>         | This parameter enables you to optionally apply a warning message. If you set this option a warning message will appear if your maximum configured value is reached. Routes can continue to be added until your device reaches either the maximum capacity value of 4294967294, or a practical system limit.                                  |

**Default** The default number of fib routes is the maximum number of fib routes (4294967294).

**Mode** Global Configuration

**Examples** To set the maximum number of dynamic routes to 2000 and warning threshold of 75%, use the following commands:

```
awplus# config terminal
awplus(config)# max-fib-routes 2000 75
```

# max-static-routes

**Overview** Use this command to set the maximum number of static routes, excluding FIB (Forwarding Information Base) routes.

**NOTE:** For FIB routes use the [max-fib-routes](#) command.

Use the **no** variant of this command to set the maximum number of static routes to the default of 1000 static routes.

**Syntax** `max-static-routes <1-1000>`  
`no max-static-routes`

**Default** The default number of static routes is the maximum number of static routes (1000).

**Mode** Global Configuration

**Example** To reset the maximum number of static routes to the default maximum, use the command:

```
awplus# configure terminal
awplus(config)# no max-static-routes
```

**NOTE:** Static routes are applied before adding routes to the RIB (Routing Information Base). Therefore, rejected static routes will not appear in the running config.

**Related  
Commands** [max-fib-routes](#)

# maximum-paths

**Overview** This command enables ECMP on your device, and sets the maximum number of paths that each route has in the Forwarding Information Base (FIB). ECMP is enabled by default.

The **no** variant of this command sets the maximum paths to the default of 4.

**Syntax** `maximum-paths <1-8>`  
`no maximum-paths`

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| <1-8>     | The maximum number of paths that a route can have in the FIB. |

**Default** By default the maximum number of paths is 4.

**Mode** Global Configuration

**Examples** To set the maximum number of paths for each route in the FIB to 5, use the command:

```
awplus# configure terminal
awplus(config)# maximum-paths 5
```

To set the maximum paths for a route to the default of 4, use the command:

```
awplus# configure terminal
awplus(config)# no maximum-paths
```

# show ip route

**Overview** Use this command to display routing entries in the FIB (Forwarding Information Base). The FIB contains the best routes to a destination, and your device uses these routes when forwarding traffic. You can display a subset of the entries in the FIB based on protocol.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

**Syntax** `show ip route [connected|ospf|rip|static|<ip-addr>|<ip-addr/prefix-length>]`

| Parameter               | Description                                                                             |
|-------------------------|-----------------------------------------------------------------------------------------|
| connected               | Displays only the routes learned from connected interfaces.                             |
| ospf                    | Displays only the routes learned from OSPF.                                             |
| rip                     | Displays only the routes learned from RIP.                                              |
| static                  | Displays only the static routes you have configured.                                    |
| <ip-addr>               | Displays the routes for the specified address. Enter an IPv4 address.                   |
| <ip-addr/prefix-length> | Displays the routes for the specified network. Enter an IPv4 address and prefix length. |

**Mode** User Exec and Privileged Exec

**Example** To display the static routes in the FIB, use the command:

```
awplus# show ip route static
```

To display the OSPF routes in the FIB, use the command:

```
awplus# show ip route ospf
```

**Output** Each entry in the output from this command has a code preceding it, indicating the source of the routing entry. For example, O indicates OSPF as the origin of the route. The first few lines of the output list the possible codes that may be seen with the route entries.

Typically, route entries are composed of the following elements:

- code
- a second label indicating the sub-type of the route
- network or host ip address
- administrative distance and metric
- next hop ip address

- outgoing interface name
- time since route entry was added

Figure 21-1: Example output from the **show ip route** command

```
Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       * - candidate default

O      10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:20:54
C      3.3.3.0/24 is directly connected, vlan1
C      10.10.31.0/24 is directly connected, vlan2
C      10.70.0.0/24 is directly connected, vlan4
O E2   14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:18:56
C      33.33.33.33/32 is directly connected, lo
```

**Connected Route** The connected route entry consists of:

```
C      10.10.31.0/24 is directly connected, vlan2
```

This route entry denotes:

- Route entries for network 10.10.31.0/24 are derived from the IP address of local interface `vlan2`.
- These routes are marked as Connected routes (C) and always preferred over routes for the same network learned from other routing protocols.

**OSPF Route** The OSPF route entry consists of:

```
O      10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:20:54
```

This route entry denotes:

- This route in the network 10.10.37.0/24 was added by OSPF.
- This route has an administrative distance of 110 and metric/cost of 11.
- This route is reachable via next hop 10.10.31.16.
- The outgoing local interface for this route is `vlan2`.
- This route was added 20 minutes and 54 seconds ago.

**OSPF External Route** The OSPF external route entry consists of:

```
O E2   14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:18:56
```

This route entry denotes that this route is the same as the other OSPF route explained above; the main difference is that it is a Type 2 External OSPF route.

**Related  
Commands**

- [ip route](#)
- [maximum-paths](#)
- [show ip route database](#)

# show ip route database

**Overview** This command displays the routing entries in the RIB (Routing Information Base).

When multiple entries are available for the same prefix, RIB uses the routes' administrative distances to choose the best route. All best routes are entered into the FIB (Forwarding Information Base). To view the routes in the FIB, use the [show ip route](#) command.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

**Syntax** `show ip route database [connected|ospf|rip|static]`

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| connected | Displays only the routes learned from connected interfaces. |
| ospf      | Displays only the routes learned from OSPF.                 |
| rip       | Displays only the routes learned from RIP.                  |
| static    | Displays only the static routes you have configured.        |

**Mode** User Exec and Privileged Exec

**Example** To display the static routes in the RIB, use the command:

```
awplus# show ip route database static
```

**Output** Figure 21-2: Example output from the **show ip route database** command

```
Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       > - selected route, * - FIB route, p - stale info

O    *> 9.9.9.9/32 [110/31] via 10.10.31.16, vlan2, 00:19:21
O    10.10.31.0/24 [110/1] is directly connected, vlan2, 00:28:20
C    *> 10.10.31.0/24 is directly connected, vlan2
S    *> 10.10.34.0/24 [1/0] via 10.10.31.16, vlan2
O    10.10.34.0/24 [110/31] via 10.10.31.16, vlan2, 00:21:19
O    *> 10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:21:19
C    *> 10.30.0.0/24 is directly connected, vlan6
S    *> 11.22.11.0/24 [1/0] via 10.10.31.16, vlan2
O E2 *> 14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:19:21
O    16.16.16.16/32 [110/11] via 10.10.31.16, vlan2, 00:21:19
S    *> 16.16.16.16/32 [1/0] via 10.10.31.16, vlan2
O    *> 17.17.17.17/32 [110/31] via 10.10.31.16, vlan2, 00:21:19
C    *> 45.45.45.45/32 is directly connected, lo
O    *> 55.55.55.55/32 [110/21] via 10.10.31.16, vlan2, 00:21:19
C    *> 127.0.0.0/8 is directly connected, lo
```

The routes added to the FIB are marked with a \*. When multiple routes are available for the same prefix, the best route is indicated with the > symbol. All unselected routes have neither the \* nor the > symbol.

```
S    *> 10.10.34.0/24 [1/0] via 10.10.31.16, vlan2
O      10.10.34.0/24 [110/31] via 10.10.31.16, vlan2, 00:21:19
```

These route entries denote:

- The same prefix was learned from OSPF and from static route configuration.
- Since this static route has a lower administrative distance than the OSPF route (110), the static route (1) is selected and installed in the FIB.

If the static route becomes unavailable, then the device automatically selects the OSPF route and installs it in the FIB.

**Related  
Commands**   [maximum-paths](#)  
[show ip route](#)

# show ip route summary

**Overview** This command displays a summary of the current RIB (Routing Information Base) entries.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

**Syntax** `show ip route summary`

**Mode** User Exec and Privileged Exec

**Example** To display a summary of the current RIB entries, use the command:

```
awplus# show ip route summary
```

**Output** Figure 21-3: Example output from the **show ip route summary** command

```
IP routing table name is Default-IP-Routing-Table(0)
IP routing table maximum-paths is 4
Route Source      Networks
connected         5
ospf               2
Total             8
```

**Related  
Commands** [show ip route](#)  
[show ip route database](#)

# show ipv6 route

**Overview** Use this command to display the IPv6 routing table for a protocol or from a particular table.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 route`  
`[connected|database|ospf|rip|static|summary|<ipv6-address>|<ipv6-addr/prefix-length>]`

| Parameter            | Description                                                                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| connected            | Displays only the routes learned from connected interfaces.                                                                                                                        |
| database             | Displays only the IPv6 routing information extracted from the database.                                                                                                            |
| ospf                 | Displays only the routes learned from IPv6 Open Shortest Path First (OSPFv3).                                                                                                      |
| rip                  | Displays only the routes learned from IPv6 Routing Information Protocol (RIPng).                                                                                                   |
| static               | Displays only the IPv6 static routes you have configured.                                                                                                                          |
| summary              | Displays summary information from the IPv6 routing table.                                                                                                                          |
| <ipv6-address>       | Displays the routes for the specified address in the IP routing table. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |
| <ipv6-prefix/length> | Displays only the routes for the specified IP prefix.                                                                                                                              |

**Mode** User Exec and Privileged Exec

**Example 1** To display an IP route with all parameters turned on, use the following command:

```
awplus# show ipv6 route
```

**Output** Figure 21-4: Example output of the **show ipv6 route** command

```
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPFS    ::/0 [1/0]
via 2001::a:0:0:c0a8:a6, vlan10
C    2001:db8::a:0:0:0:0/64 via ::, vlan10
C    2001:db8::14:0:0:0:0/64 via ::, vlan20
C    2001:db8::0:0:0:0:0/64 via ::, vlan30
C    2001:db8::28:0:0:0:0/64 via ::, vlan40
C    2001:db8::fa:0:0:0:0/64 via ::, vlan250
C    2001:db8::/64 via ::, vlan250
C    2001:db8::/64 via ::, vlan40
C    2001:db8::/64 via ::, vlan20
C    2001:db8::/64 via ::, vlan10
```

**Example 2** To display all database entries for an IP route, use the following command:

```
awplus# show ipv6 route database
```

**Output** Figure 21-5: Example output of the **show ipv6 route database** command

```
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF    > -
selected route, * - FIB route, p - stale info
Timers: Uptime

S    ::/0 [1/0] via 2001::a:0:0:c0a8:a01 inactive, 6d22h12m
      [1/0] via 2001::fa:0:0:c0a8:fa01 inactive, 6d22h12m
```

# show ipv6 route summary

**Overview** Use this command to display the summary of the current NSM RIB entries.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 route summary`

**Mode** User Exec and Privileged Exec

**Example** To display IP route summary, use the following command:

```
awplus# show ipv6 route summary
```

**Output** Figure 21-6: Example output from the **show ipv6 route summary** command

|                                                          |          |
|----------------------------------------------------------|----------|
| IPv6 routing table name is Default-IPv6-Routing-Table(0) |          |
| IPv6 routing table maximum-paths is 4                    |          |
| RouteSource                                              | Networks |

# accept-lifetime

**Overview** Use this command to specify the time period during which the authentication key on a key chain is received as valid.

Use the **no** variant of this command to remove a specified time period for an authentication key on a key chain as set previously with the **accept-lifetime** command.

**Syntax** `accept-lifetime <start-date> {<end-date>|  
duration <seconds>|infinite}  
no accept-lifetime`

| Parameter    | Description                                                                                                                       |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <start-date> | Specifies the start time and date in the format:<br><hh:mm:ss> <day> <month> <year> or<br><hh:mm:ss> <month> <day> <year>, where: |
|              | <hh:mm:ss> The time of the day, in hours, minutes and seconds                                                                     |
|              | <day> <1-31> The day of the month                                                                                                 |
|              | <month> The month of the year (the first three letters of the month, for example, Jan)                                            |
|              | <year> <1993-2035> The year                                                                                                       |
| <end-date>   | Specifies the end time and date in the format:<br><hh:mm:ss> <day> <month> <year> or<br><hh:mm:ss> <month> <day> <year>, where:   |
|              | <hh:mm:ss> The time of the day, in hours, minutes and seconds                                                                     |
|              | <day> <1-31> The day of the month                                                                                                 |
|              | <month> The month of the year (the first three letters of the month, for example, Jan)                                            |
|              | <year> <1993-2035> The year                                                                                                       |
| <seconds>    | <1-2147483646> Duration of the key in seconds.                                                                                    |
| infinite     | Never expires.                                                                                                                    |

**Mode** Keychain-key Configuration

**Examples** The following examples show the setting of accept-lifetime for key 1 on the key chain named "mychain".

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# accept-lifetime 03:03:01 Sep 3
2016 04:04:02 Oct 6 2016
```

or:

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# accept-lifetime 03:03:01 3 Sep
2016 04:04:02 6 Oct 2016
```

[key-string](#)  
[key chain](#)  
[send-lifetime](#)

# alliedware-behavior

**Overview** This command configures your device to exhibit AlliedWare behavior when sending RIPv1 response/update messages. Configuring for this behavior may be necessary if you are replacing an AlliedWare device with an AlliedWare Plus device and wish to ensure consistent RIPv1 behavior.

Use the no variant of this command to implement AlliedWare Plus behavior.

This command has no impact on devices running RIPv2. Reception and transmission can be independently altered to conform to AlliedWare standard.

**Syntax** `alliedware-behavior {rip1-send|rip1-recv}`  
`no alliedware-behavior {rip1-send|rip1-recv}`

| Parameter | Description                                                                               |
|-----------|-------------------------------------------------------------------------------------------|
| rip1-send | Configures the router to behave in AlliedWare mode when <b>sending</b> update messages.   |
| rip1-recv | Configures the router to behave in AlliedWare mode when <b>receiving</b> update messages. |

**Default** By default when sending out RIPv1 updates on an interface, if the prefix (learned through RIPv2 or otherwise redistributed into RIP) being advertised does not match the subnetting used on the outgoing RIPv1 interface it will be filtered. The **alliedware-behavior** command returns your router's RIPv1 behavior to the AlliedWare format, where the prefix will be advertised as-is.

For example, if a RIPv1 update is being sent over interface 192.168.1.4/26, by default the prefix 192.168.1.64/26 will be advertised, but the prefix 192.168.1.144/28 will be filtered because the mask /28 does not match the interface's mask of /26. If **alliedware-behavior rip1-send** is configured, the prefix 192.168.1.144 would be sent as-is.

**Mode** Router Configuration

**Examples** To configure your device for **alliedware-behavior** when sending and receiving RIPv1 update messages, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# alliedware-behavior rip1-send
awplus(config-router)# alliedware-behavior rip1-recv
```

To return your device to **AlliedWare Plus**-like behavior when sending and receiving RIPv1 update messages, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no alliedware-behavior rip1-send
awplus(config-router)# no alliedware-behavior rip1-recv
```

Commands**    [show ip protocols rip](#)  
                  [show running-config](#)

**Related  
Commands**    [fullupdate \(RIP\)](#)

# cisco-metric-behavior (RIP)

**Overview** Use this command to enable or disable the RIP routing metric update to conform to Cisco's implementation. This command is provided to allow inter-operation with older Cisco devices that do not conform to the RFC standard for RIP route metrics.

Use the **no** variant of this command to disable this feature.

**Syntax** `cisco-metric-behavior {enable|disable}`  
`no cisco-metric-behavior`

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| enable    | Enables updating the metric consistent with Cisco.  |
| disable   | Disables updating the metric consistent with Cisco. |

**Default** By default, the Cisco metric-behavior is disabled.

**Mode** Router Configuration

**Examples** To enable the routing metric update to behave as per the Cisco implementation, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# cisco-metric-behavior enable
```

To disable the routing metric update to behave as per the default setting, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no cisco-metric-behavior
```

**Validation Commands** `show running-config`

# clear ip rip route

**Overview** Use this command to clear specific data from the RIP routing table.

**Syntax** `clear ip rip route {<ip-dest-network/prefix-length>|static|connected|rip|ospf|invalid-routes|all}`

| Parameter                                    | Description                                                                                                                                             |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;ip-dest-network/prefix-length&gt;</i> | Removes entries which exactly match this destination address from RIP routing table. Enter the IP address and prefix length of the destination network. |
| static                                       | Removes static entries from the RIP routing table.                                                                                                      |
| connected                                    | Removes entries for connected routes from the RIP routing table.                                                                                        |
| rip                                          | Removes only RIP routes from the RIP routing table.                                                                                                     |
| ospf                                         | Removes only OSPF routes from the RIP routing table.                                                                                                    |
| invalid-routes                               | Removes routes with metric 16 immediately. Otherwise, these routes are not removed until RIP times out the route after 2 minutes.                       |
| all                                          | Clears the entire RIP routing table.                                                                                                                    |

**Mode** Privileged Exec

**Usage** Using this command with the `all` parameter, clears the RIP table of all the routes.

**Examples** To clear the route 10.0.0.0/8 from the RIP routing table, use the following command:

```
awplus# clear ip rip route 10.0.0.0/8
```

# debug rip

**Overview** Use this command to specify the options for the displayed debugging information for RIP events and RIP packets.

Use the **no** variant of this command to disable the specified debug option.

**Syntax** `debug rip {events|nsm|<packet>|all}`  
`no debug rip {events|nsm|<packet>|all}`

| Parameter | Description                                                    |
|-----------|----------------------------------------------------------------|
| events    | RIP events debug information is displayed.                     |
| nsm       | RIP and NSM communication is displayed.                        |
| <packet>  | packet [recv send] [detail] Specifies RIP packets only.        |
| recv      | Specifies that information for received packets be displayed.  |
| send      | Specifies that information for sent packets be displayed.      |
| detail    | Displays detailed information for the sent or received packet. |
| all       | Displays all RIP debug information.                            |

**Default** Disabled

**Mode** Privileged Exec and Global Configuration

**Example** The following example displays information about the RIP packets that are received and sent out from the device.

```
awplus# debug rip packet
```

**Related Commands** [undebug rip](#)

# default-information originate (RIP)

**Overview** Use this command to generate a default route into the Routing Information Protocol (RIP).

Use the **no** variant of this command to disable this feature.

**Syntax** `default-information originate`  
`no default-information originate`

**Default** Disabled

**Mode** Router Configuration

**Usage** If routes are being redistributed into RIP and the router's route table contains a default route, within one of the route categories that are being redistributed, the RIP protocol will advertise this default route, irrespective of whether the **default-information originate** command has been configured or not. However, if the router has not redistributed any default route into RIP, but you want RIP to advertise a default route anyway, then use this command.

This will cause RIP to create a default route entry in the RIP database. The entry will be of type RS (Rip Static). Unless actively filtered out, this default route will be advertised out every interface that is sending RIP. Split horizon does not apply to this route, as it is internally generated. This operates quite similarly to the OSPF **default-information originate always** command.

**Example** `awplus# configure terminal`  
`awplus(config)# router rip`  
`awplus(config-router)# default-information originate`

# default-metric (RIP)

**Overview** Use this command to specify the metrics to be assigned to redistributed RIP routes. Use the **no** variant of this command to reset the RIP metric back to its default (1).

**Syntax** `default-metric <metric>`  
`no default-metric [<metric>]`

| Parameter | Description                                       |
|-----------|---------------------------------------------------|
| <metric>  | <1-16> Specifies the value of the default metric. |

**Default** By default, the RIP metric value is set to 1.

**Mode** RIP Router Configuration

**Usage** This command is used with the [redistribute \(RIP\)](#) command to make the routing protocol use the specified metric value for all redistributed routes, regardless of the original protocol that the route has been redistributed from.

**Examples** This example assigns the cost of 10 to the routes that are redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# default-metric 10
awplus(config-router)# redistribute ospf
awplus(config-router)# redistribute connected
```

**Related Commands** [redistribute \(RIP\)](#)

# distance (RIP)

**Overview** This command sets the administrative distance for RIP routes. Your device uses this value to select between two or more routes to the same destination obtained from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). For more information, see the [Route Selection Feature Overview and Configuration Guide](#).

The **no** variant of this command sets the administrative distance for the RIP route to the default of 120.

**Syntax** `distance <1-255> [<ip-addr/prefix-length> [<access-list>]]`  
`no distance [<1-255>] [<ip-addr/prefix-length> [<access-list>]]`

| Parameter               | Description                                                                                                                       |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <1-255>                 | The administrative distance value you are setting for this RIP route.                                                             |
| <ip-addr/prefix-length> | The network IP address and prefix-length that you are changing the administrative distance for.                                   |
| <access-list>           | Specifies the access-list name. This access list specifies which routes within the network <ip-address/m>this command applies to. |

**Mode** RIP Router Configuration

**Examples** To set the administrative distance to 8 for the RIP routes within the 10.0.0.0/8 network that match the access-list `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distance 8 10.0.0.0/8 mylist
```

To set the administrative distance to the default of 120 for the RIP routes within the 10.0.0.0/8 network that match the access-list `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no distance 8 10.0.0.0/8 mylist
```

# distribute-list (RIP)

**Overview** Use this command to filter incoming or outgoing route updates using the access-list or the prefix-list.

Use the **no** variant of this command to disable this feature.

**Syntax** `distribute-list {<access-list> | prefix <prefix-list>} {in|out} [<interface>]`  
`no distribute-list {<access-list> | prefix <prefix-list>} {in|out} [<interface>]`

| Parameter                        | Description                                                                      |
|----------------------------------|----------------------------------------------------------------------------------|
| <code>prefix</code>              | Filter prefixes in routing updates.                                              |
| <code>&lt;access-list&gt;</code> | Specifies the IPv4 access-list number or name to use.                            |
| <code>&lt;prefix-list&gt;</code> | Specifies the name of the IPv4 prefix-list to use.                               |
| <code>in</code>                  | Filter incoming routing updates.                                                 |
| <code>out</code>                 | Filter outgoing routing updates.                                                 |
| <code>&lt;interface&gt;</code>   | The interface on which distribute-list applies. For instance: <code>vlan2</code> |

**Default** Disabled

**Mode** RIP Router Configuration

**Usage** Filter out incoming or outgoing route updates using access-list or prefix-list. If you do not specify the name of the interface, the filter will be applied to all interfaces.

**Examples** In this example the following commands are used to apply an access list called `myfilter` to filter incoming routing updates in `vlan2`

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distribute-list prefix myfilter in vlan2
```

**Related Commands** [access-list extended \(named\)](#)  
[ip prefix-list](#)

# fullupdate (RIP)

**Overview** Use this command to specify which routes RIP should advertise when performing a triggered update. By default, when a triggered update is sent, RIP will only advertise those routes that have changed since the last update. When **fullupdate** is configured, the device advertises the full RIP route table in outgoing triggered updates, including routes that have not changed. This enables faster convergence times, or allow inter-operation with legacy network equipment, but at the expense of larger update messages.

Use the **no** variant of this command to disable this feature.

**Syntax** fullupdate  
no fullupdate

**Default** By default this feature is disabled.

**Mode** RIP Router Configuration

**Example** Use the following commands to enable the fullupdate (RIP) function:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# fullupdate
```

# ip rip authentication key-chain

**Overview** Use this command to enable RIPv2 authentication on an interface and specify the name of the key chain to be used.

Use the **no** variant of this command to disable this function.

**Syntax** `ip rip authentication key-chain <key-chain-name>`  
`no ip rip authentication key-chain`

| Parameter                           | Description                                                                                       |
|-------------------------------------|---------------------------------------------------------------------------------------------------|
| <code>&lt;key-chain-name&gt;</code> | Specify the name of the key chain. This is an alpha-numeric string, but it cannot include spaces. |

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command can only be used on VLAN interfaces.

Use this command to perform authentication on the interface. Not configuring the key chain results in no authentication at all.

The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use the [ip rip authentication string](#) command for single key authentication. Use the [ip rip authentication key-chain](#) command for multiple keys authentication. See the [RIP Feature Overview and Configuration Guide](#) for illustrated RIP configuration examples.

For multiple key authentication, use the following steps to configure a route to enable RIPv2 authentication using multiple keys at different times:

- 1) Define a key chain with a key chain name, using the following commands:

```
awplus# configure terminal
awplus(config)# key chain <key-chain-name>
```

- 2) Define a key on this key chain, using the following command:

```
awplus(config-keychain)# key <keyid>
```

- 3) Define the password used by the key, using the following command:

```
awplus(config-keychain-key)# key-string <key-password>
```

- 4) Enable authentication on the desired interface and specify the key chain to be used, using the following commands:

```
awplus# configure terminal
awplus(config)# interface <id>
awplus(config-if)# ip rip authentication key-chain
<key-chain-name>
```

- 5) Specify the mode of authentication for the given interface (text or MD5), using the following command:

```
awplus(config-if)# ip rip authentication mode {md5|text}
```

**Example** In the following example of a configuration for multiple keys authentication, a password “toyota” is set for key 1 in key chain “cars”. Authentication is enabled on vlan2 and the authentication mode is set to MD5:

```
awplus# configure terminal
awplus(config)# key chain cars
awplus(config-keychain)# key 1
awplus(config-keychain-key)# key-string toyota
awplus(config-keychain-key)# accept-lifetime 10:00:00 Oct 08
2016 duration 43200
awplus(config-keychain-key)# send-lifetime 10:00:00 Oct 08 2016
duration 43200
awplus(config-keychain-key)# exit
awplus(config-keychain)# exit
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication key-chain cars
awplus(config-if)# ip rip authentication mode md5
```

**Example** In the following example, the VLAN interface vlan23 is configured to use key-chain authentication with the keychain “mykey”. See the [key](#) command for a description of how a key chain is created.

```
awplus# configure terminal
awplus(config)# interface vlan23
awplus(config-if)# ip rip authentication key-chain mykey
```

**Related  
Commands**

[accept-lifetime](#)  
[send-lifetime](#)  
[ip rip authentication mode](#)  
[ip rip authentication string](#)  
[key](#)  
[key chain](#)

# ip rip authentication mode

**Overview** Use this command to specify the type of authentication mode used for RIP v2 packets.

Use the **no** variant of this command to restore clear text authentication.

**Syntax** `ip rip authentication mode {md5|text}`  
`no ip rip authentication mode`

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| md5       | Uses the keyed MD5 authentication algorithm.            |
| text      | Specifies clear text or simple password authentication. |

**Default** Text authentication is enabled

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command can only be used on VLAN interfaces.

The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use the [ip rip authentication string](#) command for single key authentication. Use the [ip rip authentication key-chain](#) command for multiple keys authentication. See the [RIP Feature Overview and Configuration Guide](#) for illustrated RIP configuration examples.

**Usage: single key** Use the following steps to configure a route to enable RIPv2 authentication using a single key or password:

- 1) Define the authentication string or password used by the key for the desired interface, using the following commands:

```
awplus# configure terminal
awplus(config)# interface <id>
awplus(config-if)# ip rip authentication string
<auth-string>
```

- 2) Specify the mode of authentication for the given interface (text or MD5), using the following commands:

```
awplus# configure terminal
awplus(config)# interface <id>
awplus(config-if)# ip rip authentication mode {md5|text}
```

**Usage: multiple key** For multiple keys authentication, use the following steps to configure a route to enable RIPv2 authentication using multiple keys at different times:

- 1) Define a key chain with a key chain name, using the following commands:

```
awplus# configure terminal
awplus(config)# key chain <key-chain-name>
```

- 2) Define a key on this key chain using the following command:

```
awplus(config-keychain)# key <keyid>
```

- 3) Define the password used by the key, using the following command:

```
awplus(config-keychain-key)# key-string <key-password>
```

- 4) Enable authentication on the desired interface and specify the key chain to be used, using the following commands:

```
awplus(config-if)# ip rip authentication key-chain
<key-chain-name>
```

- 5) Specify the mode of authentication for the given interface (text or MD5), using the following commands:

```
awplus(config-if)# ip rip authentication mode {md5|text}
```

**Example 1** In the following example of a configuration for multiple keys authentication, a password of "toyota" is set for key 1 in key chain "cars". Authentication is enabled on vlan2 and the authentication mode is set to MD5:

```
awplus# configure terminal
awplus(config)# key chain cars
awplus(config-keychain)# key 1
awplus(config-keychain-key)# key-string toyota
awplus(config-keychain-key)# accept-lifetime 10:00:00 Oct 08
2016 duration 43200
awplus(config-keychain-key)# send-lifetime 10:00:00 Oct 08 2016
duration 43200
awplus(config-keychain-key)# exit
awplus(config-keychain)# exit
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication key-chain cars
awplus(config-if)# ip rip authentication mode md5
```

**Example 2** The following example shows MD5 authentication configured on VLAN interface vlan2, ensuring authentication of RIP packets received on this interface.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication mode md5
```

**Example 3** The following example specifies “mykey” as the authentication string with MD5 authentication, for the VLAN interface vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication string mykey
awplus(config-if)# ip rip authentication mode md5
```

**Related  
Commands** [ip rip authentication string](#)  
[ip rip authentication key-chain](#)

# ip rip authentication string

**Overview** Use this command to specify the authentication string or password used by a key. Use the **no** variant of this command to remove the authentication string.

**Syntax** `ip rip authentication string <auth-string>`  
`no ip rip authentication string`

| Parameter                        | Description                                                                                               |
|----------------------------------|-----------------------------------------------------------------------------------------------------------|
| <code>&lt;auth-string&gt;</code> | The authentication string or password used by a key. It is an alphanumeric string and can include spaces. |

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command can only be used on VLAN interfaces.

The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use this command to specify the password for a single key on an interface. Use the [ip rip authentication key-chain](#) command for multiple keys authentication. For information about configuring RIP, see the [RIP Feature Overview and Configuration Guide](#).

Use the following steps to configure a route to enable RIPv2 authentication using a single key or password:

- 1) Define the authentication string or password used by the key for the desired interface, using the following commands:

```
awplus# configure terminal
awplus(config)# interface <id>
```

- 2) Specify the mode of authentication for the given interface (text or MD5), using the following commands:

```
awplus# configure terminal
awplus(config-if)# ip rip authentication string
<auth-string>
awplus(config)# interface <id>
awplus(config-if)# ip rip authentication mode {md5|text}
```

**Example** See the example below to specify `mykey` as the authentication string with MD5 authentication for the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication string mykey
awplus(config-if)# ip rip authentication mode md5
```

**Example** In the following example, the VLAN interface `vlan2` is configured to have an authentication string as `guest`. Any received RIP packet in that interface should have the same string as password.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication string guest
```

**Related commands** [ip rip authentication key-chain](#)  
[ip rip authentication mode](#)

# ip rip receive-packet

**Overview** Use this command to configure the interface to enable the reception of RIP packets.

Use the **no** variant of this command to disable this feature.

**Syntax** `ip rip receive-packet`  
`no ip rip receive-packet`

**Default** Receive-packet is enabled

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command can only be configured on VLAN interfaces.

**Example** This example shows packet receiving being turned on for the VLAN interface `vlan3`:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip rip receive-packet
```

**Related  
Commands** [ip rip send-packet](#)

# ip rip receive version

**Overview** Use this command to specify the version of RIP packets accepted on an interface and override the setting of the version command.

Use the **no** variant of this command to use the setting specified by the [version \(RIP\)](#) command.

**Syntax** `ip rip receive version {[1][2]}`  
`no ip rip receive version`

| Parameter | Description                                                     |
|-----------|-----------------------------------------------------------------|
| 1         | Specifies acceptance of RIP version 1 packets on the interface. |
| 2         | Specifies acceptance of RIP version 2 packets on the interface. |

**Default** Version 2

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command can only be used on VLAN interfaces.

This command applies to a specific VLAN interface and overrides any the version specified by the [version \(RIP\)](#) command.

RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

**Example** In the following example, the VLAN interface `vlan3` is configured to receive both RIP version 1 and 2 packets:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip rip receive version 1 2
```

**Related Commands** [version \(RIP\)](#)

# ip rip send-packet

**Overview** Use this command to enable sending RIP packets through the current interface.  
Use the **no** variant of this command to disable this feature.

**Syntax** `ip rip send-packet`  
`no ip rip send-packet`

**Default** Send packet is enabled

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command can only be configured on VLAN interfaces.

**Example** This example shows packet sending being turned on for the VLAN interface vlan4:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send-packet
```

**Related  
Commands** [ip rip receive-packet](#)

# ip rip send version

**Overview** Use this command in Interface Configuration mode to specify the version of RIP packets sent on an interface and override the setting of the [version \(RIP\)](#) command. This mechanism causes RIP version 2 interfaces to send multicast packets instead of broadcasting packets.

Use the **no** variant of this command to use the setting specified by the [version \(RIP\)](#) command.

**Syntax** `ip rip send version {1|2|1 2|2 1}`  
`no ip rip send version`

| Parameter | Description                                                                                |
|-----------|--------------------------------------------------------------------------------------------|
| 1         | Specifies the sending of RIP version 1 packets out of an interface.                        |
| 2         | Specifies the sending of RIP version 2 packets out of an interface.                        |
| 1 2       | Specifies the sending of both RIP version 1 and RIP version 2 packets out of an interface. |
| 2 1       | Specifies the sending of both RIP version 2 and RIP version 1 packets out of an interface. |

**Default** RIP version 2 is enabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command applies to a specific interface and overrides the version specified by the [version \(RIP\)](#) command.

RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces. Selecting version parameters 1 2 or 2 1 sends RIP version 1 and 2 packets.

Use the [ip rip send version 1-compatible](#) command in an environment where you cannot send multicast packets. For example, in environments where multicast is not enabled and where hosts do not listen to multicast.

**Examples** In the following example, the VLAN interface `vlan4` is configured to send both RIP version 1 and 2 packets.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send version 1 2
```

In the following example, the VLAN interface `vlan4` is configured to send both RIP version 2 and 1 packets.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send version 2 1
```

In the following example, the VLAN interface `vlan4` is configured to send RIP version 1 packets only.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send version 1
```

In the following example, the VLAN interface `vlan4` is configured to send RIP version 2 packets only.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip rip send version 2
```

In the following example, the VLAN interface `vlan3` is configured to use the RIP version specified by the [version \(RIP\)](#) command.

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# no ip rip send version
```

**Related Commands**   [ip rip send version 1-compatible](#)  
[version \(RIP\)](#)

# ip rip send version 1-compatible

**Overview** Use this command in Interface Configuration mode to send RIP version 1 compatible packets from a RIP version 2 interfaces to other RIP Interfaces. This mechanism causes RIP version 2 interfaces to send broadcast packets instead of multicasting packets, and is used in environments where multicast is not enabled or where hosts do not listen to multicast.

Use the **no** variant of this command to use the setting specified by the [version \(RIP\)](#) command, and disable the broadcast of RIP version 2 packets that are sent as broadcast packets.

**Syntax** `ip rip send version 1-compatible`  
`no ip rip send version`

| Parameter    | Description                                                                                                                                                                                                                  |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1-compatible | Specify this parameter to send RIP version 1 compatible packets from a version 2 RIP interface to other RIP interfaces. This mechanism causes version 2 RIP interfaces to broadcast packets instead of multicasting packets. |

**Default** RIP version 2 is enabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command applies to a specific interface and overrides the version specified by the [version \(RIP\)](#) command.

RIP can be run in version 1 compatible mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Use the [ip rip send version](#) command in an environment where you can send multicast packets. For example, in environments where multicast is enabled and where hosts listen to multicast.

**Examples** In the following example, the VLAN interface `vlan2` is configured to send RIP version 1-compatible packets.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip send version 1-compatible
```

In the following example, the VLAN interface `vlan3` is configured to use the RIP version specified by the [version \(RIP\)](#) command.

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# no ip rip send version
```

**Related  
Commands** [ip rip send version](#)  
[version \(RIP\)](#)

# ip rip split-horizon

**Overview** Use this command to turn on the split-horizon mechanism on the interface.  
Use the **no** variant of this command to disable this mechanism.

**Syntax** `ip rip split-horizon [poisoned]`  
`no ip rip split-horizon`

| Parameter | Description                                                                         |
|-----------|-------------------------------------------------------------------------------------|
| poisoned  | Performs split-horizon with poison-reverse. See "Usage" below for more information. |

**Default** Split horizon poisoned

**Mode** Interface Configuration for a VLAN interface.

**Usage** Use this command to avoid including routes in updates sent to the same gateway from which they were learned. Without the **poisoned** parameter, using this command causes routes learned from a neighbor to be omitted from updates sent to that neighbor. With the **poisoned** parameter, using this command causes such routes to be included in updates, but sets their metrics to infinity. This advertises that these routes are not reachable.

**Example** To turn on split horizon poisoned on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip split-horizon poisoned
```

# key

**Overview** Use this command to manage, add and delete authentication keys in a key-chain.  
Use the **no** variant of this command to delete the authentication key.

**Syntax** `key <keyid>`  
`no key <keyid>`

| Parameter | Description                           |
|-----------|---------------------------------------|
| <keyid>   | <0-2147483647> Key identifier number. |

**Mode** Keychain Configuration

**Usage** This command allows you to enter the keychain-key mode where a password can be set for the key.

**Example** The following example configures a key number 1 and shows the change into a **keychain- key** command mode prompt.

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)#
```

**Related  
Commands** [key chain](#)  
[key-string](#)  
[accept-lifetime](#)  
[send-lifetime](#)

# key chain

**Overview** Use this command to enter the key chain management mode and to configure a key chain with a key chain name.

Use the **no** variant of this command to remove the key chain and all configured keys.

**Syntax** `key chain <key-chain-name>`  
`no key chain <key-chain-name>`

| Parameter                           | Description                                  |
|-------------------------------------|----------------------------------------------|
| <code>&lt;key-chain-name&gt;</code> | Specify the name of the key chain to manage. |

**Mode** Global Configuration

**Usage** This command allows you to enter the keychain mode from which you can specify keys on this key chain.

**Example** The following example shows the creation of a key chain named `mychain` and the change into **keychain** mode prompt.

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)#
```

**Related Commands** [key](#)  
[key-string](#)  
[accept-lifetime](#)  
[send-lifetime](#)

# key-string

**Overview** Use this command to define the password to be used by a key.  
Use the **no** variant of this command to remove a password.

**Syntax** `key-string <key-password>`  
`no key-string`

| Parameter                         | Description                                                 |
|-----------------------------------|-------------------------------------------------------------|
| <code>&lt;key-password&gt;</code> | A string of characters to be used as a password by the key. |

**Mode** Keychain-key Configuration

**Usage** Use this command to specify passwords for different keys.

**Examples** In the following example, the password for `key1` in the key chain named `mychain` is set to password **prime**:

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# key-string prime
```

In the following example, the password for `key1` in the key chain named `mychain` is removed:

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# no key-string
```

**Related Commands**

- [key](#)
- [key chain](#)
- [accept-lifetime](#)
- [send-lifetime](#)

# maximum-prefix

**Overview** Use this command to configure the maximum number of RIP routes stored in the routing table.

Use the **no** variant of this command to disable all limiting of the number of RIP routes stored in the routing table.

**Syntax** `maximum-prefix <maxprefix> [<threshold>]`  
`no maximum-prefix`

| Parameter                      | Description                                                                                                  |
|--------------------------------|--------------------------------------------------------------------------------------------------------------|
| <code>&lt;maxprefix&gt;</code> | <code>&lt;1-65535&gt;</code> The maximum number of RIP routes allowed.                                       |
| <code>&lt;threshold&gt;</code> | <code>&lt;1-100&gt;</code> Percentage of maximum routes to generate a warning. The default threshold is 75%. |

**Mode** Router Configuration

**Example** To configure the maximum number of RIP routes to 150, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# maximum-prefix 150
```

# neighbor (RIP)

**Overview** Use this command to specify a neighbor router. It is used for each router to which you wish to send unicast RIP updates.

Use the **no** variant of this command to stop sending unicast updates to the specific router.

**Syntax** `neighbor <ip-address>`  
`no neighbor <ip-address>`

| Parameter                       | Description                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | The IP address of a neighboring router with which the routing information will be exchanged. |

**Default** Disabled

**Mode** Router Configuration

**Usage** Use this command to exchange nonbroadcast routing information. It can be used multiple times for additional neighbors.

The [passive-interface \(RIP\)](#) command disables sending routing updates on an interface. Use the `neighbor` command in conjunction with the [passive-interface \(RIP\)](#) to send routing updates to specific neighbors.

**Example** To specify the neighbor router to 1.1.1.1, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# passive-interface vlan1
awplus(config-router)# neighbor 1.1.1.1
```

**Related Commands** [passive-interface \(RIP\)](#)

# network (RIP)

**Overview** Use this command to activate the transmission of RIP routing information on the defined network.

Use the **no** variant of this command to remove the specified network or VLAN as one that runs RIP.

**Syntax** `network {<network-address>[/<subnet-mask>] | <vlan-name>}`  
`no network {<network-address>[/<subnet-mask>] | <vlan-name>}`

| Parameter                                                                   | Description                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;network-address&gt;</code><br><code>[/&lt;subnet-mask&gt;]</code> | Specifies the network address to run RIP. Entering a subnet mask (or prefix length) for the network address is optional. Where no mask is entered, the device will attempt to apply a mask that is appropriate to the class (A, B, or C) of the address entered, e.g. an IP address of 10.0.0.0 will have a prefix length of 8 applied to it. |
| <code>&lt;vlan-name&gt;</code>                                              | Specify a VLAN name with up to 32 alphanumeric characters to run RIP.                                                                                                                                                                                                                                                                         |

**Default** Disabled

**Mode** RIP Router Configuration

**Usage** Use this command to specify networks, or VLANs, to which routing updates will be sent and received. The connected routes corresponding to the specified network, or VLANs, will be automatically advertised in RIP updates. RIP updates will be sent and received within the specified network or VLAN.

**Example** Use the following commands to activate RIP routing updates on network 172.16.20.0/24:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# network 172.16.20.0/24
```

**Related Commands** [show ip rip](#)  
[show running-config](#)  
[clear ip rip route](#)

# offset-list (RIP)

**Overview** Use this command to add an offset to the **in** and **out** metrics of routes learned through RIP.

Use the **no** variant of this command to remove the offset list.

**Syntax** `offset-list <access-list> {in|out} <offset> [<interface>]`  
`no offset-list <access-list> {in|out} <offset> [<interface>]`

| Parameter     | Description                                                                                |
|---------------|--------------------------------------------------------------------------------------------|
| <access-list> | Specifies the access-list number or names to apply.                                        |
| in            | Indicates the access list will be used for metrics of incoming advertised routes.          |
| out           | Indicates the access list will be used for metrics of outgoing advertised routes.          |
| <offset>      | <0-16> Specifies that the offset is used for metrics of networks matching the access list. |
| <interface>   | An alphanumeric string that specifies the interface to match.                              |

**Default** The default offset value is the metric value of the interface over which the updates are being exchanged.

**Mode** RIP Router Configuration

**Usage** Use this command to specify the offset value that is added to the routing metric. When the networks match the access list the offset is applied to the metrics. No change occurs if the offset value is zero.

**Examples** In this example the router examines the RIP updates being sent out from interface `vlan2` and adds 5 hops to the routes matching the ip addresses specified in the access list 8.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# offset-list 8 in 5 vlan2
```

# passive-interface (RIP)

**Overview** Use this command to block RIP broadcasts on the VLAN interface.  
Use the **no** variant of this command to disable this function.

**Syntax** `passive-interface <interface>`  
`no passive-interface <interface>`

| Parameter                      | Description                   |
|--------------------------------|-------------------------------|
| <code>&lt;interface&gt;</code> | Specifies the interface name. |

**Default** Disabled

**Mode** RIP Router Configuration

**Usage** This command can only be configured for VLAN interfaces.

**Examples** Use the following commands to block RIP broadcasts on vlan20:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# passive-interface vlan20
```

**Related  
Commands** [show ip rip](#)

## recv-buffer-size (RIP)

**Overview** Use this command to run-time configure the RIP UDP (User Datagram Protocol) receive-buffer size to improve UDP reliability by avoiding UDP receive buffer overrun.

Use the **no** variant of this command to reset the configured RIP UDP receive-buffer size to the system default (196608 bits).

**Syntax** `recv-buffer-size <8192-2147483647>`  
`no recv-buffer-size [<8192-2147483647>]`

| Parameter                            | Description                                                             |
|--------------------------------------|-------------------------------------------------------------------------|
| <code>&lt;8192-2147483647&gt;</code> | Specify the RIP UDP (User Datagram Protocol) buffer size value in bits. |

**Default** 196608 bits is the system default when reset using the **no** variant of this command.

**Mode** Router Configuration

**Examples** To run-time configure the RIP UDP, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# recv-buffer-size 23456789
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no recv-buffer-size 23456789
```

# redistribute (RIP)

**Overview** Use this command to redistribute information from other routing protocols into RIP.

Use the **no** variant of this command to disable the specified redistribution. The parameters **metric** and **route-map** may be used on this command, but have no effect.

**Syntax** `redistribute {connected|static|ospf} [metric <0-16>] [route-map <route-map>]`  
`no redistribute {connected|static|ospf} [metric] [route-map]`

| Parameter     | Description                                                                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| route-map     | Optional. Specifies route-map that controls how routes are redistributed.                                                                                                                                                                             |
| <route-map>   | Optional. The name of the route map.                                                                                                                                                                                                                  |
| connected     | Redistribute from connected routes.                                                                                                                                                                                                                   |
| static        | Redistribute from static routes.                                                                                                                                                                                                                      |
| ospf          | Redistribute from Open Shortest Path First (OSPF).                                                                                                                                                                                                    |
| metric <0-16> | Optional. Sets the value of the metric that will be applied to routes redistributed into RIP from other protocols. If a value is not specified, and no value is specified using the <a href="#">default-metric (RIP)</a> command, the default is one. |

**Default** By default, the RIP metric value is set to 1.

**Mode** RIP Router Configuration

**Example** To apply the metric value 15 to static routes being redistributed into RIP, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# redistribute static metric 15
```

**Related Commands** [default-metric \(RIP\)](#)

# restart rip graceful

- Overview** Use this command to force the RIP process to restart, and optionally set the grace-period.
- Syntax** `restart rip graceful [grace-period <1-65535>]`
- Mode** Privileged Exec
- Default** The default RIP grace-period is 60 seconds.
- Usage** After this command is executed, the RIP process immediately shuts down. It notifies the system that RIP has performed a graceful shutdown. Routes that have been installed into the route table by RIP are preserved until the specified grace-period expires.
- When a **restart rip graceful** command is issued, the RIP configuration is reloaded from the last saved configuration. Ensure you first enter the command `copy running-config startup-config`.
- When a master failover happens on a VCStack, the RIP grace-period will apply the larger value of either the setting's configured value, or its default of 60 seconds.
- Example** To apply a restart rip graceful setting, grace-period to 100 seconds use the following commands:
- ```
awplus# copy running-config startup-config
awplus# restart rip graceful grace-period 100
```

# rip restart grace-period

**Overview** Use this command to change the grace period of RIP graceful restart.  
Use the **no** variant of this command to disable this function.

**Syntax** `rip restart grace-period <1-65535>`  
`no rip restart grace-period <1-65535>`

**Mode** Global Configuration

**Default** The default RIP grace-period is 60 seconds.

**Usage** Use this command to enable the **Graceful Restart** feature on the RIP process.  
Entering this command configures a grace period for RIP.

When a master failover happens on a VCStack, the RIP grace-period will be the longest period between the default value (60 seconds is the default RIP grace-period) and the configured RIP grace-period value from this command. So the configured RIP grace-period value will not be used for a VCStack master failover if it is shorter than the default RIP grace-period value.

**Example** `awplus# configure terminal`  
`awplus(config)# rip restart grace-period 200`

## route (RIP)

**Overview** Use this command to configure static RIP routes.  
Use the **no** variant of this command to disable this function.

**Syntax** `route <ip-addr/prefix-length>`  
`no route <ip-addr/prefix-length>`

| Parameter                                  | Description                         |
|--------------------------------------------|-------------------------------------|
| <code>&lt;ip-addr/prefix-length&gt;</code> | The IPv4 address and prefix length. |

**Default** No static RIP route is added by default.

**Mode** RIP Router Configuration

**Usage** Use this command to add a static RIP route. After adding the RIP route, the route can be checked in the RIP routing table.

**Example** To create a static RIP route to IP subnet 192.168.1.0/24, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# route 192.168.1.0/24
```

**Related  
Commands** [show ip rip](#)  
[clear ip rip route](#)

# router rip

**Overview** Use this global command to enter Router Configuration mode to enable the RIP routing process.

Use the **no** variant of this command to disable the RIP routing process.

**Syntax** `router rip`  
`no router rip`

**Mode** Global Configuration

**Example** This command is used to begin the RIP routing process:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# version 1
awplus(config-router)# network 10.10.10.0/24
awplus(config-router)# network 10.10.11.0/24
awplus(config-router)# neighbor 10.10.10.10
```

**Related  
Commands** [network \(RIP\)](#)  
[version \(RIP\)](#)

# send-lifetime

**Overview** Use this command to specify the time period during which the authentication key on a key chain can be sent.

**Syntax** `send-lifetime <start-date> {<end-date>|  
duration <seconds>|infinite}`  
`no send-lifetime`

| Parameter    | Description                                                                                                                       |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <start-date> | Specifies the start time and date in the format:<br><hh:mm:ss> <day> <month> <year> or<br><hh:mm:ss> <month> <day> <year>, where: |
|              | <hh:mm:ss> The time of the day, in hours, minutes and seconds                                                                     |
|              | <day> <1-31> The day of the month                                                                                                 |
|              | <month> The month of the year (the first three letters of the month, for example, Jan)                                            |
|              | <year> <1993-2035> The year                                                                                                       |
| <end-date>   | Specifies the end time and date in the format:<br><hh:mm:ss> <day> <month> <year> or<br><hh:mm:ss> <month> <day> <year>, where:   |
|              | <hh:mm:ss> The time of the day, in hours, minutes and seconds                                                                     |
|              | <day> <1-31> The day of the month                                                                                                 |
|              | <month> The month of the year (the first three letters of the month, for example, Jan)                                            |
|              | <year> <1993-2035> The year                                                                                                       |
| <seconds>    | <1-2147483646> Duration of the key in seconds.                                                                                    |
| infinite     | Never expires.                                                                                                                    |

**Mode** Keychain-key Configuration

**Example** The following example shows the setting of send-lifetime for key 1 on the key chain named "mychain".

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# send-lifetime 03:03:01 Jan 3 2016
04:04:02 Dec 6 2016
```

# show debugging rip

**Overview** Use this command to display the RIP debugging status for these debugging options: nsm debugging, RIP event debugging, RIP packet debugging and RIP nsm debugging.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging rip`

**Mode** User Exec and Privileged Exec

**Usage** Use this command to display the debug status of RIP.

**Example** `awplus# show debugging rip`

# show ip protocols rip

- Overview** Use this command to display RIP process parameters and statistics.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).
- Syntax** `show ip protocols rip`
- Mode** User Exec and Privileged Exec
- Example** `awplus# show ip protocols rip`
- Output** Figure 22-1: Example output from the **show ip protocols rip** command

```
Routing Protocol is "rip"
Sending updates every 30 seconds with +/-50%, next due in 12
seconds
Timeout after 180 seconds, garbage collect after 120 seconds
Outgoing update filter list for all interface is not set
Incoming update filter list for all interface is not set
Default redistribution metric is 1
Redistributing: connected static
Default version control: send version 2, receive version 2
Interface          Send  Recv   Key-chain
   vlan25           2     2
Routing for Networks:
  10.10.0.0/24
Routing Information Sources:
  Gateway           BadPackets BadRoutes  Distance Last Update
Distance: (default is 120
```

# show ip rip

**Overview** Use this command to show RIP routes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip rip`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip rip`

**Output** Figure 22-2: Example output from the **show up rip** command

```
awplus#show ip rip
Codes: R - RIP, Rc - RIP connected, Rs - RIP static
       C - Connected, S - Static, O - OSPFNetwork      Next Hop
Metric From If      Time
C 10.0.1.0/24        1      vlan20
S 10.10.10.0/24      1      vlan20
C 10.10.11.0/24      1      vlan20
S 192.168.101.0/24   1      vlan20
R 192.192.192.0/24   1      --
```

**Related  
Commands** [route \(RIP\)](#)  
[network \(RIP\)](#)  
[clear ip rip route](#)

# show ip rip database

**Overview** Use this command to display information about the RIP database.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip rip database [full]`

| Parameter | Description                                                     |
|-----------|-----------------------------------------------------------------|
| full      | Specify the full RIP database including sub-optimal RIP routes. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip rip database`  
`awplus# show ip rip database full`

**Related Commands** [show ip rip](#)

# show ip rip interface

**Overview** Use this command to display information about the RIP interfaces. You can specify an interface name to display information about a specific interface.

**Syntax** `show ip rip interface [<interface>]`

| Parameter                      | Description                                                                    |
|--------------------------------|--------------------------------------------------------------------------------|
| <code>&lt;interface&gt;</code> | The interface to display information about. For instance: <code>vlan2</code> . |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip rip interface`

# timers (RIP)

**Overview** Use this command to adjust routing network timers.

Use the **no** variant of this command to restore the defaults.

**Syntax** `timers basic <update> <timeout> <garbage>`  
`no timers basic`

| Parameter                    | Description                                                                                                                                                                                                                          |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;update&gt;</code>  | <code>&lt;5-2147483647&gt;</code><br>Specifies the period at which RIP route update packets are transmitted. The default is 30 seconds.                                                                                              |
| <code>&lt;timeout&gt;</code> | <code>&lt;5-2147483647&gt;</code><br>Specifies the routing information timeout timer in seconds. The default is 180 seconds. After this interval has elapsed and no updates for a route are received, the route is declared invalid. |
| <code>&lt;garbage&gt;</code> | <code>&lt;5-2147483647&gt;</code><br>Specifies the routing garbage collection timer in seconds. The default is 120 seconds.                                                                                                          |

**Default** Enabled

**Mode** RIP Router Configuration

**Usage** This command adjusts the RIP timing parameters.

The update timer is the time between sending out updates, that contain the complete routing table, to every neighboring router.

If an update for a given route has not been seen for the time specified by the timeout parameter, that route is no longer valid. However, it is retained in the routing table for a short time, with metric 16, so that neighbors are notified that the route has been dropped.

When the time specified by the garbage parameter expires the metric 16 route is finally removed from the routing table. Until the garbage time expires, the route is included in all updates sent by the router.

All the routers in the network must have the same timers to ensure the smooth operation of RIP throughout the network.

**Examples** To set the update timer to 30, the routing information timeout timer to 180, and the routing garbage collection timer to 120, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# timers basic 30 180 120
```

# undebg rip

**Overview** Use this command to disable the options set for debugging information of RIP events, packets and communication between RIP and NSM.

This command has the same effect as the **no debug rip** command.

**Syntax** `undebg rip {all|events|nsm|<packet>}`

| Parameter | Description                                                           |
|-----------|-----------------------------------------------------------------------|
| all       | Disables all RIP debugging.                                           |
| events    | Disables the logging of RIP events.                                   |
| nsm       | Disables the logging of RIP and NSM communication.                    |
| <packet>  | packet [recv send] [detail]<br>Disables the debugging of RIP packets. |
| recv      | Disables the logging of received packet information.                  |
| send      | Disables the logging of sent packet information.                      |
| detail    | Disables the logging of sent or received RIP packets.                 |

**Mode** Privileged Exec

**Example** To disable the options set for debugging RIP information events, use the following command:

```
awplus# undebg rip packet
```

**Related Commands** [debug rip](#)

# version (RIP)

**Overview** Use this command to specify a RIP version used globally by the router.  
Use the **no** variant of this command to restore the default version.

**Syntax** `version {1|2}`  
`no version`

| Parameter | Description                              |
|-----------|------------------------------------------|
| 1 2       | Specifies the version of RIP processing. |

**Default** Version 2

**Mode** RIP Router Configuration

**Usage** RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Setting the version command has no impact on receiving updates, only on sending them. The [ip rip send version](#) command overrides the value set by the [version \(RIP\)](#) command on an interface-specific basis. The [ip rip receive version](#) command allows you to configure a specific interface to accept only packets of the specified RIP version. The [ip rip receive version](#) command and the [ip rip send version](#) command override the value set by this command.

**Examples** To specify a RIP version, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# version 1
```

**Related Commands** [ip rip receive version](#)  
[ip rip send version](#)  
[show running-config](#)

# 23

# RIPng for IPv6 Commands

## Introduction

**Overview** This chapter contains RIPng commands. RIPng (Routing Information Protocol next generation) is an extension of RIPv2 to support IPv6. RFC 2080 specifies RIPng. The differences between RIPv2 and RIPng are:

- RIPng does not support RIP updates authentication
- RIPng does not allow the attachment of arbitrary tags to routes
- RIPng requires the encoding of the next-hop for a set of routes

For more information, see the [RIPng Feature Overview and Configuration Guide](#).

# aggregate-address (IPv6 RIPng)

**Overview** Use this command to add an aggregate route to RIPng.  
Use the **no** variant of this command to remove the aggregate route from RIPng.

**Syntax** `aggregate-address <ipv6-addr/prefix-length>`  
`no aggregate-address <ipv6-addr/prefix-length>`

| Parameter                                    | Description                                                                                                                            |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-addr/prefix-length&gt;</code> | Specify the IPv6 Address in the format <code>X:X::X:X/Prefix-Length</code> . The prefix-length is a decimal integer between 1 and 128. |

**Mode** Router Configuration

**Usage** The route will not be added to the RIPng database unless the database contains at least one route which is contained within the address range covered by the aggregate route. As soon as there are any such component routes in the RIPng database, then the following occurs:

- the aggregate route is added to the RIPng database
- all the component routes that are within the address range covered by the aggregate route are retained in the RIPng database, but are marked as suppressed routes. The aggregate route will be advertised in RIPng updates, and the component route will no longer be advertised.

Note that simply having a component route in the IPv6 route database is not a sufficient condition for the aggregate route to be included into the RIPng database. The component route(s) must be in the RIPng database before the aggregate route will be included in the RIPng database. There is no restriction on the method by which the component routes have arrived into the RIPng database, it can be by being connected RIP interfaces, by redistribution or by direct inclusion using the **route** command in router IPv6 RIP configuration mode.

**Example** `awplus# configure terminal`  
`awplus(config)# router ipv6 rip`  
`awplus(config-router)# aggregate-address 2001:db8::/32`

# clear ipv6 rip route

**Overview** Use this command to clear specific data from the RIPng routing table.

**Syntax** `clear ipv6 rip route`  
`{<ipv6-addr/prefix-length>|all|connected|rip|static|ospf}`

| Parameter                                    | Description                                                                                                                                                                                                             |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-addr/prefix-length&gt;</code> | Specify the IPv6 Address in format <i>X:X::X:X/Prefix-Length</i> . The prefix-length is a decimal integer between 1 and 128. Removes entries which exactly match this destination address from the RIPng routing table. |
| <code>connected</code>                       | Removes redistributed connected entries from RIPng routing table.                                                                                                                                                       |
| <code>static</code>                          | Removes redistributed static entries from the RIPng routing table.                                                                                                                                                      |
| <code>rip</code>                             | Removes RIPng routes from the RIPng routing table.                                                                                                                                                                      |
| <code>ospf</code>                            | Removes redistributed OSPFv3 routes from the RIPng routing table.                                                                                                                                                       |
| <code>all</code>                             | Clears the entire RIPng routing table.                                                                                                                                                                                  |

**Mode** Privileged Exec

**Example** `awplus# clear ipv6 rip route all`  
`awplus# clear ipv6 rip route 2001:db8::/32`

# debug ipv6 rip

**Overview** Use this command to enable RIPng debugging and specify debugging for RIPng events, RIPng packets, or RIPng communication with NSM processes.

Use the **no** variant of this command to disable RIPng debugging.

**Syntax** `debug ipv6 rip [all|events|nsm|packet [detail]|recv [detail]|send [detail]]`  
`no debug ipv6 rip [all|events|nsm|packet [detail]|recv [detail]|send [detail]]`

| Parameter | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| all       | Displays all RIPng debugging showing RIPng events debug information, RIPng received packets information, and RIPng sent packets information. |
| events    | Displays RIPng events debug information.                                                                                                     |
| nsm       | Displays RIPng and NSM communication.                                                                                                        |
| packet    | Displays RIPng packets only.                                                                                                                 |
| recv      | Displays information for received packets.                                                                                                   |
| send      | Displays information for sent packets.                                                                                                       |
| detail    | Displays detailed information for the sent or received packet.                                                                               |

**Default** RIPng debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# debug ipv6 rip events`  
`awplus# debug ipv6 rip packet send detail`  
`awplus# debug ipv6 rip nsm`

**Related Commands** [undebug ipv6 rip](#)

# default-information originate (IPv6 RIPng)

**Overview** Use this command to generate a default route into RIPng.  
Use the **no** variant of this command to disable this feature.

**Syntax** default-information originate  
no default-information originate

**Default** Disabled

**Mode** Router Configuration

**Example** awplus# configure terminal  
awplus(config)# router ipv6 rip  
awplus(config-router)# default-information originate

# default-metric (IPv6 RIPng)

**Overview** Use this command to specify the metrics to be assigned to redistributed RIPng routes.

Use the **no** variant of this command to reset the RIPng metric back to its default (1).

**Syntax** `default-metric <1-16>`  
`no default-metric [<1-16>]`

| Parameter | Description   |
|-----------|---------------|
| <1-16>    | Metric value. |

**Default** By default, the RIPng metric value is set to 1.

**Mode** Router Configuration

**Usage** This command is used with the [redistribute \(IPv6 RIPng\)](#) command to make the routing protocol use the specified metric value for all redistributed RIPng routes, regardless of the original protocol that the route has been redistributed from.

Note, this metric is not applied to routes that are brought into RIPng by using the **route** command in router IPv6 RIP configuration mode. This metric is, though, applied to any RIPng aggregate routes that have been brought into the RIPng database due to the presence of a component route that was redistributed into RIPng.

Also note that the default-metric is applied to routes redistributed into RIPng with no metric assignment in the routemap associated with redistribution.

**Example**

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# default-metric 8
```

**Related Commands** [ipv6 rip metric-offset](#)  
[redistribute \(IPv6 RIPng\)](#)

# distribute-list (IPv6 RIPng)

**Overview** Use this command to filter incoming or outgoing route updates using the access-list or the prefix-list.

Use the **no** variant of this command to disable this feature.

**Syntax**

```
distribute-list [<access-list>|prefix <prefix-list-name>]  
[in|out] [<interface>]  
  
no distribute-list [<access-list>|prefix <prefix-list-name>]  
[in|out] [<interface>]  
  
no distribute-list [prefix <prefix-list-name>] [in|out]  
[<interface>]
```

| Parameter          | Description                                                                             |
|--------------------|-----------------------------------------------------------------------------------------|
| <access-list>      | Specifies the IPv6 access-list number or name to use.                                   |
| <prefix-list-name> | Filter prefixes in routing updates.<br>Specify the name of the IPv6 prefix-list to use. |
| <interface>        | The interface for which distribute-list applies. For instance: vlan2.                   |
| in                 | Filter incoming routing updates.                                                        |
| out                | Filter outgoing routing updates.                                                        |

**Default** Disabled

**Mode** Router Configuration

**Usage** Filter out incoming or outgoing route updates using the access-list or the prefix-list. If you do not specify the name of the interface, the filter is applied to all the interfaces.

**Example** To filter incoming or outgoing route updates, use the following commands:

```
awplus# configure terminal  
awplus(config)# router ipv6 rip  
awplus(config-router)# distribute-list prefix myfilter in vlan2
```

**Related Commands**

- [ipv6 access-list extended \(named\)](#)
- [ipv6 nd prefix](#)

## ipv6 rip metric-offset

**Overview** Use this command to increment the metric value on incoming routes for a specified interface. This command can be used to artificially inflate the metric value for routes learned on the specified interface. Routes learned on the specified interface are only used if the routes to the same destination with a lower metric value in the routing table are down.

Use the **no** variant of this command to reset the metric value on incoming routes to the default value (1). You can set the metric value for redistributed routes with [default-metric \(IPv6 RIPng\)](#) and [redistribute \(IPv6 RIPng\)](#) commands in Router Configuration mode.

**Syntax** `ipv6 rip metric-offset <1-16>`  
`no ipv6 rip metric-offset <1-16>`

| Parameter                 | Description                                                                                                                      |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;1-16&gt;</code> | Specify an increment to the metric value on an incoming route. The metric value for RIPng routes is the hop count for the route. |

**Default** The default RIPng metric value is 1.

**Mode** Interface Configuration for a VLAN interface only.

**Usage** When a RIPng route is received on a VLAN interface, the metric value for the interface set by this command is added to the metric value of the route in the routing table. Note this command only increments the metric for incoming routes on a specified interface. Increasing the metric value for a VLAN interface increases the metric value of routes received on that VLAN interface. This changes the route selected from the routing table.

The RIPng metric is the hop count. At regular intervals of the routing update timer (which has a default value of 30 seconds), and at the time of change in the topology, the RIPng router sends update messages to other routers. The listening routers update their route table with the new route, and increase the metric value of the path by one (referred to as a hop count). The router recognizes the IPv6 address advertising router as the next hop, then sends the routing updates to other routers. A maximum allowable hop count is 15. If a router reaches a metric value of 16 or more, the destination is identified as unreachable.

For information about how AlliedWare Plus adds routes, see the [“Route Selection” Feature Overview and Configuration Guide](#). See also the [default-metric \(IPv6 RIPng\)](#) and [redistribute \(IPv6 RIPng\)](#) commands to specify the metric for redistributed RIPng routes.

**Examples** To increment the metric-offset on the VLAN interface `vlan2`, enter the below commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# exit
awplus(config)# interface vlan2
awplus(config-if)# ipv6 rip metric-offset 1
```

To reset the metric-offset on the VLAN interface `vlan2` to the default value, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 rip metric-offset 1
```

**Validation  
Commands** [show running-config](#)

**Related  
Commands** [default-metric \(IPv6 RIPng\)](#)

# ipv6 rip split-horizon

**Overview** Use this command to perform the split-horizon action on the interface. The default is split-horizon with poisoned reverse.

Use the **no** variant of this command to disable this function.

**Syntax** `ipv6 rip split-horizon [poisoned]`  
`no ipv6 rip split-horizon`

| Parameter                  | Description                                    |
|----------------------------|------------------------------------------------|
| <code>split-horizon</code> | Perform split-horizon without poisoned reverse |
| <code>poisoned</code>      | Performs split-horizon with poisoned reverse.  |

**Default** Split-horizon with poisoned reverse is the default.

**Mode** Interface Configuration for a VLAN interface only.

**Usage** Use this command to avoid including routes in updates sent to the same gateway from which they were learned. Using the **split horizon** command omits routes learned from one neighbor, in updates sent to that neighbor. Using the **poisoned** parameter with this command includes such routes in updates, but sets their metrics to infinity. Thus, advertising that these routes are not reachable.

**Examples** To perform split-horizon with poisoned reverse on the VLAN interface `vlan2`, enter the below commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# exit
awplus(config)# interface vlan2
awplus(config-if)# ipv6 rip split-horizon poisoned
```

To disable split-horizon on the VLAN interface `vlan2`, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 rip split-horizon
```

**Validation Commands** `show running-config`

# ipv6 router rip

- Overview** Use this command to enable RIPng routing on an interface.  
Use the **no** variant of this command to disable RIPng routing on an interface.
- Syntax** `ipv6 router rip`  
`no ipv6 router rip`
- Default** RIPng routing is disabled by default.
- Mode** Interface Configuration for a VLAN interface only.
- Usage** This command can only be configured on VLAN interfaces.
- Examples** To enable RIPng routing on the VLAN interface vlan2, enter the below commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# exit
awplus(config)# interface vlan2
awplus(config-if)# ipv6 router rip
```

To disable RIPng routing on the VLAN interface vlan2, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 router rip
```

# neighbor (IPv6 RIPng)

**Overview** Use this command to specify a neighbor router.  
Use the **no** variant of this command to disable the specific router.

**Syntax** `neighbor <ipv6-link-local-addr> <interface>`  
`no neighbor <ipv6-link-local-addr> <interface>`

| Parameter                                 | Description                                                                                                                |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-link-local-addr&gt;</code> | Specify the link-local IPv6 address (in the format X:X::X:X) of a neighboring router to exchange routing information with. |
| <code>&lt;interface&gt;</code>            | The interface. For instance: <code>vlan2</code> .                                                                          |

**Mode** Router Configuration

**Usage** Use this command to exchange non broadcast routing information. It can be used multiple times for additional neighbors.

The [passive-interface \(IPv6 RIPng\)](#) command disables sending routing updates on an interface. Use the `neighbor` command in conjunction with the [passive-interface \(IPv6 RIPng\)](#) command to send routing updates to specific neighbors.

**Examples**

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# neighbor 2001:db8:1::1 vlan2
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no neighbor 2001:db8:1::1 vlan2
```

**Related Commands** [passive-interface \(IPv6 RIPng\)](#)

## offset-list (IPv6 RIPng)

**Overview** Use this command to add an offset to in and out metrics to routes learned through RIPng.

Use the **no** variant of this command to remove an offset list.

**Syntax** `offset-list {<access-list-number>|<access-list-name>} {in|out} <offset> [<interface>]`  
`no offset-list {<access-list-number>|<access-list-name>} {in|out} <offset> [<interface>]`

| Parameter            | Description                                                                               |
|----------------------|-------------------------------------------------------------------------------------------|
| <access-list-number> | Specify an access-list number to apply to an offset-list.                                 |
| <access-list-name>   | Specify an access-list name to apply to an offset-list.                                   |
| in                   | Indicates the access-list will be used for metrics of incoming advertised routes          |
| out                  | Indicates the access-list will be used for metrics of outgoing advertised routes          |
| <offset>             | <0-16> Specifies that the offset is used for metrics of networks matching the access-list |
| <interface>          | The interface to match. For instance: <code>vlan2</code> .                                |

**Default** The default offset value is the metric value of the interface over which the updates are being exchanged.

**Mode** Router Configuration

**Usage** Use this command to specify the offset value that is added to the routing metric. When the networks match the access list the offset is applied to the metrics. No change occurs if the offset value is zero.

**Example** In this example the router examines the RIPng updates being sent out from interface `vlan2` and adds 8 hops to the routes matching the ip addresses specified in the access list 2.

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# offset-list mylist in 8 vlan2
```

# passive-interface (IPv6 RIPng)

**Overview** Use this command to enable suppression of routing updates on an interface.  
Use the **no** variant of this command to disable this function.

**Syntax** `passive-interface <interface>`  
`no passive-interface <interface>`

| Parameter                      | Description                                       |
|--------------------------------|---------------------------------------------------|
| <code>&lt;interface&gt;</code> | The interface. For instance: <code>vlan2</code> . |

**Default** Disabled

**Mode** Router Configuration

**Examples** To enable suppression of routing updates, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# passive-interface vlan2
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no passive-interface vlan2
```

## recv-buffer-size (IPv6 RIPng)

**Overview** Use this command to configure the RIPng UDP (User Datagram Protocol) receive-buffer size. This should improve UDP reliability by avoiding UDP receive buffer overruns.

Use the **no** variant of this command to unset the configured RIPng UDP receive-buffer size and set it back to the system default of 196608 bits.

**Syntax** `recv-buffer-size <8192-2147483647>`  
`no recv-buffer-size [<8192-2147483647>]`

**Default** The RIPng UDP receive-buffer-size is 196608 bits by default, and is reset to the default using the **no** variant of this command.

**Mode** Router Configuration

**Examples** To configure the RIPng UPD, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# recv-buffer-size 23456789
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no recv-buffer-size 23456789
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no recv-buffer-size
```

# redistribute (IPv6 RIPng)

**Overview** Use this command to redistribute information from other routing protocols into RIPng.

Use the **no** variant of this command to disable the specified redistribution. The parameters **metric** and **route-map** may be used on this command, but have no effect.

**Syntax** `redistribute {connected|static|ospf} [metric <0-16>] [route-map <route-map>]`  
`no redistribute {connected|static|ospf} [metric <0-16>] [route-map <route-map>]`

| Parameter   | Description                                                                                                                                                                                                                |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-16>      | Optional. Specifies the metric value to be used when redistributing information. If a value is not specified, and no value is specified using the <a href="#">default-metric (IPv6 RIPng)</a> command, the default is one. |
| <route-map> | Optional. Specifies route-map to be used to redistribute information.                                                                                                                                                      |
| connected   | Redistribute from connected routes.                                                                                                                                                                                        |
| static      | Redistribute from static routes.                                                                                                                                                                                           |
| ospf        | Redistribute from Open Shortest Path First (OSPF).                                                                                                                                                                         |

**Default** By default, the RIPng metric value is set to 1.

**Mode** Router Configuration

**Example** To redistribute information from other routing protocols into RIPng, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# redistribute static route-map mymap
awplus(config-router)# redistribute static metric 8
```

**Related Commands** [default-metric \(IPv6 RIPng\)](#)

# route (IPv6 RIPng)

**Overview** Use this command to configure static RIPng routes.  
Use the **no** variant of this command to disable this function.

**Syntax** `route <ipv6-addr/prefix-length>`  
`no route <ipv6-addr/prefix-length>`

| Parameter                                    | Description                                                                                                                  |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-addr/prefix-length&gt;</code> | Specify the IPv6 Address in format <i>X:X::X:X/Prefix-Length</i> . The prefix-length is a decimal integer between 1 and 128. |

**Mode** Router Configuration

**Usage** Use this command to add a static RIPng route. After adding the RIPng route, the route can be checked in the RIPng routing table.

**Example** To configure static RIPng routes, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# route 2001:db8::1/64
```

**Related Commands** `show ipv6 rip`  
`clear ipv6 rip route`

# router ipv6 rip

**Overview** Use this global command to enter Router Configuration mode to enable a RIPng routing process.

Use the **no** variant of this command to disable the RIPng routing process.

**Syntax** `router ipv6 rip`  
`no router ipv6 rip`

**Mode** Global Configuration

**Example** To enable a RIPng routing process, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)#
```

# show debugging ipv6 rip

**Overview** Use this command to display the RIPng debugging status for the debugging options of: nsm debugging, RIPng event debugging, RIPng packet debugging, and RIPng nsm debugging.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging ipv6 rip`

**Mode** User Exec and Privileged Exec

**Usage** Use this command to display the debug status of RIPng.

**Example** To display the RIPng debugging status, use the following command:

```
awplus# show debugging ipv6 rip
```

# show ipv6 protocols rip

**Overview** Use this command to display RIPng process parameters and statistics.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 protocols rip`

**Mode** User Exec and Privileged Exec

**Example** To display RIPng process parameters and statistics, use the following command:

```
awplus# show ipv6 protocols rip
```

## Output

```
awplus#show ipv6 protocols rip
Routing Protocol is "RIPng"
  Sending updates every 30 seconds with +/-5 seconds, next due
in 6 seconds
  Timeout after 180 seconds, garbage collect after 120 seconds
  Outgoing update filter list for all interface is not set
  Incoming update filter list for all interface is not set
  Default redistribute metric is 1
  Redistributing:
  Interface
    vlan3
  Routing for Networks:
    fe80::200:cdff:fe27:c086 vlan1
```

# show ipv6 rip

**Overview** Use this command to show RIPng routes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 rip`

**Mode** User Exec and Privileged Exec

**Example** To display RIPng routes, use the following command:

```
awplus# show ipv6 rip
```

## Output

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, Ra - RIP
aggregated, Rcx - RIP connect suppressed, Rsx - RIP static
suppressed, C - Connected, S - Static, O - OSPF
   Network           Next Hop           If      Met Tag   Time
R   2001:db8:1::/48   2001:db8:2::/48   vlan3    3    0    02:28
C   2001:db8:3::/48   ::                vlan2    1    0
Ra  2001:db8:4::/48   --                1    0
Rs  2001:db8:5::/48   2001:db8:1::/48   vlan3    3    0    02:32
Cs  2001:db8:6::/48   ::                vlan3    1    0
```

**Related Commands** [show ipv6 rip database](#)

# show ipv6 rip database

**Overview** Use this command to display information about the RIPng database.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 rip database [full]`

| Parameter | Description                                                                |
|-----------|----------------------------------------------------------------------------|
| full      | Display all IPv6 RIPng full database entries including sub-optimal routes. |

**Mode** User Exec and Privileged Exec

**Example** To display information about the RIPng database, use the following command:

```
awplus# show ipv6 rip database
```

## Output

|                                                                                                                                                                          |                 |                 |       |     |     |       |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|-----------------|-------|-----|-----|-------|
| Codes: R - RIP, Rc - RIP connected, Rs - RIP static, Ra - RIP aggregated, Rcx - RIP connect suppressed, Rsx - RIP static suppressed, C - Connected, S - Static, O - OSPF |                 |                 |       |     |     |       |
|                                                                                                                                                                          | Network         | Next Hop        | If    | Met | Tag | Time  |
| R                                                                                                                                                                        | 2001:db8:1::/48 | 2001:db8:2::/48 | vlan3 | 3   | 0   | 02:28 |
| C                                                                                                                                                                        | 2001:db8:3::/48 | ::              | vlan2 | 1   | 0   |       |
| Ra                                                                                                                                                                       | 2001:db8:4::/48 | --              |       | 1   | 0   |       |
| Rs                                                                                                                                                                       | 2001:db8:5::/48 | 2001:db8:1::/48 | vlan3 | 3   | 0   | 02:32 |
| Cs                                                                                                                                                                       | 2001:db8:6::/48 | ::              | vlan3 | 1   | 0   |       |

**Related Commands** [show ipv6 rip](#)

# show ipv6 rip interface

**Overview** Use this command to display information about the RIPng interfaces. You can specify an interface name to display information about a specific interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 rip interface [<interface>]`

| Parameter   | Description                                                                    |
|-------------|--------------------------------------------------------------------------------|
| <interface> | The interface to display information about. For instance: <code>vlan2</code> . |

**Mode** User Exec and Privileged Exec

**Example** To display RIPng interface information, use the following command:

```
awplus# show ipv6 rip interface
```

## Output

```
lo is up, line protocol is up
RIPng is not enabled on this interface
vlan1 is up, line protocol is up
RIPng is not enabled on this interface
vlan2 is down, line protocol is down
RIPng is not enabled on this interface
vlan3 is up, line protocol is up
Routing Protocol: RIPng
Passive interface: Disabled
Split horizon: Enabled with Poisoned Reversed
IP interface address:
2001:db8:1::1/64
2001:db8:1::2/64
```

# timers (IPv6 RIPng)

**Overview** Use this command to adjust the RIPng routing network timers.

Use the **no** variant of this command to restore the defaults.

**Syntax** `timers basic <update> <timeout> <garbage>`  
`no timers basic`

| Parameter                    | Description                                                                                                                                                                                                                             |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;update&gt;</code>  | <code>&lt;5-2147483647&gt;</code> Specifies the RIPng routing table update timer in seconds. The default is 30 seconds.                                                                                                                 |
| <code>&lt;timeout&gt;</code> | <code>&lt;5-2147483647&gt;</code> Specifies the RIPng routing information timeout timer in seconds. The default is 180 seconds. After this interval has elapsed and no updates for a route are received, the route is declared invalid. |
| <code>&lt;garbage&gt;</code> | <code>&lt;5-2147483647&gt;</code> Specifies the RIPng routing garbage collection timer in seconds. The default is 120 seconds.                                                                                                          |

**Default** The default RIPng routing table update timer default is 30 seconds, the default RIPng routing information timeout timer is 180 seconds, and the default RIPng routing garbage collection timer is 120 seconds. The **no** variant of this command restores the default RIPng routing timers.

**Mode** Router Configuration

**Example** To adjust the RIPng routing network timers, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# timers basic 30 180 120
```

# undebg ipv6 rip

**Overview** Use this command to disable debugging options of RIPng events, RIPng packets, and communication between RIPng and NSM processes.

**Syntax** `undebg ipv6 rip [all|events|nsm|packet [recv|send][detail]]`

| Parameter | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| all       | Disables all RIPng debugging.                                             |
| events    | Disable the display of RIPng events information.                          |
| nsm       | Disable the display of RIPng and NSM communication.                       |
| packet    | Disable debugging of specified RIPng packets only.                        |
| recv      | Disable the display of information for received packets.                  |
| send      | Disable the display of information for sent packets.                      |
| detail    | Disable the display of detailed information for sent or received packets. |

**Mode** Privileged Exec and Global Configuration

**Example** To disable debugging options, use the following command:

```
awplus# undebg ipv6 rip events
awplus# undebg ipv6 rip all
awplus# undebg ipv6 rip packet send
awplus# undebg ipv6 rip packet recv detail
```

# area default-cost

**Overview** This command specifies a cost for the default summary route sent into a stub or NSSA area.

The **no** variant of this command removes the assigned default-route cost.

**Syntax** `area <area-id> default-cost <0-16777215>`  
`no area <area-id> default-cost`

| Parameter    | Description                                                                                                                                                                               |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>    | The OSPF area that you are specifying the default summary route cost for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. |
|              | <ip-addr> OSPF Area ID expressed in IPv4 address format A.B.C.D.                                                                                                                          |
|              | <0-4294967295> OSPF Area ID expressed as a decimal number within the range shown.                                                                                                         |
|              | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.                                                                                         |
| default-cost | Indicates the cost for the default summary route used for a stub or NSSA area.<br>Default: 1                                                                                              |

**Mode** Router Configuration

**Usage** The default-cost option provides the metric for the summary default route, generated by the area border router, into the NSSA or stub area. Use this option only on an area border router that is attached to the NSSA or stub area. Refer to the RFC 3101 for information on NSSA.

**Example** To set the default cost to 10 in area 1 for the OSPF instance 100, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 default-cost 10
```

[area stub](#)

# area authentication

**Overview** Use this command to enable authentication for an OSPF area. Specifying the area authentication sets the authentication to Type 1 authentication or the Simple Text password authentication (details in RFC 2328).

The **no** variant of this command removes the authentication specification for an area.

**Syntax** `area <area-id> authentication [message-digest]`  
`no area <area-id> authentication`

| Parameter      | Description                                                                                                                           |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>      | The OSPF area that you are enabling authentication for. This can be entered in either dotted decimal format or normal decimal format. |
|                | <ip-addr> OSPF Area ID expressed in IPv4 address, entered in the form A.B.C.D.                                                        |
|                | <0-4294967295> OSPF Area ID expressed as a decimal number within the range shown.                                                     |
|                | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area OSPF Area ID.                           |
| message-digest | Enables MD5 authentication in the OSPF area.                                                                                          |

**Default** By default, no authentication occurs.

**Mode** Router Configuration

**Usage** All OSPF packets transmitted in this **area** must have the same password in their OSPF header. This ensures that only routers that have the correct password may join the routing domain.

Give all routers that are to communicate with each other through OSPF the same authentication password.

Use the [ip ospf authentication-key](#) command to specify a Simple Text password.  
Use the [ip ospf message-digest-key](#) command to specify MD5 password.

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 authentication
```

**Related Commands** [ip ospf authentication](#)  
[ip ospf message-digest-key](#)

# area filter-list

**Overview** This command configures filters to advertise summary routes on Area Border Routers (ABR).

This command is used to suppress particular intra-area routes from/to an area to/from the other areas. You can use this command in conjunction with either the access-list or the prefix-list command.

The **no** variant of this command removes the filter configuration.

**Syntax**

```
area <area-id> filter-list {access
<access-list>|prefix <prefix-list>} {in|out}

no area <area-id> filter-list {access
<access-list>|prefix <prefix-list>} {in|out}
```

| Parameter     | Description                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>     | The OSPF area that you are configuring the filter for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. |
|               | <ip-addr> OSPF Area ID expressed in IPv4 address format A.B.C.D.                                                                                                       |
|               | <0-4294967295> OSPF Area ID expressed as a decimal number within the range shown.                                                                                      |
|               | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.                                                                      |
| access        | Use access-list to filter summary.                                                                                                                                     |
| prefix        | Use prefix-list to filter summary.                                                                                                                                     |
| <access-list> | Name of an access-list.                                                                                                                                                |
| <prefix-list> | Name of a prefix-list.                                                                                                                                                 |
| in            | Filter routes from the other areas to this area.                                                                                                                       |
| out           | Filter routes from this area to the other areas.                                                                                                                       |

**Mode** Router Configuration

**Example** To configure filters to advertise summary routes, use the following commands:

```
awplus# configure terminal
awplus(config)# access-list 1 deny 172.22.0.0
awplus(config)# router ospf 100
awplus(config-router)# area 1 filter-list access 1 in
```

## area nssa

**Overview** This command sets an area as a Not-So-Stubby-Area (NSSA). By default, no NSSA area is defined.

Use this command to simplify administration if you are connecting a central site using OSPF to a remote site that is using a different routing protocol. You can extend OSPF to cover the remote connection by defining the area between the central router and the remote router as an NSSA.

There are no external routes in an OSPF stub area, so you cannot redistribute from another protocol into a stub area. A NSSA allows external routes to be flooded within the area. These routes are then leaked into other areas. Although, the external routes from other areas still do not enter the NSSA. You can either configure an area to be a stub area or an NSSA, not both.

The **no** variant of this command removes this designation.

**Syntax**

```
area <area-id> nssa [default-information-originate <metric> |
no-redistribution | no-summary | translator-role <role> ]
no area <area-id> nssa [default-information-originate |
no-redistribution | no-summary | translator-role ]
```

| Parameter                     | Description                                                                                                                                                        |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>                     | The OSPF area that you are configuring as an NSSA. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. |
|                               | <ip-addr> OSPF Area ID expressed in IPv4 address format A.B.C.D.                                                                                                   |
|                               | <0-4294967295> OSPF Area ID expressed as a decimal number within the range shown.                                                                                  |
|                               | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.                                                                  |
| default-information-originate | Originate Type-7 default LSA into NSSA.                                                                                                                            |
| <metric>                      | The external or internal metric. Specify the following:                                                                                                            |
|                               | metric<0-16777214> The metric value.                                                                                                                               |
|                               | metric-type<1-2> External metric type.                                                                                                                             |
| no-redistribution             | Do not redistribute external route into NSSA.                                                                                                                      |
| no-summary                    | Do not inject inter-area route into NSSA.                                                                                                                          |
| translator-role               | Specify NSSA-ABR translator-role.                                                                                                                                  |

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| <role>    | The role type. Specify one of the following keywords:                   |
|           | always Router always translate NSSA-LSA to Type-5 LSA.                  |
|           | candidate Router may translate NSSA-LSA to Type-5 LSA if it is elected. |
|           | never Router never translate NSSA-LSA.                                  |

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 0.0.0.51 nssa
awplus(config-router)# area 3 nssa translator-role candidate
no-redistribution default-information-originate metric 34
metric-type 2
```

**Related Commands** [area default-cost](#)

# area range

**Overview** Use this command to summarize OSPF routes at an area boundary, configuring an IPv4 address range which consolidates OSPF routes. By default, this feature is not enabled.

A summary route created by this command is then advertised to other areas by the Area Border Routers (ABRs). In this way, routing information is condensed at area boundaries and outside the area so that routes are exchanged between areas in an efficient manner.

If the network numbers in an area are arranged into sets of contiguous routes, the ABRs can be configured to advertise a summary route that covers all the individual networks within the area that fall into the specified range.

The **no** variant of this command disables this function and restores default behavior.

**Syntax** `area <area-id> range <ip-addr/prefix-length> [advertise|not-advertise]`  
`no area <area-id> range <ip-addr/prefix-length>`

| Parameter               | Description                                                                                                                                                        |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>               | The OSPF area that you summarizing the routes for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. |
|                         | <ip-addr> OSPF Area ID expressed in IPv4 address format A.B.C.D.                                                                                                   |
|                         | <0-4294967295> OSPF Area ID expressed as a decimal number within the range shown.                                                                                  |
|                         | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.                                                                  |
| <ip-addr/prefix-length> | The area range prefix and length.                                                                                                                                  |
| advertise               | Advertise this range as a summary route into other areas.                                                                                                          |
| not-advertise           | Does not advertise this range.                                                                                                                                     |

**Default** The area range is not configured by default. The area range is advertised if it is configured.

**Mode** Router Configuration

**Usage** You can configure multiple ranges on a single area with multiple instances of this command, so OSPF summarizes addresses for different sets of IPv4 address ranges.

Ensure OSPF IPv4 routes exist in the area range for advertisement before using this command.

**Example**   awplus# configure terminal  
awplus(config)# router ospf 100  
awplus(config-router)# area 1 range 192.16.0.0/16  
awplus(config-router)# area 1 range 203.18.0.0/16

# area stub

**Overview** This command defines an OSPF area as a stub area. By default, no stub area is defined.

Use this command when routers in the area do not require learning about summary LSAs from other areas. You can define the area as a totally stubby area by configuring the Area Border Router of that area using the **area stub no-summary** command.

There are two stub area router configuration commands: the **area stub** and **area default-cost** commands. In all routers attached to the stub area, configure the area by using the **area stub** command. For an area border router (ABR) attached to the stub area, also use the **area default-cost** command.

The **no** variant of this command removes this definition.

**Syntax** `area <area-id> stub [no-summary]`  
`no area <area-id> stub [no-summary]`

| Parameter  | Description                                                                                                                                                                                                                                                              |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>  | The OSPF area that you are configuring as a stub area. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID. |
|            | <ip-addr> OSPF Area ID expressed in IPv4 address in the format A.B.C.D.                                                                                                                                                                                                  |
|            | <0-4294967295> OSPF Area ID expressed as a decimal number within the range shown.                                                                                                                                                                                        |
|            | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID.                                                                                                                                                                        |
| no-summary | Stops an ABR from sending summary link advertisements into the stub area.                                                                                                                                                                                                |

**Mode** Router Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# router ospf 100`  
`awplus(config-router)# area 1 stub`

**Related Commands** [area default-cost](#)

# area virtual-link

**Overview** This command configures a link between two backbone areas that are physically separated through other non-backbone areas.

In OSPF, all non-backbone areas must be connected to a backbone area. If the connection to the backbone is lost, the virtual link repairs the connection.

The **no** variant of this command removes the virtual link.

**Syntax**

```

area <area-id> virtual-link <ip-addr> [<auth-key>|<msg-key>]
no area <area-id> virtual-link <ip-addr> [<auth-key>|<msg-key>]

area <area-id> virtual-link <ip-addr> authentication
[message-digest|null] [<auth-key>|<msg-key>]

no area <area-id> virtual-link <ip-addr> authentication
[message-digest|null] [<auth-key>|<msg-key>]

area <area-id> virtual-link <ip-addr> [authentication]
[dead-interval <1-65535>] [hello-interval <1-65535>]
[retransmit-interval <1-3600>] [transmit-delay <1-3600>]

no area <area-id> virtual-link <ip-addr> [authentication]
[dead-interval] [hello-interval] [retransmit-interval]
[transmit-delay]
  
```

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |              |                                                        |                |                                                                    |

| <1-255>        | The key ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |              |                                                        |                |                                                                    |
| <pswd-long>    | Authentication password of 16 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |              |                                                        |                |                                                                    |
| authentication | Enables authentication on this virtual link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |              |                                                        |                |                                                                    |

| Parameter           | Description                                                                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| message-digest      | Use message-digest authentication.                                                                                                                                      |
| null                | Use null authentication to override password or message digest.                                                                                                         |
| dead-interval       | If no packets are received from a particular neighbor for dead-interval seconds, the router considers that neighboring router as being off-line.<br>Default: 40 seconds |
|                     | <1-65535>      The number of seconds in the interval.                                                                                                                   |
| hello-interval      | The interval the router waits before it sends a hello packet.<br>Default: 10 seconds                                                                                    |
|                     | <1-65535>      The number of seconds in the interval.                                                                                                                   |
| retransmit-interval | The interval the router waits before it retransmits a packet.<br>Default: 5 seconds                                                                                     |
|                     | <1-3600>      The number of seconds in the interval.                                                                                                                    |
| transmit-delay      | The interval the router waits before it transmits a packet.<br>Default: 1 seconds                                                                                       |
|                     | <1-3600>      The number of seconds in the interval.                                                                                                                    |

### Mode Router Configuration

**Usage** You can configure virtual links between any two backbone routers that have an interface to a common non-backbone area. The protocol treats these two routers, joined by a virtual link, as if they were connected by an unnumbered point-to-point network. To configure a virtual link, you require:

- The transit area ID, i.e. the area ID of the non backbone area that the two backbone routers are both connected to.
- The corresponding virtual link neighbor's router ID. To see the router ID use the [show ip ospf](#) command.

Configure the **hello-interval** to be the same for all routers attached to a common network. A short **hello-interval** results in the router detecting topological changes faster but also an increase in the routing traffic.

The **retransmit-interval** is the expected round-trip delay between any two routers in a network. Set the value to be greater than the expected round-trip delay to avoid needless retransmissions.

The **transmit-delay** is the time taken to transmit a link state update packet on the interface. Before transmission, the link state advertisements in the update packet, are incremented by this amount. Set the **transmit-delay** to be greater than zero. Also, take into account the transmission and propagation delays for the interface.

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 virtual-link 10.10.11.50 hello 5
dead 10
```

**Related  
Commands**    area authentication  
                  show ip ospf  
                  show ip ospf virtual-links

# auto-cost reference bandwidth

**Overview** This command controls how OSPF calculates default metrics for the interface. Use the **no** variant of this command to assign cost based only on the interface bandwidth.

**Syntax** `auto-cost reference-bandwidth <1-4294967>`  
`no auto-cost reference-bandwidth`

| Parameter                      | Description                                                  |
|--------------------------------|--------------------------------------------------------------|
| <code>&lt;1-4294967&gt;</code> | The reference bandwidth in terms of Mbits per second (Mbps). |

**Default** 1000 Mbps

**Usage** By default, OSPF calculates the OSPF metric for an interface by dividing the reference bandwidth by the interface bandwidth. The default for the reference bandwidth is 1000 Mbps. As a result, if this default is used, there is very little difference between the metrics applied to interfaces of increasing bandwidth beyond 1000 Mbps.

The auto-cost command is used to alter this reference bandwidth in order to give a real difference between the metrics of high bandwidth links of differing bandwidths. In a network that has multiple links with high bandwidths, specify a larger reference bandwidth value to differentiate the costs on those links.

Cost is calculated by dividing the reference bandwidth (Mbps) by the layer 3 interface (Switched Virtual Interface (SVI), Loopback or Ethernet interface) bandwidth. Interface bandwidth may be altered by using the [bandwidth](#) command as the SVI does not auto detect the bandwidth based on the speed of associated switch ports.

When the reference bandwidth calculation results in a cost integer greater than 1 but contains a fractional value (value after the decimal point), the result rounds down to the nearest integer. The following example shows how the cost is calculated.

The reference bandwidth is 1000 Mbps and the interface bandwidth is 7 Mbps.

Calculation =  $1000/7$

Calculation result = 142.85 (integer of 142, fractional value of 0.85)

Result after rounding down to the nearest integer = 142 (Interface cost is 142)

When the reference bandwidth calculation results in a cost less than 1, it is rounded up to the nearest integer which is 1. The following example shows how the cost is calculated.

The reference bandwidth is 1000 Mbps and the interface bandwidth is 10000 Mbps.

Calculation =  $1000/10000$

Calculation result = 0.1

Result after rounding up to the nearest integer = 1 (Interface cost is 1)

The auto-cost reference bandwidth value should be consistent across all OSPF routers in the OSPF process.

Note that using the [ip ospf cost](#) command on a layer 3 interface will override the cost calculated by the reference bandwidth command.

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# auto-cost reference-bandwidth 1000
```

**Related  
Commands** [ip ospf cost](#)

# bandwidth

**Overview** Use this command to specify the maximum bandwidth to be used for each VLAN interface.

The bandwidth value is in bits. OSPF uses this to calculate metrics for the VLAN interface.

The **no** variant of this command removes any applied bandwidth value and replaces it with a value equal to the lowest port speed within that VLAN.

**Syntax** `bandwidth <bandwidth-setting>`  
`no bandwidth`

| Parameter                              | Description                                                                                                                                                                                                                                                                      |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;bandwidth-setting&gt;</code> | Sets the bandwidth for the interface. Enter a value in the range 1 to 10000000000 bits per second. Note that to avoid entering many zeros, you can add k, m, or g to internally add 3, 6 or 9 zeros to the number entered. For example entering 1k is the same as entering 1000. |

**Mode** Interface Configuration for a VLAN interface.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# bandwidth 1000000`

**Related Commands** [show running-config access-list](#)  
[show interface](#)

# capability opaque

**Overview** This command enables opaque-LSAs. Opaque-LSAs are Type 9, 10 and 11 LSAs that deliver information used by external applications.

By default, opaque-LSAs are enabled.

Use the **no** variant of this command to disables opaque-LSAs.

**Syntax** `capability opaque`  
`no capability opaque`

**Mode** Router Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# router ospf 100`  
`awplus(config-router)# no capability opaque`

# capability restart

**Overview** This command enables OSPF Graceful Restart or restart signaling features. By default, this is enabled.

Use the **no** variant of this command to disable OSPF Graceful Restart and restart signaling features.

**Syntax** `capability restart [graceful|signaling]`  
`no capability restart`

| Parameter | Description                    |
|-----------|--------------------------------|
| graceful  | Enable graceful OSPF restart.  |
| signaling | Enable OSPF restart signaling. |

**Default** Graceful restart

**Mode** Router Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# router ospf 100`  
`awplus(config-router)# capability restart graceful`

# clear ip ospf process

**Overview** This command clears and restarts the OSPF routing process. Specify the Process ID to clear one particular OSPF process. When no Process ID is specified, this command clears all running OSPF processes.

**Syntax** `clear ip ospf [<0-65535>] process`

| Parameter | Description             |
|-----------|-------------------------|
| <0-65535> | The Routing Process ID. |

**Mode** Privileged Exec

**Example** `awplus# clear ip ospf process`

# compatible rfc1583

**Overview** This command changes the method used to calculate summary route to the that specified in RFC 1583. By default, OSPF uses the method specified in RFC 2328.

RFC 1583 specifies a method for calculating the metric for summary routes based on the minimum metric of the component paths available. RFC 2328 specifies a method for calculating metrics based on maximum cost.

It is possible that some ABRs in an area might conform to RFC 1583 and others support RFC 2328, which could lead to incompatibility in their interoperation. This command addresses this issue by allowing you to selectively disable compatibility with RFC 2328.

Use the **no** variant of this command to disable RFC 1583 compatibility.

**Syntax**    compatible rfc1583  
             no compatible rfc1583

**Mode**     Router Configuration

**Example**   awplus# configure terminal  
             awplus(config)# router ospf 100  
             awplus(config-router)# compatible rfc1583

# debug ospf events

**Overview** This command enables OSPF debugging for OSPF event troubleshooting.

To enable all debugging options, specify **debug ospf event** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF debugging. Use this command without parameters to disable all the options.

**Syntax** `debug ospf events [abr] [asbr] [lsa] [nssa] [os] [router]  
[vlink]`  
`no debug ospf events [abr] [asbr] [lsa] [nssa] [os] [router]  
[vlink]`

| Parameter | Description                  |
|-----------|------------------------------|
| abr       | Shows ABR events.            |
| asbr      | Shows ASBR events.           |
| lsa       | Shows LSA events.            |
| nssa      | Shows NSSA events.           |
| os        | Shows OS interaction events. |
| router    | Shows other router events.   |
| vlink     | Shows virtual link events.   |

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# debug ospf events asbr lsa`

**Related  
Commands** [terminal monitor](#)  
[undebug ospf events](#)

# debug ospf ifsm

- Overview** This command specifies debugging options for OSPF Interface Finite State Machine (IFSM) troubleshooting.
- To enable all debugging options, specify **debug ospf ifsm** with no additional parameters.
- The **no** and **undebug** variant of this command disable OSPF IFSM debugging. Use this command without parameters to disable all the options.

**Syntax** `debug ospf ifsm [status] [events] [timers]`  
`no debug ospf ifsm [status] [events] [timers]`

| Parameter | Description                       |
|-----------|-----------------------------------|
| events    | Displays IFSM event information.  |
| status    | Displays IFSM status information. |
| timers    | Displays IFSM timer information.  |

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# no debug ospf ifsm events status`  
`awplus# debug ospf ifsm status`  
`awplus# debug ospf ifsm timers`

**Related Commands** [terminal monitor](#)  
[undebug ospf ifsm](#)

# debug ospf lsa

**Overview** This command enables debugging options for OSPF Link State Advertisements (LSA) troubleshooting. This displays information related to internal operations of LSAs.

To enable all debugging options, specify **debug ospf lsa** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF LSA debugging. Use this command without parameters to disable all the options.

**Syntax**

```
debug ospf lsa [flooding] [generate] [install] [maxage] [refresh]
no debug ospf lsa [flooding] [generate] [install] [maxage] [refresh]
```

| Parameter | Description                              |
|-----------|------------------------------------------|
| flooding  | Displays LSA flooding.                   |
| generate  | Displays LSA generation.                 |
| install   | Show LSA installation.                   |
| maxage    | Shows maximum age of the LSA in seconds. |
| refresh   | Displays LSA refresh.                    |

**Mode** Privileged Exec and Global Configuration

**Examples** awplus# undebug ospf lsa refresh

**Output** Figure 24-1: Example output from the **debug ospf lsa** command

```
2002/05/09 14:08:11 OSPF: LSA[10.10.10.10:10.10.10.70]: instance(0x8139cd0)
created with Link State Update
2002/05/09 14:08:11 OSPF: RECV[LS-Upd]: From 10.10.10.70 via vlan5:10.10.10.50
(10.10.10.10 -> 224.0.0.5)
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: Begin send queue
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: # of LSAs 1, destination 224.0.0.5
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: End send queue
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: To 224.0.0.5 via vlan5:10.10.10.50
```

**Related Commands** [terminal monitor](#)  
[undebug ospf lsa](#)

# debug ospf nfsm

- Overview** This command enables debugging options for OSPF Neighbor Finite State Machines (NFSMs).
- To enable all debugging options, specify **debug ospf nfsm** with no additional parameters.
- The **no** and **undebug** variant of this command disable OSPF NFSM debugging. Use this command without parameters to disable all the options.

**Syntax** `debug ospf nfsm [events] [status] [timers]`  
`no debug ospf nfsm [events] [status] [timers]`

| Parameter | Description                       |
|-----------|-----------------------------------|
| events    | Displays NFSM event information.  |
| status    | Displays NFSM status information. |
| timers    | Displays NFSM timer information.  |

**Mode** Privileged Exec and Global Configuration

**Examples** `awplus# debug ospf nfsm events`  
`awplus# no debug ospf nfsm timers`  
`awplus# undebug ospf nfsm events`

**Related Commands** [terminal monitor](#)  
[undebug ospf nfsm](#)

# debug ospf nsm

**Overview** This command enables debugging options for the OSPF Network Service Module. To enable both debugging options, specify **debug ospf nsm** with no additional parameters. The **no** and **undebug** variant of this command disable OSPF NSM debugging. Use this command without parameters to disable both options.

**Syntax** debug ospf nsm [interface] [redistribute]  
no debug ospf nsm [interface] [redistribute]

| Parameter    | Description                           |
|--------------|---------------------------------------|
| interface    | Specify NSM interface information.    |
| redistribute | Specify NSM redistribute information. |

**Mode** Privileged Exec and Global Configuration

**Examples** awplus# debug ospf nsm interface  
awplus# no debug ospf nsm redistribute  
awplus# undebug ospf nsm interface

**Related Commands** [terminal monitor](#)  
[undebug ospf nsm](#)

# debug ospf packet

**Overview** This command enables debugging options for OSPF packets.

To enable all debugging options, specify **debug ospf packet** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF packet debugging. Use this command without parameters to disable all options.

**Syntax** `debug ospf packet [dd] [detail] [hello] [ls-ack] [ls-request] [ls-update] [recv] [send]`

`no debug ospf packet [dd] [detail] [hello] [ls-ack] [ls-request] [ls-update] [recv] [send]`

| Parameter  | Description                                              |
|------------|----------------------------------------------------------|
| dd         | Specifies debugging for OSPF database descriptions.      |
| detail     | Sets the debug option to detailed information.           |
| hello      | Specifies debugging for OSPF hello packets.              |
| ls-ack     | Specifies debugging for OSPF link state acknowledgments. |
| ls-request | Specifies debugging for OSPF link state requests.        |
| ls-update  | Specifies debugging for OSPF link state updates.         |
| recv       | Specifies the debug option set for received packets.     |
| send       | Specifies the debug option set for sent packets.         |

**Mode** Privileged Exec and Global Configuration

**Examples**

```
awplus# debug ospf packet detail
awplus# debug ospf packet dd send detail
awplus# no debug ospf packet ls-request recv detail
awplus# undebug ospf packet ls-request recv detail
```

**Related Commands** [terminal monitor](#)  
[undebug ospf packet](#)

# debug ospf route

**Overview** This command enables debugging of route calculation. Use this command without parameters to turn on all the options.

To enable all debugging options, specify **debug ospf route** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF route debugging. Use this command without parameters to disable all options.

**Syntax** debug ospf route [ase] [ia] [install] [spf]  
no debug ospf route [ase] [ia] [install] [spf]

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| ia        | Specifies the debugging of Inter-Area route calculation. |
| ase       | Specifies the debugging of external route calculation.   |
| install   | Specifies the debugging of route installation.           |
| spf       | Specifies the debugging of SPF calculation.              |

**Mode** Privileged Exec and Global Configuration

**Examples** awplus# debug ospf route  
awplus# no debug ospf route ia  
awplus# debug ospf route install  
awplus# undebug ospf route install

**Related Commands** [terminal monitor](#)  
[undebug ospf route](#)

# default-information originate

**Overview** This command creates a default external route into an OSPF routing domain.

When you use the **default-information originate** command to redistribute routes into an OSPF routing domain, then the system acts like an Autonomous System Boundary Router (ASBR). By default, an ASBR does not generate a default route into the OSPF routing domain.

When using this command, also specify the **route-map** *<route-map>* option to avoid a dependency on the default network in the routing table.

The **metric-type** is an external link type associated with the default route advertised into the OSPF routing domain. The value of the external route could be either Type 1 or 2. The default is Type 2.

The **no** variant of this command disables this feature.

**Syntax**

```
default-information originate [always] [metric <metric>]
[metric-type <1-2>] [route-map <route-map>]

no default-information originate [always] [metric]
[metric-type] [route-map]
```

| Parameter   | Description                                                                                                                                                                |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| always      | Used to advertise the default route regardless of whether there is a default route.                                                                                        |
| <metric>    | The metric value used in creating the default route. Enter a value in the range 0 to 16777214. The default metric value is 10. The value used is specific to the protocol. |
| <1-2>       | External metric type for default routes, either OSPF External Type 1 or Type 2 metrics. Enter the value 1 or 2.                                                            |
| route-map   | Specifies to use a specific route-map.                                                                                                                                     |
| <route-map> | The route-map name. It is a string comprised of any characters, numbers or symbols.                                                                                        |

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# default-information originate always
metric 23 metric-type 2 route-map myinfo
```

**Related Commands** [route-map](#)

# default-metric (OSPF)

**Overview** This command sets default metric values for the OSPF routing protocol.

The **no** variant of this command returns OSPF to using built-in, automatic metric translations, as appropriate for each routing protocol.

**Syntax** `default-metric <1-16777214>`  
`no default-metric [<1-16777214>]`

| Parameter                       | Description                                                          |
|---------------------------------|----------------------------------------------------------------------|
| <code>&lt;1-16777214&gt;</code> | Default metric value appropriate for the specified routing protocol. |

**Mode** Router Configuration

**Usage** A default metric facilitates redistributing routes even with incompatible metrics. If the metrics do not convert, the default metric provides an alternative and enables the redistribution to continue. The effect of this command is that OSPF will use the same metric value for **all** redistributed routes. Use this command in conjunction with the [redistribute \(OSPF\)](#) command.

**Examples**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# default-metric 100
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no default-metric
```

**Related commands** [redistribute \(OSPF\)](#)

# distance (OSPF)

**Overview** This command sets the administrative distance for OSPF routes based on the route type. Your device uses this value to select between two or more routes to the same destination from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). See the [Route Selection Feature Overview and Configuration Guide](#) for more information.

Use the command **distance ospf** to set the distance for an entire category of OSPF routes, rather than the specific routes that pass an access list.

Use the command **distance <1-255>**, with no other parameter, to set the same distance for all OSPF route types.

The **no** variant of this command sets the administrative distance for all OSPF routes to the default of 110.

**Syntax**

```
distance <1-255>
distance ospf {external <1-255>|inter-area <1-255>|intra-area <1-255>}
no distance {ospf|<1-255>}
```

| Parameter  | Description                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <1-255>    | Specify the Administrative Distance value for OSPF routes.                                                                                  |
| external   | Sets the distance for routes from other routing domains, learned by redistribution. Specify an OSPF external distance in the range <1-255>. |
| inter-area | Sets the distance for all routes from one area to another area. Specify an OSPF inter-area distance in the range <1-255>.                   |
| intra-area | Sets the distance for all routes within an area. Specify an OSPF intra-area distance in the range <1-255>.                                  |

**Default** The default OSPF administrative distance is 110. The default Administrative Distance for each type of route (intra, inter, or external) is 110.

**Mode** Router Configuration

**Usage** The administrative distance rates the trustworthiness of a routing information source. The distance could be any integer from 0 to 255. A higher distance value indicates a lower trust rating. For example, an administrative distance of 255 indicates that the routing information source cannot be trusted and should be ignored.

Use this command to set the distance for an entire group of routes, rather than a specific route that passes an access list.

**Examples** To set the following administrative distances for route types in OSPF 100:

- 20 for inter-area routes

- 10 for intra-area routes
- 40 for external routes

use the commands:

```
awplus(config)# router ospf 100
```

```
awplus(config-router)# distance ospf inter-area 20 intra-area  
10 external 40
```

To set the administrative distance for all routes in OSPF 100 back to the default of 110, use the commands:

```
awplus(config)# router ospf 100
```

```
awplus(config-router)# no distance ospf
```

# distribute-list (OSPF)

**Overview** Use this command to apply filtering to the transfer of routing information between OSPF and the IP route table. You can apply filtering in either direction, from OSPF to the IP route table using an **in** distribute-list, or from the IP route table to OSPF using an **out** distribute-list.

The effect of an **in** filter is that some route information that OSPF has learned from LSA updates will not be installed into the IP route table. The effect of an **out** filter is that some route information that could be redistributed to OSPF will not be redistributed to OSPF. See the **Usage** section below for the distinction between the **in** and **out** distribute-lists.

The entities that are used to perform filtering are ACLs or route-maps, which match on certain attributes in the routes that are being transferred.

For information about ACLs and route maps, see the [ACL Feature Overview and Configuration Guide](#) and the [Route Map Feature Overview and Configuration Guide](#).

The **no** variant of this command removes the configured distribute-list command entry.

**Syntax** `distribute-list {<access-list-name>|route-map  
<route-map-name>} in`  
`no distribute-list <access-list-name> in`

| Parameter                             | Description                                                                                                                                                                          |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;access-list-name&gt;</code> | Specifies the name of the access list. The access list defines which networks are received and which are suppressed.                                                                 |
| <code>in</code>                       | Indicates that this applies to incoming advertised routes.                                                                                                                           |
| <code>out</code>                      | Indicates that this applies to outgoing advertised routes.                                                                                                                           |
| <code>&lt;route-map-name&gt;</code>   | The name of the route-map that the distribute-list applies. This defines which networks are installed in the IP route table and which networks are filtered from the IP route table. |
| <code>connected</code>                | Specify the redistribution of connected routes.                                                                                                                                      |
| <code>rip</code>                      | Specify the redistribution of RIP routes.                                                                                                                                            |
| <code>static</code>                   | Specify the redistribution of static routes.                                                                                                                                         |

**Mode** Router Configuration

**Usage** There are **in** and **out** distribute-lists, which carry out different route filtering activities:

- The **in** distribute list is applied to the process of installing OSPF routes into the IP route table. The SPF calculation generate a set of routes calculated

from the LSA database. By default, all of these routes become OSPF's candidate routes for inclusion into the IP route table.

- An **in** distribute-list can be used to control whether or not certain routes generated by the SPF calculation are included into the set of candidates for inclusion into the IP route table. Those routes that match **deny** entries in the distribute-list will not be considered for inclusion into the IP route table.
- The **out** distribute-list applies the process of redistributing non-OSPF routes into OSPF. If OSPF redistribution is configured, and an **out** distribute-list is also configured, then routes that match deny entries in the distribute-list will not be redistributed into OSPF.

**Examples** The following example shows the installation of OSPF routes into the IP route table with route map mymap1 applied, which will process routes that have been tagged 100:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match tag 100
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# distribute-list route-map mymap1 in
```

Use the following commands to configure a route-map to specifically prevent OSPF from offering 192.168.1.0/24 as a candidate for inclusion into the IP route table:

```
awplus# configure terminal
awplus(config)# ip prefix-list 100 seq 5 permit 192.168.1.0/24
awplus(config)# route-map 100 deny 10
awplus(config-route-map)# match ip address prefix-list 100
awplus(config-route-map)# exit
awplus(config)# route-map 100 permit 20
awplus(config-router)# router ospf 1
awplus(config-router)# distribute-list route-map 100 in
```

**Related Commands**

- [match interface](#)
- [redistribute \(OSPF\)](#)
- [route-map](#)

# enable db-summary-opt

**Overview** This command enables OSPF database summary list optimization.  
The **no** variant of this command disables database summary list optimization.

**Syntax** `enable db-summary-opt`  
`no enable db-summary-opt`

**Default** The default setting is disabled.

**Mode** Router Configuration

**Usage** When this feature is enabled, the database exchange process is optimized by removing the LSA from the database summary list for the neighbor, if the LSA instance in the database summary list is the same as, or less recent than, the listed LSA in the database description packet received from the neighbor.

**Examples** To enable OSPF database summary list optimization, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf
awplus(config-router)# enable db-summary-opt
```

To disable OSPF database summary list optimization, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf
awplus(config-router)# no enable db-summary-opt
```

**Validation  
Commands** `show running-config`

# host area

**Overview** This command configures a stub host entry belonging to a particular area. You can use this command to advertise specific host routes in the router-LSA as stub link. Since stub host belongs to the specified router, specifying cost is optional.

The **no** variant of this command removes the host area configuration.

**Syntax** `host <ip-address> area <area-id> [cost <0-65535>]`  
`no host <ip-address> area <area-id> [cost <0-65535>]`

| Parameter                         | Description                                                                                                                                                                                                                                                                         |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code>   | The IPv4 address of the host, in dotted decimal notation.                                                                                                                                                                                                                           |
| <code>&lt;area-id&gt;</code>      | The OSPF area ID of the transit area that configuring the stub host entry for. Use one of the following formats: <ul style="list-style-type: none"> <li>dotted decimal format, e.g. 0.0.1.2.</li> <li>normal decimal format in the range &lt;0-4294967295&gt;, e.g. 258.</li> </ul> |
| <code>cost &lt;0-65535&gt;</code> | The cost for the stub host entry.                                                                                                                                                                                                                                                   |

**Default** By default, no host entry is configured.

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# host 172.16.10.100 area 1
awplus(config-router)# host 172.16.10.101 area 2 cost 10
```

# ip ospf authentication

**Overview** This command sets the authentication method used when sending and receiving OSPF packets on the current VLAN interface. The default is to use no authentication. If no authentication method is specified in this command, then plain text authentication will be used.

The **no** variant of this command disables the authentication.

**Syntax** `ip ospf [<ip-address>] authentication [message-digest|null]`  
`no ip ospf [<ip-address>] authentication`

| Parameter      | Description                                                                                     |
|----------------|-------------------------------------------------------------------------------------------------|
| <ip-address>   | The IP address of the interface.                                                                |
| message-digest | Use the message digest authentication.                                                          |
| null           | Use no authentication. It overrides password or message-digest authentication of the interface. |

**Mode** Interface Configuration for a VLAN interface.

**Usage** Use the [ip ospf authentication](#) command to specify a Simple Text password. Use the [ip ospf message-digest-key](#) command to specify MD5 password.

**Example** In this example, VLAN interface `vlan2` is configured to have no authentication. This will override any text or MD5 authentication configured on this interface.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf authentication null
```

**Related Commands** [ip ospf authentication-key](#)  
[area authentication](#)  
[ip ospf message-digest-key](#)

# ip ospf authentication-key

**Overview** This command specifies an OSPF authentication password for the neighboring routers.

The **no** variant of this command removes the OSPF authentication password.

**Syntax** `ip ospf [<ip-address>] authentication-key <pswd-long>`  
`no ip ospf [<ip-address>] authentication-key`

| Parameter    | Description                                                                           |
|--------------|---------------------------------------------------------------------------------------|
| <ip-address> | The IPv4 address of the interface, in dotted decimal notation.                        |
| <pswd-long>  | Specifies the authentication password.<br>The string by the end of line will be used. |

**Default** By default, an authentication password is not specified.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command creates a password (key) that is inserted into the OSPF header when AlliedWare Plus™ software originates routing protocol packets. Assign a separate password to each network for different VLAN interfaces. All neighboring routers on the same network with the same password exchange OSPF routing data.

The key can be used only when authentication is enabled for an area. Use the **area authentication** command to enable authentication.

Simple password authentication allows a password to be configured for each area. Configure the routers in the same routing domain with the same password.

**Example** In the following example, an authentication key test is created on VLAN interface `vlan2` in area 0. Note that first authentication is enabled for area 0.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# network 10.10.10.0/24 area 0
awplus(config-router)# area 0 authentication
awplus(config-router)# exit
awplus(config)# interface vlan2
awplus(config-if)# ip ospf 3.3.3.3 authentication-key test
```

**Related Commands** [area authentication](#)  
[ip ospf authentication](#)

# ip ospf cost

**Overview** This command explicitly specifies the cost of the link-state metric in a router-LSA. The **no** variant of this command resets the VLAN interface cost to the default.

**Syntax** `ip ospf [<ip-address>] cost <1-65535>`  
`no ip ospf [<ip-address>] cost`

| Parameter    | Description                                                    |
|--------------|----------------------------------------------------------------|
| <ip-address> | The IPv4 address of the interface, in dotted decimal notation. |
| <1-65535>    | The link-state metric.                                         |

**Default** By default there is no static value set and the OSPF cost is automatically calculated by using the [auto-cost reference bandwidth](#) command.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command explicitly sets a user specified cost of sending packets out the interface. Using this command overrides the cost value calculated automatically with the auto-cost reference bandwidth feature.

The interface cost indicates the overhead required to send packets across a certain VLAN interface. This cost is stated in the Router-LSA's link. Typically, the cost is inversely proportional to the bandwidth of an interface. By default, the cost of a VLAN interface is calculated according to the following formula:

$$\text{reference bandwidth} / \text{interface bandwidth}$$

To set the VLAN interface cost manually, use this command.

**Example** The following example shows setting ospf cost to 10 on VLAN interface `vlan25` for IP address 10.10.10.50

```
awplus# configure terminal
awplus(config)# interface vlan25
awplus(config-if)# ip ospf 10.10.10.50 cost 10
```

**Related Commands** [show ip ospf interface](#)  
[auto-cost reference bandwidth](#)

# ip ospf database-filter

**Overview** This command turns on the LSA database-filter for a particular VLAN interface. The **no** variant of this command turns off the LSA database-filter.

**Syntax** `ip ospf [<ip-address>] database-filter all out`  
`no ip ospf [<ip-address>] database-filter`

| Parameter    | Description                                                    |
|--------------|----------------------------------------------------------------|
| <ip-address> | The IPv4 address of the interface, in dotted decimal notation. |

**Default** By default, all outgoing LSAs are flooded to the interface.

**Mode** Interface Configuration for a VLAN interface.

**Usage** OSPF floods new LSAs over all interfaces in an area, except the interface on which the LSA arrives. This redundancy ensures robust flooding. However, too much redundancy can waste bandwidth and might lead to excessive link and CPU usage in certain topologies, resulting in destabilizing the network. To avoid this, use the **ip ospf database-filter** command to block flooding of LSAs over specified interfaces.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan1`  
`awplus(config-if# ip ospf database-filter all out`

# ip ospf dead-interval

**Overview** This command sets the interval during which no hello packets are received and after which a neighbor is declared dead.

The dead-interval is the amount of time that OSPF waits to receive an OSPF hello packet from the neighbor before declaring the neighbor is down. This value is advertised in the router's hello packets. It must be a multiple of the hello-interval and be the same for all routers on a specific network.

The **no** variant of this command returns the interval to the default of 40 seconds. If you have configured this command specifying the IP address of the interface and want to remove the configuration, specify the IP address ( **no ip ospf**<ip-address>**dead-interval**).

**Syntax** `ip ospf [<ip-address>] dead-interval <1-65535>`  
`no ip ospf [<ip-address>] dead-interval`

| Parameter    | Description                                                    |
|--------------|----------------------------------------------------------------|
| <ip-address> | The IPv4 address of the interface, in dotted decimal notation. |
| <1-65545>    | The interval in seconds.<br>Default: 40                        |

**Mode** Interface Configuration for a VLAN interface.

**Example** The following example shows configuring the dead-interval to 10 seconds on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf dead-interval 10
```

**Related Commands** [ip ospf hello-interval](#)  
[show ip ospf interface](#)

# ip ospf disable all

**Overview** This command completely disables OSPF packet processing on a VLAN interface. It overrides the [network area](#) command and disables the processing of packets on the specific interface.

Use the **no** variant of this command to restore OSPF packet processing on a selected interface.

**Syntax** `ip ospf disable all`  
`no ip ospf disable all`

**Mode** Interface Configuration for a VLAN interface.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip ospf disable all`

# ip ospf hello-interval

- Overview** This command specifies the interval between hello packets.
- The hello-interval is advertised in the hello packets. Configure the same hello-interval for all routers on a specific network. A shorter hello interval ensures faster detection of topological changes, but results in more routing traffic.
- The **no** variant of this command returns the interval to the default of 10 seconds.

**Syntax** `ip ospf [<ip-address>] hello-interval <1-65535>`  
`no ip ospf [<ip-address>] hello-interval`

| Parameter    | Description                                                  |
|--------------|--------------------------------------------------------------|
| <ip-address> | The IP address of the interface, in dotted decimal notation. |
| <1-65535>    | The interval in seconds.<br>Default: 10                      |

- Default** The default interval is 10 seconds.
- Mode** Interface Configuration for a VLAN interface.

**Example** The following example shows setting the hello-interval to 3 seconds on VLAN interface vlan2.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf hello-interval 3
```

**Related Commands** [ip ospf dead-interval](#)  
[show ip ospf interface](#)

# ip ospf message-digest-key

**Overview** This command registers an MD5 key for OSPF MD5 authentication.

Message Digest Authentication is a cryptographic authentication. A key (password) and key-id are configured on each router. The router uses an algorithm based on the OSPF packet, the key, and the key-id to generate a message digest that gets appended to the packet.

The **no** variant of this command removes the MD5 key.

**Syntax** `ip ospf [<ip-address>] message-digest-key <key-id> md5  
<pswd-long>`  
`no ip ospf [<ip-address>] message-digest-key <key-id>`

| Parameter    | Description                                                                 |
|--------------|-----------------------------------------------------------------------------|
| <ip-address> | The IPv4 address of the interface, in dotted decimal notation.              |
| <key-id>     | A key ID number specified as an integer between 1 and 255.                  |
| md5          | Use the MD5 algorithm.                                                      |
| <pswd-long>  | The OSPF password. This is a string of 1 to 16 characters including spaces. |

**Default** By default, there is no MD5 key registered.

**Mode** Interface Configuration for a VLAN interface.

**Usage** Use this command for uninterrupted transitions between passwords. It allows you to add a new key without having to delete the existing key. While multiple keys exist, all OSPF packets will be transmitted in duplicate; one copy of the packet will be transmitted for each of the current keys. This is helpful for administrators who want to change the OSPF password without disrupting communication. The system begins a rollover process until all the neighbors have adopted the new password. This allows neighboring routers to continue communication while the network administrator is updating them with a new password. The router will stop sending duplicate packets once it detects that all of its neighbors have adopted the new password.

Maintain only one password per interface, removing the old password whenever you add a new one. This will prevent the local system from continuing to communicate with the system that is using the old password. Removing the old password also reduces overhead during rollover. All neighboring routers on the same network must have the same password value to enable exchange of OSPF routing data.

**Examples** The following example shows OSPF authentication on the VLAN interface vlan5 when IP address has not been specified.

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ip ospf authentication message-digest
awplus(config-if)# ip ospf message-digest-key 1 md5 yourpass
```

The following example shows configuring OSPF authentication on the VLAN interface vlan2 for the IP address 1.1.1.1. (If the interface has two IP addresses assigned-- 1.1.1.1 & 2.2.2.2, OSPF authentication will be enabled only for the IP address 1.1.1.1).

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf 1.1.1.1 authentication
message-digest
awplus(config-if)# ip ospf 1.1.1.1 message-digest-key 2 md5
yourpass
```

## ip ospf mtu

**Overview** This command sets the MTU size for OSPF. Whenever OSPF constructs packets, it uses VLAN interface MTU size as Maximum IP packet size. This command forces OSPF to use the specified value, overriding the actual VLAN interface MTU size.

Use the **no** variant of this command to return the MTU size to the default.

**Syntax** `ip ospf mtu <576-65535>`  
`no ip ospf mtu`

**Default** By default, OSPF uses interface MTU derived from the VLAN interface.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command allows an administrator to configure the MTU size recognized by the OSPF protocol. It does not configure the MTU settings on the VLAN interface. OSPF will not recognize MTU size configuration changes made to the kernel until the MTU size is updated through the CLI.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip ospf mtu 1480`

# ip ospf mtu-ignore

**Overview** Use this command to configure OSPF so that OSPF does not check the MTU size during DD (Database Description) exchange.

Use the **no** variant of this command to make sure that OSPF checks the MTU size during DD exchange.

**Syntax** `ip ospf [<ip-address>] mtu-ignore`  
`no ip ospf [<ip-address>] mtu-ignore`

| Parameter    | Description                                                |
|--------------|------------------------------------------------------------|
| <ip-address> | IPv4 address of the interface, in dotted decimal notation. |

**Mode** Interface Configuration for a VLAN interface.

**Usage** By default, during the DD exchange process, OSPF checks the MTU size described in the DD packets received from the neighbor. If the MTU size does not match the interface MTU, the neighbor adjacency is not established. Using this command makes OSPF ignore this check and allows establishing of adjacency regardless of MTU size in the DD packet.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip ospf mtu-ignore`

# ip ospf network

**Overview** This command configures the OSPF network type to a type different from the default for the particular VLAN interface.

The **no** variant of this command returns the network type to the default for the particular VLAN interface.

**Syntax** `ip ospf network [broadcast|non-broadcast|point-to-point|point-to-multipoint]`  
`no ip ospf network`

| Parameter                        | Description                                   |
|----------------------------------|-----------------------------------------------|
| <code>broadcast</code>           | Sets the network type to broadcast.           |
| <code>non-broadcast</code>       | Sets the network type to NBMA.                |
| <code>point-to-multipoint</code> | Sets the network type to point-to-multipoint. |
| <code>point-to-point</code>      | Sets the network type to point-to-point.      |

**Default** The default is the `broadcast` OSPF network type for a VLAN interface.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command forces the interface network type to the specified type. Depending on the network type, OSPF changes the behavior of the packet transmission and the link description in LSAs.

**Example** The following example shows setting the network type to `point-to-point` on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf network point-to-point
```

# ip ospf priority

**Overview** This command sets the router priority, which is a parameter used in the election of the designated router for the network.

The **no** variant of this command returns the router priority to the default of 1.

**Syntax** `ip ospf [<ip-address>] priority <priority>`  
`no ip ospf [<ip-address>] priority`

| Parameter    | Description                                             |
|--------------|---------------------------------------------------------|
| <ip-address> | The IP address of the interface.                        |
| <priority>   | <0-255> Specifies the Router Priority of the interface. |

**Default** The router priority for an interface is set to 1 by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage** Set the priority to help determine the OSPF Designated Router (DR) for a network. If two routers attempt to become the DR, the router with the higher router priority becomes the DR. If the router priority is the same for two routers, the router with the higher router ID takes precedence.

Only routers with nonzero router priority values are eligible to become the designated or backup designated router.

Configure router priority for multi-access networks only and not for point-to-point networks.

**Example** The following example shows setting the OSPF priority value to 3 on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf priority 3
```

**Related Commands** [ip ospf network](#)

# ip ospf resync-timeout

**Overview** Use this command to set the interval after which adjacency is reset if out-of-band resynchronization has not occurred. The interval period starts from the time a restart signal is received from a neighbor.

Use the **no** variant of this command to return to the default.

**Syntax** `ip ospf [<ip-address>] resync-timeout <1-65535>`  
`no ip ospf [<ip-address>] resync-timeout`

| Parameter    | Description                                                                |
|--------------|----------------------------------------------------------------------------|
| <ip-address> | The IP address of the interface.                                           |
| <1-65535>    | Specifies the resynchronization timeout value of the interface in seconds. |

**Mode** Interface Configuration for a VLAN interface.

**Example** The following example shows setting the OSPF resynchronization timeout value to 65 seconds on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf resync-timeout 65
```

# ip ospf retransmit-interval

**Overview** Use this command to specify the time between link-state advertisement (LSA) retransmissions for adjacencies belonging to the interface.

Use the **no** variant of this command to return to the default of 5 seconds.

**Syntax** `ip ospf [<ip-address>] retransmit-interval <1-65535>`  
`no ip ospf [<ip-address>] retransmit-interval`

| Parameter    | Description                        |
|--------------|------------------------------------|
| <ip-address> | The IP address of the interface.   |
| <1-65535>    | Specifies the interval in seconds. |

**Default** The default interval is 5 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage** After sending an LSA to a neighbor, the router keeps the LSA until it receives an acknowledgment. In case the router does not receive an acknowledgment during the set time (the retransmit interval value) it retransmits the LSA. Set the retransmission interval value conservatively to avoid needless retransmission. The interval should be greater than the expected round-trip delay between two routers.

**Example** The following example shows setting the `ospf retransmit interval` to 6 seconds on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf retransmit-interval 6
```

# ip ospf transmit-delay

**Overview** Use this command to set the estimated time it takes to transmit a link-state-update packet on the VLAN interface.

Use the **no** variant of this command to return to the default of 1 second.

**Syntax** `ip ospf [<ip-address>] transmit-delay <1-65535>`  
`no ip ospf [<ip-address>] transmit-delay`

| Parameter    | Description                                                      |
|--------------|------------------------------------------------------------------|
| <ip-address> | The IP address of the VLAN interface.                            |
| <1-65535>    | Specifies the time, in seconds, to transmit a link-state update. |

**Default** The default interval is 1 second.

**Mode** Interface Configuration for a VLAN interface.

**Usage** The transmit delay value adds a specified time to the age field of an update. If the delay is not added, the time in which the LSA transmits over the link is not considered. This command is especially useful for low speed links. Add transmission and propagation delays when setting the transmit delay value.

**Example** The following example shows setting the OSPF transmit delay time to 3 seconds on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip ospf transmit-delay 3
```

# max-concurrent-dd

**Overview** Use this command to set the limit for the number of Database Descriptors (DD) that can be processed concurrently.

Use the **no** variant of this command to reset the limit for the number of Database Descriptors (DD) that can be processed concurrently.

**Syntax** `max-concurrent-dd <1-65535>`  
`no max-concurrent-dd`

| Parameter                    | Description                         |
|------------------------------|-------------------------------------|
| <code>&lt;1-65535&gt;</code> | Specify the number of DD processes. |

**Mode** Router Configuration

**Usage** This command is useful when a router's performance is affected from simultaneously bringing up several OSPF adjacencies. This command limits the maximum number of DD exchanges that can occur concurrently per OSPF instance, thus allowing for all of the adjacencies to come up.

**Example** The following example sets the max-concurrent-dd value to 4, so that only 4 DD exchanges will be processed at a time.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# max-concurrent-dd 4
```

# maximum-area

**Overview** Use this command to set the maximum number of OSPF areas.

Use the **no** variant of this command to set the maximum number of OSPF areas to the default.

**Syntax** `maximum-area <1-4294967294>`  
`no maximum-area`

| Parameter                         | Description                               |
|-----------------------------------|-------------------------------------------|
| <code>&lt;1-4294967294&gt;</code> | Specify the maximum number of OSPF areas. |

**Default** The default for the maximum number of OSPF areas is 4294967294.

**Mode** Router Configuration

**Usage** Use this command in router OSPF mode to specify the maximum number of OSPF areas.

**Examples** The following example sets the maximum number of OSPF areas to 2:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# maximum-area 2
```

The following example removes the maximum number of OSPF areas and resets to default:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no maximum-area
```

# neighbor (OSPF)

**Overview** Use this command to inform the router of other neighboring routers that are connected to the same NBMA network.

Use the **no** variant of this command to remove a configuration.

**Syntax** `neighbor <ip-address> [<cost>]{<priority>|<poll-interval>}`  
`no neighbor <ip-address> [<cost>]{<priority>|<poll-interval>}`

| Parameter                          | Description                                                                                                                                                                                                                   |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code>    | Specifies the interface IP address of the neighbor.                                                                                                                                                                           |
| <code>&lt;priority&gt;</code>      | <i>priority &lt;0-255&gt;</i><br>Specifies the router priority value of the non-broadcast neighbor associated with the specified IP address. The default is 0. This keyword does not apply to point-to-multipoint interfaces. |
| <code>&lt;poll-interval&gt;</code> | <i>poll-interval &lt;1-2147483647&gt;</i><br>Dead neighbor polling interval in seconds. It is recommended to set this value much higher than the hello interval. The default is 120 seconds.                                  |
| <code>&lt;cost&gt;</code>          | <i>cost &lt;1-65535&gt;</i><br>Specifies the link-state metric to this neighbor.                                                                                                                                              |

**Mode** Router Configuration

**Usage** To configure a neighbor on an NBMA network manually, use the `neighbor` command and include one neighbor entry for each known nonbroadcast network neighbor. The IP address used in this command is the neighbor's primary IP address on the interface where that neighbor connects to the NBMA network.

The poll interval is the reduced rate at which routers continue to send hello packets, when a neighboring router has become inactive. Set the poll interval to be much larger than hello interval.

**Examples** This example shows a neighbor configured with a priority value, poll interval time, and cost.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# neighbor 1.2.3.4 priority 1
poll-interval 90
awplus(config-router)# neighbor 1.2.3.4 cost 15
```

# network area

**Overview** Use this command to enable OSPF routing with a specified Area ID on any interfaces with IP addresses that match the specified network address.

Use the **no** variant of this command to disable OSPF routing on the interfaces.

**Syntax** `network <network-address> area <area-id>`  
`no network <network-address> area <area-id>`

| Parameter                                                         | Description                                                                                                                                                                                                                     |
|-------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;network-address&gt;</code>                              | <code>{&lt;ip-network/m&gt; &lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;}</code>                                                                                                                                                    |
| <code>&lt;ip-network/m&gt;</code>                                 | IP address of the network, entered in the form A.B.C.D/M.<br>Dotted decimal notation followed by a forward slash, and then the subnet mask length.                                                                              |
| <code>&lt;ip-addr&gt;</code><br><code>&lt;reverse-mask&gt;</code> | IPv4 network address, entered in the form A.B.C.D, followed by the mask. Enter the mask as a wildcard, or reverse, mask (e.g. 0.0.0.255). Note that the device displays the mask as a subnet mask in the running configuration. |
| <code>&lt;area-id&gt;</code>                                      | <code>{&lt;ip-addr&gt; &lt;0-4294967295&gt;}</code>                                                                                                                                                                             |
| <code>&lt;ip-addr&gt;</code>                                      | OSPF Area ID in IPv4 address format, in the form A.B.C.D.                                                                                                                                                                       |
| <code>&lt;0-4294967295&gt;</code>                                 | OSPF Area ID as 4 octets unsigned integer value.                                                                                                                                                                                |

**Default** No **network area** is configured by default.

**Mode** Router Configuration

**Usage** OSPF routing can be enabled per IPv4 subnet. The network address can be defined using either the prefix length or a wild card mask. A wild card mask is comprised of consecutive 0's as network bits and consecutive 1's as host bits.

**Examples** The following commands show the use of the **network area** command with OSPF multiple instance support disabled:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# network 10.0.0.0/8 area 3
awplus(config-router)# network 10.0.0.0/8 area 1.1.1.1
```

The following commands disable OSPF routing with Area ID 3 on all interfaces:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no network 10.0.0.0/8 area3
```

# ospf abr-type

**Overview** Use this command to set an OSPF Area Border Router (ABR) type.

Use the **no** variant of this command to revert the ABR type to the default setting (Cisco).

**Syntax** `ospf abr-type {cisco|ibm|standard}`  
`no ospf abr-type {cisco|ibm|standard}`

| Parameter | Description                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------|
| cisco     | Specifies an alternative ABR using Cisco implementation (RFC 3509). This is the default ABR type. |
| ibm       | Specifies an alternative ABR using IBM implementation (RFC 3509).                                 |
| standard  | Specifies a standard behavior ABR (RFC 2328).                                                     |

**Default** ABR type `Cisco`

**Mode** Router Configuration

**Usage** Specifying the ABR type allows better interoperability between different implementations. This command is specially useful in a multi-vendor environment. The different ABR types are:

- Cisco ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and one of them is the backbone area.
- IBM ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and the backbone area is configured. In this case the configured backbone need not be actively connected.
- Standard ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached to it.

**Example** `awplus# configure terminal`  
`awplus(config)# router ospf 100`  
`awplus(config-router)# ospf abr-type ibm`

# ospf restart grace-period

**Overview** Use this command to configure the grace-period for restarting OSPF routing.  
Use the **no** variant of this command to revert to the default grace-period.

**Syntax** `ospf restart grace-period <1-1800>`  
`no ospf restart grace-period`

| Parameter | Description                            |
|-----------|----------------------------------------|
| <1-1800>  | Specifies the grace period in seconds. |

**Default** In the AlliedWare Plus™ OSPF implementation, the default OSPF grace-period is 180 seconds.

**Mode** Global Configuration

**Usage** Use this command to enable the OSPF Graceful Restart feature and set the restart grace-period. Changes from the default restart grace-period are displayed in the running- config. The restart grace-period is not displayed in the running-config if it has been reset to the default using the **no** variant of this command.

When a master failover happens on a VCStack, the grace-period will be the longer of the default value (180 seconds) and the configured value from this command. Therefore, the configured grace-period value will only be used in a master failover if it is longer than 180 seconds.

**Example** To set the OSPF restart grace-period to 250 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ospf restart grace-period 250
```

To reset the OSPF restart grace-period to the default (180 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no ospf restart grace-period
```

**Validation Commands** [show running-config](#)

**Related Commands** [ospf restart helper](#)  
[restart ospf graceful](#)

# ospf restart helper

**Overview** Use this command to configure the **helper** behavior for the OSPF Graceful Restart feature.

Use the **no** variant of this command to revert to the default grace-period.

**Syntax**

```
ospf restart helper {max-grace-period  
<grace-period>|only-reload|only-upgrade}  
ospf restart helper {never router-id <router-id>}  
no ospf restart helper [max-grace-period]
```

| Parameter        | Description                                                                                                                       |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| max-grace-period | Specify help if received grace-period is less than a specified value.                                                             |
| <grace-period>   | Maximum grace period accepted in seconds in range <1-1800>.                                                                       |
| never            | Specify the local policy to never to act as a helper for this feature.                                                            |
| only-reload      | Specify help only on software reloads not software upgrades.                                                                      |
| only-upgrade     | Specify help only on software upgrades not software reloads.                                                                      |
| router-id        | Enter the router-id keyword to specify the OSPF Router ID that is never to act as a helper for the OSPF Graceful Restart feature. |
| <router-id>      | <A.B.C.D><br>Specify the OSPF Router ID in dotted decimal format A.B.C.D                                                          |

**Default** In the AlliedWare Plus™ OSPF implementation, the default OSPF grace-period is 180 seconds.

**Mode** Global Configuration

**Usage** The **ospf restart helper** command requires at least one parameter, but you may use more than one in the same command (excluding parameter **never**).

The **no** version of this command turns off the OSPF restart helper, while the **no ospf restart helper max-grace-period** command resets the max-grace-period, rather than the helper policy itself.

**Example**

```
awplus# configure terminal  
awplus(config)# ospf restart helper only-reload  
awplus# configure terminal  
awplus(config)# ospf restart helper never router-id 10.10.10.1  
awplus# configure terminal  
awplus(config)# no ospf restart helper max-grace-period
```

**Related  
Commands**    ospf restart grace-period  
                 restart ospf graceful

# ospf router-id

**Overview** Use this command to specify a router ID for the OSPF process.  
Use the **no** variant of this command to disable this function.

**Syntax** `ospf router-id <ip-address>`  
`no ospf router-id`

| Parameter                       | Description                                     |
|---------------------------------|-------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | Specifies the router ID in IPv4 address format. |

**Mode** Router Configuration

**Usage** Configure each router with a unique router-id. In an OSPF router process that has active neighbors, a new router-id takes effect at the next reload or when you restart OSPF manually.

**Example** The following example shows a specified router ID 2.3.4.5.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# ospf router-id 2.3.4.5
```

**Related  
Commands** [show ip ospf](#)

# overflow database

**Overview** Use this command to limit the maximum number of Link State Advertisements (LSAs) that can be supported by the current OSPF instance.

Use the **no** variant of this command to have no limit on the maximum number of LSAs.

**Syntax** `overflow database <0-4294967294> {hard|soft}`  
`no overflow database`

| Parameter      | Description                                                                |
|----------------|----------------------------------------------------------------------------|
| <0-4294967294> | The maximum number of LSAs.                                                |
| hard           | Shutdown occurs if the number of LSAs exceeds the specified value.         |
| soft           | Warning message appears if the number of LSAs exceeds the specified value. |

**Mode** Router Configuration

**Usage** Use **hard** with this command if a shutdown is required if the number of LSAs exceeds the specified number. Use **soft** with this command if a shutdown is not required, but a warning message is required, if the number of LSAs exceeds the specified number.

**Example** The following example shows setting the database overflow to 500, and a shutdown to occur, if the number of LSAs exceeds 500.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# overflow database 500 hard
```

# overflow database external

**Overview** Use this command to configure the size of the external database and the time the router waits before it tries to exit the overflow state.

Use the **no** variant of this command to revert to default.

**Syntax** `overflow database external <max-lsas> <recover-time>`  
`no overflow database external`

| Parameter                         | Description                                                                                                                                                                                                                  |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;max-lsas&gt;</code>     | <code>&lt;0-2147483647&gt;</code> The maximum number of Link State Advertisements (LSAs). Note that this value should be the same on all routers in the AS.                                                                  |
| <code>&lt;recover-time&gt;</code> | <code>&lt;0-65535&gt;</code> the number of seconds the router waits before trying to exit the database overflow state. If this parameter is 0, router exits the overflow state only after an explicit administrator command. |

**Mode** Router Configuration

**Usage** Use this command to limit the number of AS-external-LSAs a router can receive, once it is in the wait state. It takes the number of seconds specified as the `<recover-time>` to recover from this state.

**Example** The following example shows setting the maximum number of LSAs to 5 and the time to recover from overflow state to be 3:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# overflow database external 50 3
```

# passive-interface (OSPF)

**Overview** Use this command to suppress the sending of Hello packets on all interfaces, or on a specified interface. If you use the **passive-interface** command without the optional parameters then **all** interfaces are put into passive mode.

Use the **no** variant of this command to allow the sending of Hello packets on all interfaces, or on the specified interface. If you use the **no** variant of this command without the optional parameters then **all** interfaces are removed from passive mode.

**Syntax** `passive-interface [<interface>] [<ip-address>]`  
`no passive-interface [<interface>] [<ip-address>]`

| Parameter    | Description                                               |
|--------------|-----------------------------------------------------------|
| <interface>  | The name of the interface.                                |
| <ip-address> | IP address of the interface, entered in the form A.B.C.D. |

**Mode** Router Configuration

**Usage** Configure an interface to be passive if you wish its connected route to be treated as an OSPF route (rather than an AS-external route), but do not wish to actually exchange any OSPF packets via this interface.

**Examples** To configure passive interface mode on interface vlan2, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# passive-interface vlan2
```

To configure passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# passive-interface
```

To remove passive interface mode on interface vlan2, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# no passive-interface vlan2
```

To remove passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# no passive-interface
```

# redistribute (OSPF)

**Overview** Use this command to redistribute routes from other routing protocols, static routes and connected routes into an OSPF routing table.

Use the **no** variant of this command to disable this function.

**Syntax**

```
redistribute {connected|rip|static} {metric  
<0-16777214>|metric-type {1|2}|route-map <name>|tag  
<0-4294967295>}  
  
no redistribute {connected|rip|static} {metric  
<0-16777214>|metric-type {1|2}|route-map <name>|tag  
<0-4294967295>}
```

| Parameter   | Description                                                            |
|-------------|------------------------------------------------------------------------|
| connected   | Specifies that this applies to the redistribution of connected routes. |
| rip         | Specifies that this applies to the redistribution of RIP routes.       |
| static      | Specifies that this applies to the redistribution of static routes.    |
| metric      | Specifies the external metric.                                         |
| metric-type | Specifies the external metric-type.                                    |
| route-map   | Specifies name of the route-map.                                       |
| tag         | Specifies the external route tag.                                      |

**Default** The default metric value for routes redistributed into OSPF is 20. The metric can also be defined using the [set metric](#) command for a route map. Note that a metric defined using the [set metric](#) command for a route map overrides a metric defined with this command.

**Mode** Router Configuration

**Usage** You use this command to inject routes, learned from other routing protocols, into the OSPF domain to generate AS-external-LSAs. If a route-map is configured by this command, then that route-map is used to control which routes are redistributed and can set metric and tag values on particular routes.

The metric, metric-type, and tag values specified on this command are applied to any redistributed routes that are not explicitly given a different metric, metric-type, or tag value by the route map.

See the [OSPF Feature Overview and Configuration Guide](#) for more information about metrics, and about behavior when configured in route maps.

Note that this command does not redistribute the default route. To redistribute the default route, use the [default-information originate](#) command.

**Example** The following example shows the configuration of a route-map named `rmap2`, which is then applied using the **redistribute route-map** command, so routes learned via interface `vlan1` can be redistributed as type-1 external LSAs:

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 3
awplus(config-route-map)# match interface vlan1
awplus(config-route-map)# set metric-type 1
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# redistribute rip route-map rmap2
```

Note that configuring a route-map and applying it with the **redistribute route-map** command allows you to filter which routes are distributed from another routing protocol (such as RIP). A route-map can also set the metric, tag, and metric-type of the redistributed routes.

**Related  
Commands**

- [distribute-list \(OSPF\)](#)
- [match interface](#)
- [route-map](#)
- [show ip ospf database external](#)

# restart ospf graceful

**Overview** Use this command to force the OSPF process to restart, and optionally set the grace-period.

**Syntax** `restart ospf graceful [grace-period <1-1800>]`

| Parameter    | Description                  |
|--------------|------------------------------|
| grace-period | Specify the grace period.    |
| <1-1800>     | The grace period in seconds. |

**Default** In the AlliedWare Plus™ OSPF implementation, the default OSPF grace-period is 180 seconds.

**Mode** Privileged Exec

**Usage** After this command is executed, the OSPF process immediately shuts down. It notifies the system that OSPF has performed a graceful shutdown. Routes installed by OSPF are preserved until the grace-period expires.

When a **restart ospf graceful** command is issued, the OSPF configuration is reloaded from the last saved configuration. Ensure you first enter the command [copy running-config startup-config](#).

When a master failover happens on a VCStack, the grace-period will be the longer of the default value (180 seconds) and the configured value from this command. Therefore, the configured grace-period value will only be used in a master failover if it is longer than 180 seconds.

**Example**

```
awplus# copy running-config startup-config
awplus# restart ospf graceful grace-period 200
```

**Related Commands** [ospf restart grace-period](#)  
[ospf restart helper](#)

# router ospf

**Overview** Use this command to enter Router Configuration mode to configure an OSPF routing process. You must specify the process ID with this command for multiple OSPF routing processes on the device.

Use the **no** variant of this command to terminate an OSPF routing process.

Use the **no** parameter with the **process-id** parameter, to terminate and delete a specific OSPF routing process. If no **process-id** is specified on the **no** variant of this command, then all OSPF routing processes are terminated, and all OSPF configuration is removed.

**Syntax** `router ospf [<process-id>]`  
`no router ospf [<process-id>]`

| Parameter                       | Description                                                                  |
|---------------------------------|------------------------------------------------------------------------------|
| <code>&lt;process-id&gt;</code> | A positive number from 1 to 65535, that is used to define a routing process. |

**Default** No routing process is defined by default.

**Mode** Global Configuration

**Usage** The process ID of OSPF is an optional parameter for the **no** variant of this command only. When removing all instances of OSPF, you do not need to specify each Process ID, but when removing particular instances of OSPF you must specify each Process ID to be removed.

**Example** To enter Router Configuration mode to configure an existing OSPF routing process 100, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)#
```

# router-id

**Overview** Use this command to specify a router ID for the OSPF process.

Use the **no** variant of this command to force OSPF to use the previous OSPF router-id behavior.

**Syntax** `router-id <ip-address>`  
`no router-id`

| Parameter                       | Description                                     |
|---------------------------------|-------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | Specifies the router ID in IPv4 address format. |

**Mode** Router Configuration

**Usage** Configure each router with a unique router-id. In an OSPF router process that has active neighbors, a new router-id is used at the next reload or when you restart OSPF manually.

**Example** The following example shows a fixed router ID 10.10.10.60

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# router-id 10.10.10.60
```

**Related  
Commands** [show ip ospf](#)

# show debugging ospf

**Overview** Use this command to display which OSPF debugging options are currently enabled.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging ospf`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show debugging ospf`

**Output** Figure 24-2: Example output from the **show debugging ospf** command

```
OSPF debugging status:
  OSPF packet Link State Update debugging is on
  OSPF all events debugging is on
```

# show ip ospf

**Overview** Use this command to display general information about all OSPF routing processes. Include the process ID parameter with this command to display information about specified instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf`  
`show ip ospf <process-id>`

| Parameter    | Description                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <process-id> | <0-65535> The ID of the router process for which information will be displayed. If this parameter is included, only the information for the specified routing process is displayed. |

**Mode** User Exec and Privileged Exec

**Examples** To display general information about all OSPF routing processes, use the command:

```
awplus# show ip ospf
```

To display general information about OSPF routing process 100, use the command:

```
awplus# show ip ospf 100
```

**Table 1:** Example output from the **show ip ospf** command

```
Route Licence: Route : Limit=0, Allocated=0, Visible=0, Internal=0
Route Licence: Breach: Current=0, Watermark=0
Routing Process "ospf 10" with ID 192.168.1.1
Process uptime is 10 hours 24 minutes
Process bound to VRF default
Conforms to RFC2328, and RFC1583 Compatibility flag is disabled
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Graceful Restart
SPF schedule delay min 0.500 secs, SPF schedule delay max 50.0 secs
Refresh timer 10 secs
Number of incoming current DD exchange neighbors 0/5
Number of outgoing current DD exchange neighbors 0/5
Number of external LSA 0. Checksum 0x000000
Number of opaque AS LSA 0. Checksum 0x000000
Number of non-default external LSA 0
```

**Table 1:** Example output from the **show ip ospf** command (cont.)

```
External LSA database is unlimited.
Number of LSA originated 0
Number of LSA received 0
Number of areas attached to this router: 2
  Area 0 (BACKBONE) (Inactive)
    Number of interfaces in this area is 0(0)
    Number of fully adjacent neighbors in this area is 0
    Area has no authentication
    SPF algorithm executed 0 times
    Number of LSA 0. Checksum 0x000000

  Area 1 (Inactive)
    Number of interfaces in this area is 0(0)
    Number of fully adjacent neighbors in this area is 0
    Number of fully adjacent virtual neighbors through this area is 0
    Area has no authentication
    SPF algorithm executed 0 times
    Number of LSA 0. Checksum 0x000000
```

**Table 2:** Example output from the **show ip ospf <process-id>** command

```
Routing Process "ospf 100" with ID 10.10.11.146
Process uptime is 0 minute
Conforms to RFC2328, and RFC1583Compatibility flag is disabled
Supports only single TOS(TOS0) routes
Supports opaque LSA
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Refresh timer 10 secs
Number of external LSA 0. Checksum Sum 0x0
Number of non-default external LSA 0
External LSA database is unlimited.
Number of areas attached to this router: 1
  Area 1
    Number of interfaces in this area is 1(1)
    Number of fully adjacent neighbors in this area is 0
    Number of fully adjacent virtual neighbors through this area is 0
    Area has no authentication
    SPF algorithm executed 0 times
    Number of LSA 1. Checksum Sum 0x00e3e2
```

**Table 3:** Parameters in the output of the **show ip ospf** command

| Output Parameter        |           | Meaning                                                                 |
|-------------------------|-----------|-------------------------------------------------------------------------|
| Route Licence: Route:   | Limit     | The maximum number of OSPF routes which may be used for forwarding.     |
|                         | Allocated | The current total number of OSPF routes allocated in the OSPF module.   |
|                         | Visible   | The current number of OSPF routes which may be used for forwarding.     |
|                         | Internal  | The number of OSPF internal routes used for calculating paths to ASBRs. |
| Number of external LSA  |           | The number of external link-state advertisements                        |
| Number of opaque AS LSA |           | Number of opaque link-state advertisements                              |

**Related Commands** [router ospf](#)

# show ip ospf border-routers

**Overview** Use this command to display the ABRs and ASBRs for all OSPF instances. Include the process ID parameter with this command to view data about specified instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf border-routers`  
`show ip ospf <process-id> border-routers`

| Parameter    | Description                                                                     |
|--------------|---------------------------------------------------------------------------------|
| <process-id> | <0-65535> The ID of the router process for which information will be displayed. |

**Mode** User Exec and Privileged Exec

**Output** Figure 24-3: Example output from the **show ip ospf border-routers** command

```
OSPF process 1 internal Routing Table
Codes: i - Intra-area route, I - Inter-area route
i 10.15.0.1 [10] via 10.10.0.1, vlan2, ASBR, Area 0.0.0.0
i 172.16.10.1 [10] via 10.10.11.50, vlan3, ABR, ASBR, Area
0.0.0.0
```

# show ip ospf database

**Overview** Use this command to display a database summary for OSPF information. Include the process ID parameter with this command to display information about specified instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf [<process-id>] database`  
`[self-originate|max-age|adv router <adv-router-id>]`

| Parameter       | Description                                                                                                                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <process-id>    | <0-65535> The ID of the router process for which information will be displayed.                                                                                                                              |
| self-originate  | Displays self-originated link states.                                                                                                                                                                        |
| max-age         | Displays LSAs in MaxAge list. It maintains the list of the all LSAs in the database which have reached the max-age which is 3600 seconds.                                                                    |
| adv-router      | Advertising Router LSA.                                                                                                                                                                                      |
| <adv-router-id> | The Advertising Router ID (usually entered in IPv4 address format A.B.C.D).<br>Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format. |

**Mode** User Exec and Privileged Exec

**Examples** To display the ABRs and ASBRs for all OSPF instances, use the command:

```
awplus# show ip ospf border-routers
```

To display the ABRs and ASBRs for the specific OSPF instance 721, use the command:

```
awplus# show ip ospf 721 border-routers
```

**Output** Figure 24-4: Example output from the **show ip ospf database** command

|                                               |             |     |            |        |      |

# show ip ospf database asbr-summary

**Overview** Use this command to display information about the Autonomous System Boundary Router (ASBR) summary LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database asbr-summary [<ip-addr>]  
[self-originate|<advrouter>]`

| Parameter      | Description                                    |
|----------------|------------------------------------------------|
| <advrouter>    | adv-router <ip-address>                        |
| adv-router     | Displays all the LSAs of the specified router. |
| <ip-addr>      | A link state ID, as an IP address.             |
| self-originate | Displays self-originated link states.          |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf database asbr-summary 1.2.3.4  
self-originate  
  
awplus# show ip ospf database asbr-summary self-originate  
  
awplus# show ip ospf database asbr-summary 1.2.3.4 adv-router  
2.3.4.5
```

# show ip ospf database external

**Overview** Use this command to display information about the external LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database external adv-router[<adv-router-id>]  
[self-originate|adv-router<adv-router-id>]`

| Parameter        | Description                                                                                                                                                                                                  |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| adv-router       | Displays all the LSAs of the specified router.                                                                                                                                                               |
| self-originate   | Displays self-originated link states.                                                                                                                                                                        |
| <adv-router- id> | The Advertising Router ID (usually entered in IPv4 address format A.B.C.D).<br>Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format. |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip ospf database external 1.2.3.4 self-originate`  
`awplus# show ip ospf database external self-originate`  
`awplus# show ip ospf database external 1.2.3.4 adv-router 2.3.4.5`

**Output** Figure 24-6: Example output from the **show ip ospf database external self-originate** command

```
OSPF Router process 100 with ID (10.10.11.50)
  AS External Link States
LS age: 298
Options: 0x2 (*|-|-|-|-|E|-)
LS Type: AS-external-LSA
Link State ID: 10.10.100.0 (External Network Number)
Advertising Router: 10.10.11.50
LS Seq Number: 80000001
Checksum: 0x7033
Length: 36
Network Mask: /24
  Metric Type: 2 (Larger than any link state path)
  TOS: 0
  Metric: 20
  Forward Address: 10.10.11.50
  External Route Tag: 0
```

**Output** Figure 24-7: Example output from the **show ip ospf database external adv-router** command

```
awplus#show ip ospf database external adv-router 1.1.1.1

                        AS External Link States
LS age: 273
Options: 0x2 (-|-|-|-|-|E|-)
LS Type: AS-external-LSA
Link State ID: 172.16.0.0 (External Network Number)
Advertising Router: 1.1.1.1
LS Seq Number: 80000004
Checksum: 0x02f8
Length: 36
Network Mask: /24
    Metric Type: 2 (Larger than any link state path)
    TOS: 0
    Metric: 20
    Forward Address: 0.0.0.0
    External Route Tag: 0
```

# show ip ospf database network

**Overview** Use this command to display information about the network LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database network [<adv-router-id>]  
[self-originate|<adv-router-id>]`

| Parameter       | Description                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------|
| <adv-router-id> | The router ID of the advertising router, in IPv4 address format. Note however, that this no longer represents a real address. |
| self-originate  | Displays self-originated link states.                                                                                         |
| adv-router      | Displays all the LSAs of the specified router.                                                                                |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip ospf database network 1.2.3.4 self-originate`  
`awplus# show ip ospf database network self-originate`  
`awplus# show ip ospf database network 1.2.3.4 adv-router 2.3.4.5`

**Output** Figure 24-8: Example output from the **show ip ospf database network** command

```
OSPF Router process 200 with ID (192.30.30.2)
  Net Link States (Area 0.0.0.0)
LS age: 1387
Options: 0x2 (*|-|-|-|-|E|-)
LS Type: network-LSA
Link State ID: 192.10.10.9 (address of Designated Router)
Advertising Router: 192.30.30.3
LS Seq Number: 80000001
Checksum: 0xe1b0
Length: 32
Network Mask: /24
  Attached Router: 192.20.20.1
  Attached Router: 192.30.30.3
OSPF Router process 200 with ID (192.30.30.2)
  Net Link States (Area 0.0.0.0)
...
```

# show ip ospf database nssa-external

**Overview** Use this command to display information about the NSSA external LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database nssa-external [<ip-address>]  
[self-originate|<advrouter>]`

| Parameter      | Description                                    |
|----------------|------------------------------------------------|
| <advrouter>    | adv-router <ip-address>                        |
| adv-router     | Displays all the LSAs of the specified router. |
| <ip-address>   | A link state ID, as an IP address.             |
| self-originate | Displays self-originated link states.          |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf database nssa-external 1.2.3.4  
self-originate  
  
awplus# show ip ospf database nssa-external self-originate  
  
awplus# show ip ospf database nssa-external 1.2.3.4 adv-router  
2.3.4.5
```

**Output** Figure 24-9: Example output from the **show ip ospf database nssa-external adv-router** command

```
OSPF Router process 100 with ID (10.10.11.50)

        NSSA-external Link States (Area 0.0.0.1 [NSSA])
```

# show ip ospf database opaque-area

**Overview** Use this command to display information about the area-local (link state type 10) scope LSAs. Type-10 Opaque LSAs are not flooded beyond the borders of their associated area.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database opaque-area [<ip-address>]  
[self-originate|<advrouter>]`

| Parameter      | Description                                    |
|----------------|------------------------------------------------|
| <advrouter>    | adv-router <ip-address>                        |
| adv-router     | Displays all the LSAs of the specified router. |
| <ip-address>   | A link state ID, as an IP address.             |
| self-originate | Displays self-originated link states.          |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf database opaque-area 1.2.3.4  
self-originate  
  
awplus# show ip ospf database opaque-area self-originate  
  
awplus# show ip ospf database opaque-area 1.2.3.4 adv-router  
2.3.4.5
```

**Output** Figure 24-10: Example output from the **show ip ospf database opaque-area** command

```
OSPF Router process 100 with ID (10.10.11.50)
      Area-Local Opaque-LSA (Area 0.0.0.0)
LS age: 262
Options: 0x2 (*|-|-|-|-|E|-)
LS Type: Area-Local Opaque-LSA
Link State ID: 10.0.25.176 (Area-Local Opaque-Type/ID)
Opaque Type: 10
Opaque ID: 6576
Advertising Router: 10.10.11.50
LS Seq Number: 80000001
Checksum: 0xb413
Length: 26
```

# show ip ospf database opaque-as

**Overview** Use this command to display information about the link-state type 11 LSAs. This type of link-state denotes that the LSA is flooded throughout the Autonomous System (AS).

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database opaque-as [<ip-address>]  
[self-originate|<advrouter>]`

| Parameter      | Description                                    |
|----------------|------------------------------------------------|
| <advrouter>    | adv-router <ip-address>                        |
| adv-router     | Displays all the LSAs of the specified router. |
| <ip-address>   | A link state ID, as an IP address.             |
| self-originate | Displays self-originated link states.          |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip ospf database opaque-as 1.2.3.4 self-originate`  
`awplus# show ip ospf database opaque-as self-originate`  
`awplus# show ip ospf database opaque-as 1.2.3.4 adv-router`  
`2.3.4.5`

**Output** Figure 24-11: Example output from the **show ip ospf database opaque-as** command

```
OSPF Router process 100 with ID (10.10.11.50)
      AS-Global Opaque-LSA
LS age: 325
Options: 0x2 (*|-|-|-|-|E|-)
LS Type: AS-external Opaque-LSA
Link State ID: 11.10.9.23 (AS-external Opaque-Type/ID)
Opaque Type: 11
Opaque ID: 657687
Advertising Router: 10.10.11.50
LS Seq Number: 80000001
Checksum: 0xb018
Length: 25
```

# show ip ospf database opaque-link

**Overview** Use this command to display information about the link-state type 9 LSAs. This type denotes a link-local scope. The LSAs are not flooded beyond the local network.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database opaque-link [<ip-address>]  
[self-originate|<advrouter>]`

| Parameter      | Description                                    |
|----------------|------------------------------------------------|
| <advrouter>    | adv-router <ip-address>                        |
| adv-router     | Displays all the LSAs of the specified router. |
| <ip-address>   | A link state ID, as an IP address.             |
| self-originate | Displays self-originated link states.          |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf database opaque-link 1.2.3.4  
self-originate  
  
awplus# show ip ospf database opaque-link self-originate  
  
awplus# show ip ospf database opaque-link 1.2.3.4 adv-router  
2.3.4.5
```

**Output** Figure 24-12: Example output from the **show ip ospf database opaque-link** command

```
OSPF Router process 100 with ID (10.10.11.50)
      Link-Local Opaque-LSA (Link hme0:10.10.10.50)
LS age: 276
Options: 0x2 (*|---|---|E|)
LS Type: Link-Local Opaque-LSA
Link State ID: 10.0.220.247 (Link-Local Opaque-Type/ID)
Opaque Type: 10
Opaque ID: 56567
Advertising Router: 10.10.11.50
LS Seq Number: 80000001
Checksum: 0x744e
Length: 26
      Link-Local Opaque-LSA (Link hme1:10.10.11.50)
```

# show ip ospf database router

**Overview** Use this command to display information only about the router LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database router [<adv-router-id>  
self-originate|<adv-router-id>]`

| Parameter        | Description                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------|
| adv-router       | Displays all the LSAs of the specified router.                                                                                |
| self-originate   | Displays self-originated link states.                                                                                         |
| <adv-router- id> | The router ID of the advertising router, in IPv4 address format. Note however, that this no longer represents a real address. |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip ospf database router 1.2.3.4 self-originate`  
`awplus# show ip ospf database router self-originate`  
`awplus# show ip ospf database router 1.2.3.4 adv-router 2.3.4.5`

**Output** Figure 24-13: Example output from the **show ip ospf database router** command

```
OSPF Router process 100 with ID (10.10.11.50)
Router Link States (Area 0.0.0.0)

LS age: 878
Options: 0x2 (*|-|-|-|-|E|-)

```

# show ip ospf database summary

**Overview** Use this command to display information about the summary LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf database summary [<ip-address>]  
[self-originate|<advrouter>]`

| Parameter      | Description                                    |
|----------------|------------------------------------------------|
| <advrouter>    | adv-router <ip-address>                        |
| adv-router     | Displays all the LSAs of the specified router. |
| <ip-address>   | A link state ID, as an IP address.             |
| self-originate | Displays self-originated link states.          |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip ospf database summary 1.2.3.4 self-originate`  
`awplus# show ip ospf database summary self-originate`  
`awplus# show ip ospf database summary 1.2.3.4 adv-router 2.3.4.5`

**Output** Figure 24-14: Example output from the **show ip ospf database summary** command

```

# show ip ospf interface

**Overview** Use this command to display interface information for OSPF.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf interface [<interface-name>]`

| Parameter        | Description                       |
|------------------|-----------------------------------|
| <interface-name> | The VLAN name, for example vlan3. |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip ospf interface vlan2`

**Output** Figure 24-17: Example output from the **show ip ospf interface** command

```
vlan2 is up, line protocol is up
Internet Address 1.1.1.1/24, Area 0.0.0.0, MTU 1500
Process ID 0, Router ID 33.33.33.33, Network Type BROADCAST, Cost: 10
Transmit Delay is 1 sec, State Waiting, Priority 1, TE Metric 0
No designated router on this network
No backup designated router on this network
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
  Hello due in 00:00:02
Neighbor Count is 0, Adjacent neighbor count is 0
Crypt Sequence Number is 1106347721
Hello received 0 sent 1, DD received 0 sent 0
LS-Req received 0 sent 0, LS-Upd received 0 sent 0
LS-Ack received 0 sent 0, Discarded 0
```

# show ip ospf neighbor

**Overview** Use this command to display information on OSPF neighbors. Include the **ospf-id** parameter with this command to display information about specified instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax**

```
show ip ospf [<ospf-id>] neighbor <neighbor-ip-addr> [detail]
show ip ospf [<ospf-id>] neighbor detail [all]
show ip ospf [<ospf-id>] neighbor [all]
show ip ospf [<ospf-id>] neighbor interface <ip-addr>
```

| Parameter          | Description                                                                     |
|--------------------|---------------------------------------------------------------------------------|
| <ospf-id>          | <0-65535> The ID of the router process for which information will be displayed. |
| <neighbor-ip-addr> | The Neighbor ID, entered as an IP address.                                      |
| all                | Include downstatus neighbor.                                                    |
| detail             | Detail of all neighbors.                                                        |
| <ip-addr>          | IP address of the interface.                                                    |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf neighbor detail
awplus# show ip ospf neighbor 1.2.3.4
awplus# show ip ospf neighbor interface 10.10.10.50 detail all
```

**Output** Note that before a device enters OSPF Graceful Restart it first informs its OSPF neighbors. In the **show** output, the \* symbol beside the **Dead Time** parameter indicates that the device has been notified of a neighbor entering the graceful restart state, as shown in the figures below.

Figure 24-18: Example output from the **show ip ospf neighbor** command

|                                |     |             |           |             |           |
|--------------------------------|-----|-------------|-----------|-------------|-----------|
| OSPF process 1:                |     |             |           |             |           |
| Neighbor ID                    | Pri | State       | Dead Time | Address     | Interface |
| 10.10.10.50                    | 1   | Full/DR     | 00:00:38  | 10.10.10.50 | vlan1     |
| OSPF process 100:              |     |             |           |             |           |
| Neighbor ID                    | Pri | State       | Dead Time | Address     | Interface |
| 10.10.11.50                    | 1   | Full/Backup | 00:00:31  | 10.10.11.50 | vlan2     |
| awplus#show ip ospf 1 neighbor |     |             |           |             |           |
| OSPF process 1:                |     |             |           |             |           |
| Neighbor ID                    | Pri | State       | Dead Time | Address     | Interface |
| 10.10.10.50                    | 1   | Full/DR     | 00:00:38* | 10.10.10.50 | vlan1     |

Figure 24-19: Example output from the **show ip ospf <ospf-id> neighbor** command

| OSPF process 100: |     |               |           |               |           |
|-------------------|-----|---------------|-----------|---------------|-----------|
| Neighbor ID       | Pri | State         | Dead Time | Address       | Interface |
| 192.168.0.3       | 50  | 2-Way/DROther | 00:01:59* | 192.168.200.3 | vlan200   |

# show ip ospf route

**Overview** Use this command to display the OSPF routing table. Include the `process ID` parameter with this command to display the OSPF routing table for specified instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf [<ospf-id>] route`

| Parameter | Description                                                                                                                                                                          |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ospf-id> | <0-65535> The ID of the router process for which information will be displayed. If this parameter is included, only the information for this specified routing process is displayed. |

**Mode** User Exec and Privileged Exec

**Examples** To display the OSPF routing table, use the command:

```
awplus# show ip ospf route
```

**Output** Figure 24-21: Example output from the **show ip ospf route** command for a specific process

```
OSPF process 1:
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
O  10.10.0.0/24 [10] is directly connected, vlan1, Area 0.0.0.0
O  10.10.11.0/24 [10] is directly connected, vlan2, Area 0.0.0.0
O  10.10.11.100/32 [10] is directly connected, lo, Area 0.0.0.0
E2 10.15.0.0/24 [10/50] via 10.10.0.1, vlan1
IA 172.16.10.0/24 [30] via 10.10.11.50, vlan2, Area 0.0.0.0
E2 192.168.0.0/16 [10/20] via 10.10.11.50, vlan2
```

# show ip ospf virtual-links

**Overview** Use this command to display virtual link information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip ospf virtual-links`

**Mode** User Exec and Privileged Exec

**Examples** To display virtual link information, use the command:

```
awplus# show ip ospf virtual-links
```

**Output** Figure 24-22: Example output from the **show ip ospf virtual-links** command

```
Virtual Link VLINK0 to router 10.10.0.9 is up
  Transit area 0.0.0.1 via interface vlan5
  Transmit Delay is 1 sec, State Point-To-Point,
  Timer intervals configured, Hello 10, Dead 40, Wait 40,
  Retransmit 5
    Hello due in 00:00:02
    Adjacency state Full
Virtual Link VLINK1 to router 10.10.0.123 is down
  Transit area 0.0.0.1 via interface *
  Transmit Delay is 1 sec, State Down,
  Timer intervals configured, Hello 10, Dead 40, Wait 40,
  Retransmit 5
    Hello due in inactive
    Adjacency state Down
```

# show ip protocols ospf

**Overview** Use this command to display OSPF process parameters and statistics.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip protocols ospf`

**Mode** User Exec and Privileged Exec

**Examples** To display OSPF process parameters and statistics, use the command:

```
awplus# show ip protocols ospf
```

**Output** Figure 24-23: Example output from the **show ip protocols ospf** command

```
Routing Protocol is "ospf 200"
  Invalid after 0 seconds, hold down 0, flushed after 0
  Outgoing update filter list for all interfaces is
    Redistributed kernel filtered by filter1
  Incoming update filter list for all interfaces is
  Redistributing: kernel
  Routing for Networks:
    192.30.30.0/24
    192.40.40.0/24
  Routing Information Sources:
    Gateway          Distance          Last Update
  Distance: (default is 110)
    Address          Mask              Distance List
```

# summary-address

**Overview** Use this command to summarize, or possibly suppress, external routes that have the specified address range.

Use the **no** variant of this command to stop summarizing, or suppressing, external routes that have the specified address range.

**Syntax** `summary-address <ip-addr/prefix-length> [not-advertise] [tag <0-4294967295>]`  
`no summary-address <ip-addr/prefix-length> [not-advertise] [tag <0-4294967295>]`

| Parameter                                  | Description                                                                                                                                                                                   |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-addr/prefix-length&gt;</code> | Specifies the base IP address of the summary address. The range of addresses given as IPv4 starting address and a prefix length.                                                              |
| <code>not-advertise</code>                 | Set the <b>not-advertise</b> option if you do not want OSPF to advertise either the summary address or the individual networks within the range of the summary address.                       |
| <code>tag &lt;0-4294967295&gt;</code>      | The tag parameter specifies the tag value that OSPF places in the AS external LSAs created as a result of redistributing the summary route. The tag overrides tags set by the original route. |

**Default** The default tag value for a summary address is 0.

**Mode** Router Configuration

**Usage** An address range is a pairing of an address and a mask that is almost the same as IP network number. For example, if the specified address range is 192.168.0.0/255.255.240.0, it matches: 192.168.1.0/24, 192.168.4.0/22, 192.168.8.128/25 and so on.

Redistributing routes from other protocols into OSPF requires the router to advertise each route individually in an external LSA. Use the **summary address** command to advertise one summary route for all redistributed routes covered by a specified network address and mask. This helps decrease the size of the OSPF link state database.

Ensure OSPF routes exist in the summary address range for advertisement before using this command.

**Example** The following example uses the **summary-address** command to aggregate external LSAs that match the network 172.16.0.0/16 and assign a Tag value of 3.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# summary-address 172.16.0.0/16 tag 3
```

# timers spf exp

**Overview** Use this command to adjust route calculation timers using exponential back-off delays.

Use **no** form of this command to return to the default exponential back-off timer values.

**Syntax** `timers spf exp <min-holdtime> <max-holdtime>`  
`no timers spf exp`

| Parameter      | Description                                                                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <min-holdtime> | <0-2147483647><br>Specifies the minimum delay between receiving a change to the SPF calculation in milliseconds. The default SPF min-holdtime value is 50 milliseconds. |
| <max-holdtime> | <0-2147483647><br>Specifies the maximum delay between receiving a change to the SPF calculation in milliseconds. The default SPF max-holdtime value is 50 seconds.      |

**Mode** Router Configuration

**Default** The default SPF min-holdtime is 50 milliseconds. The default SPF max-holdtime is 40 seconds.

**Usage** This command configures the minimum and maximum delay time between the receipt of a topology change and the calculation of the Shortest Path First (SPF).

**Examples** To set the minimum delay time to 5 milliseconds and maximum delay time to 10 milliseconds, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# timers spf exp 5 10
```

To reset the minimum and maximum delay times to the default values, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no timers spf exp
```

# abr-type

**Overview** Use this command to set an OSPF Area Border Router (ABR) type.

Use the **no** variant of this command to revert the ABR type to the default setting (Cisco).

**Syntax** `abr-type {cisco|ibm|standard}`  
`no abr-type {cisco|ibm|standard}`

| Parameter | Description                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------|
| cisco     | Specifies an alternative ABR using Cisco implementation (RFC 3509). This is the default ABR type. |
| ibm       | Specifies an alternative ABR using IBM implementation (RFC 3509).                                 |
| standard  | Specifies a standard behavior ABR (RFC 2328).                                                     |

**Default** ABR type `cisco`

**Mode** Router Configuration

**Usage** Specifying the ABR type allows better interoperability between different implementations. This command is specially useful in a multi-vendor environment. The different ABR types are:

- Cisco ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and one of them is the backbone area.
- IBM ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and the backbone area is configured. In this case the configured backbone need not be actively connected.
- Standard ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached to it.

**Example** `awplus# configure terminal`  
`awplus(config)# router ipv6 ospf 100`  
`awplus(config-router)# abr-type ibm`

# area authentication ipsec spi

**Overview** Use this command in Router Configuration mode to enable either MD5 (Message-Digest 5) or SHA1 (Secure Hash Algorithm 1) authentication for a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable the authentication configured for a specified OSPF area.

**Syntax** `area <area-id> authentication ipsec spi <256-4294967295> {md5 <MD5-key>|sha1 <SHA1-key>}`  
`no area <area-id> authentication ipsec spi <256-4294967295>`

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |           |                                                        |                |                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|--------------------------------------------------------|----------------|--------------------------------------------------------------------|
| <area-id>        | The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats: <table><tr><td>&lt;ip-addr&gt;</td><td>OSPF area-ID expressed in IPv4 address format A.B.C.D.</td></tr><tr><td>&lt;0-4294967295&gt;</td><td>OSPF area-ID expressed as a decimal number within the range shown.</td></tr></table> For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID. | <ip-addr> | OSPF area-ID expressed in IPv4 address format A.B.C.D. | <0-4294967295> | OSPF area-ID expressed as a decimal number within the range shown. |
| <ip-addr>        | OSPF area-ID expressed in IPv4 address format A.B.C.D.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |           |                                                        |                |                                                                    |
| <0-4294967295>   | OSPF area-ID expressed as a decimal number within the range shown.                                                                                                                                                                                                                                                                                                                                                                                                                                             |           |                                                        |                |                                                                    |
| <256-4294967295> | Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.                                                                                                                                                                                                                                                                                                                                                                                                 |           |                                                        |                |                                                                    |
| md5              | Specify the MD5 (Message-Digest 5) hashing algorithm.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |           |                                                        |                |                                                                    |
| <MD5-key>        | Enter an MD5 key containing up to 32 hexadecimal characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |           |                                                        |                |                                                                    |
| sha1             | Specify the SHA-1 (Secure Hash Algorithm 1) hashing algorithm.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |           |                                                        |                |                                                                    |
| <SHA1-key>       | Enter an SHA-1 key containing up to 40 hexadecimal characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |           |                                                        |                |                                                                    |

**Mode** Router Configuration

**Usage** Use this command on an OSPFv3 area, use the [area virtual-link authentication ipsec spi](#) command on an OSPFv3 area virtual link. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information and examples.

**NOTE:** You can configure an authentication security policy (SPI) on an OSPFv3 area with this command, or on a VLAN interface with the [ipv6 ospf authentication spi](#) command.

When you configure authentication for an area, the security policy is applied to all VLAN interfaces in the area. However, Allied Telesis recommends a different authentication security policy is applied to each interface for higher security.

If you apply the `ipv6 ospf authentication null` command this affects authentication configured on both the VLAN interface and the OSPFv3 area.

This is due to OSPFv3 hello messages ingressing VLAN interfaces, which are part of area authentication, not being authenticated. So neighbors time out.

**Example** To enable MD5 authentication with a 32 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 authentication ipsec spi 1000 md5
1234567890ABCDEF1234567890ABCDEF
```

To enable SHA-1 authentication with a 40 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 authentication ipsec spi 1000
sha1 1234567890ABCDEF1234567890ABCDEF12345678
```

To disable authentication for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 authentication ipsec spi 1000
```

# area default-cost (IPv6 OSPF)

**Overview** This command specifies a cost for the default summary route sent into a stub area. The **no** variant of this command removes the assigned default-route cost.

**Syntax** `area <area-id> default-cost <0-16777215>`  
`no area <area-id> default-cost`

| Parameter    | Description                                                                                                                                                                               |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>    | The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats: |
|              | <ip-addr> OSPF area-ID expressed in IPv4 address format A.B.C.D.                                                                                                                          |
|              | <0-4294967295> OSPF area-ID expressed as a decimal number within the range shown.                                                                                                         |
|              | For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.                                                                                                       |
| default-cost | Indicates the cost for the default summary route used for a stub area.<br>Default: 1                                                                                                      |

**Mode** Router Configuration

**Usage** The default-cost option provides the metric for the summary default route, generated by the area border router, into the stub area. Use this option only on an area border router that is attached to the stub area.

**Example** To set the default cost to 10 in area 1 for the OSPF process P2, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf P2
awplus(config-router)# area 1 default-cost 10
```

**Related Commands** [area stub \(IPv6 OSPF\)](#)

# area encryption ipsec spi esp

**Overview** Use this command in Router Configuration mode to enable either AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) or 3DES (Triple Data Encryption Standard) ESP (Encapsulating Security Payload) encryption for a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable the encryption configured for a specified OSPF area.

**Syntax** `area <area-id> encryption ipsec spi <256-4294967295> esp  
{aes-cbc <AES-CBC-key>|3des <3DES-key>|null}{md5  
<MD5-key>|sha1 <SHA1-key>}  
no area <area-id> encryption ipsec spi <256-4294967295>`

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |           |                                                        |                |                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|--------------------------------------------------------|----------------|--------------------------------------------------------------------|
| <area-id>        | The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats:<br><table><tr><td>&lt;ip-addr&gt;</td><td>OSPF area-ID expressed in IPv4 address format A.B.C.D.</td></tr><tr><td>&lt;0-4294967295&gt;</td><td>OSPF area-ID expressed as a decimal number within the range shown.</td></tr></table><br>For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID. | <ip-addr> | OSPF area-ID expressed in IPv4 address format A.B.C.D. | <0-4294967295> | OSPF area-ID expressed as a decimal number within the range shown. |
| <ip-addr>        | OSPF area-ID expressed in IPv4 address format A.B.C.D.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |           |                                                        |                |                                                                    |
| <0-4294967295>   | OSPF area-ID expressed as a decimal number within the range shown.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |           |                                                        |                |                                                                    |
| <256-4294967295> | Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.                                                                                                                                                                                                                                                                                                                                                                                                       |           |                                                        |                |                                                                    |
| esp              | Specify the esp keyword (Encapsulating Security Payload) to then apply either AES-CBC or 3DES encryption.                                                                                                                                                                                                                                                                                                                                                                                                            |           |                                                        |                |                                                                    |
| aes-cbc          | Specify this keyword to enable AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) encryption.                                                                                                                                                                                                                                                                                                                                                                                                              |           |                                                        |                |                                                                    |
| <AES-CBC-key>    | Enter an AES-CBC key containing either 32, 48, or 64 hexadecimal characters.                                                                                                                                                                                                                                                                                                                                                                                                                                         |           |                                                        |                |                                                                    |
| 3des             | Specify 3DES (Triple Data Encryption Standard) encryption.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |           |                                                        |                |                                                                    |
| <3DES-key>       | Enter a 3DES key containing 48 hexadecimal characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |           |                                                        |                |                                                                    |
| null             | Specify ESP without AES-CBC or 3DES encryption applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |           |                                                        |                |                                                                    |
| md5              | Specify the MD5 (Message-Digest 5) encryption algorithm.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |           |                                                        |                |                                                                    |
| <MD5-key>        | Enter an MD5 key containing 32 hexadecimal characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |           |                                                        |                |                                                                    |
| sha1             | Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |           |                                                        |                |                                                                    |
| <SHA1-key>       | Enter an SHA-1 key containing 40 hexadecimal characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |           |                                                        |                |                                                                    |

**Mode** Router Configuration

**Usage** When you issue this command, authentication and encryption are both enabled.

Use this command on an OSPFv3 area, use the [area virtual-link encryption ipsec spi](#) command on an OSPFv3 area virtual link. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Security is achieved using the IPv6 ESP extension header. The IPv6 ESP extension header is used to provide confidentiality, integrity, authentication, and confidentiality. Authentication fields are removed from OSPF for IPv6 packet headers, so applying IPv6 ESP extension headers are required for integrity, authentication, and confidentiality.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information and examples.

**NOTE:** You can configure an encryption security policy (SPI) on an OSPFv3 area with this command, or on a VLAN interface with the [ipv6 ospf encryption spi esp](#) command.

When you configure encryption for an area, the security policy is applied to all VLAN interfaces in the area. However, Allied Telesis recommends a different encryption security policy is applied to each interface for higher security.

If you apply the `ipv6 ospf encryption null` command this affects encryption configured on both the VLAN interface and the OSPFv3 area.

This is due to OSPFv3 hello messages ingressing VLAN interfaces, which are part of area encryption, not being being encrypted. So neighbors time out.

**Example** To enable ESP encryption, but not apply an AES-CBC key or an 3DES key, and MD5 authentication with a 32 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp null
md5 1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption, but not apply an AES-CBC key or an 3DES key, and SHA-1 authentication with a 40 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp null
sha1 1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with a 48 hexadecimal character 3DES key and a 32 hexadecimal character MD5 authentication for OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp 3des
1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF md5
1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption with a 32 hexadecimal character AES-CBC key, and a 40 hexadecimal character SHA-1 authentication key for OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp
aes-cbc 1234567890ABCDEF1234567890ABCDEF sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To disable ESP encryption for OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 encryption ipsec spi 1000
```

## area range (IPv6 OSPF)

**Overview** Use this command to summarize OSPFv3 routes at an area boundary, configuring an IPv6 address range which consolidates OSPFv3 routes. By default, this feature is not enabled.

A summary route created by this command is then advertised to other areas by the Area Border Routers (ABRs). In this way, routing information is condensed at area boundaries and outside the area so that routes are exchanged between areas in an efficient manner.

If the network numbers in an area are arranged into sets of contiguous routes, the ABRs can be configured to advertise a summary route that covers all the individual networks within the area that fall into the specified range.

The **no** variant of this command disables this function and restores default behavior.

**Syntax** `area <area-id> range <ipv6address/prefix-length> [advertise|not-advertise]`  
`no area <area-id> range <ipv6address/prefix-length>`

| Parameter               | Description                                                                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>               | The OSPFv3 area that you summarizing the routes for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. |
|                         | <A.B.C.D> OSPF area-ID expressed in IPv4 address format A.B.C.D.                                                                                                     |
|                         | <0-4294967295> OSPF area-ID expressed as a decimal number within the range shown.                                                                                    |
|                         | For example the values 0.0.1.2 and decimal 258 would both define the same area-ID.                                                                                   |
| <ip-addr/prefix-length> | The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.                                                          |
| advertise               | Advertise this range as a summary route into other areas.                                                                                                            |
| not-advertise           | Do not advertise this range.                                                                                                                                         |

**Default** The area range is not configured by default. The area range is advertised if it is configured.

**Mode** Router Configuration

**Usage** You can configure multiple ranges on a single area with multiple instances of this command, so OSPFv3 summarizes addresses for different sets of IPv6 address ranges.

Ensure OSPFv3 IPv6 routes exist in the area range for advertisement before using this command.

**Example**   awplus# configure terminal  
awplus(config)# router ipv6 ospf P2  
awplus(config-router)# area 1 range 2000::/3

## area stub (IPv6 OSPF)

**Overview** This command defines an OSPF area as a stub area. By default, no stub area is defined.

Use this command when routers in the area do not require learning about external LSAs. You can define the area as a totally stubby area by configuring the Area Border Router of that area using the **area stub no-summary** command.

The **no** variant of this command removes this definition.

**Syntax** `area <area-id> stub [no-summary]`  
`no area <area-id> stub [no-summary]`

| Parameter  | Description                                                                                                                                                                                                                                                              |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>  | The OSPF area that you are configuring as a stub area. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area-ID. |
|            | <A.B.C.D> OSPF area-ID, expressed in the IPv4 address format <A.B.C.D>.                                                                                                                                                                                                  |
|            | <0-4294967295> OSPF area-ID expressed as a decimal number within the range shown.                                                                                                                                                                                        |
|            | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area-ID.                                                                                                                                                                        |
| no-summary | Stops an ABR from sending summary link advertisements into the stub area.                                                                                                                                                                                                |

**Mode** Router Configuration

**Usage** There are two stub area router configuration commands: the **area stub** and **area default-cost** commands. In all routers attached to the stub area, configure the area by using the **area stub** command. For an area border router (ABR) attached to the stub area, also use the **area default-cost** command.

**Example**

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# area 100 stub
```

**Related Commands** [area default-cost \(IPv6 OSPF\)](#)

## area virtual-link (IPv6 OSPF)

**Overview** This command configures a link between a non-backbone area and the backbone, through other non-backbone areas.

In OSPF, all non-backbone areas must be connected to a backbone area. If the connection to the backbone is lost, the virtual link repairs the connection.

The **no** variant of this command removes the virtual link.

**Syntax**

```
area <area-id> virtual-link <router-id>
no area <area-id> virtual-link <router-id>
area <area-id> virtual-link <router-id>
no area <area-id> virtual-link <router-id>
area <area-id> virtual-link <router-id> [hello-interval
<1-65535>] [retransmit-interval <1-65535>] [transmit-delay
<1-65535>]
no area <area-id> virtual-link <router-id> [hello-interval]
[retransmit-interval] [transmit-delay]
```

| Parameter           | Description                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>           | The area-ID of the transit area that the virtual link passes through. This can be entered in either dotted decimal format or normal decimal format as shown below. |
|                     | <A.B.C.D> OSPF area-ID, expressed in the IPv4 address format <A.B.C.D>.                                                                                            |
|                     | <0-4294967295> OSPF area-ID expressed as a decimal number within the range shown.                                                                                  |
|                     | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area-ID.                                                                  |
| <router-id>         | The OSPF router ID of the virtual link neighbor.                                                                                                                   |
| dead-interval       | If no packets are received from a particular neighbor for dead-interval seconds, the router considers the neighbor router to be off-line.<br>Default: 40 seconds   |
|                     | <1-65535> The number of seconds in the interval.                                                                                                                   |
| hello-interval      | The interval the router waits before it sends a hello packet.<br>Default: 10 seconds                                                                               |
|                     | <1-65535> The number of seconds in the interval.                                                                                                                   |
| retransmit-interval | The interval the router waits before it retransmits a packet.<br>Default: 5 seconds                                                                                |
|                     | <1-65535> The number of seconds in the interval.                                                                                                                   |

| Parameter      | Description                                                                       |
|----------------|-----------------------------------------------------------------------------------|
| transmit-delay | The interval the router waits before it transmits a packet.<br>Default: 1 seconds |
|                | <1-65535>      The number of seconds in the interval.                             |

**Mode** Router Configuration

**Usage** You can configure virtual links between any two backbone routers that have an interface to a common non-backbone area. The protocol treats these two routers, joined by a virtual link, as if they were connected by an unnumbered point-to-point network. To configure a virtual link, you require:

- The transit area-ID, i.e. the area-ID of the non-backbone area that the two backbone routers are both connected to.
- The corresponding virtual link neighbor's router ID. To see the router ID use the [show ipv6 ospf](#) command.

Configure the **hello-interval** to be the same for all routers attached to a common network. A short **hello-interval** results in the router detecting topological changes faster but also an increase in the routing traffic.

The **retransmit-interval** is the expected round-trip delay between any two routers in a network. Set the value to be greater than the expected round-trip delay to avoid needless retransmissions.

The **transmit-delay** is the time taken to transmit a link state update packet on the interface. Before transmission, the link state advertisements in the update packet, are incremented by this amount. Set the **transmit-delay** to be greater than zero. Also, take into account the transmission and propagation delays for the interface.

**Example** To configure a virtual link through area 1 to the router with router-ID 10.10.11.50, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# area 1 virtual-link 10.10.11.50 hello 5
dead 10
```

**Related Commands** [show ipv6 ospf](#)

# area virtual-link authentication ipsec spi

**Overview** Use this command in Router Configuration mode to enable authentication for virtual links in a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable authentication for virtual links in a specified OSPF area.

**Syntax** `area <area-id> virtual-link <router-ID> authentication ipsec spi <256-4294967295> {md5 <MD5-key>|sha1 <SHA1-key>}`  
`no area <area-id> virtual-link <router-ID> authentication ipsec spi <256-4294967295>`

| Parameter        | Description                                                                                                                                                                               |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>        | The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats: |
|                  | <ip-addr> OSPF area-ID expressed in IPv4 address format A.B.C.D.                                                                                                                          |
|                  | <0-4294967295> OSPF area-ID expressed as a decimal number within the range shown.                                                                                                         |
|                  | For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.                                                                                                       |
| virtual-link     | Specify a virtual link and its parameters.                                                                                                                                                |
| <router-ID>      | Enter a router ID associated with a virtual link neighbor in IPv4 address format A.B.C.D.                                                                                                 |
| authentication   | Specify this keyword to enable authentication.                                                                                                                                            |
| ipsec            | Specify this keyword to use IPsec authentication.                                                                                                                                         |
| spi              | Specify this keyword to set the SPI (Security Parameters Index).                                                                                                                          |
| <256-4294967295> | Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.                                                                            |
| md5              | Specify the MD5 (Message-Digest 5) encryption algorithm.                                                                                                                                  |
| <MD5-key>        | Enter an MD5 key containing 32 hexadecimal characters.                                                                                                                                    |
| sha1             | Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm.                                                                                                                         |
| <SHA1-key>       | Enter an SHA-1 key containing 40 hexadecimal characters.                                                                                                                                  |

**Mode** Router Configuration

**Usage** Use this command on an OSPFv3 area virtual link, use the [area authentication ipsec spi](#) command on an OSPFv3 area. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by

link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

OSPFv3 areas are connected to a backbone area. Virtual links can be configured to repair lost connections to a backbone area for OSPFv3 areas. To configure an OSPFv3 virtual link, use a router ID instead of the IPv6 prefix of the router.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information and examples.

**Example** To enable MD5 authentication with a 32 hexadecimal character key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1
authentication ipsec spi 1000 md5
1234567890ABCDEF1234567890ABCDEF
```

To enable SHA-1 authentication with a 40 hexadecimal character key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1
authentication ipsec spi 1000 sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To disable authentication for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 virtual-link ipsec spi 1000
```

- [show ipv6 ospf virtual-links](#)

# area virtual-link encryption ipsec spi

**Overview** Use this command in Router Configuration mode to enable either AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) or 3DES (Triple Data Encryption Standard) ESP (Encapsulating Security Payload) encryption for virtual links in a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable encryption configured for virtual links in a specified OSPF area.

**Syntax** `area <area-id> virtual-link <router-ID> encryption ipsec spi <256-4294967295> esp {aes-cbc <AES-CBC-key>|3des <3DES-key>|null}{md5 <MD5-key>|sha1 <SHA1-key>}`  
`no area <area-id> encryption ipsec spi <256-4294967295>`

| Parameter        | Description                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>        | The OSPF area that you are specifying the summary route default- cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats: |
|                  | <ip-addr> OSPF area-ID expressed in IPv4 address format A.B.C.D.                                                                                                                           |
|                  | <0-4294967295> OSPF area-ID expressed as a decimal number within the range shown.                                                                                                          |
|                  | For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID.                                                                                                        |
| virtual-link     | Specify a virtual link and its parameters.                                                                                                                                                 |
| <router-ID>      | Enter a router ID associated with a virtual link neighbor in IPv4 address format A.B.C.D.                                                                                                  |
| encryption       | Specify this keyword to enable encryption.                                                                                                                                                 |
| ipsec            | Specify this keyword to use IPsec authentication.                                                                                                                                          |
| spi              | Specify this keyword to set the SPI (Security Parameters Index).                                                                                                                           |
| <256-4294967295> | Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.                                                                             |
| esp              | Specify the esp keyword (Encapsulating Security Payload) to then apply either AES-CBC or 3DES encryption.                                                                                  |
| aes-cbc          | Specify this keyword to enable AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) encryption.                                                                                    |
| <AES-CBC-key>    | Enter an AES-CBC key containing either 32, 48, or 64 hexadecimal characters.                                                                                                               |
| 3des             | Specify 3DES (Triple Data Encryption Standard) encryption.                                                                                                                                 |
| <3DES-key>       | Enter a 3DES key containing 48 hexadecimal characters.                                                                                                                                     |

| Parameter  | Description                                                       |
|------------|-------------------------------------------------------------------|
| null       | Specify ESP without AES-CBC or 3DES encryption applied.           |
| md5        | Specify the MD5 (Message-Digest 5) encryption algorithm.          |
| <MD5-key>  | Enter an MD5 key containing 32 hexadecimal characters.            |
| sha1       | Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm. |
| <SHA1-key> | Enter an SHA-1 key containing 40 hexadecimal characters.          |

**Mode** Router Configuration

**Usage** When you issue this command, authentication and encryption are both enabled.

Use this command on an OSPFv3 area virtual link, use the [area encryption ipsec spi esp](#) command on an OSPFv3 area. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Security is achieved using the IPv6 ESP extension header. ESP is used to provide confidentiality, integrity, authentication, and confidentiality. Authentication fields are removed from OSPF for IPv6 packet headers. The IPv6 ESP extension header is required for integrity, authentication, and confidentiality.

Note that interface configuration takes priority over area configuration. If an interface configuration is removed then an area configuration is applied to an interface instead.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information and examples.

**Example** To enable ESP encryption, but not apply an AES-CBC key or a 3DES key, and MD5 authentication with a 32 hexadecimal character key for virtual links in OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp null md5 1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption, but not apply an AES-CBC key or a 3DES key, and SHA-1 authentication with a 40 hexadecimal character key for virtual links in OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp null sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with a 32 hexadecimal character AES-CBC key and a 40 hexadecimal character SHA-1 authentication key for virtual links in OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp aes-cbc 1234567890ABCDEF1234567890ABCDEF
sha1 1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with a 48 hexadecimal character 3DES key and a 40 hexadecimal character SHA-1 authentication key for virtual links in OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp 3des
1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To disable authentication for virtual links in OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 virtual-link 10.0.0.1
authentication ipsec spi 1000
```

# auto-cost reference bandwidth (IPv6 OSPF)

**Overview** This command controls how OSPF calculates default metrics for the interface.

Use the **no** variant of this command to assign cost based only on the interface bandwidth.

**Syntax** `auto-cost reference-bandwidth <1-4294967>`  
`no auto-cost reference-bandwidth`

| Parameter                      | Description                                                   |
|--------------------------------|---------------------------------------------------------------|
| <code>&lt;1-4294967&gt;</code> | The reference bandwidth, measured in Mbits per second (Mbps). |

**Default** 1000 Mbps

**Usage** By default, OSPF calculates the OSPF metric for an interface by dividing the reference bandwidth by the interface bandwidth. The default for the reference bandwidth is 1000 Mbps. As a result, if this default is used, there is very little difference between the metrics applied to interfaces of increasing bandwidth beyond 1000 Mbps.

The auto-cost command is used to alter this reference bandwidth in order to give a real difference between the metrics of high bandwidth links of differing bandwidths. In a network that has multiple links with high bandwidths, specify a larger reference bandwidth value to differentiate the costs on those links.

Cost is calculated by dividing the reference bandwidth (Mbps) by the layer 3 interface (Switched Virtual Interface (SVI), Loopback or Ethernet interface) bandwidth. Interface bandwidth may be altered by using the [bandwidth](#) command as the SVI does not auto detect the bandwidth based on the speed of associated device ports.

When the reference bandwidth calculation results in a cost integer greater than 1 but contains a fractional value (value after the decimal point), the result rounds down to the nearest integer. The following example shows how the cost is calculated.

The reference bandwidth is 1000 Mbps and the interface bandwidth is 7 Mbps.

Calculation =  $1000/7$

Calculation result = 142.85 (integer of 142, fractional value of 0.85)

Result after rounding down to the nearest integer = 142 (Interface cost is 142)

When the reference bandwidth calculation results in a cost less than 1, it is rounded up to the nearest integer which is 1. The following example shows how the cost is calculated.

The reference bandwidth is 1000 Mbps and the interface bandwidth is 10000 Mbps.

Calculation =  $1000/10000$

Calculation result = 0.1

Result after rounding up to the nearest integer = 1 (Interface cost is 1)

The auto-cost reference bandwidth value should be consistent across all OSPF routers in the OSPF process.

Note that using the `ipv6 ospf cost` command on a layer 3 interface will override the cost calculated by the reference bandwidth command.

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 20
awplus(config-router)# auto-cost reference-bandwidth 1000
```

**Related  
Commands** `ipv6 ospf cost`

# bandwidth

**Overview** Use this command to specify the maximum bandwidth to be used for each VLAN interface. The bandwidth value is in bits per second. OSPF uses this to calculate metrics for the VLAN interface.

The **no** variant of this command removes any applied bandwidth value and replaces it with a value equal to the lowest port speed within that VLAN.

**Syntax** `bandwidth <bandwidth-setting>`  
`no bandwidth`

| Parameter                              | Description                                                                                                                                                                                                                                                                      |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;bandwidth-setting&gt;</code> | Sets the bandwidth for the interface. Enter a value in the range 1 to 10000000000 bits per second. Note that to avoid entering many zeros, you can add k, m, or g to internally add 3, 6 or 9 zeros to the number entered. For example entering 1k is the same as entering 1000. |

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the bandwidth on VLAN2 to be 1 Mbps, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# bandwidth 1000000
```

Or

```
awplus(config-if)# bandwidth 1m
```

**Related Commands** [show running-config access-list](#)  
[show interface](#)

# clear ipv6 ospf process

**Overview** This command clears and restarts the IPv6 OSPF routing process. Specify the Process ID to clear one particular OSPF process. When no Process ID is specified, this command clears all running OSPF processes.

**Syntax** `clear ipv6 ospf [<0-65535>] process`

| Parameter | Description             |
|-----------|-------------------------|
| <0-65535> | The routing process ID. |

**Mode** Privileged Exec

**Example** `awplus# clear ipv6 ospf process`

# debug ipv6 ospf events

**Overview** This command enables IPv6 OSPF debugging for event troubleshooting.

To enable all debugging options, specify **debug ipv6 ospf event** with no additional parameters.

The **no** and **undebug** variants of this command disable OSPF debugging. Using this command with no parameters entered, will disable debugging for all parameter options.

**Syntax** `debug ipv6 ospf events [abr] [asbr] [os][router] [vlink]`  
`no debug ipv6 ospf events [abr] [asbr] [os] [router] [vlink]`

| Parameter | Description                |
|-----------|----------------------------|
| abr       | Shows ABR events.          |
| asbr      | Shows ASBR events.         |
| router    | Shows other router events. |
| os        | Shows OS events.           |
| vlink     | Shows virtual link events. |

**Mode** Privileged Exec and Global Configuration

**Example** To enable IPv6 event debugging and show ABR events, use the following command:

```
awplus# debug ipv6 ospf events asbr
```

# debug ipv6 ospf ifsm

- Overview** This command specifies debugging options for IPv6 OSPF Interface Finite State Machine (IFSM) troubleshooting.
- To enable all debugging options, specify **debug ipv6 ospf ifsm** with no additional parameters.
- The **no** and **undebug** variants of this command disable IPv6 OSPF IFSM debugging. Use these commands without parameters to disable all the options.

**Syntax** `debug ipv6 ospf ifsm [events] [status] [timers]`  
`no debug ipv6 ospf ifsm [events] [status] [timers]`

| Parameter | Description                       |
|-----------|-----------------------------------|
| events    | Displays IFSM event information.  |
| status    | Displays IFSM status information. |
| timers    | Displays IFSM timer information.  |

**Mode** Privileged Exec and Global Configuration

**Example** To specify IPv6 OSPF debugging options to display IPv6 OSPF IFSM events information, use the following commands:

```
awplus# debug ipv6 ospf ifsm events
```

**Related Commands** [terminal monitor](#)  
[undebug ipv6 ospf ifsm](#)

# debug ipv6 ospf lsa

**Overview** This command enables debugging options for IPv6 OSPF Link State Advertisements (LSA) troubleshooting. This displays information related to internal operations of LSAs.

To enable all debugging options, specify **debug ipv6 ospf lsa** with no additional parameters.

The **no** and **undebug** variants of this command disable IPv6 OSPF LSA debugging. Use this command without parameters to disable all the options.

**Syntax**

```
debug ipv6 ospf lsa [flooding] [generate] [install] [maxage] [refresh]
no debug ipv6 ospf lsa [flooding] [generate] [install] [maxage] [refresh]
```

| Parameter             | Description                              |
|-----------------------|------------------------------------------|
| <code>flooding</code> | Displays LSA flooding.                   |
| <code>generate</code> | Displays LSA generation.                 |
| <code>install</code>  | Show LSA installation.                   |
| <code>maxage</code>   | Shows maximum age of the LSA in seconds. |
| <code>refresh</code>  | Displays LSA refresh.                    |

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging for IPv6 OSPF refresh LSA, use the following commands:

```
awplus# debug ipv6 ospf lsa refresh
```

**Related Commands** [terminal monitor](#)  
[undebug ipv6 ospf lsa](#)

# debug ipv6 ospf nfsm

**Overview** This command enables debugging options for IPv6 OSPF Neighbor Finite State Machines (NFSMs).

To enable all debugging options, specify **debug ipv6 ospf nfsm** with no additional parameters.

The **no** and **undebug** variants of this command disable IPv6 OSPF NFSM debugging. Use this command without parameters to disable all the options.

**Syntax** `debug ipv6 ospf nfsm [events] [status] [timers]`  
`no debug ipv6 ospf nfsm [events] [status] [timers]`

| Parameter | Description                       |
|-----------|-----------------------------------|
| events    | Displays NFSM event information.  |
| status    | Displays NFSM status information. |
| timers    | Displays NFSM timer information.  |

**Mode** Privileged Exec and Global Configuration

**Examples** To enable IPv6 debugging option to display timer information, use the following command:

```
awplus# debug ipv6 ospf nfsm timers
```

**Related Commands** [terminal monitor](#)  
[undebug ipv6 ospf nfsm](#)

# debug ipv6 ospf packet

**Overview** This command enables debugging options for IPv6 OSPF packets.

To enable all debugging options, specify **debug ipv6 ospf packet** with no additional parameters.

The **no** and **undebug** variants of this command disable IPv6 OSPF packet debugging. Use this command without parameters to disable all options.

**Syntax**

```
debug ipv6 ospf packet [dd] [detail] [hello] [ls-ack]
[ls-request] [ls-update] [recv] [send]

no debug ipv6 ospf packet [dd] [detail] [hello] [ls-ack]
[ls-request] [ls-update] [recv] [send]
```

| Parameter  | Description                                                   |
|------------|---------------------------------------------------------------|
| dd         | Specifies debugging for IPv6 OSPF database descriptions.      |
| detail     | Sets the debug option to detailed information.                |
| hello      | Specifies debugging for IPv6 OSPF hello packets.              |
| ls-ack     | Specifies debugging for IPv6 OSPF link state acknowledgments. |
| ls-request | Specifies debugging for IPv6 OSPF link state requests.        |
| ls-update  | Specifies debugging for IPv6 OSPF link state updates.         |
| recv       | Specifies the debug option set for received packets.          |
| send       | Specifies the debug option set for sent packets.              |

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging for hello packets, use the following command:

```
awplus# debug ipv6 ospf packet hello
```

**Related Commands**

- [terminal monitor](#)
- [undebug ipv6 ospf packet](#)

# debug ipv6 ospf route

**Overview** This command enables debugging of route calculation. Use this command without parameters to turn on all the options.

The **no** and **undebug** variants of this command disable IPv6 OSPF route debugging. Use this command without parameters to disable all options.

**Syntax** debug ipv6 ospf route [ase] [ia] [install] [spf]  
no debug ipv6 ospf route [ase] [ia] [install] [spf]

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| ase       | Specifies the debugging of external route calculation.   |
| ia        | Specifies the debugging of inter-area route calculation. |
| install   | Specifies the debugging of route installation.           |
| spf       | Specifies the debugging of SPF calculation.              |

**Mode** Privileged Exec and Global Configuration

**Examples** To enable IPv6 route debugging of inter-area route calculations, use the following command:

```
awplus# debug ipv6 ospf route ia
```

**Related Commands** [terminal monitor](#)  
[undebug ipv6 ospf route](#)

# default-information originate

**Overview** This command creates a default external route into an OSPF routing domain.

When you use the **default-information originate** command to redistribute routes into an OSPF routing domain, then the system acts like an Autonomous System Boundary Router (ASBR). By default, an ASBR does not generate a default route into the OSPF routing domain.

When using this command, also specify the **route-map** *<route-map>* option to avoid a dependency on the default network in the routing table.

The **metric-type** is an external link type associated with the default route advertised into the OSPF routing domain. The value of the external route could be either Type 1 or 2. The default is Type 2.

The **no** variant of this command disables this feature.

**Syntax**

```
default-information originate [always] [metric <metric>]
[metric-type <1-2>] [route-map <route-map>]

no default-information originate [always] [metric]
[metric-type] [route-map]
```

| Parameter   | Description                                                                                                                                                                |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| always      | Used to advertise the default route regardless of whether there is a default route.                                                                                        |
| <metric>    | The metric value used in creating the default route. Enter a value in the range 0 to 16777214. The default metric value is 10. The value used is specific to the protocol. |
| <1-2>       | External metric type for default routes, either OSPF External Type 1 or Type 2 metrics. Enter the value 1 or 2.                                                            |
| route-map   | Specifies to use a specific route-map.                                                                                                                                     |
| <route-map> | The route-map name. It is a string comprised of any characters, numbers or symbols.                                                                                        |

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# default-information originate always
metric 23 metric-type 2 route-map myinfo
```

**Related Commands** [route-map](#)

# default-metric (IPv6 OSPF)

**Overview** This command sets default metric value for routes redistributed into the IPv6 OSPF routing protocol.

The **no** variant of this command returns IPv6 OSPF to using built-in, automatic metric translations, as appropriate for each routing protocol.

**Syntax** `default-metric <0-16777214>`  
`no default-metric [<0-16777214>]`

| Parameter                       | Description                                                          |
|---------------------------------|----------------------------------------------------------------------|
| <code>&lt;1-16777214&gt;</code> | Default metric value appropriate for the specified routing protocol. |

**Mode** Router Configuration

**Usage** A default metric facilitates redistributing routes even with incompatible metrics. If the metrics do not convert, the default metric provides an alternative and enables the redistribution to continue. The effect of this command is that IPv6 OSPF will use the same metric value for **all** redistributed routes. Use this command in conjunction with the [redistribute \(IPv6 OSPF\)](#) command.

**Examples**

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# default-metric 100
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# no default-metric
```

**Related commands** [redistribute \(IPv6 OSPF\)](#)

## distance (IPv6 OSPF)

**Overview** This command sets the administrative distance for OSPFv3 routes based on the route type. Your device uses this value to select between two or more routes to the same destination from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). See the [Route Selection Feature Overview and Configuration Guide](#) for more information.

Use the command **distance ospfv3** to set the distance for an entire category of OSPFv3 routes, rather than the specific routes that pass an access list.

Use the command **distance <1-254>**, with no other parameter, to set the same distance for all OSPFv3 route types.

The **no** variant of this command sets the administrative distance for OSPFv3 routes to the default of 110.

**Syntax**

```
distance <1-254>
distance ospfv3 {external <1-254>|inter-area <1-254>|intra-area <1-254>}
no distance {ospfv3|<1-254>}
```

| Parameter  | Description                                                                                                                                      |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-254>    | Specify the Administrative Distance value for OSPFv3 routes.                                                                                     |
| external   | Sets the distance for routes from other routing domains, learned by redistribution.<br>Specify an OSPFv3 external distance in the range <1-254>. |
| inter-area | Sets the distance for all routes from one area to another area.<br>Specify an OSPFv3 inter-area distance in the range <1-254>.                   |
| intra-area | Sets the distance for all routes within an area.<br>Specify an OSPFv3 intra-area distance in the range <1-254>.                                  |

**Default** The default OSPFv3 administrative distance is 110. The default Administrative Distance for each type of route (intra, inter, or external) is 110.

**Mode** Router Configuration

**Usage** The administrative distance rates the trustworthiness of a routing information source. The distance could be any integer from 0 to 254. A higher distance value indicates a lower trust rating. For example, an administrative distance of 254 indicates that the routing information source cannot be trusted and should be ignored.

Use this command to set the distance for an entire group of routes, rather than a specific route that passes an access list.

**Examples** To set the following administrative distances for route types in OSPF 100:

- 20 for inter-area routes
- 10 for intra-area routes
- 40 for external routes

use the commands:

```
awplus(config)# router ipv6 ospf 100  
awplus(config-router)# distance ospfv3 inter-area 20 intra-area  
10 external 40
```

To set the administrative distance for all routes in OSPFv3 100 back to the default of 110, use the commands:

```
awplus(config)# router ipv6 ospf 100  
awplus(config-router)# no distance ospfv3
```

# distribute-list (IPv6 OSPF)

**Overview** Use this command in Router Configuration mode to filter incoming or outgoing OSPFv3 route updates from the networks as defined in an associated access-list.

The entities that are used to perform filtering are ACLs (Access Control Lists), which match on certain attributes in the routes that are being transferred. For information about ACLs, see the [ACL Feature Overview and Configuration Guide](#).

Use the **no** variant of this command in Router Configuration mode to disable this feature for networks as defined in an associated access-list.

**Syntax**

```
distribute-list <access-list> in
no distribute-list [<access-list>] in
distribute-list <access-list> out {connected|ospf
[<process-tag>]|rip|static}
no distribute-list <access-list> out {connected|ospf
[<process-tag>]|rip|static}
```

| Parameter     | Description                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <access-list> | Specifies the IPv6 access-list number or name to use. The specified access list defines which networks are received and which are suppressed. |
| in            | Indicates that this applies to incoming advertised routes.                                                                                    |
| out           | Indicates that this applies to outgoing advertised routes.                                                                                    |
| connected     | Specify the redistribution of connected routes.                                                                                               |
| ospf          | Specify the redistribution of OSPFv3 routes.                                                                                                  |
| <process-tag> | Optionally specify an OSPFv3 process tag for OSPFv3 routes.                                                                                   |
| rip           | Specify the redistribution of RIPng routes.                                                                                                   |
| static        | Specify the redistribution of connected routes.                                                                                               |

**Default** Disabled

**Mode** Router Configuration

**Usage** This command applies filtering to the transfer of routing information between OSPFv3 and the IPv6 route table. You can apply filtering in either direction, from OSPFv3 to the IPv6 route table using an **in** distribute-list, or from the IPv6 route table to OSPFv3 using an **out** distribute-list.

The effect of an **in** filter is that some route information that OSPFv3 has learned from LSA updates will not be installed into the IPv6 route table. The effect of an **out** filter is that some route information that could be redistributed to OSPFv3 will not be redistributed to OSPFv3.

There are **in** and **out** distribute-lists, which carry out different route filtering activities:

- The **in** distribute list is applied to the process of installing OSPFv3 routes into the IPv6 route table. The SPF calculation generate a set of routes calculated from the LSA database. By default, all of these routes become OSPFv3 candidate routes for inclusion into the IPv6 route table.
- An **in** distribute-list can be used to control whether or not certain routes generated by the SPF calculation are included into the set of candidates for inclusion into the IP route table. Those routes that match **deny** entries in the distribute-list will not be considered for inclusion into the IPv6 route table.
- The **out** distribute-list applies the process of redistributing non-OSPFv3 routes into OSPFv3. If OSPFv3 redistribution is configured, and an **out** distribute-list is also configured, then routes that match deny entries in the distribute-list will not be redistributed into OSPFv3.

**Example** The below commands redistribute incoming route updates from networks defined with the standard named access-list called `myacl`:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard myacl permit
2001:db8:1::/64
awplus(config)# router ipv6 ospf
awplus(config-router)# distribute-list myacl in
```

The below commands redistribute outgoing connected route updates from networks defined with the standard named access-list called `myacl`:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard myacl permit
2001:db8:1::/64
awplus(config)# router ipv6 ospf
awplus(config-router)# distribute-list myacl out connected
```

The below commands disable incoming route updates from networks defined with the standard named access-list called `myacl`:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no distribute-list myacl in
```

The below commands disable outgoing connected route updates from networks defined with the standard named access-list called `myacl`:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no distribute-list myacl out connected
```

**Related Commands** [ipv6 access-list extended \(named\)](#)  
[ipv6 access-list standard \(named\)](#)

# ipv6 ospf authentication spi

**Overview** Use this command in Interface Configuration mode to enable either MD5 (Message-Digest 5) or SHA1 (Secure Hash Algorithm 1) authentication for a specified interface.

Use the **no** variant of this command in Interface Configuration mode to disable the authentication configured for a specified interface.

**Syntax** `ipv6 ospf authentication ipsec spi <256-4294967295> {md5 <MD5-key>|sha1 <SHA1-key>}`  
`ipv6 ospf authentication null`  
`no ipv6 ospf authentication ipsec spi <256-4294967295>`

| Parameter        | Description                                                                                                                                                                                                   |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| authentication   | Specify this keyword to enable authentication.                                                                                                                                                                |
| ipsec            | Specify this keyword to use IPsec authentication.                                                                                                                                                             |
| spi              | Specify this keyword to set the SPI (Security Parameters Index).                                                                                                                                              |
| <256-4294967295> | Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.                                                                                                |
| md5              | Specify the MD5 (Message-Digest 5) hashing algorithm.                                                                                                                                                         |
| <MD5-key>        | Enter an MD5 key containing up to 32 hexadecimal characters.                                                                                                                                                  |
| sha1             | Specify the SHA-1 (Secure Hash Algorithm 1) hashing algorithm.                                                                                                                                                |
| <SHA1-key>       | Enter an SHA-1 key containing up to 40 hexadecimal characters.                                                                                                                                                |
| null             | Specify no authentication is applied when no other parameters are applied after this keyword ( <code>ipv6 ospf authentication null</code> ). Note this overrides any existing area authentication configured. |

**Mode** Interface Configuration

**Default** Authentication is not configured on an interface by default.

**Usage** Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

Use the **null** keyword to override existing area authentication. Apply the null keyword if area authentication is already configured to configure authentication on an interface.

Use the **null** keyword to override existing area authentication. Apply the **null** keyword if area authentication is already configured to configure authentication on an interface.

See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information and examples.

**NOTE:** You can configure an authentication security policy (SPI) on a VLAN interface with this command, or an OSPFv3 area with the [area authentication ipsec spi](#) command.

When you configure authentication for an area, the security policy is applied to all VLAN interfaces in the area. Allied Telesis recommends a different authentication security policy is applied to each interface for higher security.

If you apply the `ipv6 ospf authentication null` command this affects authentication configured on both the VLAN interface and the OSPFv3 area.

This is due to OSPFv3 hello messages ingressing VLAN interfaces, which are part of area authentication, not being authenticated. So neighbors time out.

**Example** To enable MD5 authentication with a 32 hexadecimal character key for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# area 1 authentication ipsec spi 1000 md5
1234567890ABCDEF1234567890ABCDEF
```

To enable SHA-1 authentication with a 32 hexadecimal character key for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf authentication ipsec spi 1000 sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To specify no authentication is applied to interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf authentication null
```

To disable authentication for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 ospf authentication ipsec spi 1000
```

- [area encryption ipsec spi esp](#)
- [ipv6 ospf encryption spi esp](#)
- [show ipv6 ospf interface](#)

# ipv6 ospf cost

**Overview** This command explicitly specifies the cost of the link-state metric in a router-LSA. The interface cost indicates the overhead required to send packets across a certain VLAN interface. Use this command to set the VLAN interface cost manually. The **no** variant of this command resets the VLAN interface cost to the default.

**Syntax** `ipv6 ospf cost <1-65535>`  
`no ipv6 ospf cost`

| Parameter | Description            |
|-----------|------------------------|
| <1-65535> | The link-state metric. |

**Default** By default there is no static value set and the OSPF cost is automatically calculated by using the command [auto-cost reference bandwidth \(IPv6 OSPF\)](#) command.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command explicitly sets a user specified cost of sending packets out the interface. Using this command overrides the cost value calculated automatically with the auto-cost reference bandwidth (IPv6 OSPF) feature.

The link-state metric cost is stated in the Router-LSA's link. Typically, the cost is inversely proportional to the bandwidth of an interface. By default, the cost of a VLAN interface is calculated according to the following formula:

reference bandwidth / interface bandwidth

The reference bandwidth is set by default at 1000000 kbps (or 1000 Mbps), but can be changed by the [auto-cost reference bandwidth \(IPv6 OSPF\)](#) command.

The interface bandwidth is set by default to 1000000 kbps (or 1000 Mbps), but can be changed by the [bandwidth](#) command.

**Example** To set the IPv6 OSPF cost to 10 on the VLAN interface `vlan25`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan25
awplus(config-if)# ipv6 ospf cost 10
```

**Related Commands** [show ipv6 ospf interface](#)  
[auto-cost reference bandwidth \(IPv6 OSPF\)](#)  
[bandwidth](#)

# ipv6 ospf dead-interval

**Overview** This command sets the interval during which no hello packets are received and after which a neighbor is declared dead.

The dead-interval is the amount of time that OSPF waits to receive an OSPF hello packet from the neighbor before declaring the neighbor is down. This value is advertised in the router's hello packets. It must be a multiple of the hello-interval and be the same for all routers on a specific network.

The **no** variant of this command returns the interval to the default of 40 seconds.

**Syntax** `ipv6 ospf dead-interval <1-65535> [<inst-id>]`  
`no ipv6 ospf dead-interval`

| Parameter | Description                             |
|-----------|-----------------------------------------|
| <1-65535> | The interval in seconds.<br>Default: 40 |
| <inst-id> | The instance ID<br>Default: 0           |

**Mode** Interface Configuration for a VLAN interface.

**Example** The following example shows configuring the dead-interval to 10 seconds on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf dead-interval 10
```

**Related Commands** [ipv6 ospf hello-interval](#)  
[show ipv6 ospf interface](#)

# ipv6 ospf display route single-line

**Overview** Use this command to change the result of the **show ipv6 route** command to display each route entry on a single line.

**Syntax** `ipv6 ospf display route single-line`  
`no ipv6 ospf display route single-line`

**Mode** Global Configuration

**Example** To display each route entry on a single line.

```
awplus# configure terminal
awplus(config)# ipv6 ospf display route single-line
```

**Related Commands** [show ipv6 ospf route](#)

# ipv6 ospf encryption spi esp

**Overview** Use this command in Interface Configuration mode to enable either AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) or 3DES (Triple Data Encryption Standard) ESP (Encapsulating Security Payload) encryption for a specified interface.

Use the **no** variant of this command in Interface Configuration mode to disable the encryption configured for a specified interface.

**Syntax** `ipv6 ospf encryption ipsec spi <256-4294967295> esp {aes-cbc <AES-CBC-key>|3des <3DES-key>|null}{md5 <MD5-key>|sha1 <SHA1-key>}`

`ipv6 ospf encryption null`

`no ipv6 ospf encryption ipsec spi <256-4294967295>`

| Parameter        | Description                                                                                                                          |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <256-4294967295> | Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer.                       |
| esp              | Specify the esp keyword (Encapsulating Security Payload) to then apply either AES-CBC or 3DES encryption.                            |
| aes-cbc          | Specify this keyword to enable AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) encryption.                              |
| <AES-CBC-key>    | Enter an AES-CBC key containing either 32, 48, or 64 hexadecimal characters.                                                         |
| 3des             | Specify 3DES (Triple Data Encryption Standard) encryption.                                                                           |
| <3DES-key>       | Enter a 3DES key containing 48 hexadecimal characters.                                                                               |
| null             | Specify ESP without AES-CBC or 3DES encryption applied.                                                                              |
| md5              | Specify the MD5 (Message-Digest 5) encryption algorithm.                                                                             |
| <MD5-key>        | Enter an MD5 key containing 32 hexadecimal characters.                                                                               |
| sha1             | Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm.                                                                    |
| <SHA1-key>       | Enter an SHA-1 key containing 40 hexadecimal characters.                                                                             |
| null             | Specify no encryption is applied when no other parameters are applied after this keyword ( <code>ipv6 ospf encryption null</code> ). |

**Default** Authentication is not configured on an interface by default.

**Mode** Interface Configuration

**Usage** When you issue this command, authentication and encryption are both enabled. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Security is achieved using the IPv6 ESP extension header. The IPv6 ESP extension header is used to provide confidentiality, integrity, authentication, and confidentiality. Authentication fields are removed from OSPF for IPv6 packet headers, so applying IPv6 ESP extension headers are required for integrity, authentication, and confidentiality.

Use the **null** keyword to override existing area encryption. Apply the **null** keyword if area encryption is already configured to then configure encryption on an interface instead.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information and examples.

**NOTE:** You can configure an encryption security policy (SPI) on a VLAN interface with this command, or an OSPFv3 area with the [area encryption ipsec spi esp](#) command.

When you configure encryption for an area, the security policy is applied to all VLAN interfaces in the area. Allied Telesis recommends a different encryption security policy is applied for each interface for higher security.

If you apply the **ipv6 ospf encryption null** command this affects encryption configured on both the VLAN interface and the OSPFv3 area.

This is due to OSPFv3 hello messages ingressing VLAN interfaces, which are part of area encryption, not being encrypted. So neighbors time out.

**Example** To enable ESP encryption, but not apply an AES-CBC key or a 3DES key, for interface VLAN 2 and MD5 authentication with a 32 hexadecimal character key, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf encryption ipsec spi 1000 esp null
md5 1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption, but not apply an AES-CBC key or a 3DES key, for interface VLAN 2 and SHA-1 authentication with a 40 hexadecimal character key, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf encryption ipsec spi 1000 esp null
sha1 1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with an 3DES key with a 48 hexadecimal character key and MD5 authentication with a 32 hexadecimal character key for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf encryption ipsec spi 1000 esp 3des
1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF md5
1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption with an AES-CBC key with a 32 hexadecimal character key and SHA-1 authentication with a 40 hexadecimal character key for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf encryption ipsec spi 1000 esp
aes-cbc 1234567890ABCDEF1234567890ABCDEF sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To specify no ESP encryption is applied to interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf encryption null
```

To disable ESP encryption for interface VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 ospf encryption ipsec spi 1000
```

### **Related Commands**

[area authentication ipsec spi](#)  
[area encryption ipsec spi esp](#)  
[ipv6 ospf authentication spi](#)  
[show ipv6 ospf interface](#)

# ipv6 ospf hello-interval

**Overview** This command specifies the interval between hello packets.

The hello-interval is advertised in the hello packets. Configure the same hello-interval for all routers on a specific network. A shorter interval ensures faster detection of topological changes, but results in more routing traffic.

The **no** variant of this command returns the interval to the default of 10 seconds.

**Syntax** `ipv6 ospf hello-interval <1-65535>`  
`no ipv6 ospf hello-interval`

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| <1-65535> | The hello-interval in seconds.<br>Default: 10 |

**Default** The default interval is 10 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Example** The following example shows setting the `hello-interval` to 3 seconds on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf hello-interval 3
```

**Related Commands** [ipv6 ospf dead-interval](#)  
[show ipv6 ospf interface](#)

# ipv6 ospf neighbor

**Overview** Use this command to configure static OSPFv3 IPv6 neighbors when using the OSPFv3 "non-broadcast" (NBMA) and "point-to-multipoint non-broadcast" (P2MP NBMA) network types. OSPFv3 messages exchanged between the neighbors are unicast only.

Use the **no** variant of this command to remove a configuration.

**Syntax** `ipv6 ospf neighbor <ipv6-address>  
[<cost>|<instance-id>|<poll-interval>|<priority>]  
no ipv6 ospf neighbor <ipv6-address>  
[<cost>|<instance-id>|<poll-interval>|<priority>]`

| Parameter                          | Description                                                                                                                                                                                                                   |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-address&gt;</code>  | Specifies the interface IPv6 address of the neighbor.                                                                                                                                                                         |
| <code>&lt;cost&gt;</code>          | <i>cost &lt;1-65535&gt;</i><br>OSPF cost for point-to-multipoint neighbor.                                                                                                                                                    |
| <code>&lt;instance-id&gt;</code>   | <i>instance-id &lt;0-255&gt;</i><br>Interface instance ID.                                                                                                                                                                    |
| <code>&lt;poll-interval&gt;</code> | <i>poll-interval &lt;0-4294967295&gt;</i><br>Dead neighbor polling interval in seconds. It is recommended to set this value much higher than the hello interval. The default is 120 seconds.                                  |
| <code>&lt;priority&gt;</code>      | <i>priority &lt;0-255&gt;</i><br>Specifies the router priority value of the non-broadcast neighbor associated with the specified IP address. The default is 0. This keyword does not apply to point-to-multipoint interfaces. |

**Mode** Interface Configuration

**Usage** To configure a neighbor on an NBMA network manually, use the **ipv6 ospf neighbor** command and include one neighbor entry for each known non-broadcast network neighbor. The IPv6 address used in this command is the neighbor's primary IPv6 address on the interface where that neighbor connects to the NBMA network.

The poll interval is the reduced rate at which routers continue to send hello packets, when a neighboring router has become inactive. Set the poll interval to be much larger than hello interval.

You can use this command to configure static OSPFv3 IPv6 neighbors for Layer 3 interfaces, such as Ethernet or tunnel interfaces on routers or a VLAN interface on switches or routers.

**Examples** This example shows a neighbor configured with a priority value, poll interval time, and cost.

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 ospf neighbor fe80::c:20:0:1 priority 1
poll-interval 90
awplus(config-router)# ipv6 ospf neighbor fe80::c:20:0:1 cost
15
```

**Related  
Commands** [show ipv6 ospf neighbor](#)

# ipv6 ospf network

**Overview** This command configures the OSPF network type to a type different from the default for the particular VLAN interface.

The **no** variant of this command returns the network type to the default for the particular VLAN interface.

**Syntax** `ipv6 ospf network [broadcast | non-broadcast | point-to-point | point-to-multipoint]`  
`no ipv6 ospf network`

| Parameter                        | Description                                   |
|----------------------------------|-----------------------------------------------|
| <code>broadcast</code>           | Sets the network type to broadcast.           |
| <code>non-broadcast</code>       | Sets the network type to NBMA.                |
| <code>point-to-multipoint</code> | Sets the network type to point-to-multipoint. |
| <code>point-to-point</code>      | Sets the network type to point-to-point.      |

**Default** The default is the `broadcast` OSPF network type for a VLAN interface.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command forces the interface network type to the specified type. Depending on the network type, OSPF changes the behavior of the packet transmission and the link description in LSAs.

**Example** The following example shows setting the network type to `point-to-point` on the VLAN interface `vlan1`:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 ospf network point-to-point
```

# ipv6 ospf priority

**Overview** This command sets the router priority, which is a parameter used in the election of the designated router for the link.

The **no** variant of this command returns the router priority to the default of 1.

**Syntax** `ipv6 ospf priority <priority>`  
`no ipv6 ospf priority`

| Parameter  | Description                                                                                                                                                                                                  |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <priority> | <0-255><br>Specifies the router priority of the interface. The larger the value, the greater the priority level. The value 0 defines that the device cannot become either the DR, or backup DR for the link. |

**Default** The default priority is 1.

**Mode** Interface Configuration for a VLAN interface.

**Usage** Set the priority to help determine the OSPF Designated Router (DR) for a link. If two routers attempt to become the DR, the router with the higher router priority becomes the DR. If the router priority is the same for two routers, the router with the higher router ID takes precedence.

Routers with zero router priority values cannot become the designated or backup designated router.

**Example** The following example shows setting the OSPFv3 priority value to 3 on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf priority 3
```

# ipv6 ospf retransmit-interval

**Overview** Use this command to specify the time between link-state advertisement (LSA) retransmissions for adjacencies belonging to the interface.

Use the **no** variant of this command to return to the default of 5 seconds.

**Syntax** `ipv6 ospf retransmit-interval <1-65535>`  
`no ipv6 ospf retransmit-interval`

| Parameter                    | Description                        |
|------------------------------|------------------------------------|
| <code>&lt;1-65535&gt;</code> | Specifies the interval in seconds. |

**Default** The default interval is 5 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage** After sending an LSA to a neighbor, the router keeps the LSA until it receives an acknowledgment. In case the router does not receive an acknowledgment during the set time (the retransmit interval value) it retransmits the LSA. Set the retransmission interval value conservatively to avoid needless retransmission. The interval should be greater than the expected round-trip delay between two routers.

**Example** The following example shows setting the `ospf retransmit interval` to 6 seconds on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf retransmit-interval 6
```

# ipv6 ospf transmit-delay

**Overview** Use this command to set the estimated time it takes to transmit a link-state-update packet on the VLAN interface.

Use the **no** variant of this command to return to the default of 1 second.

**Syntax** `ipv6 ospf transmit-delay <1-65535>`  
`no ipv6 ospf transmit-delay`

| Parameter                    | Description                                                      |
|------------------------------|------------------------------------------------------------------|
| <code>&lt;1-65535&gt;</code> | Specifies the time, in seconds, to transmit a link-state update. |

**Default** The default interval is 1 second.

**Mode** Interface Configuration for a VLAN interface.

**Usage** The transmit delay value adds a specified time to the age field of an update. If the delay is not added, the time in which the LSA transmits over the link is not considered. This command is especially useful for low speed links. Add transmission and propagation delays when setting the transmit delay value.

**Example** To set the IPv6 OSPF transmit delay time to 3 seconds on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 ospf transmit-delay 3
```

# ipv6 router ospf area

**Overview** Use this command to enable IPv6 OSPF routing on an interface.  
Use the **no** variant of this command to disable IPv6 OSPF routing on an interface.

**Syntax** `ipv6 router ospf area <area-id> [tag <process-id>] [instance <inst-id>]`  
`no ipv6 router ospf area <area-id>`

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-id>     | The ID of the IPv6 OSPF routing area. Can be entered as either an IPv4 A.B.C.D address format, or as an unsigned integer in the range, 0 to 4294967295. Use either of the following forms when entering an area-ID: <ul style="list-style-type: none"><li>• area-id &lt;A.B.C.D&gt; where A.B.C.D is a number entered in IPv4 address format.</li><li>• area-id &lt;0 to 4294967295&gt;.</li></ul> |
| <process-id>  | The process tag denotes a separate router process. It can comprise any string of alphanumeric characters.<br>Note that this tag is local to the router on which it is set and does not appear in any OSPF packets or LSA.                                                                                                                                                                          |
| <instance-id> | The OSPF instance ID, entered as an integer between 0 and 255. This is the value that will appear in the instance field of the IPv6 OSPF hello packet.                                                                                                                                                                                                                                             |

**Defaults** IPv6 OSPF routing is disabled by default.  
When enabling IPv6 OSPF routing:

- the process-tag will default to a null value if not set.
- the Instance ID defaults to 0 if not set.

**Mode** Interface Configuration for a VLAN interface.

**Usage** When enabling IPv6 OSPF routing on an interface, specifying the area-ID is mandatory, but the Process tag and Instance are optional.

See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information and examples.

**Examples** The following commands enable IPv6 OSPF on VLAN interface `vlan2`, OSPF area 1, tag PT2, and instance 2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 router ospf area 1 tag PT2 instance-id 2
```

The following commands disable IPv6 OSPF on VLAN interface `vlan2` and OSPF area 1:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 router ospf area 1
```

# max-concurrent-dd (IPv6 OSPF)

**Overview** Use this command to limit the number of neighbors that can be concurrently processed in the database exchange. The specified value limits the number of neighbors from all interfaces, not per interface.

Use the **no** variant of this command to have no limit on the maximum number of LSAs.

**Syntax** `max-concurrent-dd <max-neighbors>`  
`no max-concurrent-dd`

| Parameter                          | Description                                                   |
|------------------------------------|---------------------------------------------------------------|
| <code>&lt;max-neighbors&gt;</code> | <code>&lt;1-65535&gt;</code> The maximum number of neighbors. |

**Mode** Router Configuration

**Usage** This command is useful where bringing up several adjacencies on a router is affecting performance. In this situation, you can often enhance the system performance by limiting the number of neighbors that can be processed concurrently.

**Example** The following example sets the max-concurrent-dd value to allow only 4 neighbors to be processed at a time.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# max-concurrent-dd 4
```

**Related Commands** [router ipv6 ospf](#)

# passive-interface (IPv6 OSPF)

**Overview** Use this command to suppress the sending of Hello packets on a specified interface. If you use the **passive-interface** command without the optional parameters then **all** interfaces are put into passive mode.

Use the **no** variant of this command to allow the sending of Hello packets on all interfaces, or on the specified interface. If you use the **no** variant of this command without the optional parameters then **all** interfaces are removed from passive mode.

**Syntax** `passive-interface [<interface>]`  
`no passive-interface [<interface>]`

| Parameter   | Description                                |
|-------------|--------------------------------------------|
| <interface> | The name or the VID of the VLAN interface. |

**Mode** Router Configuration

**Usage** Configure an interface to be passive if you wish its connected route to be treated as an OSPF route (rather than an AS-external route), but do not wish to actually exchange any OSPF packets via this interface.

**Examples** To configure passive interface mode on interface vlan2, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# passive-interface vlan2
```

To configure passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# passive-interface
```

To remove passive interface mode on interface vlan2, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# no passive-interface vlan2
```

To remove passive interface mode on **all** interfaces, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# no passive-interface
```

# redistribute (IPv6 OSPF)

**Overview** Use this command to redistribute routes from other routing protocols, static routes and connected routes into an IPv6 OSPF routing table.

Use the **no** variant of this command to disable this function.

**Syntax** `redistribute <protocol> [metric <0-16777214>] [metric-type {1|2}] [route-map <route-map-entry>]`  
`no redistribute <protocol>`

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <protocol>  | The routing protocol to be redistributed, can be one of:                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| connected   | Connected routes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| rip         | Routing Internet Protocol                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| static      | Static Routes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| metric      | Specifies the external metric.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| metric-type | Specifies the external metric-type, either type 1 or type 2. <ul style="list-style-type: none"><li>• <b>For Metric Type 1:</b> The best route is based on the external redistributed path cost plus the internal path cost presented by the native routing protocol.</li><li>• <b>For Metric Type 2:</b> The best route is based only on the external redistributed path cost. The internal path cost is only used to break a "tie" situation between two identical external path costs.</li></ul> |
| route-map   | The name of the specific route-map.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Default** The default metric value for routes redistributed into OSPFv3 is 20. The metric can also be defined using the [set metric](#) command for a route map. Note that a metric defined using the [set metric](#) command for a route map overrides a metric defined with this command.

**Mode** Router Configuration

**Usage** You use this command to inject routes, learned from other routing protocols, into the OSPF domain to generate AS-external-LSAs. If a route-map is configured by this command, then that route-map is used to control which routes are redistributed and can set metric and tag values on particular routes.

The metric, metric-type, and tag values specified on this command are applied to any redistributed routes that are not explicitly given a different metric, metric-type, or tag value by the route map.

See the [OSPF Feature Overview and Configuration Guide](#) for more information about metrics, and about behavior when configured in route maps.

Note that this command does not redistribute the default route. To redistribute the default route, use the [default-information originate](#) command.

**Example** The following example shows the redistribution of RIP routes into the IPv6 OSPF routing table, with a metric of 10 and a metric type of 1.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# redistribute rip metric 10 metric-type 1
```

# restart ipv6 ospf graceful

**Overview** Use this command to force the OSPFv3 process to restart. You may optionally specify a grace-period value. If a grace-period is not specified then a default value of 120 seconds is applied.

You should specify a grace-period value of 120 seconds or more. Low grace-period values may cause the graceful restart process on neighboring routers to terminate with routes missing.

**Syntax** `restart ipv6 ospf graceful [grace-period <1-1800>]`

| Parameter    | Description                  |
|--------------|------------------------------|
| grace-period | Specify the grace period.    |
| <1-1800>     | The grace period in seconds. |

**Default** The default OSPF grace-period is 120 seconds.

**Mode** Privileged Exec

**Usage** After this command is executed, the OSPFv3 process immediately shuts down. It notifies the system that OSPF has performed a graceful shutdown. Routes installed by OSPF are preserved until the grace-period expires.

When a **restart ospf graceful** command is issued, the OSPF configuration is reloaded from the last saved configuration. Ensure you first enter the [copy running-config startup-config](#) command.

**Example** To restart OSPFv3, use the following commands:

```
awplus# copy running-config startup-config
awplus# restart ipv6 ospf graceful grace-period 200
```

To apply the default grace-period (120 seconds), use the following commands:

```
awplus# copy running-config startup-config
awplus# restart ipv6 ospf graceful
```

# router ipv6 ospf

**Overview** Use this command to create or remove an IPv6 OSPF routing process, or to enter the Router Configuration mode to configure a specific IPv6 OSPF routing process. Use the **no** variant of this command to terminate an IPv6 OSPF routing process.

Use the **no** parameter with the **process-id** parameter, to terminate and delete a specific IPv6 OSPF routing process.

**Syntax** `router ipv6 ospf [<process-id>]`  
`no router ipv6 ospf [<process-id>]`

| Parameter    | Description                                                                                                                                                                                                                                                                                             |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <process-id> | A character string that identifies a routing process.<br>If you do not specify the process-id a "null" process ID will be applied.<br>Note that this will appear in show output as *null*. However you cannot select the null process by using the character string *null* as command entry characters. |

**Default** No routing process is defined by default.

**Mode** Global Configuration

**Usage** The process ID enables you to run more than one OSPF session within the same router, then configure each session to a different router port. Note that this function is internal to the router, and other routers (neighbors) have no knowledge of these different processes. The hello and LSAs issued from each process will appear as if coming from a separate physical router.

To a large extent the requirement for multiple processes has been replaced by the ability within IPv6 OSPF of running simultaneous router instances.

The process ID of IPv6 OSPF is an optional parameter for the **no** variant of this command only. When removing all IPv6 OSPF processes on the device, you do not need to specify each Process ID, but when removing particular IPv6 OSPF processes, you must specify each Process ID to be removed.

For a description of processes and instances and their configuration relationships, see the [OSPFv3 Feature Overview and Configuration Guide](#).

**Example** This example shows the use of this command to enter Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf P100
awplus(config-router)#
```

# router-id (IPv6 OSPF)

**Overview** Use this command to specify a router ID for the IPv6 OSPF process.  
Use the **no** variant of this command to disable this function.

**Syntax** `router-id <router-id>`  
`no router-id`

| Parameter                      | Description                                     |
|--------------------------------|-------------------------------------------------|
| <code>&lt;router-id&gt;</code> | Specifies the router ID in IPv4 address format. |

**Mode** Router Configuration

**Usage** Configure each router with a unique router-id. In an IPv6 OSPF router process that has active neighbors, a new router-id takes effect at the next reload or when you restart OSPF manually.

**Example** The following example shows a specified router ID 0.0.4.5.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# router-id 0.0.4.5
```

**Related  
Commands** [show ipv6 ospf](#)

# show debugging ipv6 ospf

**Overview** Use this command in User Exec or Privileged Exec modes to display which OSPFv3 debugging options are currently enabled.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging ipv6 ospf`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show debugging ipv6 ospf`

**Output** Figure 25-1: Example output from the **show debugging ipv6 ospf** command

```
OSPFv3 debugging status:
OSPFv3 all packet detail debugging is on
OSPFv3 all IFSM debugging is on
OSPFv3 all NFSM debugging is on
OSPFv3 all LSA debugging is on
OSPFv3 all NSM debugging is on
OSPFv3 all route calculation debugging is on
OSPFv3 all event debugging is on
```

# show ipv6 ospf

- Overview** Use this command in User Exec or Privileged Exec modes to display general information about all IPv6 OSPF routing processes, including OSPFv3 Authentication configuration and status information.
- Include the process ID parameter with this command to display information about specified processes.
- For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf`  
`show ipv6 ospf <process-id>`

| Parameter    | Description                                                                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <process-id> | <0-65535><br>The ID of the router process for which information will be displayed. If this parameter is included, only the information for the specified routing process is displayed. |

**Mode** User Exec and Privileged Exec

- Examples** To display general information about all IPv6 OSPF routing processes, use the command:
- ```
awplus# show ipv6 ospf
```
- To display general information about IPv6 OSPF (OSPFv3) routing process P10, use the command:
- ```
awplus# show ipv6 ospf P10
```

**Output** Figure 25-2: Example output from the **show ipv6 ospf** command for process P10, showing OSPFv3 Authentication configuration information highlighted in bold

```
awplus#show ipv6 ospf
  Routing Process "OSPFv3 (10)" with ID 192.168.1.2
  Route Licence: Route : Limit=Unlimited, Allocated=0, Visible=0,
Internal=0
  Route Licence: Breach: Current=0, Watermark=0
  Process uptime is 6 minutes
  Current grace period is 120 secs (default)
  SPF schedule delay min 0.500 secs, SPF schedule delay max 50.0
secs
  Minimum LSA interval 5 secs, Minimum LSA arrival 1 secs
  Number of incoming current DD exchange neighbors 0/5
  Number of outgoing current DD exchange neighbors 0/5
  Number of external LSA 0. Checksum Sum 0x0000
  Number of AS-Scoped Unknown LSA 0
  Number of LSA originated 4
  Number of LSA received 10

# show ipv6 ospf database

**Overview** Use this command in User Exec or Privileged Exec modes to display a database summary for IPv6 OSPF information. Include the process ID parameter with this command to display information about specified processes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf <process-id> database`  
`[self-originate|max-age|adv router <adv-router-id>]`

| Parameter        | Description                                                                                                                                                                                                  |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <process-id>     | <0-65535><br>The ID of the router process for which information will be displayed.                                                                                                                           |
| self-originate   | Displays self-originated link states.                                                                                                                                                                        |
| max-age          | Displays LSAs in MaxAge list. It maintains the list of the all LSAs in the database which have reached the max-age which is 3600 seconds.                                                                    |
| adv-router       | Advertising Router LSA.                                                                                                                                                                                      |
| <adv-router- id> | The Advertising Router ID (usually entered in IPv4 address format A.B.C.D).<br>Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format. |

**Mode** User Exec and Privileged Exec

**Example** To display the database summary for IPv6 OSPF information on process P10, use the command:

```
awplus# show ipv6 ospf P10 database
```

**Output** Figure 25-3: Example output from the **show ipv6 ospf P10 database** command

OSPFv3 Router with ID (0.0.1.1) (Process P10)

# show ipv6 ospf database external

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the external LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf database external <adv-router-id>  
[self-originate|adv-router <adv-router-id>]`

| Parameter       | Description                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <adv-router-id> | The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format. |
| self originate  | Self-originated link states.                                                                                                                                                                              |
| adv-router      | Displays all the LSAs of the specified router.                                                                                                                                                            |

**Mode** User Exec and Privileged Exec

**Examples** To display information about the external LSAs, use the following command:

```
awplus# show ipv6 ospf database external adv-router 10.10.10.1
```

**Output** Figure 25-4: Example output from the **show ipv6 ospf database external** command

```
LS age: 1087
LS Type: AS-External-LSA
Link State ID: 0.0.0.13
Advertising Router: 0.0.1.1
LS Seq Number: 0x8000000C
Checksum: 0xCE9D
Length: 52
  Metric Type: 2 (Larger than any link state path)
  Metric: 20
  Prefix: 2010:2222::/64
  Prefix Options: 0 (-|-|-|-)
  Forwarding Address: 2003:1111::1
...
```

# show ipv6 ospf database grace

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the grace LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf database grace <adv-router-id>  
[self-originate|adv-router <adv-router-id>]`

| Parameter       | Description                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <adv-router-id> | The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format. |
| adv-router      | Displays all the LSAs of the specified router.                                                                                                                                                            |
| self originate  | Self-originated link states.                                                                                                                                                                              |

**Mode** User Exec and Privileged Exec

**Examples** To display information about the grace LSAs, use the following command:

```
awplus# show ipv6 ospf database grace adv-router 10.10.10.1
```

**Output** Figure 25-5: Example output from the **show ipv6 ospf database grace** command

```
LS age: 1087
LS Type: AS-External-LSA
Link State ID: 0.0.0.13
Advertising Router: 0.0.1.1
LS Seq Number: 0x8000000C
Checksum: 0xCE9D
Length: 52
  Metric Type: 2 (Larger than any link state path)
  Metric: 20
  Prefix: 2010:2222::/64
  Prefix Options: 0 (-|-|-|-)
  Forwarding Address: 2003:1111::1
```

# show ipv6 ospf database inter-prefix

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the inter-prefix LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf database inter-prefix <adv-router-id>  
[self-originate|adv-router <adv-router-id>]`

| Parameter       | Description                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <adv-router-id> | The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format. |
| adv-router      | Displays all the LSAs of the specified router.                                                                                                                                                            |
| self originate  | Self-originated link states.                                                                                                                                                                              |

**Mode** User Exec and Privileged Exec

**Examples** To display information about the inter-prefix LSAs, use the following command:

```
awplus# show ipv6 ospf database external adv-router 10.10.10.1
```

**Output** Figure 25-6: Example output from the **show ipv6 ospf database inter-prefix** command

```
LS age: 1087

# show ipv6 ospf database inter-router

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the inter-router LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf database inter-router <adv-router-id>  
[self-originate] adv-router <adv-router-id>]`

| Parameter       | Description                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <adv-router-id> | The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format. |
| adv-router      | Displays all the LSAs of the specified router.                                                                                                                                                            |
| self originate  | Self-originated link states.                                                                                                                                                                              |

**Mode** User Exec and Privileged Exec

**Examples** To display information about the inter-router LSAs, use the following command:

```
awplus# show ipv6 ospf database inter-router adv-router  
10.10.10.1
```

**Output** Figure 25-7: Example output from the **show ipv6 ospf database inter-router** command

```
LS age: 1087  
LS Type: AS-External-LSA

...
```

# show ipv6 ospf database intra-prefix

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the intra-prefix LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf database intra-prefix <adv-router-id>  
[self-originate|adv-router <adv-router-id>]`

| Parameter       | Description                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <adv-router-id> | The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format. |
| adv-router      | Displays all the LSAs of the specified router.                                                                                                                                                            |
| self originate  | Self-originated link states.                                                                                                                                                                              |

**Mode** User Exec and Privileged Exec

**Examples** To display information about the intra-prefix LSAs, use the following command:

```
awplus# show ipv6 ospf database intra-prefix adv-router  
10.10.10.1
```

**Output** Figure 25-8: Example output from the **show ipv6 ospf database intra-prefix** command

```
LS age: 1087  
LS Type: AS-External-LSA  
Link State ID: 0.0.0.13  
Advertising Router: 0.0.1.1

Forwarding Address: 2003:1111::1  
...
```

# show ipv6 ospf database link

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the link LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf database link <adv-router-id>  
[self-originate|adv-router <adv-router-id>]`

| Parameter       | Description                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <adv-router-id> | The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format. |
| adv-router      | Displays all the LSAs of the specified router.                                                                                                                                                            |
| self originate  | Self-originated link states.                                                                                                                                                                              |

**Mode** User Exec and Privileged Exec

**Examples** To display information about the link LSAs, use the following command:

```
awplus# show ipv6 ospf database link adv-router 10.10.10.1
```

**Output** Figure 25-9: Example output from the **show ipv6 ospf database link** command

```
LS age: 1087
  LS Type: AS-External-LSA
  Link State ID: 0.0.0.13
  Advertising Router: 0.0.1.1
  LS Seq Number: 0x8000000C
  Checksum: 0xCE9D
  Length: 52
    Metric Type: 2 (Larger than any link state path)
    Metric: 20
    Prefix: 2010:2222::/64
    Prefix Options: 0 (-|-|-|-)
    Forwarding Address: 2003:1111::1
...
```

# show ipv6 ospf database network

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the network LSAs.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf database network <adv-router-id>  
[self-originate|adv-router <adv-router-id>]`

| Parameter       | Description                                                                                                                    |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------|
| <adv-router-id> | The router ID of the advertising router, in IPv4 address format. Note, however, that this no longer represents a real address. |
| self-originate  | Self-originated link states.                                                                                                   |
| adv-router      | The advertising router selected.                                                                                               |

**Mode** User Exec and Privileged Exec

**Examples** To display information about the OSPFv3 network LSAs, use the following command:

```
awplus# show ipv6 ospf database network
```

**Output** Figure 25-10: Example output from the **show ipv6 ospf database network** command

```
OSPFv3 Router with ID (0.0.1.1) (Process P10)

# show ipv6 ospf interface

**Overview** Use this command in User Exec or Privileged Exec modes to display interface information for OSPF for all interfaces or a specified interface, including OSPFv3 Authentication status for all interfaces or for a specified interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf interface [<interface-name>]`

| Parameter        | Description                                                                                    |
|------------------|------------------------------------------------------------------------------------------------|
| <interface-name> | An alphanumeric string that is the interface name. Omit the optional interface to display OSPF |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ipv6 ospf interface vlan2`

**Output** Figure 25-12: Example output from the **show ipv6 ospf interface** command showing OSPFv3 Authentication configuration information highlighted in bold

```
awplus#show ipv6 ospf interface
vlan2 is up, line protocol is up
Interface ID 302
IPv6 Prefixes
  fe80::215:77ff:fead:f87e/64 (Link-Local Address)
Security Policy
  MD5 Authentication SPI 1000
  NULL Encryption SHA-1 Auth, SPI 1001

OSPFv3 Process (10), Area 0.0.0.0, Instance ID 0
Router ID 192.168.1.2, Network Type BROADCAST, Cost: 1

# show ipv6 ospf neighbor

**Overview** Use this command in User Exec or Privileged Exec modes to display information on OSPF neighbors. Include the process ID parameter with this command to display information about specified processes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf [<process-id>] neighbor <neighbor-id>`  
`show ipv6 ospf [<process-id>] neighbor detail`  
`show ipv6 ospf [<process-id>] neighbor <interface> [detail]`

| Parameter     | Description                                                                               |
|---------------|-------------------------------------------------------------------------------------------|
| <process-id>  | <character string><br>The ID of the OSPF process for which information will be displayed. |
| <neighbor-id> | The Neighbor ID, entered in IP address (A.B.C.D) format.                                  |
| detail        | Detail of all neighbors.                                                                  |
| <interface>   | IP address of the interface.                                                              |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ipv6 ospf neighbor`

**Output** Figure 25-14: Example output from **show ipv6 ospf neighbor**

```
awplus#show ipv6 ospf P1 neighbor 2.2.2.2
OSPFv3 Process (P1)
Neighbor ID    Pri      State                Dead Time   Interface Instance ID
2.2.2.2        5        2-Way/DROther        00:00:33   vlan3         0
```

Figure 25-15: Example output from **show ipv6 ospf neighbor detail**

```
awplus#show ipv6 ospf neighbor detail
Neighbor 0.0.1.2, interface address fe80::215:77ff:fec9:7472
  In the area 0.0.0.0 via interface vlan2
  Neighbor priority is 1, State is Full, 6 state changes
  DR is 0.0.1.2      BDR is 0.0.1.1
  Options is 0x000013 (-|R|-|-|E|V6)
  Dead timer due in 00:00:33

  Link State Retransmission List 0
```

# show ipv6 ospf route

**Overview** Use this command in User Exec or Privileged Exec modes to display the OSPF routing table. Include the process ID parameter with this command to display the OSPF routing table for specified processes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf [<process-id>] route`

| Parameter                       | Description                                                                                                                                                |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;process-id&gt;</code> | A character string that specifies the router process. If this parameter is included, only the information for this specified routing process is displayed. |

**Mode** User Exec and Privileged Exec

**Examples** To display the OSPF routing table, use the command:

```
awplus# show ipv6 ospf route
```

**Output** Figure 25-16: Example output from the **show ipv6 ospf P10 route** command for a specific process

```

# show ipv6 ospf virtual-links

**Overview** Use this command in User Exec or Privileged Exec modes to display virtual link information, including OSPFv3 Authentication status for virtual links.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 ospf virtual-links`

**Mode** User Exec and Privileged Exec

**Usage** See the [OSPFv3 Feature Overview and Configuration Guide](#) for more information and examples.

**Examples** To display virtual link information, use the command:

```
awplus# show ipv6 ospf virtual-links
```

**Output** Figure 25-17: Example output from the **show ipv6 ospf virtual-links** command showing OSPFv3 Authentication configuration information highlighted in bold

```
awplus#show ipv6 ospf virtual-links
Virtual Link VLINK1 to router 192.168.1.10 is down
  Transit area 0.0.0.1 via interface *, instance ID 0
  Local address
  Remote address
MD5 Authentication SPI 1000
NULL encryption SHA-1 auth SPI 1001
  Transmit Delay is 1 sec, State Down,
  Timer intervals configured, Hello 10, Dead 40, Wait 40,
  Retransmit 5
    Hello due in inactive
    Adjacency state Down
```

## summary-address (IPv6 OSPF)

**Overview** Use this command in Router Configuration mode to summarize, or possibly suppress, external redistributed OSPFv3 routes within the specified address range.

Use the **no** variant of this command in Router Configuration mode to stop summarizing, or suppressing, external redistributed OSPFv3 routes within the specified address range.

**Syntax** `summary-address <ipv6-addr/prefix-length> [not-advertise] [tag <0-4294967295>]`  
`no summary-address <ipv6-addr/prefix-length> [not-advertise] [tag <0-4294967295>]`

| Parameter                                    | Description                                                                                                                                                                                     |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-addr/prefix-length&gt;</code> | Specifies the base IPv6 address of the IPv6 summary address. The range of addresses given as IPv6 starting address and an IPv6 prefix length.                                                   |
| <code>not-advertise</code>                   | Set the <b>not-advertise</b> option if you do not want OSPFv3 to advertise either the summary address or the individual networks within the range of the summary address.                       |
| <code>tag &lt;0-4294967295&gt;</code>        | The tag parameter specifies the tag value that OSPFv3 places in the AS external LSAs created as a result of redistributing the summary route. The tag overrides tags set by the original route. |

**Default** The default tag value for a summary address is 0.

**Mode** Router Configuration

**Usage** An address range is a pairing of an address and a prefix length. Redistributing routes from other protocols into OSPFv3 requires the router to advertise each route individually in an external LSA. Use this command to advertise one summary route for all redistributed routes covered by a specified prefix to decrease the size of the OSPFv3 link state database.

For example, if the specified address range is 2001:0db8:44::/48, then summary-address functionality will match 2001:0db8:4400:0000::1/128 through 2001:0db8:44ff:ffff::1/128.

Ensure OSPFv3 routes exist in the summary address range for advertisement before using this command.

**Example** The following example uses the `summary-address` command to aggregate external LSAs that match the IPv6 prefix `2001:0db8::/32` and assigns a tag value of 3.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# summary-address 2001:0db8::/32 tag 3
```

The following example uses the `no summary-address` command to stop summarizing IPv6 addresses in the address range covered within the IPv6 prefix `2001:0db8::/32`.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no summary-address 2001:0db8::/32
```

# timers spf (IPv6 OSPF) (deprecated)

**Overview** This command has been deprecated because SPF timers have been replaced by exponential SPF timers. To configure the exponential timers, please use the [timers spf exp \(IPv6 OSPF\)](#) command instead.

# timers spf exp (IPv6 OSPF)

**Overview** Use this command to adjust route calculation timers using exponential back-off delays.

Use **no** form of this command to return to the default exponential back-off timer values.

**Syntax** `timers spf exp <min-holdtime> <max-holdtime>`  
`no timers spf exp <min-holdtime> <max-holdtime>`

| Parameter      | Description                                                                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <min-holdtime> | Specifies the minimum delay between receiving a change to the SPF calculation in milliseconds. The range is 0-2147483647. The default SPF min-holdtime value is 50 milliseconds. |
| <max-holdtime> | Specifies the maximum delay between receiving a change to the SPF calculation in milliseconds. The range is 0-2147483647. The default SPF max-holdtime value is 50 seconds.      |

**Mode** Router Configuration

**Usage** This command configures the minimum and maximum delay time between the receipt of a topology change and the calculation of the Shortest Path First (SPF).  
The time between SPF runs increases if a topology change occurs (and triggers a new SPF run) before the last SPF holdtimer has finished. The time between runs may increase up to the max-holdtime value. This increase in holdtime prevents too many SPF runs from occurring if multiple OSPF topology change events occur.

**Examples** To set the minimum delay time to 5 milliseconds and maximum delay time to 2 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# timers spf exp 5 2000
```

# Route Map Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for route map commands. These commands can be divided into the following categories:

- **route-map** command, used to create a route map and/or route map entry, and to put you into route map mode
- **match** commands, used to determine which routes the route map applies to
- **set** commands, used to modify matching routes

- Command List**
- **"match interface"** on page 1062
  - **"match ip address"** on page 1063
  - **"match ip next-hop"** on page 1066
  - **"match ipv6 address"** on page 1068
  - **"match metric"** on page 1069
  - **"match route-type"** on page 1070
  - **"match tag"** on page 1071
  - **"route-map"** on page 1072
  - **"set ip next-hop (route map)"** on page 1074
  - **"set metric"** on page 1075
  - **"set metric-type"** on page 1077
  - **"set tag"** on page 1078
  - **"show route-map"** on page 1079

# match interface

**Overview** Use this command to add an interface match clause to a route map entry. Specify the interface name to match.

A route matches the route map if its interface matches the interface name.

Each entry of a route map can only match against one interface in one interface match clause. If the route map entry already has an interface match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the interface match clause from the route map entry. Use the **no** variant of this command without a specified interface to remove all interfaces.

**Syntax** `match interface <interface>`  
`no match interface [<interface>]`

| Parameter                      | Description                                  |
|--------------------------------|----------------------------------------------|
| <code>&lt;interface&gt;</code> | The VLAN to match, e.g. <code>vlan2</code> . |

**Mode** Route-map Configuration

**Usage** This command is valid for RIP and OSPF routes only.

**Example** To add entry 10 to the route map called `mymap1`, which will process routes if they use the interface `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match interface vlan1
```

To remove all interfaces from the route map called `mymap1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# no match interface
```

- [show route-map](#)

# match ip address

**Overview** Use this command to add an IP address prefix match clause to a route map entry. You can specify the prefix or prefixes to match by specifying the name of the prefix list. To create the prefix list, enter Global Configuration mode and use the **ip prefix-list** command.

A route matches the route map entry if the route's prefix matches the access list or prefix list.

Each entry of a route map can have at most one one prefix list-based IP address match clause. If the route map entry already has one match clause, entering this command replaces that match clause with the new clause.

Note that prefix lists and route map entries all specify an action of deny or permit. The action in the prefix list determines whether the route map checks update messages and routes for a given prefix. The route map action and its **set** clauses determine what the route map does with routes that contain that prefix.

Use this command to add an IP address prefix match clause to a route map entry. You can specify the prefix or prefixes to match by either:

- specifying the name of an access list. To create the access list, enter Global Configuration mode and use the **access-list** command.
- specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ip prefix-list** command.

A route matches the route map entry if the route's prefix matches the access list or prefix list.

Each entry of a route map can have at most one access list-based IP address match clause and one prefix list-based IP address match clause. If the route map entry already has one of these match clauses, entering this command replaces that match clause with the new clause.

Note that access lists, prefix lists and route map entries all specify an action of deny or permit. The action in the access list or prefix list determines whether the route map checks update messages and routes for a given prefix. The route map action and its **set** clauses determine what the route map does with routes that contain that prefix.

Use the **no** variant of this command to remove the IP address match clause from a route map entry. To remove a prefix list-based match clause you must also specify the **prefix-list** parameter.

**Syntax**

```
match ip address {<accesslistID>|prefix-list <prefix-listname>}  
no match ip address [<accesslistID>]  
no match ip address prefix-list <prefix-listname>
```

| Parameter          | Description                                                                    |
|--------------------|--------------------------------------------------------------------------------|
| <accesslistID>     | {<access-list-name> <1-199> <1300-2699>}<br>The IP access list name or number. |
| <access-list-name> | The IP access list name.                                                       |
| <1-199>            | The IP access list number.                                                     |
| <1300-2699>        | The IP access list number (expanded range).                                    |
| prefix-list        | Use an IP prefix list to specify which prefixes to match.                      |
| <prefix-listname>  | The prefix list name.                                                          |

**Mode** Route-map Configuration

**Usage** The **match ip address** command specifies the IP address to be matched. The outcome of matching against the IP address is:

- If there is a match for the specified IP address, and **permit** is specified, then the route is redistributed or controlled, as specified by the set action.
- If there is a match for the specified IP address, and **deny** is specified, then the route is not redistributed or controlled.
- If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of **permit** or **deny** specifications.

This command is valid for:

- OSPF routes
- RIP routes.

**Examples** To add entry 3 to the route map called `myroute`, which will process routes that match the ACL called `List1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# match ip address List1
```

To add entry 3 to the route map called `rmap1`, which will process routes that match the prefix list called `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ip address prefix-list mylist
```

**Related  
Commands**

- access-list (extended numbered)
- access-list (standard numbered)
- ip prefix-list
- route-map
- show ip access-list
- show route-map

# match ip next-hop

**Overview** Use this command to add a next-hop match clause to a route map entry. You can specify the next hop to match by either:

- specifying the name of an access list. To create the access list, enter Global Configuration mode and use the **access-list** command.
- specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ip prefix-list** command.

A route matches the route map if the route's next hop matches the access list or prefix list.

Each entry of a route map can have at most one access list-based next-hop match clause and one prefix list-based next-hop match clause. If the route map entry already has one of these match clauses, entering this command replaces that match clause with the new clause.

Note that access lists, prefix lists and route map entries all specify an action of deny or permit. The action in the access list or prefix list determines whether the route map checks update messages and routes for a given next-hop value. The route map action and its **set** clauses determine what the route map does with update messages and routes that contain that next hop.

Use the **no** variant of this command to remove the next-hop match clause from a route map entry. To remove a prefix list-based match clause you must also specify the prefix-list parameter.

**Syntax**

```
match ip next-hop {<accesslistID>|prefix-list  
<prefix-listname>}  
  
no match ip next-hop [<accesslistID>]  
  
no match ip next-hop prefix-list [<prefix-listname>]
```

| Parameter          | Description                                                                    |
|--------------------|--------------------------------------------------------------------------------|
| <accesslistID>     | {<access-list-name> <1-199> <1300-2699>}<br>The IP access list name or number. |
| <access-list-name> | The IP access list name.                                                       |
| <1-199>            | The IP access list number.                                                     |
| <1300-2699>        | The IP access list number (expanded range).                                    |
| prefix-list        | Use an IP prefix list to specify which next hop to match.                      |
| <prefix-listname>  | The prefix list name.                                                          |

**Mode** Route-map Configuration

**Usage** This command is valid for:

- OSPF routes

- RIP routes.

**Examples** To add entry 3 to the route map called `rmap1`, which will process routes whose next hop matches the ACL called `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ip next-hop mylist
```

To add entry 3 to the route map called `mymap`, which will process routes whose next hop matches the prefix list called `list1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap permit 3
awplus(config-route-map)# match ip next-hop prefix-list list1
```

**Related  
Commands** [access-list \(extended numbered\)](#)  
[access-list \(standard numbered\)](#)

[ip prefix-list](#)

[route-map](#)

[show ip access-list](#)

[show ip prefix-list](#)

[show route-map](#)

# match ipv6 address

**Overview** Use this command to specify the match address of route.

Use the **no** variant of this command to remove the `match ipv6 address` entry.

**Syntax**

```
match ipv6 address {<access-list-name>|prefix-list  
<prefix-listname>}  
  
no match ipv6 address [<access-list-name>|prefix-list  
<prefix-listname>]
```

| Parameter          | Description                                                                                                         |
|--------------------|---------------------------------------------------------------------------------------------------------------------|
| <access-list-name> | The name of the IPv6 access list that specifies criteria for the addresses to match.<br>Valid only with RIPng.      |
| <prefix-listname>  | The name of the IPv6 prefix list that specifies criteria for the addresses to be matched.<br>Valid only with RIPng. |

**Mode** Route-map Configuration

**Usage** The **match ipv6 address <access-list>** command specifies the IPv6 address to be matched. If there is a match for the specified IPv6 address, and `permit` is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and `deny` is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

The **match ipv6 address prefix-list** command specifies the entries of prefix-lists to be matched. If there is a match for the specified prefix-list entries, and `permit` is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and `deny` is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

**Examples**

```
awplus# configure terminal  
awplus(config)# route-map rmap1 deny 1  
awplus(config-route-map)# match ipv6 address rmap1  
  
awplus# configure terminal  
awplus(config)# route-map rmap1 permit 3  
awplus(config-route-map)# match ipv6 address prefix-list mylist
```

# match metric

**Overview** Use this command to add a metric match clause to a route map entry. Specify the metric value to match.

A route matches the route map if its metric matches the route map's metric.

Each entry of a route map can only match against one metric value in one metric match clause. If the route map entry already has a metric match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the metric match clause from the route map entry.

**Syntax** `match metric <metric>`  
`no match metric [<metric>]`

| Parameter                   | Description                                                   |
|-----------------------------|---------------------------------------------------------------|
| <code>&lt;metric&gt;</code> | <code>&lt;0-4294967295&gt;</code> Specifies the metric value. |

**Mode** Route-map Configuration

**Usage** This command is valid for:

- OSPF routes
- RIP routes.

**Example** To stop entry 3 of the route map called `myroute` from processing routes with a metric of 888999, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# no match metric 888999
```

**Related Commands** [route-map](#)  
[set metric](#)  
[show route-map](#)

# match route-type

**Overview** Use this command to add an external route-type match clause to a route map entry. Specify whether to match OSPF type-1 external routes or OSPF type-2 external routes.

An OSPF route matches the route map if its route type matches the route map's route type.

Each entry of a route map can only match against one route type in one match clause. If the route map entry already has a route type match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the route type match clause from the route map entry.

**Syntax** `match route-type external {type-1|type-2}`  
`no match route-type external [type-1|type-2]`

| Parameter | Description                  |
|-----------|------------------------------|
| type-1    | OSPF type-1 external routes. |
| type-2    | OSPF type-2 external routes. |

**Mode** Route-map Configuration

**Usage** Use the **match route-type external** command to match specific external route types. AS- external LSA is either Type-1 or Type-2. **external type-1** matches only Type 1 external routes, and **external type-2** matches only Type 2 external routes. This command is valid for OSPF routes only.

**Example** To add entry 10 to the route map called `mymap1`, which will process type-1 external routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match route-type external type-1
```

- [show route-map](#)

# match tag

**Overview** Use this command to add a tag match clause to a route map entry. Specify the route tag value to match.

An OSPF route matches the route map if it has been tagged with the route map's tag value. Routes can be tagged through OSPF commands or through another route map's set clause.

Each entry of a route map can only match against one tag in one match clause. If the route map entry already has a tag match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the tag match clause from the route map entry.

**Syntax** `match tag <0-4294967295>`  
`no match tag [<0-4294967295>]`

**Mode** Route-map Configuration

**Usage** This command is valid for OSPF routes only.

**Example** To add entry 10 to the route map called `mymap1`, which will process routes that are tagged 100, use the following commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match tag 100
```

# route-map

**Overview** Use this command to configure a route map entry, and to specify whether the device will process or discard matching routes.

The device uses a name to identify the route map, and a sequence number to identify each entry in the route map.

The **route-map** command puts you into route-map configuration mode. In this mode, you can use the following:

- one or more of the **match** commands to create match clauses. These specify what routes match the entry.
- one or more of the **set** commands to create set clauses. These change the attributes of matching routes.

Use the **no** variant of this command to delete a route map or to delete an entry from a route map.

**Syntax** `route-map <mapname> {deny|permit} <seq>`  
`no route-map <mapname>`  
`no route-map <mapname> {deny|permit} <seq>`

| Parameter | Description                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------|
| <mapname> | A name to identify the route map.                                                                                         |
| deny      | The route map causes a routing process to discard matching routes.                                                        |
| permit    | The route map causes a routing process to use matching routes.                                                            |
| <seq>     | <1-65535> The sequence number of the entry. You can use this parameter to control the order of entries in this route map. |

**Mode** Global Configuration

**Usage** Route maps allow you to control and modify routing information by filtering routes and setting route attributes. You can apply route maps when the device:

- redistributes routes from one routing protocol into another
- redistributes static routes into routing protocols

When a routing protocol passes a route through a route map, it checks the entries in order of their sequence numbers, starting with the lowest numbered entry.

If it finds a match on a route map with an action of permit, then it applies any set clauses and accepts the route. Having found a match, the route is not compared against any further entries of the route map.

If it finds a match on a route map with an action of deny, it will discard the matching route.

If it does not find a match, it discards the route. This means that route maps end with an implicit deny entry. To permit all non-matching routes, end your route map with an entry that has an action of **permit** and no match clause.

**Examples** To enter route-map mode for entry 2 of the route map called `route1`, and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 2
awplus(config-route-map)# match interface vlan2
awplus(config-route-map)# set metric 20
```

Note how the prompt changes when you go into route map configuration mode.

To make the device process non-matching routes instead of discarding them, add a command like the following one:

```
awplus(config)# route-map route1 permit 100
```

**Related  
Commands**

For OSPF:

[distribute-list \(OSPF\)](#)

[default-information originate](#)

[redistribute \(OSPF\)](#)

For RIP:

[redistribute \(RIP\)](#)

# set ip next-hop (route map)

**Overview** Use this command to add a next-hop set clause to a route map entry.

When a route matches the route map entry, the device sets the route's next hop to the specified IP address.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set ip next-hop <ip-address>`  
`no set ip next-hop [<ip-address>]`

| Parameter                       | Description                                                  |
|---------------------------------|--------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | The IP address of the next hop, entered in the form A.B.C.D. |

**Mode** Route-map Configuration

**Usage** Use this command to set the next-hop IP address to the routes.

This command is valid for:

- OSPF routes
- RIP routes.

**Example** To use entry 3 of the route map called `mymap` to give matching routes a next hop of 10.10.0.67, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap permit 3
awplus(config-route-map)# set ip next-hop 10.10.0.67
```

**Related Commands** [match ip next-hop](#)  
[route-map](#)  
[show route-map](#)

# set metric

**Overview** Use this command to add a metric set clause to a route map entry.

When a route matches the route map entry, the device takes one of the following actions:

- changes the metric to the specified value, or
- adds or subtracts the specified value from the metric, if you specify **+or-** before the value (for example, to increase the metric by 2, enter +2)

Use the **no** variant of this command to remove the set clause.

**Syntax** `set metric {+<metric-value>|-<metric-value>|<metric-value>}`  
`no set metric [+<metric-value>|-<metric-value> |<metric-value>]`

| Parameter      | Description                                                                                                |
|----------------|------------------------------------------------------------------------------------------------------------|
| +              | Increase the metric by the specified amount.                                                               |
| -              | Decrease the metric by the specified amount.                                                               |
| <metric-value> | <0-4294967295><br>The new metric value, or the amount by which to increase or decrease the existing value. |

**Default** The default metric value for routes redistributed into OSPF and OSPFv3 is 20.

**Mode** Route-map Configuration

**Usage** This command is valid for:

- OSPF routes
- RIP routes.

Note that defining the OSPF metric in a route map supersedes the metric defined using a [redistribute \(OSPF\)](#) or a [redistribute \(IPv6 OSPF\)](#) command. For more information, see the [OSPFv3 Feature Overview and Configuration Guide](#) and the [OSPF Feature Overview and Configuration Guide](#).

**Examples** To use entry 3 of the route map called `rmap1` to give matching routes a metric of 600, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric 600
```

To use entry 3 of the route map called `rmap1` to increase the metric of matching routes by 2, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric +2
```

**Related  
Commands**

- [match metric](#)
- [route-map](#)
- [show route-map](#)

# set metric-type

**Overview** Use this command to add a metric-type set clause to a route map entry.

When a route matches the route map entry, the device sets its route type to the specified value.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set metric-type {type-1|type-2}`  
`no set metric-type [type-1|type-2]`

| Parameter | Description                                                       |
|-----------|-------------------------------------------------------------------|
| type-1    | Redistribute matching routes into OSPF as type-1 external routes. |
| type-2    | Redistribute matching routes into OSPF as type-2 external routes. |

**Mode** Route-map Configuration

**Usage** This command is valid for OSPF routes only.

**Example** To use entry 3 of the route map called `rmap1` to redistribute matching routes into OSPF as type-1 external routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric-type 1
```

**Related Commands**

- [default-information originate](#)
- [redistribute \(OSPF\)](#)
- [match route-type](#)
- [route-map](#)
- [show route-map](#)

# set tag

**Overview** Use this command to add a tag set clause to a route map entry.

When a route matches the route map entry, the device sets its tag to the specified value when it redistributes the route into OSPF.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set tag <tag-value>`  
`no set tag [<tag-value>]`

| Parameter   | Description                                          |
|-------------|------------------------------------------------------|
| <tag-value> | <0-4294967295><br>Value to tag matching routes with. |

**Mode** Route-map Configuration

**Usage** This command is valid only when redistributing routes into OSPF.

**Example** To use entry 3 of the route map called `rmap1` to tag matching routes with the number 6, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set tag 6
```

**Related Commands**

- [default-information originate](#)
- [redistribute \(OSPF\)](#)
- [match tag](#)
- [route-map](#)
- [show route-map](#)

# show route-map

**Overview** Use this command to display information about one or all route maps.

**Syntax** `show route-map <map-name>`

| Parameter                     | Description                       |
|-------------------------------|-----------------------------------|
| <code>&lt;map-name&gt;</code> | A name to identify the route map. |

**Mode** User Exec and Privileged Exec

**Example** To display information about the route-map named `example-map`, use the command:

```
awplus# show route-map example-map
```

**Output** Figure 26-1: Example output from the **show route-map** command

```
route-map example-map, permit, sequence 1
  Match clauses:
    ip address prefix-list example-pref
  Set clauses:
    metric 100
route-map example-map, permit, sequence 200
  Match clauses:
  Set clauses:
```

# Part 4: Multicast Applications

# 27

# IGMP and IGMP Snooping Commands

## Introduction

**Overview** Devices running AlliedWare Plus use IGMP (Internet Group Management Protocol) and MLD (Multicast Listener Discovery) to track which multicast groups their clients belong to. This enables them to send the correct multimedia streams to the correct destinations. IGMP is used for IPv4 multicasting, and MLD is used for IPv6 multicasting.

This chapter describes the commands to configure IGMP Querier behaviour and selection, IGMP Snooping and IGMP Proxy.

# clear ip igmp

**Overview** Use this command to clear all IGMP group membership records on all interfaces.

**Syntax** `clear ip igmp`

**Mode** Privileged Exec

**Example** `awplus# clear ip igmp`

**Related  
Commands**

- [clear ip igmp group](#)
- [clear ip igmp interface](#)
- [show ip igmp interface](#)
- [show running-config](#)

# clear ip igmp group

**Overview** Use this command to clear IGMP group membership records for a specific group on either all interfaces, a single interface, or for a range of interfaces.

**Syntax** `clear ip igmp group *`  
`clear ip igmp group <ip-address> <interface>`

| Parameter    | Description                                                                                                    |
|--------------|----------------------------------------------------------------------------------------------------------------|
| *            | Clears all groups on all interfaces. This has the same effect as the <b>clear ip igmp</b> command.             |
| <ip-address> | Specifies the group whose membership records will be cleared from all interfaces, entered in the form A.B.C.D. |
| <interface>  | Specifies the name of the interface; all groups learned on this interface are deleted.                         |

**Mode** Privileged Exec

**Usage** This command applies to groups learned by IGMP, IGMP Snooping, or IGMP Proxy. In addition to the group, an interface can be specified. Specifying this will mean that only entries with the group learned on the interface will be deleted.

**Examples** To delete all group records, use the command:

```
awplus# clear ip igmp group *
```

To delete records for 224.1.1.1 on vlan1, use the command:

```
awplus# clear ip igmp group 224.1.1.1 vlan1
```

**Related Commands**

- [clear ip igmp](#)
- [clear ip igmp interface](#)
- [show ip igmp interface](#)
- [show running-config](#)

# clear ip igmp interface

**Overview** Use this command to clear IGMP group membership records on a particular interface.

**Syntax** `clear ip igmp interface <interface>`

| Parameter   | Description                                                                            |
|-------------|----------------------------------------------------------------------------------------|
| <interface> | Specifies the name of the interface. All groups learned on this interface are deleted. |

**Mode** Privileged Exec

**Usage** This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

**Example** To delete records for vlan1, use the command:  
`awplus# clear ip igmp interface vlan1`

**Related  
Commands**

- [clear ip igmp](#)
- [clear ip igmp group](#)
- [show ip igmp interface](#)
- [show running-config](#)

# debug igmp

**Overview** Use this command to enable debugging of either all IGMP or a specific component of IGMP.

Use the **no** variant of this command to disable all IGMP debugging, or debugging of a specific component of IGMP.

**Syntax** `debug igmp {all|decode|encode|events|fsm|tib}`  
`no debug igmp {all|decode|encode|events|fsm|tib}`

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| all       | Enable or disable all debug options for IGMP  |
| decode    | Debug of IGMP packets that have been received |
| encode    | Debug of IGMP packets that have been sent     |
| events    | Debug IGMP events                             |
| fsm       | Debug IGMP Finite State Machine (FSM)         |
| tib       | Debug IGMP Tree Information Base (TIB)        |

**Modes** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug igmp all`

**Related Commands** [show debugging igmp](#)  
[undebug igmp](#)

# ip igmp

**Overview** Use this command to enable IGMP on an interface. The command configures the device as an IGMP querier.

Use the **no** variant of this command to return all IGMP related configuration to the default on this interface.

**Syntax** `ip igmp`  
`no ip igmp`

**Default** Disabled

**Mode** Interface Configuration for a VLAN interface.

**Usage** An IP address must be assigned to the interface first, before this command will work.

**Example** To specify an interface as an IGMP querier, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp
```

**Validation  
Commands** `show ip igmp interface`  
`show running-config`

# ip igmp access-group

**Overview** This command adds an access control list to a VLAN interface configured for IGMP, IGMP Snooping, or IGMP Proxy. The access control list is used to control and filter the multicast groups learned on the VLAN interface.

The **no** variant of this command disables the access control filtering on the interface.

**Syntax** `ip igmp access-group {<access-list-number>|<access-list-name>}`  
`no ip igmp access-group`

| Parameter                               | Description                                          |
|-----------------------------------------|------------------------------------------------------|
| <code>&lt;access-list-number&gt;</code> | Standard IP access-list number, in the range <1-99>. |
| <code>&lt;access-list-name&gt;</code>   | Standard IP access-list name.                        |

**Default** By default there are no access lists configured on any interface.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

**Example** In the following example, hosts serviced by VLAN interface vlan2 can only join the group 225.2.2.2:

```
awplus# configure terminal
awplus(config)# access-list 1 permit 225.2.2.2 0.0.0.0
awplus(config)# interface vlan2
awplus(config-if)# ip igmp access-group 1
```

# ip igmp flood specific-query

**Overview** Use this command if you want IGMP to flood specific queries to all VLAN member ports, instead of only sending the queries to multicast group member ports.

Use the **no** variant of this command if you want IGMP to only send the queries to multicast group member ports.

**Syntax** `ip igmp flood specific-query`  
`no ip igmp flood specific-query`

**Default** By default, specific queries are flooded to all VLAN member ports.

**Mode** Global Configuration

**Usage** In an L2 switched network running IGMP, it is considered more robust to flood all specific queries. In most cases, the benefit of flooding specific queries to all VLAN member ports outweighs the disadvantages.

However, sometimes this is not the case. For example, if hosts with very low CPU capability receive specific queries for multicast groups they are not members of, their performance may degrade unacceptably. In this situation, it is desirable for IGMP to send specific queries to known member ports only. This minimises the performance degradation of such hosts. In those circumstances, use this command to turn off flooding of specific queries.

**Example** To cause IGMP to flood specific queries only to multicast group member ports, use the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp flood specific-query
```

**Related Commands** [show ip igmp interface](#)

# ip igmp immediate-leave

**Overview** In IGMP version 2, use this command to minimize the leave latency of IGMP memberships for specified multicast groups. The specified access list number or name defines the multicast groups in which the immediate leave feature is enabled.

Use the **no** variant of this command to disable this feature.

**Syntax** `ip igmp immediate-leave group-list  
{<access-list-number>|<access-list-number-expanded>|  
<access-list-name>}`  
`no ip igmp immediate-leave`

| Parameter                     | Description                                                    |
|-------------------------------|----------------------------------------------------------------|
| <access-list-number>          | Access-list number, in the range <1-99>.                       |
| <access-list-number-expanded> | Access-list number (expanded range), in the range <1300-1999>. |
| <access-list-name>            | Standard IP access-list name.                                  |

**Default** Disabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

**Example** The following example shows how to enable the immediate-leave feature on the VLAN interface vlan2 for a specific range of multicast groups:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp immediate-leave group-list 34
awplus(config-if)# exit
awplus(config)# access-list 34 permit 225.192.20.0 0.0.0.255
```

**Related Commands** [ip igmp last-member-query-interval](#)

# ip igmp last-member-query-count

**Overview** Use this command to set the last-member query-count value for an interface.  
Use the **no** variant of this command to return to the default on an interface.

**Syntax** `ip igmp last-member-query-count <2-7>`  
`no ip igmp last-member-query-count`

| Parameter | Description                    |
|-----------|--------------------------------|
| <2-7>     | Last member query count value. |

**Default** The default last member query count value is 2.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

**Example** To set the last-member query-count to 3 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp last-member-query-count 3
```

**Related Commands** [ip igmp last-member-query-interval](#)  
[ip igmp startup-query-count](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp last-member-query-interval

**Overview** Use this command to configure the frequency at which the router sends IGMP group specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

**Syntax** `ip igmp last-member-query-interval <interval>`  
`no ip igmp last-member-query-interval`

| Parameter  | Description                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------|
| <interval> | The frequency in milliseconds at which IGMP group-specific host query messages are sent, in the range 1000-25500. |

**Default** 1000 milliseconds

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

**Example** To change the IGMP group-specific host query message interval to 2 seconds (2000 milliseconds) on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp last-member-query-interval 2000
```

**Related Commands** [ip igmp immediate-leave](#)  
[ip igmp last-member-query-count](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp limit

**Overview** Use this command to configure the limit on the maximum number of group membership entries for the device as a whole or for the specified interface (if in interface mode). Once the specified number of group memberships is reached, all further membership reports will be ignored.

Optionally, you can configure an access-list to stop certain addresses from being subject to the limit.

Use the **no** variant of this command to unset the limit and any specified exception access-list.

**Syntax**

```
ip igmp limit <limit-value> [except  
{<access-list-number>|<access-list-number-extended>|  
<access-list-name>}]  
  
no ip igmp limit
```

| Parameter                     | Description                                                     |
|-------------------------------|-----------------------------------------------------------------|
| <limit-value>                 | Maximum number of group membership entries, from 2 to 512.      |
| <access-list-number>          | Access-list number, in the range 1 to 99.                       |
| <access-list-number-extended> | Access-list number (expanded range), in the range 1300 to 1999. |
| <access-list-name>            | IP access-list name.                                            |

**Default** The default limit, which is reset by the **no** variant of this command, is 512.

**Mode** Global Configuration and Interface Configuration for a VLAN interface.

**Usage** This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

**Example** To configure an IGMP limit of 100 group membership entries on vlan2, use the commands:

```
awplus# configure terminal  
awplus(config)# interface vlan2  
awplus(config-if)# ip igmp limit 100
```

To configure an IGMP limit of 100 group membership entries across all interfaces on which IGMP is enabled, and exclude group 224.1.1.1 from this limitation, use the commands:

```
awplus# configure terminal  
awplus(config)# access-list 1 permit 224.1.1.1 0.0.0.0  
awplus(config)# ip igmp limit 100 except 1
```

# ip igmp maximum-groups

**Overview** Use this command to set a limit, per switch port, on the number of IGMP groups clients can join. This stops a single client from using all the switch's available group-entry resources, and ensures that clients on all ports have a chance to join IGMP groups.

Use the **no** variant of this command to remove the limit.

**Syntax** `ip igmp maximum-groups <0-65535>`  
`no ip igmp maximum-groups`

| Parameter                    | Description                                                                               |
|------------------------------|-------------------------------------------------------------------------------------------|
| <code>&lt;0-65535&gt;</code> | The maximum number of IGMP groups clients can join on this switch port. 0 means no limit. |

**Default** The default is 0, which means no limit

**Mode** Interface mode for a switch port

**Usage** We recommend using this command with IGMP snooping fast leave on the relevant VLANs. To enable fast leave, use the command:

```
awplus(config-if)# ip igmp snooping fast-leave
```

The device keeps count of the number of groups learned by each port. This counter is incremented when group joins are received via IGMP reports. It is decremented when:

- Group memberships time out
- Group leaves are received via leave messages or reports

Also, the port's group counter is cleared when:

- The port goes down
- You run the command **clear ip igmp group \***
- The port is removed from a VLAN
- The port is on a VCSack back-up member, and that member reboots or otherwise leaves the stack.

You can see the current value of the group counter by using either of the commands:

```
awplus# show ip igmp snooping statistics interface <port-list>  
awplus# show ip igmp interface <port>
```

**Example** To limit clients to 10 groups on port 1.0.1, which is in vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ip igmp maximum-groups 10
awplus(config-if)# exit
awplus(config)# interface vlan1
awplus(config-if)# ip igmp snooping fast-leave
```

**Related  
Commands**

- [clear ip igmp group](#)
- [ip igmp snooping fast-leave](#)
- [show ip igmp interface](#)
- [show ip igmp snooping statistics](#)

# ip igmp mroute-proxy

**Overview** Use this command to enable IGMP mroute proxy on this downstream interface and associate it with the upstream proxy service interface.

Use the **no** variant of this command to remove the association with the proxy-service interface.

**Syntax** `ip igmp mroute-proxy <interface>`  
`no ip igmp mroute-proxy`

| Parameter   | Description                |
|-------------|----------------------------|
| <interface> | The name of the interface. |

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command applies to VLAN interfaces configured for IGMP Proxy.

You must also enable the IGMP proxy service on the upstream interface, using the [ip igmp proxy-service](#) command. You can associate one or more downstream mroute proxy interfaces on the device with a single upstream proxy service interface. This downstream mroute proxy interface listens for IGMP reports, and forwards them to the upstream IGMP proxy service interface.

IGMP Proxy does not work with other multicast routing protocols, such as PIM-SM or PIM-DM.

**Example** To configure vlan2 as the upstream proxy-service interface for the downstream vlan3 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip igmp mroute-proxy vlan2
```

**Related Commands** [ip igmp proxy-service](#)

# ip igmp proxy-service

**Overview** Use this command to enable the VLAN interface to be the upstream IGMP proxy-service interface for the device. All associated downstream IGMP mroute proxy interfaces on this device will have their memberships consolidated on this proxy service interface, according to IGMP host-side functionality.

Use the **no** variant of this command to remove the designation of the VLAN interface as an upstream proxy-service interface.

**Syntax** `ip igmp proxy-service`  
`no ip igmp proxy-service`

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command applies to VLAN interfaces configured for IGMP Proxy.

This command is used with the [ip igmp mroute-proxy](#) command to enable forwarding of IGMP reports to a proxy service interface for all forwarding entries for this interface. You must also enable the downstream IGMP mroute proxy interfaces on this device using the command [ip igmp mroute-proxy](#).

IGMP Proxy does not work with other multicast routing protocols, such as PIM-SM or PIM-DM.

**Example** To designate vlan1 as the upstream proxy-service interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip igmp proxy-service
```

**Related Commands** [ip igmp mroute-proxy](#)

# ip igmp querier-timeout

**Overview** Use this command to configure the timeout period before the device takes over as the querier for the interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

**Syntax** `ip igmp querier-timeout <timeout>`  
`no ip igmp querier-timeout`

| Parameter | Description                                                           |
|-----------|-----------------------------------------------------------------------|
| <timeout> | IGMP querier timeout interval value in seconds, in the range 1-65535. |

**Default** The default timeout interval is 255 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command applies to VLAN interfaces configured for IGMP.  
The timeout value should not be less than the current active querier's general query interval.

**Example** To configure the device to wait 130 seconds from the time it received the last query before it takes over as the querier for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp querier-timeout 130
```

**Related Commands** [ip igmp query-interval](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp query-holdtime

**Overview** This command sets the time that an IGMP Querier waits after receiving a query solicitation before it sends an IGMP Query. IGMP General Query messages will not be sent during the hold time interval.

Use the **no** variant of this command to return to the default query hold time period.

**Syntax** `ip igmp query-holdtime <interval>`  
`no ip igmp query-holdtime`

| Parameter  | Description                                                    |
|------------|----------------------------------------------------------------|
| <interval> | Query interval value in milliseconds, in the range <100-5000>. |

**Default** By default the delay before sending IGMP General Query messages is 500 milliseconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage** Use this command to configure a value for the IGMP query hold time in the current network. IGMP Queries can be generated after receiving Query Solicitation (QS) packets and there is a possibility of a DoS (Denial of Service) attack if a stream of Query Solicitation (QS) packets are sent to the IGMP Querier, eliciting a rapid stream of IGMP Queries. This command applies to interfaces on which the device is acting as an IGMP Querier.

Use the [ip igmp query-interval](#) command when a delay for IGMP general query messages is required and IGMP general query messages are required. The **ip igmp query-holdtime** command stops IGMP query messages during the configured holdtime interval, so the rate of IGMP Queries that can be sent out of an interface can be restricted.

See the [IGMP Feature Overview and Configuration Guide](#) for introductory information about the Query Solicitation feature.

**NOTE:** *This command will function on the switch in the stand-alone mode, but it is not supported when the device forms part of a VCS Stack.*

**Examples** To set the IGMP query holdtime to 900 ms for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-holdtime 900
```

To reset the IGMP query holdtime to the default (500 ms) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-holdtime
```

**Related  
Commands**

[ip igmp query-interval](#)  
[ip igmp snooping tcn query solicit](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp query-interval

**Overview** Use this command to configure the period for sending IGMP General Query messages.

The IGMP query interval specifies the time between IGMP General Query messages being sent.

Use the **no** variant of this command to return to the default query interval period.

**NOTE:** The IGMP query interval must be greater than IGMP query maximum response time.

**Syntax** `ip igmp query-interval <interval>`  
`no ip igmp query-interval`

| Parameter  | Description                                              |
|------------|----------------------------------------------------------|
| <interval> | Query interval value in seconds, in the range <2-18000>. |

**Default** The default IGMP query interval is 125 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command applies to interfaces configured for IGMP. Note that the IGMP query interval is automatically set to a greater value than the IGMP query max response time.

For example, if you set the IGMP query max response time to 2 seconds using the [ip igmp query-max-response-time](#) command, and the IGMP query interval is currently less than 3 seconds, then the IGMP query interval period will be automatically reconfigured to be 3 seconds, so it is greater than the IGMP query maximum response time.

Use the **ip igmp query-interval** command when a non-default interval for IGMP General Query messages is required.

The [ip igmp query-holdtime](#) command can occasionally delay the sending of IGMP Queries.

**Examples** To set the period between IGMP host-query messages to 3 minutes (180 seconds) for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-interval 180
```

To reset the period between sending IGMP host-query messages to the default (125 seconds) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-interval
```

**Related  
Commands**

[ip igmp query-holdtime](#)  
[ip igmp query-max-response-time](#)  
[ip igmp startup-query-interval](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp query-max-response-time

**Overview** Use this command to configure the maximum response time advertised in IGMP Queries.

Use the **no** variant of this command to restore the default.

**NOTE:** The IGMP query maximum response time must be less than the IGMP query interval.

**Syntax** `ip igmp query-max-response-time <response-time>`  
`no ip igmp query-max-response-time`

| Parameter                          | Description                                          |
|------------------------------------|------------------------------------------------------|
| <code>&lt;response-time&gt;</code> | Response time value in seconds, in the range 1-3180. |

**Default** The default IGMP query maximum response time is 10 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command applies to interfaces configured for IGMP.

Note that the IGMP query interval is automatically set to a greater value than the IGMP query maximum response time.

For example, if you set the IGMP query interval to 3 seconds using the [ip igmp query-interval](#) command, and the current IGMP query interval is less than 3 seconds, then the IGMP query maximum response time will be automatically reconfigured to be 2 seconds, so it is less than the IGMP query interval time.

To get the network to converge faster, use the **ip igmp query-max-response-time** command and set a low response time value, such as one or two seconds, so that the clients will respond immediately with a report as a response to the IGMP Queries.

**Examples** To set a maximum response time of 8 seconds for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-max-response-time 8
```

To reset the default maximum response time to the default (10 seconds) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-max-response-time
```

**Related  
Commands**

- ip igmp query-interval
- show ip igmp interface
- show running-config

## ip igmp ra-option

**Overview** Use this command to enable strict Router Alert (RA) option validation. With strict RA option enabled, IGMP packets without RA options are ignored.

**Syntax** `ip igmp ra-option`  
`no ip igmp ra-option`

**Default** The default state of RA validation is unset.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command applies to interfaces configured for IGMP and IGMP Snooping.

**Examples** To enable strict Router Alert (RA) option validation on vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp ra-option
```

# ip igmp robustness-variable

**Overview** Use this command to change the robustness variable value on an interface.  
Use the **no** variant of this command to return to the default on an interface.

**Syntax** `ip igmp robustness-variable <1-7>`  
`no ip igmp robustness-variable`

| Parameter | Description                    |
|-----------|--------------------------------|
| <1-7>     | The robustness variable value. |

**Default** The default robustness variable value is 2.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command applies to interfaces configured for IGMP and IGMP Snooping.

**Examples** To set the robustness variable to 3 on vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp robustness-variable 3
```

**Related  
Commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping

**Overview** Use this command to enable IGMP Snooping. When this command is used in the Global Configuration mode, IGMP Snooping is enabled at the device level. When this command is used in Interface Configuration mode, IGMP Snooping is enabled for the specified VLANs.

Use the **no** variant of this command to either globally disable IGMP Snooping, or disable IGMP Snooping on a specified interface.

**NOTE:** *IGMP snooping cannot be disabled on an interface if IGMP snooping has already been disabled globally. IGMP snooping can be disabled on both an interface and globally if disabled on the interface first and then disabled globally.*

**Syntax** `ip igmp snooping`  
`no ip igmp snooping`

**Default** By default, IGMP Snooping is enabled both globally and on all VLANs.

**Mode** Global Configuration and Interface Configuration for a VLAN interface.

**Usage** For IGMP snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (both are enabled by default.)

Both IGMP snooping and MLD snooping must be enabled globally on the device for IGMP snooping to operate. MLD snooping is also enabled by default. To enable it if it has been disabled, use the [ipv6 mld snooping](#) command in Global Configuration mode.

**Examples** To enable IGMP Snooping on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ip igmp snooping
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping
```

**Related Commands** [ipv6 mld snooping](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping fast-leave

**Overview** Use this command to enable IGMP Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing. The IGMP group-membership entry is removed as soon as an IGMP leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

**Syntax** `ip igmp snooping fast-leave`  
`no ip igmp snooping fast-leave`

**Default** IGMP Snooping fast-leave processing is disabled.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This IGMP Snooping command can only be configured on VLAN interfaces.

**Example** To enable fast-leave processing on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping fast-leave
```

**Related Commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping mrouter

**Overview** Use this command to statically configure the specified port as a multicast router port for IGMP Snooping for an interface. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to remove the static configuration of the port as a multicast router port.

**Syntax** `ip igmp snooping mrouter interface <port>`  
`no ip igmp snooping mrouter interface <port>`

| Parameter | Description                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------|
| <port>    | The port may be a device port (e.g. port1.0.4), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4). |

**Mode** Interface Configuration for a VLAN interface.

**Example** To configure port1.0.2 statically as a multicast router interface for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping mrouter interface port1.0.2
```

**Related Commands** [show ip igmp snooping mrouter](#)

# ip igmp snooping querier

**Overview** Use this command to enable IGMP querier operation when no multicast routing protocol is configured. When enabled, the IGMP Snooping querier sends out periodic IGMP queries for all interfaces. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to disable IGMP querier configuration.

**Syntax** `ip igmp snooping querier`  
`no ip igmp snooping querier`

**Mode** Interface Configuration for a VLAN interface.

**Usage** The IGMP Snooping querier uses the 0.0.0.0 Source IP address because it only masquerades as a proxy IGMP querier for faster network convergence.

It does not start, or automatically cease, the IGMP Querier operation if it detects query message(s) from a multicast router.

If an IP address is assigned to a VLAN, which has IGMP querier enabled on it, then the IGMP Snooping querier uses the VLAN's IP address as the Source IP Address in IGMP queries.

The IGMP Snooping Querier will not stop sending IGMP Queries if there is another IGMP Snooping Querier in the network with a lower Source IP Address.

**NOTE:** Do not enable the IGMP Snooping Querier feature on a Layer 2 device when there is an operational IGMP Querier in the network.

**Example** To configure vlan2 as a Snooping querier, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping querier
```

**Related Commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping report-suppression

**Overview** Use this command to enable report suppression for IGMP versions 1 and 2. This command applies to interfaces configured for IGMP Snooping.

Report suppression stops reports being sent to an upstream multicast router port when there are already downstream ports for this group on this interface.

Use the **no** variant of this command to disable report suppression.

**Syntax** `ip igmp snooping report-suppression`  
`no ip igmp snooping report-suppression`

**Default** Report suppression does not apply to IGMPv3, and is turned on by default for IGMPv1 and IGMPv2 reports.

**Mode** Interface Configuration for a VLAN interface.

**Example** To enable report suppression for IGMPv2 reports for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp version 2
awplus(config-if)# ip igmp snooping report-suppression
```

**Related Commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping routermode

**Overview** Use this command to set the destination IP addresses as router multicast addresses.

Use the **no** variant of this command to set it to the default. You can also remove a specified IP address from a custom list of multicast addresses.

**Syntax** `ip igmp snooping routermode  
{all|default|ip|multicasterouter|address <ip-address>}  
no ip igmp snooping routermode [address <ip-address>]`

| Parameter               | Description                                                                                                                                                                                           |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| all                     | All reserved multicast addresses (224.0.0.x). Packets from all possible addresses in range 224.0.0.x are treated as coming from routers.                                                              |
| default                 | Default set of reserved multicast addresses. Packets from 224.0.0.1, 224.0.0.2, 224.0.0.4, 224.0.0.5, 224.0.0.6, 224.0.0.9, 224.0.0.13, 224.0.0.15 and 224.0.0.24 are treated as coming from routers. |
| ip                      | Custom reserved multicast addresses. Packets from custom IP address in the 224.0.0.x range are treated as coming from routers.                                                                        |
| multicasterouter        | Packets from DVMRP (224.0.0.4) and PIM (224.0.0.13) multicast addresses are treated as coming from routers.                                                                                           |
| address<br><ip-address> | Packets from the specified multicast address are treated as coming from routers. The address must be in the 224.0.0.x range.                                                                          |

**Default** The default routermode is **default** (not **all**) and shows the following reserved multicast addresses:

|                            |
|----------------------------|
| Router mode.....Def        |
| Reserved multicast address |
| 224.0.0.1                  |
| 224.0.0.2                  |
| 224.0.0.4                  |
| 224.0.0.5                  |
| 224.0.0.6                  |
| 224.0.0.9                  |
| 224.0.0.13                 |
| 224.0.0.15                 |
| 224.0.0.24                 |

**Mode** Global Configuration

**Examples** To set **ip igmp snooping routermode** for all default reserved addresses enter:

```
awplus(config)# ip igmp snooping routermode default
```

To remove the multicast address 224.0.0.5 from the custom list of multicast addresses enter:

```
awplus(config)# no ip igmp snooping routermode address  
224.0.0.5
```

**Related commands** [ip igmp trusted](#)  
[show ip igmp snooping routermode](#)

# ip igmp snooping tcn query solicit

**Overview** Use this command to enable IGMP (Internet Group Management Protocol) Snooping TCN (Topology Change Notification) Query Solicitation feature. When this command is used in the Global Configuration mode, Query Solicitation is enabled.

Use the **no** variant of this command to disable IGMP Snooping TCN Query Solicitation. When the **no** variant of this command is used in Interface Configuration mode, this overrides the Global Configuration mode setting and Query Solicitation is disabled.

**Syntax** `ip igmp snooping tcn query solicit`  
`no ip igmp snooping tcn query solicit`

**Default** IGMP Snooping TCN Query Solicitation is disabled by default on the device, unless the device is the Master Node in an EPSR ring, or is the Root Bridge in a Spanning Tree.

When the device is the Master Node in an EPSR ring, or the device is the Root Bridge in a Spanning Tree, then IGMP Snooping TCN Query Solicitation is enabled by default and cannot be disabled using the Global Configuration mode command. However, Query Solicitation can be disabled for specified interfaces using the **no** variant of this command from the Interface Configuration mode.

**Mode** Global Configuration, and Interface Configuration for a VLAN interface.

**Usage** Once enabled, if the device is not an IGMP Querier, on detecting a topology change, the device generates IGMP Query Solicit messages that are sent to all the ports of the vlan configured for IGMP Snooping on the device.

On a device that is not the Master Node in an EPSR ring or the Root Bridge in a Spanning Tree, Query Solicitation can be disabled using the **no** variant of this command after being enabled.

If the device that detects a topology change is an IGMP Querier then the device will generate an IGMP Query message.

Note that the **no** variant of this command when issued in Global Configuration mode has no effect on a device that is the Master Node in an EPSR ring or on a device that is a Root Bridge in a Spanning Tree. Query Solicitation is not disabled for the device these instances. However, Query Solicitation can be disabled on a per-vlan basis from the Interface Configuration mode.

See the following state table that shows when Query Solicit messages are sent in these instances:

| Command issued from Global Configuration | Command issued from Interface Configuration | Device is STP Root Bridge or the EPSR Master Node | IGMP Query Solicit message sent on VLAN |
|------------------------------------------|---------------------------------------------|---------------------------------------------------|-----------------------------------------|
| No                                       | Yes                                         | Yes                                               | Yes                                     |
| Yes                                      | No                                          | Yes                                               | No                                      |
| Yes                                      | Yes                                         | Yes                                               | Yes                                     |

See the [IGMP Feature Overview and Configuration Guide](#) for introductory information about the Query Solicitation feature.

**NOTE:** This command will function on the switch in the stand-alone mode, but it is not supported when the device forms part of a VCS Stack.

**Examples** To enable Query Solicitation on a device, use the commands:

```
awplus# configure terminal
awplus(config)# ip igmp snooping tcn query solicit
```

To disable Query Solicitation on a device, use the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp snooping tcn query solicit
```

To enable Query Solicitation for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping tcn query solicit
```

To disable Query Solicitation for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip igmp snooping tcn query solicit
```

# ip igmp source-address-check

**Overview** This command enables the checking of the Source Address for an IGMP Report, rejecting any IGMP Reports originating on devices outside of the local subnet.

Use the **no** variant of this command to disable the checking of the Source Address for an IGMP Report, which allows IGMP Reports from devices outside of the local subnet.

**Syntax** `ip igmp source-address-check`  
`no ip igmp source-address-check`

**Default** Source address checking for IGMP Reports is enabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage** This is a security feature, and should be enabled unless IGMP Reports from outside the local subnet are expected, for example, if Multicast VLAN Registration is active in the network.

The no variant of this command is required to disable the IGMP Report source address checking feature in networks that use Multicast VLAN Registration to allow IGMP Reports from devices outside of the local subnet.

**Examples** To deny IGMP Reports from outside the current subnet for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp source-address-check
```

To allow IGMP Reports from outside the current subnet for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp source-address-check
```

**Validation  
Commands** `show ip igmp interface`  
`show running-config`

## ip igmp ssm

**Overview** Use this command to define a non-default Source Specific Multicast (SSM) range of IP multicast addresses in IGMP. Incoming IGMPv1 and IGMPv2 join requests are ignored if the multicast IP address is in the SSM range and no SSM mapping is configured for these addresses. By default, the SSM range is 232/8. To define the SSM range to be other than the default, use one of the access-list parameter options.

Use the **no** variant of this command to change the SSM range in IGMP back to the default.

**Syntax** `ip igmp ssm range {<access-list-number>|<access-list-name>}`  
`no ip igmp ssm`

| Parameter            | Description                               |
|----------------------|-------------------------------------------|
| <access-list-number> | Access-list number, in the range 1 to 99. |
| <access-list-name>   | Standard IP access-list name.             |

**Default** By default the SSM range is 232/8.

**Mode** Global Configuration

**Examples** To configure a non-default SSM range to be used in IGMP enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 224.1.1.0 0.0.0.255
awplus(config)# ip igmp ssm range 10
```

To return to the default configuration enter the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp ssm
```

**Related Commands** [access-list \(standard numbered\)](#)  
[ip pim ssm](#)

# ip igmp ssm-map enable

**Overview** Use this command to enable Source Specific Multicast (SSM) mapping on the device.

Use the **no** variant of this command to disable SSM mapping.

**Syntax** `ip igmp ssm-map enable`  
`no ip igmp ssm-map enable`

**Mode** Global Configuration

**Usage** This command applies to VLAN interfaces configured for IGMP.

**Example** To enable SSM on the device enter the commands:

```
awplus# configure terminal
awplus(config)# ip igmp ssm-map enable
```

**Related Commands** [ip igmp ssm-map static](#)

# ip igmp ssm-map static

**Overview** Use this command to specify the static mode of defining Source Specific Multicast (SSM) mapping. SSM statically assigns sources to IGMPv1 and IGMPv2 groups to translate such (\*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.

Use the **no** variant of this command to remove the SSM map association.

**Syntax**

```
ip igmp ssm-map static  
{<access-list-number>|<access-list-number-extended>|  
<access-list-name>} <ip-address>  
  
no ip igmp ssm-map static  
{<access-list-number>|<access-list-number-extended>|  
<access-list-name>} <ip-address>
```

| Parameter                     | Description                                                              |
|-------------------------------|--------------------------------------------------------------------------|
| <access-list-number>          | Access-list number, in the range 1 to 99.                                |
| <access-list-number-extended> | Access-list number (expanded range), in the range 1300 to 1999.          |
| <access-list-name>            | Standard IP access-list name.                                            |
| <ip-address>                  | Source address to use for static map group, entered in the form A.B.C.D. |

**Mode** Global Configuration

**Usage** This command applies to VLAN interfaces configured for IGMP. You can use Standard numbered and Standard named ACLs plus Expanded Numbered ACLs.

**Examples** This example shows how to configure an SSM static mapping for group-address 224.1.1.1, using a standard numbered ACL shown as 10:

```
awplus# configure terminal  
awplus(config)# access-list 10 permit 224.1.1.1 0.0.0.0  
awplus(config)# ip igmp ssm-map static 10 1.2.3.4
```

This example shows how to configure an SSM static mapping for group-address 224.1.1.1, using an expanded numbered ACL shown as 1301:

```
awplus# configure terminal  
awplus(config)# access-list 1301 permit 224.1.1.1 0.0.0.0  
awplus(config)# ip igmp ssm-map static 1301 1.2.3.4
```

This example shows how to configure an SSM static mapping for group-address 224.1.1.1, using a standard named ACL shown as sales:

```
awplus# configure terminal
awplus(config)# access-list sales permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp ssm-map static sales 1.2.3.4
```

**Related** [ip igmp ssm-map enable](#)  
**Commands**

## ip igmp static-group

**Overview** Use this command to statically configure multicast group membership entries on a VLAN interface, or to statically forward a multicast channel out a particular port or port range.

To statically add only a group membership, do not specify any parameters.

To statically add a (\*,g) entry to forward a channel out of a port, specify only the multicast group address and the switch port range.

To statically add an (s,g) entry to forward a channel out of a port, specify the multicast group address, the source IP address, and the switch port range.

To use Source Specific Multicast mapping to determine the source IP address of the multicast server use the **ssm-map** parameter instead of specifying the source IP address.

Use the **no** variant of this command to delete static group membership entries.

**Syntax**

```
ip igmp static-group <ip-address> [source  
{<ip-source-addr>|ssm-map}] [interface <port>]  
  
no ip igmp static-group <ip-address> [source  
{<ip-source-addr>|ssm-map}] [interface <port>]
```

| Parameter        | Description                                                                                                                                                                                                                                    |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address>     | Standard IP Multicast group address, entered in the form A.B.C.D, to be configured as a static group member.                                                                                                                                   |
| source           | Optional.                                                                                                                                                                                                                                      |
| <ip-source-addr> | Standard IP source address, entered in the form A.B.C.D, to be configured as a static source from where multicast packets originate.                                                                                                           |
| ssm-map          | This parameter uses Source Specific Multicast (SSM) Mapping to determine the source IP address associated with the specified IP Multicast group address. SSM mappings are configured using the <a href="#">ip igmp ssm-map static</a> command. |
| interface        | Use this parameter to specify a specific switch port or switch port range to statically forward the multicast group out of. If not used, static configuration is applied on all ports in the VLAN.                                             |
| <port>           | The port or port range to statically forward the group out of. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2).                                                |

**Mode** Interface Configuration for a VLAN interface.

**Usage** This command applies to IGMP operation, or to IGMP Snooping on a VLAN interface.

**Example** The following example show how to statically add group and source records for IGMP on vlan3:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip igmp
awplus(config-if)# ip igmp static-group 226.1.2.4 source
10.2.3.4
```

# ip igmp startup-query-count

**Overview** Use this command to configure the IGMP startup query count for an interface. The IGMP startup query count is the number of IGMP General Query messages sent by a querier at startup. The default IGMP startup query count is 2.

Use the **no** variant of this command to return an interface's configured IGMP startup query count to the default.

**Syntax** `ip igmp startup-query-count <startup-query-count>`  
`no ip igmp startup-query-count`

| Parameter                                | Description                                              |
|------------------------------------------|----------------------------------------------------------|
| <code>&lt;startup-query-count&gt;</code> | Specify the IGMP startup query count, in the range 2-10. |

**Default** The default IGMP startup query count is 2.

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the IGMP startup query count to 4 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp startup-query-count 4
```

**Related Commands** [ip igmp last-member-query-count](#)  
[ip igmp startup-query-interval](#)

# ip igmp startup-query-interval

**Overview** Use this command to configure the IGMP startup query interval for an interface. The IGMP startup query interval is the amount of time in seconds between successive IGMP General Query messages sent by a querier during startup. The default IGMP startup query interval is one quarter of the IGMP query interval value.

Use the **no** variant of this command to return an interface's configured IGMP startup query interval to the default.

**Syntax** `ip igmp startup-query-interval <startup-query-interval>`  
`no ip igmp startup-query-interval`

| Parameter                                   | Description                                                                                                                              |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;startup-query-interval&gt;</code> | Specify the IGMP startup query interval, in the range of 2-1800 seconds. The value must be one quarter of the IGMP query interval value. |

**Default** The default IGMP startup query interval is one quarter of the IGMP query interval value.

**NOTE:** *The IGMP startup query interval must be one quarter of the IGMP query interval.*

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the IGMP startup query interval to 15 seconds for vlan2, which is one quarter of the IGMP query interval of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp query-interval 60
awplus(config-if)# ip igmp startup-query-interval 15
```

**Related Commands** [ip igmp last-member-query-interval](#)  
[ip igmp query-interval](#)  
[ip igmp startup-query-count](#)

# ip igmp trusted

**Overview** Use this command to allow IGMP to process packets received on certain trusted ports only.

Use the **no** variant of this command to stop IGMP from processing specified packets if the packets are received on the specified ports or aggregator.

**Syntax** `ip igmp trusted {all|query|report|routermode}`  
`no ip igmp trusted {all|query|report|routermode}`

| Parameter  | Description                                                                                        |
|------------|----------------------------------------------------------------------------------------------------|
| all        | Specifies whether or not the interface is allowed to receive all IGMP and other routermode packets |
| query      | Specifies whether or not the interface is allowed to receive IGMP queries                          |
| report     | Specifies whether or not the interface is allowed to receive IGMP membership reports               |
| routermode | Specifies whether or not the interface is allowed to receive routermode packets                    |

**Default** By default, all ports and aggregators are trusted interfaces, so IGMP is allowed to process all IGMP query, report, and router mode packets arriving on all interfaces.

**Mode** Interface mode for one or more switch ports or aggregators

**Usage** Because all ports are trusted by default, use this command in its **no** variant to stop IGMP processing packets on ports you do not trust.

For example, you can use this command to make sure that only ports attached to approved IGMP routers are treated as router ports.

**Example** To stop ports port1.0.3-port1.0.6 from being treated as router ports by IGMP, use the commands:

```
awplus(config)# interface port1.0.3-port1.0.6  
awplus(config-if)# no ip igmp trusted routermode
```

**Related Commands** [ip igmp snooping routermode](#)

# ip igmp version

**Overview** Use this command to set the current IGMP version (IGMP version 1, 2 or 3) on an interface.

Use the **no** variant of this command to return to the default version.

**Syntax** `ip igmp version <1-3>`  
`no ip igmp version`

| Parameter                        | Description                  |
|----------------------------------|------------------------------|
| <code>version &lt;1-3&gt;</code> | IGMP protocol version number |

**Default** The default IGMP version is 3.

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the IGMP version to 2 for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp version 2
```

**Related Commands** [show ip igmp interface](#)

# show debugging igmp

**Overview** Use this command to display the IGMP debugging options set.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging igmp`

**Mode** User Exec and Privileged Exec

**Example** To display the IGMP debugging options set, enter the command:

```
awplus# show debugging igmp
```

**Output** Figure 27-1: Example output from the **show debugging igmp** command

```
IGMP Debugging status:
IGMP Decoder debugging is on
IGMP Encoder debugging is on
IGMP Events debugging is on
IGMP FSM debugging is on
IGMP Tree-Info-Base (TIB) debugging is on
```

**Related Commands** [debug igmp](#)

# show ip igmp groups

**Overview** Use this command to display the multicast groups with receivers directly connected to the router, and learned through IGMP.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp groups [<ip-address>|<interface> detail]`

| Parameter    | Description                                                  |
|--------------|--------------------------------------------------------------|
| <ip-address> | Address of the multicast group, entered in the form A.B.C.D. |
| <interface>  | Interface name for which to display local information.       |

**Mode** User Exec and Privileged Exec

**Example** The following command displays local-membership information for all ports in all interfaces:

```
awplus# show ip igmp groups
```

**Output** Figure 27-2: Example output from the **show ip igmp groups** command

| IGMP Connected Group Membership |            |          |          |               |  |
|---------------------------------|------------|----------|----------|---------------|--|
| Group Address                   | Interface  | Uptime   | Expires  | Last Reporter |  |
| 224.0.1.1                       | port1.0.1  | 00:00:09 | 00:04:17 | 10.10.0.82    |  |
| 224.0.1.24                      | port1.0.2  | 00:00:06 | 00:04:14 | 10.10.0.84    |  |
| 224.0.1.40                      | port1.0.3  | 00:00:09 | 00:04:15 | 10.10.0.91    |  |
| 224.0.1.60                      | port1.0.3  | 00:00:05 | 00:04:15 | 10.10.0.7     |  |
| 224.100.100.100                 | port1.0.1  | 00:00:11 | 00:04:13 | 10.10.0.91    |  |
| 228.5.16.8                      | port1.0.3  | 00:00:11 | 00:04:16 | 10.10.0.91    |  |
| 228.81.16.8                     | port1.0.7  | 00:00:05 | 00:04:15 | 10.10.0.91    |  |
| 228.249.13.8                    | port1.0.3  | 00:00:08 | 00:04:17 | 10.10.0.91    |  |
| 235.80.68.83                    | port1.0.11 | 00:00:12 | 00:04:15 | 10.10.0.40    |  |
| 239.255.255.250                 | port1.0.3  | 00:00:12 | 00:04:15 | 10.10.0.228   |  |
| 239.255.255.254                 | port1.0.12 | 00:00:08 | 00:04:13 | 10.10.0.84    |  |

**Table 1:** Parameters in the output of the **show ip igmp groups** command

| Parameter     | Description                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------|
| Group Address | Address of the multicast group.                                                                              |
| Interface     | Port through which the group is reachable.                                                                   |
| Uptime        | The time in weeks, days, hours, minutes, and seconds that this multicast group has been known to the device. |

**Table 1:** Parameters in the output of the **show ip igmp groups** command (cont.)

| Parameter     | Description                                                    |
|---------------|----------------------------------------------------------------|
| Expires       | Time (in hours, minutes, and seconds) until the entry expires. |
| Last Reporter | Last host to report being a member of the multicast group.     |

# show ip igmp interface

**Overview** Use this command to display the state of IGMP, IGMP Proxy service, and IGMP Snooping for a specified VLAN, or all VLANs. IGMP is shown as Active or Disabled in the show output. You can also display the number of groups a switch port belongs to.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip igmp interface [<interface>]

| Parameter   | Description                                                                                                                                                                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface> | The name of the interface.<br>If you specify a switch port number, the output displays the number of groups the port belongs to, and the port’s group membership limit, if a limit has been set (with the command <a href="#">ip igmp maximum-groups</a> ). |

**Mode** User Exec and Privileged Exec

**Output** The following output shows IGMP interface status for vlan2 with IGMP Snooping enabled:

```
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
  IGMP Disabled, Inactive, Version 3 (default)
  IGMP interface has 0 group-record states
  IGMP activity: 0 joins, 0 leaves
  IGMP robustness variable is 2
  IGMP last member query count is 2
  IGMP query interval is 125 seconds
  IGMP query holdtime is 500 milliseconds
  IGMP querier timeout is 255 seconds
  IGMP max query response time is 10 seconds
  Last member query response interval is 1000 milliseconds
  Group Membership interval is 260 seconds
  Strict IGMPv3 ToS checking is disabled on this interface
  Source Address checking is enabled
  IGMP Snooping is globally enabled
  IGMP Snooping query solicitation is globally disabled
  Num. query-solicit packets: 57 sent, 0 recvd
  IGMP Snooping is enabled on this interface
  IGMP Snooping fast-leave is not enabled
  IGMP Snooping querier is not enabled
  IGMP Snooping report suppression is enabled
```

The following output shows IGMP interface status for vlan2 with IGMP Snooping disabled:

```
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
  IGMP Disabled, Inactive, Version 3 (default)
  IGMP interface has 0 group-record states
  IGMP activity: 0 joins, 0 leaves
  IGMP robustness variable is 2
  IGMP last member query count is 2
  IGMP query interval is 125 seconds
  IGMP query holdtime is 500 milliseconds
  IGMP querier timeout is 255 seconds
  IGMP max query response time is 10 seconds
  Last member query response interval is 1000 milliseconds
  Group Membership interval is 260 seconds
  Strict IGMPv3 ToS checking is disabled on this interface
  Source Address checking is enabled
  IGMP Snooping is globally enabled
  IGMP Snooping query solicitation is globally disabled
    Num. query-solicit packets: 57 sent, 0 recvd
  IGMP Snooping is not enabled on this interface
  IGMP Snooping fast-leave is not enabled
  IGMP Snooping querier is not enabled
  IGMP Snooping report suppression is enabled
```

The following output displays membership information for port1.0.1:

```
awplus#show ip igmp interface port1.0.1
IGMP information for port1.0.1
  Maximum groups limit set: 10
  Number of groups port belongs to: 0
```

# show ip igmp proxy

**Overview** Use this command to display the state of IGMP Proxy services for a specified interface or for all interfaces.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax**

```
show ip igmp proxy
show ip igmp proxy groups [detail]
show ip igmp proxy groups <multicast-group> [detail]
show ip igmp proxy groups <vlan> [detail]
show ip igmp proxy groups <vlan> <multicast-group> [detail]
```

| Parameter         | Description                                                                |
|-------------------|----------------------------------------------------------------------------|
| groups            | Specify IGMP proxy group membership information.                           |
| detail            | Specify detailed IGMPv3 source information.                                |
| <vlan>            | Specify the name of a single VLAN interface, for example <b>vlan1</b> .    |
| <multicast-group> | Specify the IPv4 address in of the multicast group, in the format A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example** To display the state of IGMP Proxy services for all interfaces, enter the command:

```
awplus# show ip igmp proxy
```

To display the state of IGMP Proxy services for VLAN interface **vlan1**, enter the command:

```
awplus# show ip igmp proxy groups vlan1
```

To display the detailed state of IGMP Proxy services for VLAN interface **vlan1**, enter the command:

```
awplus# show ip igmp proxy groups vlan1 detail
```

**Related Commands** [ip igmp proxy-service](#)

# show ip igmp snooping mrouter

**Overview** Use this command to display the multicast router ports, both static and dynamic, in a VLAN.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp snooping mrouter [interface <interface>]`

| Parameter                      | Description                     |
|--------------------------------|---------------------------------|
| <code>interface</code>         | A specific interface.           |
| <code>&lt;interface&gt;</code> | The name of the VLAN interface. |

**Mode** User Exec and Privileged Exec

**Example** To show all multicast router interfaces, use the command:

```
awplus# show ip igmp snooping mrouter
```

To show the multicast router interfaces in `vlan1`, use the command:

```
awplus# show ip igmp snooping mrouter interface vlan1
```

**Output** Figure 27-3: Example output from the `show ip igmp snooping mrouter` command

| VLAN | Interface | Static/Dynamic        |
|------|-----------|-----------------------|
| 1    | port1.0.5 | Statically configured |
| 200  | port1.0.2 | Statically configured |

Figure 27-4: Example output from the `show ip igmp snooping mrouter interface vlan1` command

| VLAN | Interface | Static/Dynamic        |
|------|-----------|-----------------------|
| 1    | port1.0.5 | Statically configured |

**Related Commands** [ip igmp snooping mrouter](#)

# show ip igmp snooping routermode

**Overview** Use this command to display the current routermode and the list of IP addresses set as router multicast addresses from the [ip igmp snooping routermode](#) command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip igmp snooping routermode

**Mode** User Exec and Privileged Exec

**Example** To show the routermode and the list of router multicast addresses, use the command:

```
awplus# show ip igmp snooping routermode
```

**Output** Figure 27-5: Example output from the **show ip igmp snooping router mode** command

```
awplus#show ip igmp snooping routermode
Router mode.....Def
Reserved multicast address

      224.0.0.1
      224.0.0.2
      224.0.0.4
      224.0.0.5
      224.0.0.6
      224.0.0.9
      224.0.0.13
      224.0.0.15
      224.0.0.24
```

**Related Commands** [ip igmp snooping routermode](#)

# show ip igmp snooping statistics

**Overview** Use this command to display IGMP Snooping statistics data.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp snooping statistics interface <interface-range>  
[group [<ip-address>]]`

| Parameter    | Description                                                                                                                                                                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address> | Optionally specify the address of the multicast group, entered in the form A.B.C.D.                                                                                                                                                                                         |
| <interface>  | Specify the name of the interface or interface range. If you specify a port number, the output displays the number of groups the port belongs to, and the port’s group membership limit, if a limit has been set (with the command <a href="#">ip igmp maximum-groups</a> ) |

**Mode** User Exec and Privileged Exec

**Example** To display IGMP statistical information for **vlan1** and **vlan2**, use the command:

```
awplus# show ip igmp snooping statistics interface vlan1-vlan2
```

**Output** Figure 27-6: Example output from the **show ip igmp snooping statistics** command for VLANs

```
awplus#show ip igmp interface vlan1-vlan2
IGMP Snooping statistics for vlan1
Interface:      port1.0.3
Group:          224.1.1.1
Uptime:         00:00:09
Group mode:     Exclude (Expires: 00:04:10)
Last reporter:  10.4.4.5
Source list is empty
IGMP Snooping statistics for vlan2
Interface:      port1.0.4
Group:          224.1.1.2
Uptime:         00:00:19
Group mode:     Exclude (Expires: 00:05:10)
Last reporter:  10.4.4.6
Source list is empty
```

Figure 27-7: Example output from the **show ip igmp snooping statistics** command for a switch port

```
awplus#show ip igmp interface port1.0.1
IGMP information for port1.0.1
  Maximum groups limit set: 10
  Number of groups port belongs to: 0
```

# undebbug igmp

# MLD and MLD Snooping Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of configuration, clear, and show commands related to MLD and MLD Snooping.

The Multicast Listener Discovery (MLD) module includes the MLD Proxy service and MLD Snooping functionality. Some of the following commands may have commonalities and restrictions; these are described under the Usage section for each command.

MLD and MLD Snooping commands only apply to switch ports, not ETH interfaces.

Before using PIM-SMv6:

- IPv6 must be enabled on an interface ([ipv6 enable](#)),
- IPv6 forwarding must be enabled globally for routing IPv6 ([ipv6 forwarding](#)), and
- IPv6 multicasting must be enabled globally ([ipv6 multicast-routing](#)).

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306. The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPV6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

# clear ipv6 mld

**Overview** Use this command to clear all MLD local memberships on all interfaces.

**Syntax** `clear ipv6 mld`

**Mode** Privileged Exec

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

**Example** `awplus# clear ipv6 mld`

**Related  
Commands** [clear ipv6 mld group](#)  
[clear ipv6 mld interface](#)

# clear ipv6 mld group

**Overview** Use this command to clear MLD specific local-membership(s) on all interfaces, for a particular group.

**Syntax** `clear ipv6 mld group {*|<ipv6-address>}`

| Parameter      | Description                                                                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| *              | Clears all groups on all interfaces. This is an alias to the <a href="#">clear ipv6 mld</a> command.                                                                               |
| <ipv6-address> | Specify the group address for which MLD local-memberships are to be cleared from all interfaces.<br>Specify the IPv6 multicast group address in the format in the format X:X::X:X. |

**Mode** Privileged Exec

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

**Example** `awplus# clear ipv6 mld group *`

**Related Commands** [clear ipv6 mld](#)  
[clear ipv6 mld interface](#)

# clear ipv6 mld interface

**Overview** Use this command to clear MLD interface entries.

**Syntax** `clear ipv6 mld interface <interface>`

| Parameter                      | Description                                                                          |
|--------------------------------|--------------------------------------------------------------------------------------|
| <code>&lt;interface&gt;</code> | Specifies name of the interface; all groups learned from this interface are deleted. |

**Mode** Privileged Exec

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

**Example** `awplus# clear ipv6 mld interface vlan2`

**Related  
Commands** [clear ipv6 mld](#)  
[clear ipv6 mld group](#)

# debug mld

**Overview** Use this command to enable all MLD debugging modes, or a specific MLD debugging mode.

Use the **no** variant of this command to disable all MLD debugging modes, or a specific MLD debugging mode.

**Syntax** `debug mld {all|decode|encode|events|fsm|tib}`  
`no debug mld {all|decode|encode|events|fsm|tib}`

| Parameter | Description                            |
|-----------|----------------------------------------|
| all       | Debug all MLD.                         |
| decode    | Debug MLD decoding.                    |
| encode    | Debug MLD encoding.                    |
| events    | Debug MLD events.                      |
| fsm       | Debug MLD Finite State Machine (FSM).  |
| tib       | Debug MLD Tree Information Base (TIB). |

**Mode** Privileged Exec and Global Configuration

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

**Examples**

```
awplus# configure terminal
awplus(config)# debug mld all
awplus# configure terminal
awplus(config)# debug mld decode
awplus# configure terminal
awplus(config)# debug mld encode
awplus# configure terminal
awplus(config)# debug mld events
```

**Commands**

## ipv6 mld

**Overview** Use this command to enable the MLD protocol operation on an interface. This command enables MLD protocol operation in stand-alone mode, and can be used to learn local-membership information prior to enabling a multicast routing protocol on the interface.

Use the **no** variant of this command to return all MLD related configuration to the default (including MLD Snooping).

**NOTE:** *There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing.*

*There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing.*

*The device has a 512 MLD group limit for (\*, G) and (S,G) entries.*

**Syntax** `ipv6 mld`  
`no ipv6 mld`

**Default** MLD is disabled by default.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld
```

# ipv6 mld access-group

**Overview** Use this command to control the multicast local-membership groups learned on an interface.

Use the **no** variant of this command to disable this access control.

**Syntax** `ipv6 mld access-group <IPv6-access-list-name>`  
`no ipv6 mld access-group`

| Parameter                                  | Description                                                                                                                                                     |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;IPv6-access-list-name&gt;</code> | Specify a Standard or an Extended software IPv6 access-list name. See <a href="#">IPv6 Software Access Control List (ACL) Commands</a> for supported IPv6 ACLs. |

**Default** No access list is configured by default.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Examples** In the following example, the VLAN interface `vlan2` will only accept MLD joins for groups in the range `ff1e:0db8:0001::/64`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard group1 permit
ff1e:0db8:0001::/64
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld access-group group1
```

In the following example, the VLAN interfaces `vlan2-vlan4` will only accept MLD joins for groups in the range `ff1e:0db8:0001::/64`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard group1 permit
ff1e:0db8:0001::/64
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld access-group group1
```

# ipv6 mld immediate-leave

**Overview** Use this command to minimize the leave latency of MLD memberships.  
Use the **no** variant of this command to disable this feature.

**Syntax** `ipv6 mld immediate-leave group-list <IPv6-access-list-name>`  
`no ipv6 mld immediate-leave`

| Parameter                                  | Description                                                                                                                                                                                                                                      |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;IPv6-access-list-name&gt;</code> | Specify a Standard or an Extended software IPv6 access-list name that defines multicast groups in which the immediate leave feature is enabled.<br>See <a href="#">IPv6 Software Access Control List (ACL) Commands</a> for supported IPv6 ACLs. |

**Default** Disabled

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Example** The following example shows how to enable the immediate-leave feature on an interface for a specific range of multicast groups. In this example, the router assumes that the group access-list consists of groups that have only one node membership at a time per interface:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld immediate-leave v6grp
awplus(config-if)# exit
```

**Related Commands** [ipv6 mld last-member-query-interval](#)

# ipv6 mld last-member-query-count

**Overview** Use this command to set the last-member query-count value.  
Use the **no** variant of this command to return to the default on an interface.

**Syntax** `ipv6 mld last-member-query-count <value>`  
`no ipv6 mld last-member-query-count`

| Parameter | Description                                |
|-----------|--------------------------------------------|
| <value>   | Count value. Valid values are from 2 to 7. |

**Default** The default last-member query-count value is 2.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-count 3
```

# ipv6 mld last-member-query-interval

**Overview** Use this command to configure the interval at which the router sends MLD group-specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

**Syntax** `ipv6 mld last-member-query-interval <milliseconds>`  
`no ipv6 mld last-member-query-interval`

| Parameter                         | Description                                                                                                           |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <code>&lt;milliseconds&gt;</code> | The time delay between successive query messages (in milliseconds). Valid values are from 1000 to 25500 milliseconds. |

**Default** 1000 milliseconds

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Example** The following example changes the MLD group-specific host query message interval to 2 seconds:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-interval 2000
```

**Related Commands** [ipv6 mld immediate-leave](#)

# ipv6 mld limit

**Overview** Use this command to configure a limit on the maximum number of group memberships that may be learned. The limit may be set for the device as a whole, or for a specific interface.

Once the specified group membership limit is reached, all further local-memberships will be ignored.

Optionally, an exception access-list can be configured to specify the group-address(es) that are exempted from being subject to the limit.

Use the **no** variant of this command to unset the limit and any specified exception access-list.

**Syntax** `ipv6 mld limit <limitvalue> [except <IPv6-access-list-name>]`  
`no ipv6 mld limit`

| Parameter               | Description                                                                                                                                                                                                                                                     |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <limitvalue>            | <2-512> Maximum number of group membership states.                                                                                                                                                                                                              |
| <IPv6-access-list-name> | Specify a Standard or an Extended software IPv6 access-list name that defines multicast groups, which are exempted from being subject to the configured limit.<br>See <a href="#">IPv6 Software Access Control List (ACL) Commands</a> for supported IPv6 ACLs. |

**Default** The default limit, which is reset by the **no** variant of this command, is the same as maximum number of group membership entries that can be learned with the **ipv6 mld limit** command.

The default limit of group membership entries that can be learned is 512 entries.

**Mode** Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

**Examples** The following example configures an MLD limit of 100 group-memberships across all VLAN interfaces on which MLD is enabled, and excludes groups in the range `ff1e:0db8:0001::/64` from this limitation:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard v6grp permit
ff1e:0db8:0001::/64
awplus(config)# ipv6 mld limit 100 except v6grp
```

The following example configures an MLD limit of 100 group-membership states on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld limit 100
```

The following example configures an MLD limit of 100 group-membership states on the VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld limit 100
```

**Related Commands**    [ipv6 mld immediate-leave](#)  
                          [show ipv6 mld groups](#)

# ipv6 mld querier-timeout

**Overview** Use this command to configure the timeout period before the router takes over as the querier for the interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

**Syntax** `ipv6 mld querier-timeout <seconds>`  
`no ipv6 mld querier-timeout`

| Parameter | Description                                                                                                                                                            |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <seconds> | Number of seconds that the router waits after the previous querier has stopped querying before it takes over as the querier. Valid values are from 2 to 65535 seconds. |

**Default** 255 seconds

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols.

**Example** The following example configures the router to wait 120 seconds from the time it received the last query before it takes over as the querier for the interface:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld querier-timeout 120
```

**Related Commands** [ipv6 mld query-interval](#)

# ipv6 mld query-interval

**Overview** Use this command to configure the frequency of sending MLD host query messages.

Use the **no** variant of this command to return to the default frequency.

**Syntax** `ipv6 mld query-interval <seconds>`  
`no ipv6 mld query-interval`

| Parameter                    | Description                                                                                                                               |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;seconds&gt;</code> | Variable that specifies the time delay between successive MLD host query messages (in seconds). Valid values are from 1 to 18000 seconds. |

**Default** The default query interval is 125 seconds.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols.

**Example** The following example changes the frequency of sending MLD host-query messages to 2 minutes:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-interval 120
```

**Related Commands** [ipv6 mld querier-timeout](#)

# ipv6 mld query-max-response-time

**Overview** Use this command to configure the maximum response time advertised in MLD queries.

Use the **no** variant of with this command to restore the default.

**Syntax** `ipv6 mld query-max-response-time <seconds>`  
`no ipv6 mld query-max-response-time`

| Parameter | Description                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------|
| <seconds> | Maximum response time (in seconds) advertised in MLD queries. Valid values are from 1 to 240 seconds. |

**Default** 10 seconds

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols.

**Example** The following example configures a maximum response time of 8 seconds:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-max-response-time 8
```

# ipv6 mld robustness-variable

**Overview** Use this command to change the robustness variable value on an interface.  
Use the **no** variant of this command to return to the default on an interface.

**Syntax** `ipv6 mld robustness-variable <value>`  
`no ipv6 mld robustness-variable`

| Parameter | Description                   |
|-----------|-------------------------------|
| <value>   | Valid values are from 1 to 7. |

**Default** The default robustness variable value is 2.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This command applies to interfaces configured for MLD Layer-3 multicast protocols.

**Example**

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld robustness-variable 3
```

# ipv6 mld snooping

**Overview** Use this command to enable MLD Snooping. When this command is issued in the Global Configuration mode, MLD Snooping is enabled globally for the device. When this command is issued in Interface mode for a VLAN then MLD Snooping is enabled for the specified VLAN. Note that MLD Snooping is enabled on the VLAN only if it is enabled globally and on the VLAN.

Use the **no** variant of this command to globally disable MLD Snooping in Global Configuration mode, or for the specified VLAN interface in Interface mode.

**NOTE:** *There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing.*

*There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing.*

*The device has a 512 MLD group limit for (\*, G) and (S,G) entries.*

**Syntax** `ipv6 mld snooping`  
`no ipv6 mld snooping`

**Default** By default, MLD Snooping is enabled both globally and on all VLANs.

**Mode** Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** For MLD Snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (both are enabled by default).

MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

**Examples** To configure MLD Snooping on the VLAN interface `vlan2`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping
```

To configure MLD Snooping on the VLAN interfaces `vlan2-vlan4`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping
```

To disable MLD Snooping for the VLAN interface `vlan2`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config)# no ipv6 mld snooping
```

To disable MLD Snooping for the VLAN interfaces `vlan2-vlan4`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config)# no ipv6 mld snooping
```

To configure MLD Snooping globally for the device, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 mld snooping
```

To disable MLD Snooping globally for the device, enter the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 mld snooping
```

# ipv6 mld snooping fast-leave

**Overview** Use this command to enable MLD Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing; the MLD group-membership is removed as soon as an MLD leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

**Syntax** `ipv6 mld snooping fast-leave`  
`no ipv6 mld snooping fast-leave`

**Default** MLD Snooping fast-leave processing is disabled.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This MLD Snooping command can only be configured on VLAN interfaces.

**Examples** This example shows how to enable fast-leave processing on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping fast-leave
```

This example shows how to enable fast-leave processing on the VLAN interface `vlan2-vlan4`.

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping fast-leave
```

# ipv6 mld snooping mrouter
