**Command changes** Version 5.4.9-0.1: command added

# show atmf

**Overview** Displays information about the current AMF node.

**Syntax** `show atmf [summary|tech|nodes|session]`

| Parameter | Description                                               |
|-----------|-----------------------------------------------------------|
| summary   | Displays summary information about the current AMF node.  |
| tech      | Displays global AMF information.                          |
| nodes     | Displays a list of AMF nodes together with brief details. |
| session   | Displays information on an AMF session.                   |

**Default** Only summary information is displayed.

**Mode** User Exec and Privileged Exec

**Usage notes** AMF uses internal VLANs to communicate between nodes about the state of the AMF network. Two VLANs have been selected specifically for this purpose. Once these have been assigned, they are reserved for AMF and cannot be used for other purposes

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Example 1** To show summary information on AMF node\_1 use the following command:

```
node_1# show atmf summary
```

**Table 57:** Output from the **show atmf summary** command

|                           |                |
|---------------------------|----------------|
| node_1#show atmf summary  |                |
| ATMF Summary Information: |                |
| ATMF Status               | : Enabled      |
| Network Name              | : Test_network |
| Node Name                 | : node_1       |
| Role                      | : Master       |
| Restricted login          | : Disabled     |
| Current ATMF Nodes        | : 3            |

**Example 2** To show information specific to AMF nodes use the following command:

```
node_1# show atmf nodes
```

**Example 3** The **show amf session** command displays all CLI (Command Line Interface) sessions for users that are currently logged in and running a CLI session.

To display AMF active sessions, use the following command:

```
node_1# show atmf session
```

For example, in the output below, node\_1 and node\_5 have active users logged in.

**Table 58:** Output from the **show atmf session** command

|                                      |                  |

| DBE Retransmit Queue Length          | : 0              |
| DBE Request List Length              | : 0              |

**Example 4** The AMF tech command collects all the AMF commands, and displays them. You can use this command when you want to see an overview of the AMF network.

To display AMF technical information, use the following command:

```
node_1# show atmf tech
```

**Table 59:** Output from the **show atmf tech** command

```
node_1#show atmf tech
ATMF Summary Information:

ATMF Status : Enabled

**Table 60:** Parameter definitions from the **show atmf tech** command

| Parameter    | Definition                                         |
|--------------|----------------------------------------------------|
| ATMF Status  | The Node's AMF status, either Enabled or Disabled. |
| Network Name | The AMF network that a particular node belongs to. |

**Table 60:** Parameter definitions from the **show atmf tech** command (cont.)

| Parameter          | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node Name          | The name assigned to a particular node.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Role               | The role configured for this AMF device, either Master or Member.                                                                                                                                                                                                                                                                                                                                                                                                |
| Current ATMF Nodes | The count of AMF nodes in an AMF Network.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Node Address       | An address used to access a remotely located node (.atmf).                                                                                                                                                                                                                                                                                                                                                                                                       |
| Node ID            | A unique identifier assigned to a Node on an AMF network.                                                                                                                                                                                                                                                                                                                                                                                                        |
| Node Depth         | The number of nodes in path from this node to level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.                                                                                                                                                                                                                                                           |
| Domain State       | The state of Node in a Domain in AMF network as Controller/Backup.                                                                                                                                                                                                                                                                                                                                                                                               |
| Recovery State     | The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.                                                                                                                                                                                                                                                                                                                                           |
| Management VLAN    | The VLAN created for traffic between Nodes of different domain (up/down links). <ul style="list-style-type: none"> <li>• VLAN ID - In this example VLAN 4092 is configured as the Management VLAN.</li> <li>• Management Subnet - Network prefix for the subnet.</li> <li>• Management IP Address - The IP address allocated for this traffic.</li> <li>• Management Mask - The subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul> |
| Domain VLAN        | The VLAN assigned for traffic between Nodes of same domain (crosslink). <ul style="list-style-type: none"> <li>• VLAN ID - In this example VLAN 4091 is configured as the domain VLAN.</li> <li>• Domain Subnet. The subnet address used for this traffic.</li> <li>• Domain IP Address. The IP address allocated for this traffic.</li> <li>• Domain Mask. The subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul>                 |
| Device Type        | The Product Series name.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ATMF Master        | Whether the node is an AMF master node for its area ('Y' if it is and 'N' if it is not).                                                                                                                                                                                                                                                                                                                                                                         |
| SC                 | The device configuration, one of C - Chassis (SBx8100 Series), S - Stackable (VCS) or N - Standalone.                                                                                                                                                                                                                                                                                                                                                            |
| Parent             | The node to which the current node has an active uplink.                                                                                                                                                                                                                                                                                                                                                                                                         |
| Node Depth         | The number of nodes in the path from this node to the master node.                                                                                                                                                                                                                                                                                                                                                                                               |

**Related commands** [show atmf detail](#)

# show atmf area

**Overview** Use this command to display information about an AMF area. On AMF controllers, this command displays all areas that the controller is aware of. On remote AMF masters, this command displays the controller area and the remote local area. On gateways, this command displays the controller area and remote master area.

**Syntax** `show atmf area [detail] [<area-name>]`

| Parameter   | Description                                                                     |
|-------------|---------------------------------------------------------------------------------|
| detail      | Displays detailed information                                                   |
| <area-name> | Displays information about master and gateway nodes in the specified area only. |

**Mode** Privileged Exec

**Example 1** To show information about all areas, use the command:

```
controller-1# show atmf area
```

The following figure shows example output from running this command on a controller.

**Table 61:** Example output from the **show atmf area** command on a Controller.

| controller-1#show atmf area |         |                  |                |               |            |

The following figure shows example output from running this command on a remote master.

**Table 62:** Example output from the **show atmf area** command on a remote master.

```
Canterbury#show atmf area

ATMF Area Information:

* = Local area
```

| Area Name    | Area ID | Local Gateway          | Remote Gateway | Remote Master | Node Count |
|--------------|---------|------------------------|----------------|---------------|------------|
| NZ           | 1       | Reachable              | N/A            | N/A           | -          |
| * Canterbury | 3       | Reachable              | N/A            | N/A           | 40         |
| Area count:  | 2       | Local area node count: |                |               | 40         |

**Table 63:** Parameter definitions from the **show atmf area** command

| Parameter       | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| *               | Indicates the area of the device on which the command is being run.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Area Name       | The name of each area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Area ID         | The ID of the area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Local Gateway   | Whether the local gateway node is reachable or not.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Remote Gateway  | Whether the remote gateway node is reachable or not. This is one of the following: <ul style="list-style-type: none"> <li>Reachable, if the link has been established.</li> <li>Unreachable, if a link to the remote area has not been established. This could mean that a port or vlan is down, or that inconsistent VLANs have been configured using the <a href="#">switchport atmf-arealink</a> command.</li> <li>N/A for the area of the controller or remote master on which the command is being run, because the gateway node on that device is local.</li> <li>Auth Start, which may indicate that the area names match on the controller and remote master, but the IDs do not match.</li> <li>Auth Error, which indicates that the areas tried to authenticate but there is a problem. For example, the passwords configured on the controller and remote master may not match, or a password may be missing on the remote master.?</li> <li>Auth OK, which indicates that area authentication was successful and you can now use the <a href="#">atmf select-area</a> command.</li> </ul> |
| Remote Master   | Whether the remote master node is reachable or not. This is N/A for the area of the controller or remote master on which the command is being run, because the master node on that device is local.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Node Count      | The number of nodes in the area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Area Count      | The number of areas controlled by the controller.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Area Node Count | The total number of nodes in the area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Example 2** To show detailed information about the areas, use the command:

```
controller-1# show atmf area detail
```

The following figure shows example output from running this command.

**Table 64:** Output from the **show atmf area detail** command

|                                    |                      |

# show atmf area guests

**Overview** This command will display details of all guests that the controller is aware of.

**Syntax** show atmf area guests [<area-name> [<node-name>]]

| Parameter   | Description                                       |
|-------------|---------------------------------------------------|
| <area-name> | The area name for guest information               |
| <node-name> | The name of the node that connects to the guests. |

**Default** n/a

**Mode** User Exec/Privileged Exec

**Example 1** To display atmf area guest nodes on a controller, use the command,

```
GuestNode[1]#show atmf area guests
```

**Output** Figure 56-15: Example output from the **show atmf area guests** command

|                                            |                |                |       |              |

**Table 65:** Parameters in the output from **show atmf area guests** command

| Parameter   | Description                                                         |
|-------------|---------------------------------------------------------------------|
| Device Type | The device type as read from the guest node.                        |
| MAC Address | The MAC address of the guest-node                                   |
| Parent      | The device that directly connects to the guest-node                 |
| Port        | The port number on the parent node that connects to the guest node. |
| IP/IPv6     | The IP or IPv6 address of the guest node.                           |

# show atmf area guests-detail

**Overview** This command displays the local and remote guest information from an AMF controller.

**Syntax** show atmf area guests-detail [<area-name> [<node-name>]]

| Parameter   | Description                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------|
| <area-name> | The name assigned to the AMF area. An area is an AMF network that is under the control of an AMF Controller. |
| <node-name> | The name assigned to the network node.                                                                       |

**Default** n/a.

**Mode** Privileged Exec

**Example** To display detailed information for all guest nodes attached to “node1”, which is located within the area named “northern”, use the following command:

```
AMF_controller#show atmf area guests-detail northern node1
```

**Output** Figure 56-16: Example output from the **show atmf guest detail** command.

| Parameter         | Description                                                                                                                                                                               |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node Name         | The name of the guest's parent node.                                                                                                                                                      |
| Port Name         | The port on the parent node that connects to the guest.                                                                                                                                   |
| IFindex           | An internal index number that maps to the port number on the parent node.                                                                                                                 |
| Guest Description | A brief description of the guest node as manually entered into the <a href="#">description (interface)</a> command for the guest node port on the parent node.                            |
| Device Type       | The device type as supplied by the guest node itself.                                                                                                                                     |
| Backup Supported  | Indicates whether AMF supports backup of this guest node.                                                                                                                                 |
| MAC Address       | The MAC address of the guest node.                                                                                                                                                        |
| IP Address        | The IP address of the guest node.                                                                                                                                                         |
| IPv6 Address      | The IPv6 address of the guest node.                                                                                                                                                       |
| HTTP Port         | The HTTP port enables you to specify a port when enabling http to allow a URL for the http user interface of a Guest Node. This is determined by the <a href="#">http-enable</a> command. |
| Firmware Version  | The firmware version that the guest node is currently running.                                                                                                                            |

# show atmf area nodes

**Overview** Use this command to display summarized information about an AMF controller's remote nodes.

Note that this command can only be run from a controller node.

**Syntax** `show atmf area nodes <area-name> [<node-name>]`

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| <area-name> | Displays information about nodes in the specified area. |
| <node-name> | Displays information about the specified node.          |

**Mode** Privileged Exec

**Usage notes** If you do not limit the output to a single area or node, this command lists all remote nodes that the controller is aware of. This can be a very large number of nodes.

**Example** To show summarized information for all the nodes in area 'Wellington', use the command:

```
controller-1# show atmf area nodes Wellington
```

The following figure shows partial example output from running this command.

**Table 67:** Output from the **show atmf area nodes Wellington** command

```
controller-1#show atmf area nodes Wellington
```

Wellington Area Node Information:

| Node        | Device        | ATMF   |    | Parent      | Node  |
|-------------|---------------|--------|----|-------------|-------|
| Name        | Type          | Master | SC | Domain      | Depth |
| -----       |               |        |    |             |       |
| well-gate   | x230-18GP     | N      | N  | well-master | 1     |
| well-master | AT-x930-28GPX | Y      | N  | none        | 0     |

Wellington node count 2

**Table 68:** Parameter definitions from the **show atmf area nodes** command

| Parameter   | Definition                                                                               |
|-------------|------------------------------------------------------------------------------------------|
| Node Name   | The name assigned to a particular node.                                                  |
| Device Type | The Product series name.                                                                 |
| ATMF Master | Whether the node is an AMF master node for its area ('Y' if it is and 'N' if it is not). |

**Table 68:** Parameter definitions from the **show atmf area nodes** command

| Parameter     | Definition                                                                                            |
|---------------|-------------------------------------------------------------------------------------------------------|
| SC            | The device configuration, one of C - Chassis (SBx8100 series), S - Stackable (VCS) or N - Standalone. |
| Parent Domain | The node to which the current node has an active uplink.                                              |
| Node Depth    | The number of nodes in the path from this node to the master node.                                    |

**Related commands** [show atmf area](#)  
[show atmf area nodes-detail](#)

# show atmf area nodes-detail

**Overview** Use this command to display detailed information about an AMF controller's remote nodes.

Note that this command can only be run from a controller node.

**Syntax** `show atmf area nodes-detail <area-name> [<node-name>]`

| Parameter   | Description                                                      |
|-------------|------------------------------------------------------------------|
| <area-name> | Displays detailed information about nodes in the specified area. |
| <node-name> | Displays detailed information about the specified node.          |

**Mode** Privileged Exec

**Usage notes** If you do not limit the output to a single area or node, this command displays information about all remote nodes that the controller is aware of. This can be a very large number of nodes.

**Example** To show information for all the nodes in area 'Wellington', use the command:

```
controller-1# show atmf area nodes-detail Wellington
```

The following figure shows partial example output from running this command.

**Table 69:** Output from the **show atmf area nodes-detail Wellington** command

                              [show atmf area nodes](#)

# show atmf area summary

**Overview** Use this command to display a summary of IPv6 addresses used by AMF, for one or all of the areas controlled by an AMF controller.

**Syntax** `show atmf area summary [<area-name>]`

| Parameter   | Description                                       |
|-------------|---------------------------------------------------|
| <area-name> | Displays information for the specified area only. |

**Mode** Privileged Exec

**Example 1** To show a summary of IPv6 addresses used by AMF, for all of the areas controlled by controller-1, use the command:

```
controller-1# show atmf area summary
```

The following figure shows example output from running this command.

**Table 71:** Output from the **show atmf area summary** command

|                                     |                         |

# show atmf authorization

**Overview** Use this command on an AMF master to display the authorization status of other AMF members and masters on the network.

On an AMF controller this command will show the authorization status of remote area AMF masters.

**Syntax** `show atmf authorization {current|pending|provisional}`

| Parameter   | Description                                                                                                                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| current     | Show the status of all authorized nodes.                                                                                                                                                                    |
| pending     | Show the status of unauthorized nodes in the pending queue. These are nodes that enabled secure mode with <code>atmf secure-mode</code> but have not yet been authorized with <code>atmf authorize</code> . |
| provisional | Show the status of provisionally authorized nodes. These are nodes that have been provisioned with <code>atmf authorize provision</code> .                                                                  |

**Mode** Privileged Exec

**Example** To display all authorized AMF nodes on an AMF controller or AMF master, use the command:

```
awplus# show atmf authorization current
```

To display AMF nodes which are requesting authorization on an AMF controller or AMF master, use the command:

```
awplus# show atmf authorization pending
```

To display AMF nodes which have provisional authorization, use the command:

```
awplus# show atmf authorization provisional
```

**Output** Figure 56-17: Example output from **show atmf authorization current**

| NZ Authorized Nodes: |          |            |
|----------------------|----------|------------|
| Node Name            | Signer   | Expires    |
| -----                |          |            |
| master_1             | master_1 | 4 Mar 2017 |
| area_1_node_1        | master_1 | 4 Mar 2017 |
| area_1_node_2        | master_1 | 4 Mar 2017 |

Table 56-1: Parameters in the output from **show atmf authorization current**

| Parameter | Description                                                                                                                    |
|-----------|--------------------------------------------------------------------------------------------------------------------------------|
| Node Name | AMF node name of the authorized node.                                                                                          |
| Signer    | Name of the AMF master that authorized the node.                                                                               |
| Expires   | Expiry date of the authorization. Authorization expiry time is set using <a href="#">atmf secure-mode certificate expiry</a> . |

**Output** Figure 56-18: Example output from **show atmf authorization pending**

|                         |            |             |           |
|-------------------------|------------|-------------|-----------|
| Pending Authorizations: |            |             |           |
| NZ Requests:            |            |             |           |
| Node Name               | Product    | Parent Node | Interface |
| -----                   | -----      | -----       | -----     |
| area_1_node_3           | x230-18GP  | master_1    | port1.2.9 |

**Command  
changes**

Version 5.4.7-0.3: command added

# show atmf backup

**Overview** This command displays information about AMF backup status for all the nodes in an AMF network. It can only be run on AMF master and controller nodes.

**Syntax**

```
show atmf backup
show atmf backup logs
show atmf backup server-status
show atmf backup synchronize [logs]
```

| Parameter     | Description                                                                           |
|---------------|---------------------------------------------------------------------------------------|
| logs          | Displays detailed log information.                                                    |
| server-status | Displays connectivity diagnostics information for each configured remote file server. |
| synchronize   | Display the file server synchronization status                                        |
| logs          | For each remote file server, display the logs for the last synchronization            |

**Mode** Privileged Exec

**Example 1** To display the AMF backup information, use the command:

```
node_1# show atmf backup
```

To display log messages to do with backups, use the command:

```
node_1# show atmf backup logs
```

**Example 2** To display the AMF backup synchronization status, use the command:

```
node_1# show atmf backup synchronize
```

To display log messages to do with synchronization of backups, use the command:

```
node_1# show atmf backup synchronize logs
```

Table 56-6: Output from **show atmf backup synchronize**

```
Node_1#show atmf backup synchronize

ATMF backup synchronization:

* = Active file server

 Id Date Time Status

 1 04 May 2016 22:25:57 Synchronized
* 2 - - Active
```

Table 56-7: Output from **show atmf backup synchronize logs**

```
Node_1#show atmf backup synchronize logs

Id Log Details

1 2019/05/04 22:25:54 [8039] receiving file list
 2019/05/04 22:25:54 [8039] >f..t.... backup_Box1.info
 2019/05/04 22:25:54 [8039] sent 46 bytes received 39 bytes total size 40
```

**Example 3** To display the AMF backup information with the optional parameter **server-status**, use the command:

```
Node_1# show atmf backup server-status
```

```
Node1#sh atmf backup server-status

Id Last Check State

1 186 s File server ready
2 1 s SSH no route to host
```

**Table 57:** Parameter definitions from the **show atmf backup** command

| Parameter         | Definition                                                                                                                                                                                                                                  |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Scheduled Backup  | Indicates whether AMF backup scheduling is enabled or disabled.                                                                                                                                                                             |
| Schedule          | Displays the configured backup schedule.                                                                                                                                                                                                    |
| Next Backup Time  | Displays the date and time of the next scheduled.                                                                                                                                                                                           |
| Backup Media      | The current backup medium in use.<br>This will be one of USB, SD, or NONE.<br>Utilized and available memory (MB) will be indicated if backup media memory is present.                                                                       |
| Current Action    | The task that the AMF backup mechanism is currently performing. This will be a combination of either (Idle, Starting, Doing, Stopping), or (manual, scheduled).                                                                             |
| Started           | The date and time that the currently executing task was initiated in the format DD MMM YYYY HH:MM                                                                                                                                           |
| Current Node      | The name of the node that is currently being backed up.                                                                                                                                                                                     |
| Backup Redundancy | Whether backup redundancy is enabled or disabled.                                                                                                                                                                                           |
| Local media       | The local media to be used for backup redundancy; SD, USB, INTERNAL, or NONE, and total and free memory available on the media.                                                                                                             |
| State             | Whether SD or USB media is installed and available for backup redundancy. May be Active (if backup redundancy is functional—requires both the local redundant backup media and a remote server to be configured and available) or Inactive. |
| Node Name         | The name of the node that is storing backup data - on its backup media.                                                                                                                                                                     |
| Date              | The data of the last backup in the format DD MMM YYYY.                                                                                                                                                                                      |
| Time              | The time of the last backup in the format HH:MM:SS.                                                                                                                                                                                         |
| In ATMF           | Whether the node shown is active in the AMF network, (Yes or No).                                                                                                                                                                           |
| On Media          | Whether the node shown has a backup on the backup media (Yes or No).                                                                                                                                                                        |

**Table 57:** Parameter definitions from the **show atmf backup** command (cont.)

| Parameter         | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status            | The output can contain one of four values: <ul style="list-style-type: none"><li>• “-” meaning that the status file cannot be found or cannot be read.</li><li>• “Errors” meaning that there are issues - note that the backup may still be deemed successful depending on the errors.</li><li>• “Stopped” meaning that the backup attempt was manually aborted.</li><li>• “Good” meaning that the backup was completed successfully.</li><li>• “In Progress” meaning that the backup is currently running on that node.</li></ul> |
| Log File Location | All backup attempts will generate a result log file in the identified directory based on the node name. In the above example this would be:<br>card:/amf/office/logs/rsync_amf_testbox1.log.                                                                                                                                                                                                                                                                                                                                       |
| Log Details       | The contents of the backup log file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| server-status     | Displays connectivity diagnostics information for each configured remove file server.                                                                                                                                                                                                                                                                                                                                                                                                                                              |

# show atmf backup area

**Overview** Use this command to display backup status information for the master nodes in one or more areas.

Note that this command is only available on AMF controllers.

**Syntax** `show atmf backup area [<area-name> [<node-name>]] [logs]`

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| logs        | Displays the logs for the last backup of each node.     |
| <area-name> | Displays information about nodes in the specified area. |
| <node-name> | Displays information about the specified node.          |

**Mode** Privileged Exec

**Example** To show information about backups for an area, use the command:

```
controller-1# show atmf backup area
```

**Table 58:** Output from the **show atmf backup area** command

```

controller-1#show atmf backup area

# show atmf backup guest

**Overview** This command displays backup status information of guest nodes in an AMF network. This command can only be run on a device configured as an AMF Master and has an AMF guest license.

**Syntax** `show atmf backup guest [<node-name> [<guest-port>]] [logs]`

| Parameter    | Description                        |
|--------------|------------------------------------|
| <node-name>  | The name of parent guest node      |
| <guest-port> | The port number on the parent node |

**Mode** User Exec/Privileged Exec

**Example** On the switch named x930-master, to display information about the AMF backup guest status, use the command:

```
x930-master# show atmf backup guest
```

**Output** Figure 56-20: Example output from **show atmf backup guest**

```
x930-master#sh atmf backup guest

Table 56-1: Parameters in the output from **show atmf backup guest**

| Parameter        | Description                                                                                                                                                                |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Guest Backup     | The status of the guest node backup process                                                                                                                                |
| Scheduled Backup | The timing configured for guest backups.                                                                                                                                   |
| Schedule         | Displays the configured backup schedule.                                                                                                                                   |
| Next Backup Time | The time the next backup process will be initiated.                                                                                                                        |
| Backup Bandwidth | The bandwidth limit applied to the backup data flow measured in kilo Bytes /second. Note that unlimited means there is no limit set specifically for the backup data flow. |
| Backup Media     | Detail of the memory media used to store the backup files and the current memory capacity available.                                                                       |

# show atmf container

**Overview** Use this command to display information about the AMF containers created on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** `show atmf container [detail] [<container-name>]`

| Parameter        | Description                                                        |
|------------------|--------------------------------------------------------------------|
| detail           | Show detailed information.                                         |
| <container-name> | The name of the AMF container you wish to display information for. |

**Mode** Privileged Exec

**Output** Figure 56-21: Example output from **show atmf container**

```
awplus#show atmf container
```

ATMF Container Information:

| Container | Area | Bridge | State   | Memory  | CPU% |
|-----------|------|--------|---------|---------|------|
| vac-wlg-1 | wlg  | br1    | running | 70.3 MB | 1.2  |
| vac-akl-1 | akl  | br2    | stopped | 0 bytes | 0.0  |
| vac-nsn-1 | nsn  | br3    | running | 53.2 MB | 0.7  |

Current ATMF Container count: 3

Figure 56-22: Example output from **show atmf container vac-wlg-1**

```
awplus#show atmf container vac-wlg-1
```

ATMF Container Information:

| Container | Area | Bridge | State   | Memory  | CPU% |
|-----------|------|--------|---------|---------|------|
| vac-wlg-1 | wlg  | br1    | running | 70.3 MB | 1.2  |

Current ATMF Container count: 1

Table 56-2: Parameters in the output from **show atmf container**

| Parameter | Description                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------------------|
| Container | Name of the AMF container.                                                                                       |
| Area      | Name of the area the container is in.                                                                            |
| Bridge    | Name of the bridge connecting the container to the physical network.                                             |
| State     | Container state, <code>running</code> or <code>stopped</code> . This is set with the <code>state</code> command. |
| Memory    | The amount of memory the container is using on the VAA host.                                                     |
| CPU%      | The percentage of CPU time the container is using on the VAA, at the time the show command is run.               |

Figure 56-23: Example output from **show atmf container detail vac-wlg-1**

```
awplus#show atmf container detail vac-wlg-1

ATMF Container Information:

Name: vac-wlg-1
State: RUNNING
PID: 980
IP: 172.31.0.1
IP: 192.168.0.2
IP: fd00:4154:4d46:3c::1
CPU use: 3.95 seconds
Memory use: 67.07 MiB
Memory use: 0 bytes
Link: vethP31UFA
TX bytes: 166.01 KiB
RX bytes: 141.44 KiB
Total bytes: 307.45 KiB
Link: vethYCT7BB
TX bytes: 674.27 KiB
RX bytes: 698.27 KiB
Total bytes: 1.34 MiB
```

Table 56-3: Parameters in the output from **show atmf container detail**

| Parameter | Description                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------------------|
| Name      | Name of the AMF container.                                                                                       |
| State     | Container state, <code>RUNNING</code> or <code>STOPPED</code> . This is set with the <code>state</code> command. |

Table 56-3: Parameters in the output from **show atmf container detail** (cont.)

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PID         | Internal container id.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| IP          | This lists the IP addresses used by the container. These include the eth1 IP address and the AMF management IP address.                                                                                                                                                                                                                                                                                                                                                |
| CPU use     | The CPU usage of the container since it was enabled.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Memory use  | Container memory usage.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Link        | Each container has two links:<br><ol style="list-style-type: none"><li>1 An AMF area-link, this connects the container to the AMF controller and uses virtual interface eth0 on the AMF container.</li><li>2 A bridged L2 network link, this connects the container to the outside world and uses the virtual interface eth1 on the AMF container.</li></ol> See the <a href="#">AMF Feature Overview and Configuration_Guide</a> for more information on these links. |
| TX/RX bytes | Bytes sent and received on a link.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Total bytes | Total bytes transferred on a link.                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Command  
changes**

Version 5.4.7-0.1: command added

# show atmf detail

**Overview** This command displays details about an AMF node. It can only be run on AMF master and controller nodes.

**Syntax** `show atmf detail`

| Parameter | Description                       |
|-----------|-----------------------------------|
| detail    | Displays output in greater depth. |

**Mode** Privileged Exec

**Example 1** To display the AMF node1 information in detail, use the command:

```
controller-1# show atmf detail
```

A typical output screen from this command is shown below:

```
atmf-1#show atmf detail
ATMF Detail Information:

Network Name : Test_network
Network Mtu : 1300
Node Name : controller-1
Node Address : controller-1.atmf
Node ID : 342
Node Depth : 0
Domain State : BackupDomainController
Recovery State : None
Recovery Over ETH Ports : Disabled
Log Verbose Setting : Verbose
Topology GUI : Disabled

Management VLAN
VLAN ID : 4000
Management Subnet : 172.31.0.0
Management IP Address : 172.31.1.86
Management Mask : 255.255.128.0
Management IPv6 Address : fd00:4154:4d46:1::156
Management IPv6 Prefix Length : 64

Domain VLAN
VLAN ID : 4091
Domain Subnet : 172.31.128.0
Domain IP Address : 172.31.129.86
Domain Mask : 255.255.128.0
```

**Table 57:** Parameter definitions from the **show atmf detail** command

| Parameter               | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Network MTU             | The network MTU for the ATMF network.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Network Name            | The AMF network that a particular node belongs to.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Node Name               | The name assigned to a particular node.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Node Address            | An address used to access a remotely located node. This is simply the Node Name plus the dotted suffix atmf (.atmf).                                                                                                                                                                                                                                                                                                                                                 |
| Node ID                 | A unique identifier assigned to a node on an AMF network.                                                                                                                                                                                                                                                                                                                                                                                                            |
| Node Depth              | The number of nodes in the path from this node to the level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.                                                                                                                                                                                                                                                       |
| Domain State            | The state of a node in a Domain in an AMF network as Controller/Backup.                                                                                                                                                                                                                                                                                                                                                                                              |
| Recovery State          | The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.                                                                                                                                                                                                                                                                                                                                               |
| Recovery Over ETH Ports | Allow AMF recovery over the Eth port on an AR-series device.                                                                                                                                                                                                                                                                                                                                                                                                         |
| Log Verbose Setting     | The state of the <a href="#">atmf log-verbose</a> command.                                                                                                                                                                                                                                                                                                                                                                                                           |
| Topology GUI            | This feature allows your AMF network to interact with Vista Manager EX and must be enabled on your AMF master.                                                                                                                                                                                                                                                                                                                                                       |
| Management VLAN         | The VLAN created for traffic between nodes of different domain (up/down links). <ul style="list-style-type: none"> <li>• VLAN ID - in this example VLAN 4092 is configured as the Management VLAN.</li> <li>• Management Subnet - the network prefix for the subnet.</li> <li>• Management IP Address - the IP address allocated for this traffic.</li> <li>• Management Mask - the subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul> |
| Domain VLAN             | The VLAN assigned for traffic between nodes of the same domain (crosslink). <ul style="list-style-type: none"> <li>• VLAN ID - in this example VLAN 4091 is configured as the domain VLAN.</li> <li>• Domain Subnet - the subnet address used for this traffic.</li> <li>• Domain IP Address - the IP address allocated for this traffic.</li> <li>• Domain Mask - the subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul>              |
| Node Depth              | The number of nodes in the path from this node to the core domain.                                                                                                                                                                                                                                                                                                                                                                                                   |

# show atmf group

**Overview** This command can be used to display the group membership within to a particular AMF node. It can also be used with the working-set command to display group membership within a working set.

Each node in the AMF is automatically added to the group that is appropriate to its hardware architecture, e.g. x510, x230. Nodes that are configured as masters are automatically assigned to the master group.

You can create arbitrary groups of AMF members based on your own selection criteria. You can then assign commands collectively to any of these groups.

**Syntax** `show atmf group [user-defined|automatic]`

| Parameter    | Description                             |
|--------------|-----------------------------------------|
| user-defined | User-defined-group information display. |
| automatic    | Automatic group information display.    |

**Default** All groups are displayed

**Mode** Privileged Exec

**Example 1** To display group membership of node2, use the following command:

```
node2# show atmf group
```

A typical output screen from this command is shown below:

```
ATMF group information

master, x510

node2#
```

This screen shows that node2 contains the groups **master** and **x510**. Note that although the node also contains the implicit groups, these do not appear in the show output.

**Example 2** The following commands (entered on *node2*) will display all the automatic groups within the working set containing *node1* and all nodes that have been pre-defined to contain the *sysadmin* group:

First define the working-set:

```
node1# #atmf working-set node1 group sysadmin
```

A typical output screen from this command is shown below:

```

ATMF group information

AMF_NETWORK[6]#

```

This confirms that the six nodes (*node1* to *node6*) are now members of the working-set and that these nodes reside within the *AMF-NETWORK*.

Note that to run this command, you must have previously entered the command [atmf working-set](#) on page 2645. This can be seen from the network level prompt, which in this case is *AMF\_NETWORK[6]#*.

| ATMF group information | <p>Displays a list of nodes and the groups that they belong to, for example:</p> <ul style="list-style-type: none"> <li>• master - Shows a common group name for Nodes configured as AMF masters.</li> <li>• Hardware Arch - Shows a group for all Nodes sharing a common Hardware architecture, e.g. x8100, x230, for example.</li> <li>• User-defined - Arbitrary groups created by the user for AMF nodes.</li> </ul> |

# show atmf group members

**Overview** This command will display all group memberships within an AMF working-set. Each node in the AMF working set is automatically added to automatic groups which are defined by hardware architecture, e.g. x510, x230. Nodes that are configured as masters are automatically assigned to the master group. Users can define arbitrary groupings of AMF members based on their own criteria, which can be used to select groups of nodes.

**Syntax** `show atmf group members [user-defined|automatic]`

| Parameter    | Description                            |
|--------------|----------------------------------------|
| user-defined | User defined group membership display. |
| automatic    | Automatic group membership display.    |

**Mode** Privileged Exec

**Example** To display group membership of all nodes in a working-set, use the command:

```
ATMF_NETWORK[9]# show atmf group members
```

**Table 60:** Sample output from the **show atmf group members** command

|                       |               |                            |

- [show atmf](#)
- [atmf group \(membership\)](#)

# show atmf guests

**Overview** This command is available on any AMF master or controller in the network. It displays a summary of the AMF guest nodes that exist in the AMF network, including device type, parent node, and IP address.

**Syntax** `show atmf guests`

**Mode** User Exec/Privileged Exec

**Usage notes** Use this command to display all guest nodes in a network. If you want to see only the guests attached to a single node, use the [show atmf links guest](#) command, which shows information about the guest nodes and also about their link to their parent node.

**Example** To display the AMF guest output, use the command:

```
awplus# show atmf guests
```

**Output** Figure 56-24: Example output from the **show atmf guests** command

```
master#show atmf guests

Guest Information:

Device Device Parent Guest IP/IPv6
Name Type Node Port Address

node1-2.0.1 x600-24Ts node1 2.0.1 192.168.2.10
wireless-zone1 AT-TQ4600 node2 1.0.1 192.168.1.10
wireless-zone2 AT-TQ4600 node2 1.0.2 192.168.1.12

Current ATMF guest node count 3
```

**Table 62:** Parameters shown in the output of the **show atmf guests** command

| Parameter   | Description                                                                                                                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device Name | The name that is discovered from the device, or failing that, a name that is auto-assigned by AMF. The auto-assigned name consists of:<br><parent node name>-<attached port number><br>You can change this by configuring a description on the port. |
| Device Type | The product name of the guest node, which is discovered from the device. If no device type can be discovered, this shows the name of the AMF guest-class that has been assigned to the guest node by the <a href="#">atmf guest-class</a> command.   |

**Table 62:** Parameters shown in the output of the **show atmf guests** command

| Parameter       | Description                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------|
| Parent Node     | The name of the AMF node that directly connects to the guest node.                                 |
| Guest Port      | The port on the parent node that directly connects to the guest node.                              |
| IP/IPv6 Address | The address discovered from the node, or statically configured on the parent node's attached port. |

commands**

[atmf guest-class](#)  
[switchport atmf-guestlink](#)  
[show atmf backup guest](#)  
[show atmf links guest](#)

# show atmf guests detail

**Overview** This command is available on any AMF master in the network. It displays details about the AMF guest nodes that exist in the AMF network, such as device type, IP address, MAC address etc.

**Syntax** `show atmf guests detail [<node-name>] [<guest-port>]`

| Parameter    | Description                          |
|--------------|--------------------------------------|
| <node-name>  | The name of the guest node's parent. |
| <guest-port> | The port name on the parent node.    |

**Mode** User Exec/Privileged Exec

**Usage notes** If you want to see only the guests attached to a single node, you can use either:

- this command and specify the node name, or
- [show atmf links guest detail](#), which shows information about the guest nodes and also about their link to their parent node.

Note that the parameters that are displayed depend on the guest node's model.

**Example** To display the AMF guest output, use the command:

```
awplus# show atmf guests detail
```

**Output** Figure 56-25: Example output from **show atmf guests detail**

```
master#show atmf guests detail

| Parameter         | Description                                                                                                                                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node Name         | The name of the parent node, which is the AMF node that directly connects to the guest node.                                                                                                                                                       |
| Port Name         | The port on the parent node that connects to the guest.                                                                                                                                                                                            |
| IfIndex           | An internal index number that maps to the port number on the parent node.                                                                                                                                                                          |
| Guest Description | A description that is discovered from the device, or failing that, auto-assigned by AMF. The auto-assigned name consists of:<br><parent node name>-<attached port number>.<br>You can change this by configuring a description on the port.        |
| Device Type       | The product name of the guest node, which is discovered from the device. If no device type can be discovered, this shows the name of the AMF guest-class that has been assigned to the guest node by the <a href="#">atmf guest-class</a> command. |
| Username          | The user name configured on the guest node.                                                                                                                                                                                                        |
| Backup Supported  | Whether the guest node supports AMF backup functionality.                                                                                                                                                                                          |
| MAC Address       | The MAC address of the guest node.                                                                                                                                                                                                                 |
| IP Address        | The IP address of the guest node.                                                                                                                                                                                                                  |
| IPv6 Address      | The IPv6 address of the guest node.                                                                                                                                                                                                                |
| Firmware Version  | The version of the firmware operating on the guest node.                                                                                                                                                                                           |
| HTTP port         | The HTTP port as specified with the <a href="#">http-enable</a> command when defining a guest class. You can set this if the guest node provides an HTTP user interface on a non-standard port (any port other than port 80).                      |

**Related  
commands**    [atmf guest-class](#)  
                  [switchport atmf-guestlink](#)  
                  [show atmf backup guest](#)

# show atmf links

**Overview** This command displays information about AMF links on a switch. The display output contains link status state information.

**Syntax** `show atmf links [brief]`

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| brief     | A brief summary of AMF links, their configuration and status. |

**Mode** User Exec and Privileged Exec

**Usage notes** The **show atmf links** and **show atmf links brief** commands both produce a table of summarized link information. For a more detailed view use the [show atmf links detail](#) command.

This command does not show links that are configured on provisioned ports.

**Example** To display a brief summary of the AMF links, use the following command:

```
node-1# show atmf links brief
```

| Parameter   | Definition                                                                                     |
|-------------|------------------------------------------------------------------------------------------------|
| Local Port  | Shows the local port on the selected node.                                                     |
| Link Type   | Shows link type as Uplink or Downlink (parent and child) or Cross-link (nodes in same domain). |
| Link Status | Shows the link status of the local port on the node as either Up or Down.                      |

Table 56-1: Parameter in the output from **show atmf links brief** (cont.)

| Parameter         | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ATMF State        | Shows AMF state of the local port: <ul style="list-style-type: none"><li>• Init - Link is down.</li><li>• Hold - Link transitioned to up state, but waiting for hold period to ensure link is stable.</li><li>• Incompatible - Neighbor rejected the link because of inconsistency in AMF configurations.</li><li>• OneWay - Link is up and has waited the hold down period and now attempting to link to another unit in another domain.</li><li>• OneWaySim - Device is running in secure mode and link is up but waiting for authorization from an AMF master.</li><li>• Full - Link hello packets are sent and received from its neighbor with its own node id.</li><li>• Shutdown - Link has been shut down by user configuration.</li></ul> |
| Adjacent Node     | Shows the Adjacent AMF Node to the one being configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Adjacent IF Index | Shows the IF index for the Adjacent AMF Node connected to the node being configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Link State        | Shows the state of the AMF link. Valid states are either Forwarding or Blocking.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

# show atmf links detail

**Overview** This command displays detailed information on all the links configured in the AMF network. It can only be run on AMF master and controller nodes.

**Syntax** `show atmf links detail`

| Parameter | Description                     |
|-----------|---------------------------------|
| detail    | Detailed AMF links information. |

**Mode** User Exec

**Usage notes** For summarized link information see the [show atmf links](#) command.  
This command does not show links that are configured on provisioned ports.

**Example** To display the AMF link details use this command:

```
device1# show atmf links detail
```

The output from this command will display all the internal data held for AMF links. The following example gives details of the links that are summarized in the example in [show atmf links](#).

**Related  
commands**    no debug all  
                 clear atmf links statistics  
                 show atmf

# show atmf links guest

**Overview** This command displays information about guest nodes visible to an AMF device.

**Syntax** `show atmf links guest [interface <interface-range>]`

| Parameter                      | Description                                                                |
|--------------------------------|----------------------------------------------------------------------------|
| interface<br><interface-range> | Select a specific range of ports to display information about guest nodes. |

**Default** With no parameters specified this command will display its standard output for all ports with guest nodes connected.

**Mode** User Exec/Privileged Exec

**Usage notes** Use this command to display the guest nodes connected to a single parent node. If you want to see a list of all the guests in the AMF network, use [show atmf guests](#).

**Example 1** To display information about AMF guests that are connectible from node1, use the command:

```
node1# show atmf links guest
```

**Output** Figure 56-27: Example output from **show atmf links guest**

| node1#sh atmf links guest    |              |            |        |                |                   |

# show atmf links guest detail

**Overview** This command displays detailed information about guest nodes visible to an AMF device.

**Syntax** `show atmf links guest detail [interface <interface-range>]`

| Parameter                                                      | Description                                                                |
|----------------------------------------------------------------|----------------------------------------------------------------------------|
| <code>interface</code><br><code>&lt;interface-range&gt;</code> | Select a specific range of ports to display information about guest nodes. |

**Mode** User Exec and Privileged Exec

**Usage notes** Use this command to display the guest nodes connected to a single parent node. If you want to see a list of all the guests in the AMF network, use [show atmf guests detail](#).

Note that the parameters that are displayed depend on the guest node's model and state.

**Example** To display detailed information about AMF guests, use the command:

```
node1# show atmf links guest detail
```

**Output** Figure 56-28: Example output from **show atmf links guest detail**

```

node1#show atmf links guest detail

Detailed Guest Link Information:

Interface : port1.0.13
Link State : Down
Class Name : test
Model Type : Other
Discovery Method : Static
IP Address : 192.168.1.13
Node State : Down

Interface : port1.0.5
Link State : Full
Class Name : tq_device
Model Type : TQ
Discovery Method : Dynamic
IP Address : 192.168.1.221
Username : manager
Login Fallback : Yes
Node State : Full
Backup Supported : Yes
MAC address : 001a.ebab.d2e0
Device Type : AT-TQ4600
Description : AP221
Firmware Version : 3.2.1 B02
HTTP port : 80

```

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface  | The port on the parent node that connects to the guest.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Link State | <p>The state of the link to the guest node; one of:</p> <ul style="list-style-type: none"> <li>Down: The physical link is down.</li> <li>Up: The physical link has come up, but it is still during a timeout period that is enforced to allow other links to come up.</li> <li>Learn: The timeout period described above has elapsed, and the link is now learning information from the AMF guest node. You can see what information it is learning from the "Node State" field below.</li> <li>Full: The node connected by this link has joined the AMF network.</li> <li>Fail: The port is physically up but something has prevented the guest node from joining the AMF network.</li> </ul> |
| Class Name | The name of the ATMF guest-class that has been assigned to the guest node by the <b>atmf guest-class</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Table 56-2: Parameters in the output from **show atmf links guest detail** (cont.)

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Model Type       | The model type of the guest node, as entered by the <a href="#">modeltype</a> command. The mode type can be one of the following: <ul style="list-style-type: none"> <li>alliedware</li> <li>aw+</li> <li>onvif</li> <li>tq</li> <li>other</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Discovery Method | The discovery method as applied by the <a href="#">discovery</a> command. This can be either dynamic or static.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| IP Address       | The IP address of the guest node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Username         | The user name configured on the guest node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Login Fallback   | Whether the guest node supports Login Fallback. For TQ model guest nodes, when login fallback is enabled, if a guest node is replaced, then AMF logs in to the new TQ using the factory default manager/friend settings. The new TQ is then discovered and managed as an AMF guest node by an AMF master or member. This means any backed up settings for the replaced guest node can also be recovered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Node state       | The state of the guest node; one of: <ul style="list-style-type: none"> <li>Down: The initial state when a link to a guest node is first configured. This is also the state if the physical link goes down.</li> <li>Getting IP: The AMF device is in the process of retrieving the IP address of the guest node.</li> <li>Getting Mac: The AMF device is in the process of retrieving the MAC address of the guest node.</li> <li>Getting Info: The AMF device is in the process of retrieving any other available information from the guest (firmware version etc). The information available depends on what device the guest node is.</li> <li>Full: The AMF device has retrieved all necessary information and the guest node has joined the AMF network. Once this state is reached, the Link State also changes to "Full".</li> <li>Failure: The physical link is up but the AMF member has failed to retrieve enough information to allow the guest node to join the AMF network.</li> </ul> |
| Backup Supported | Whether the guest node supports AMF backup functionality.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MAC Address      | The MAC address of the guest node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Table 56-2: Parameters in the output from **show atmf links guest detail** (cont.)

| Parameter        | Description                                                                                                                                                                                                                           |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device Type      | Model information for the guest node. This field shows the model information that AMF retrieved from the guest node. In contrast, the Model Type shows what a user entered as the type of device they intended this guest node to be. |
| Description      | By default, this is a concatenation of the guest node's parent node and the port to which it is attached. You can change it by configuring a description on the port.                                                                 |
| Serial Number    | The serial number of the guest node.                                                                                                                                                                                                  |
| Firmware Name    | The name of the firmware operating on the guest node.                                                                                                                                                                                 |
| Firmware Version | The version of the firmware operating on the guest node.                                                                                                                                                                              |
| HTTP port        | The HTTP port as specified with the <a href="#">http-enable</a> command when defining a guest class. You can set this if the guest node provides an HTTP user interface on a non-standard port (any port other than port 80).         |

**Command  
changes**

Version 5.5.0-1.1: **Login Fallback** parameter added

# show atmf links statistics

**Overview** This command displays details of the AMF links configured on the device and also displays statistics about the AMF packet exchanges between the devices.

It is also possible to display the AMF link configuration and packet exchange statistics for a specified interface.

This command can only be run on AMF master and controller nodes

**Syntax** `show atmf links statistics [interface [<port-number>]]`

| Parameter     | Description                                                                                                                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface     | Specifies that the command applies to a specific interface (port) or range of ports. Where both the interface and port number are unspecified, full statistics (not just those relating to ports) will be displayed.     |
| <port-number> | Enter the port number for which statistics are required. A port range, a static channel or LACP link can also be specified. Where no port number is specified, statistics will be displayed for all ports on the device. |

**Mode** User Exec

**Example 1** To display AMF link statistics for the whole device, use the command:

```
device1# show atmf links statistics
```

| Type27                        | 0       | : AMF Master license node limit exceeded                    |          |                  |

**Example 2** To display the AMF links statistics on interface port1.0.4, use the command:

```
device1# show atmf links statistics interface port1.0.4
```

Figure 56-29: Sample output from the **show atmf links statistics** command for interface port1.0.4

```
device1# show atmf links statistics interface port1.0.4

ATMF Port Statistics:

port1.0.4 Crosslink Hello 231 232
port1.0.4 Crosslink Hello Domain 116 116
port1.0.4 Crosslink Hello Uplink 116 115
port1.0.4 Hello Link 0 0
port1.0.4 Arealink Hello 0 0
```

Figure 56-30: Parameter definitions from the **show atmf links statistics** command output

| Parameter            | Definition                                                             |
|----------------------|------------------------------------------------------------------------|
| Receive              | Shows a count of AMF protocol packets received per message type.       |
| Transmit             | Shows the number of AMF protocol packets transmitted per message type. |
| Database Entries     | Shows the number of AMF elements existing in the distributed database. |
| Database Full Ages   | Shows the number of times the entries aged in the database.            |
| ATMF Packet Discards | Shows the number of discarded packets of each type.                    |

# show atmf nodes

**Overview** This command displays nodes currently configured within the AMF network.

Note that the output also tells you whether or not node map exchange is active. Node map exchange improves the tracking of nodes joining and leaving an AMF network. This improves the efficiency of AMF networks. Node map exchange is only available if every node in your AMF network is running version 5.4.6-2.1 or later. We recommend running the latest version on all nodes in your network, so you receive the advantages of node map exchange and other improvements.

**Syntax** `show atmf nodes [guest|all]`

| Parameter | Description                                                  |
|-----------|--------------------------------------------------------------|
| guest     | Display only guest nodes in the AMF network.                 |
| all       | Display all nodes in the AMF network, including guest nodes. |

**Mode** Privileged Exec

**Usage notes** You can use this command to display one of three sets of nodes:

- all nodes except guest nodes, by specifying **show atmf nodes**
- all nodes including guest nodes, by specifying **show atmf nodes all**
- only guest nodes, by specifying **show atmf nodes guest**

**Examples** To display AMF information for all nodes except guest nodes, use the command:

```
node1# show atmf nodes
```

Table 56-1: Sample output from **show atmf nodes**

|                                                |            |        |    |        |  |       |
|------------------------------------------------|------------|--------|----|--------|--|-------|
| node1#show atmf nodes guest                    |            |        |    |        |  |       |
| Node Information:                              |            |        |    |        |  |       |
| * = Local device                               |            |        |    |        |  |       |
| SC = Switch Configuration:                     |            |        |    |        |  |       |
| C = Chassis    S = Stackable    N = Standalone |            |        |    |        |  |       |
| Node                                           | Device     | ATMF   |    | Parent |  | Node  |
| Name                                           | Type       | Master | SC | Domain |  | Depth |
| -----                                          |            |        |    |        |  |       |
| * M1                                           | x510-28GTX | Y      | S  | none   |  | 0     |
| N3                                             | x230-18GP  | N      | N  | M1     |  | 1     |
| N1                                             | AR4050S    | N      | N  | M1     |  | 1     |
| Node map exchange is active                    |            |        |    |        |  |       |
| Current ATMF node count 3                      |            |        |    |        |  |       |

To display AMF information for all nodes, including guest nodes, use the command:

```
node1# show atmf nodes all
```

**Table 57:** Sample output from **show atmf nodes all**. In this example, not all nodes support node map exchange, as shown by the message at the end

```
node1#show atmf nodes all
```

Node and Guest Information:

\* = Local device

SC = Switch Configuration:  
C = Chassis S = Stackable N = Standalone G = Guest

| Node/Guest<br>Name | Device<br>Type | ATMF<br>Master | SC | Parent<br>Domain | Node<br>Depth |
|--------------------|----------------|----------------|----|------------------|---------------|
| * M1               | x510-28GTX     | Y              | S  | none             | 0             |
| N3                 | x230-18GP      | N              | N  | M1               | 1             |
| N1                 | AR4050S        | N              | N  | M1               | 1             |
| N3-1.0.24          | AT-TQ4600      | N              | G  | N3               | -             |

Node map exchange is inactive  
Firmware on some nodes does not support node map exchange, eg AR4050S  
Current ATMF node count 4 (guests 1)

To display AMF information for guest nodes only, use the command:

```
node1# show atmf nodes guest
```

**Table 56-1:** Sample output from **show atmf nodes guest**

```
node1#show atmf nodes guest
```

Guest Information:

| Device<br>Name | MAC<br>Address | Parent | Port  | IP/IPv6<br>Address |
|----------------|----------------|--------|-------|--------------------|
| aastra-...     | 0008.5d10.7635 | Node-1 | 1.0.2 | 192.168.4.7        |
| poe-1.0.1      | 0013.1a1e.4589 | Node-1 | 1.0.1 | 192.168.4.6        |
| ip-camera      | 0800.239e.f1fe | Node-1 | 1.0.4 | 192.168.4.8        |
| tq4600         | eccd.6df2.da60 | Node-1 | 1.0.5 | 192.168.4.50       |

# show atmf provision nodes

**Overview** This command displays information about each provisioned node with details about date and time of creation, boot and configuration files available in the backup, and license files present in the provisioned backup. This includes nodes that have joined the network but are yet to run their first backup.

This command can only be run on AMF master and controller nodes.

**Syntax** `show atmf provision nodes`

**Mode** Privileged Exec

**Usage notes** This command will only work if provisioned nodes have already been set up. Otherwise, an error message is shown when the command is run.

**Example** To show the details of all the provisioned nodes in the backup use the command:

```
NodeName# show atmf provision nodes
```

Figure 56-31: Sample output from the **show atmf provision nodes** command

```
device1#show atmf provision nodes

ATMF Provisioned Node Information:

Backup Media: SD (Total 3827.0MB, Free 3481.1MB)

Node Name : device2
Date& Time : 06-Oct-2016 & 23:25:44
Provision Path : card:/atmf/provision_nodes

Boot configuration :
Current boot image : x510-5.4.9-0.1.rel (file exists)
Backup boot image : x510-5.4.8-2.3.rel (file exists)

# show atmf recovery-file

**Overview** Use this command to display the recovery file information for an AMF node.  
AMF recovery files are created for nodes with special links. Special links include:

- virtual links,
- area links terminating on an AMF master, and
- area virtual links terminating on an AMF master.

**Syntax** `show atmf recovery-file`

**Mode** Privileged Exec

**Example** To display recovery file information for an AMF node, use the command:

```
node1# show atmf recovery-file
```

**Output** Figure 56-32: Example output from **show atmf recovery-file**

```
node1#show atmf recovery-file

ATMF Recovery File Info: Special Link Present
Location Date Time
USB storage device 30 Apr 2018 14:50:32
Master 30 Apr 2018 14:56:45

# show atmf secure-mode audit

**Overview** Use this command to detect security vulnerabilities on a node.

**Syntax** show atmf secure-mode audit

**Mode** Privileged Exec

**Example** To display AMF secure mode link audits for a node, use the command

```
awplus# show atmf secure-mode audit
```

**Output** Figure 56-35: Example output from **show atmf secure-mode audit**

```
ATMF Secure Mode Audit:

Warning : The default username and password is enabled.
Good : SNMP V1 or V2 is disabled.
Warning : Telnet server is enabled.
Good : ATMF is enabled. Secure-Mode is on.
Good : ATMF Topology-GUI is disabled. No trustpoints configured.

ATMF Secure Mode Log Events:

2017 Feb 2 00:59:25 user.notice node1 ATMF[848]: Sec_Audit - ATMF Secure
Mode is enabled.
2017 Feb 2 01:30:00 user.notice node1 ATMF[848]: Sec_Audit - Established
secure connection to area_1_node_1 on interface vlink1.
```

Table 56-3: Parameters in the output from **show atmf secure-mode audit link**

| Parameter                   | Description                                                                                                                                                                                                     |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ATMF Secure Mode Audit      | A list of security recommendations to secure the AMF network. Items prefaced with <code>Warning</code> need to be fixed. In the sample above the default username and password, and telnet, should be disabled. |
| ATMF Secure Mode Log Events | A list of recorded secure mode log events.                                                                                                                                                                      |

**Related commands** [show atmf secure-mode](#)

**Command changes** Version 5.4.7-0.3: command added

# show atmf secure-mode audit link

**Overview** Use this command to detect security vulnerabilities by identifying devices that are connected to a secure mode node that are not in secure mode or are not authorized.

**Syntax** `show atmf secure-mode audit link`

**Mode** Privileged Exec

**Example** To display AMF secure mode link audits for a node, use the command  
`awplus# show atmf secure-mode audit link`

**Output** Figure 56-36: Example output from **show atmf secure-mode audit link**

```
ATMF Secure Mode Audit Link:

* ATMF links connected to devices which are not authorized
 or are not in secure-mode.

Port Link Type Discovered Node/Area Name

vlink1 Downlink 16/02/2017 09:28:22 Member3
```

Table 56-4: Parameters in the output from **show atmf secure-mode audit link**

| Parameter      | Description                         |
|----------------|-------------------------------------|
| Port           | Port name on local device.          |
| Link Type      | Link type.                          |
| Discovered     | Date discovered                     |
| Node/Area Name | Node or area name of remote device. |

**Related commands** [show atmf](#)  
[show atmf secure-mode](#)

**Command changes** Version 5.4.7-0.3: command added

# show atmf secure-mode certificates

**Overview** Use this command to display the certificate status details when secure mode is enabled on an AMF network.

**Syntax** `show atmf secure-mode certificates [detail] [area <area-name>]  
[node <node-name>]`

| Parameter   | Description                                                   |
|-------------|---------------------------------------------------------------|
| detail      | Display detailed certificate information.                     |
| area        | Specify an AMF area.                                          |
| <area-name> | The AMF area you want to see the certificate information for. |
| node        | Specify an AMF node.                                          |
| <node-name> | The AMF node you want to see information for.                 |

**Mode** Privileged Exec

**Example** To display AMF secure mode certificates on a master or member node, use the command:

```
awplus# show atmf secure-mode certificates
```

To display detailed information about AMF secure mode certificates for a node named "area\_2\_node\_1" in an area named "area-2", use the command:

```
awplus# show atmf secure-mode certificates detail area area-2
node area_2_node_1
```

**Output** Figure 56-37: Example output from **show atmf secure-mode certificates**

| Area-1 Certificates: |          |             |          |

| area_1_node_2        | master_1 | 11 Mar 2017 | Revoked  |
|                      | master_2 | 4 Mar 2017  |          |
|                      |          |             |          |
| Area-2 Certificates: |          |             |          |
| Node Name            | Signer   | Expires     | Status   |
| -----                |          |             |          |
| area_2_node_1        | master_1 | 18 Mar 2017 | Active   |
| area_2_node_2        | master_1 | 18 Mar 2017 | Rejected |

Table 56-5: Parameters in the output from **show atmf secure-mode certificates**

| Parameter | Description                                                                                                                                                                                     |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node Name | Name of AMF node the certificate was issued to.                                                                                                                                                 |
| Signer    | Name of AMF master that issued the certificate.                                                                                                                                                 |
| Expires   | Certificate expiry date.                                                                                                                                                                        |
| Status    | The status column will display <i>Active</i> before a member node is trusted, and can be accessed using AMF commands. Valid statuses are <i>Active</i> , <i>Revoked</i> , and <i>Rejected</i> . |

- show atmf secure-mode sa

**Command changes** Version 5.4.7-0.3: command added

# show atmf secure-mode sa

**Overview** Use this command to display the security associations on the network. This is the list of links and neighbors that are trusted.

**Syntax** `show atmf secure-mode sa [detail] [link|neighbor|broadcast]`

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| detail    | Display detailed security association information. |
| link      | Display security associations for type links.      |
| neighbor  | Display security associations for type neighbors.  |
| broadcast | Display security associations for type broadcast.  |

**Mode** Privileged Exec

**Example** To display an overview of AMF secure mode security associations on a master or member node, use the command:

```
awplus# show atmf secure-mode sa
```

To display a detailed overview of AMF secure mode neighbor security associations on a master or member node, use the command:

```
awplus# show atmf secure-mode sa detail neighbor
```

**Output** Figure 56-39: Example output from **show atmf secure-mode sa**

| ATMF Security Associations: |               |          |            |

# show atmf secure-mode statistics

**Overview** Use this command to display AMF secure mode statistics. These statistics are from when AMF secure mode was first enabled or the statistics were cleared with the [clear atmf secure-mode statistics](#) command.

**Syntax** `show atmf secure-mode statistics`

**Mode** Privileged Exec

**Example** To display AMF secure mode statistics on a master or member node, use the command:

```
awplus# show atmf secure-mode statistics
```

**Output** Figure 56-41: Example output from **show atmf secure-mode statistics** on an AMF master.

```
ATMF Secure Mode Statistics:

Certificates:
New 7 Expired 0
Updated 7 Deleted 0

**Command changes** Version 5.4.7-0.3: command added

# show atmf tech

**Overview** This command collects and displays all the AMF command output. The command can thus be used to display a complete picture of an AMF network.

**Syntax** show atmf tech

**Mode** Privileged Exec

**Example** To display output for all AMF commands, use the command:

```
NodeName# show atmf tech
```

**Table 57:** Sample output from the **show atmf tech** command.

```
node1#show atmf tech
ATMF Summary Information:

ATMF Status : Enabled
Network Name : ATMF_NET
Node Name : node1
Role : Master
Current ATMF Nodes : 8

ATMF Technical information:

Network Name : ATMF_NET
Domain : node1's domain
Node Depth : 0
Domain Flags : 0
Authentication Type : 0
MAC Address : 0014.2299.137d
Board ID : 287
Domain State : DomainController
Domain Controller : node1
Backup Domain Controller : node2
Domain controller MAC : 0014.2299.137d
Parent Domain : -
Parent Domain Controller : -
Parent Domain Controller MAC : 0000.0000.0000
Number of Domain Events : 0
Crosslink Ports Blocking : 0
Uplink Ports Waiting on Sync : 0
```

**Table 57:** Sample output from the **show atmf tech** command. (cont.)

|                                   |         |
|-----------------------------------|---------|
| Crosslink Sequence Number         | : 7     |
| Domains Sequence Number           | : 28    |
| Uplink Sequence Number            | : 2     |
| Number of Crosslink Ports         | : 1     |
| Number of Domain Nodes            | : 2     |
| Number of Neighbors               | : 5     |
| Number of Non Broadcast Neighbors | : 3     |
| Number of Link State Entries      | : 1     |
| Number of Up Uplinks              | : 0     |
| Number of Up Uplinks on This Node | : 0     |
| DBE Checksum                      | : 84fc6 |
| Number of DBE Entries             | : 0     |

**Table 58:** Parameter definitions from the **show atmf tech** command

| Parameter          | Definition                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ATMF Status        | Shows status of AMF feature on the Node as Enabled/Disabled.                                                                                                                                                                                                                                                                                                                                         |
| Network Name       | The name of the AMF network to which this node belongs.                                                                                                                                                                                                                                                                                                                                              |
| Node Name          | The name assigned to the node within the AMF network.                                                                                                                                                                                                                                                                                                                                                |
| Role               | The role configured on the device within the AMF - either master or member.                                                                                                                                                                                                                                                                                                                          |
| Current ATMF Nodes | A count of the AMF nodes in the AMF network.                                                                                                                                                                                                                                                                                                                                                         |
| Node Address       | The identity of a node (in the format name.atmf) that enables its access it from a remote location.                                                                                                                                                                                                                                                                                                  |
| Node ID            | A unique identifier assigned to an AMF node.                                                                                                                                                                                                                                                                                                                                                         |
| Node Depth         | The number of nodes in the path from this node to the core domain.                                                                                                                                                                                                                                                                                                                                   |
| Domain State       | A node's state within an AMF Domain - either controller or backup.                                                                                                                                                                                                                                                                                                                                   |
| Recovery State     | The AMF node recovery status. Indicates whether a node recovery is in progress on this device - either Auto, Manual, or None.                                                                                                                                                                                                                                                                        |
| Management VLAN    | The VLAN created for traffic between nodes of different domains (up/down links).<br>VLAN ID - In this example VLAN 4092 is configured as the Management VLAN.<br>Management Subnet - the Network prefix for the subnet.<br>Management IP Address - the IP address allocated for this traffic.<br>Management Mask - the Netmask used to create a subnet for this traffic 255.255.128.0 (= prefix /17) |

**Table 58:** Parameter definitions from the **show atmf tech** command (cont.)

| Parameter   | Definition                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Domain VLAN | The VLAN assigned for traffic between Nodes of same domain (crosslink).<br>VLAN ID - In this example VLAN 4091 is configured as the domain VLAN.<br>Domain Subnet - the Subnet address used for this traffic.<br>Domain IP Address - the IP address allocated for this traffic.<br>Domain Mask - the Netmask used to create a subnet for this traffic 255.255.128.0<br>(= prefix /17) |
| Device Type | Shows the Product Series Name.                                                                                                                                                                                                                                                                                                                                                        |
| ATMF Master | Indicates the node's membership of the core domain (membership is indicated by Y)                                                                                                                                                                                                                                                                                                     |
| SC          | Shows switch configuration: <ul style="list-style-type: none"><li>• C - Chassis (such as SBx8100 series)</li><li>• S - Stackable (VCS)</li><li>• N - Standalone</li></ul>                                                                                                                                                                                                             |
| Parent      | A node that is connected to the present node's uplink, i.e. one layer higher in the hierarchy.                                                                                                                                                                                                                                                                                        |
| Node Depth  | Shows the number of nodes in path from the current node to the Core domain.                                                                                                                                                                                                                                                                                                           |

**NOTE:** The **show atmf tech** command can produce very large output. For this reason only the most significant terms are defined in this table.

# show atmf virtual-links

**Overview** This command displays a summary of all virtual links (L2TP tunnels) currently in the running configuration.

**Syntax** `show atmf virtual-links [macaddr]`  
`show atmf virtual-links [id <1-4094>] [remote-id <1-4094>]`  
`show atmf virtual-links detail [id <1-4094>]`

| Parameter          | Description                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| macaddr            | Display the virtual AMF links' MAC addresses.                                                                                                                                              |
| id <1-4094>        | ID of the local virtual link.                                                                                                                                                              |
| remote-id <1-4094> | ID of the remote virtual link                                                                                                                                                              |
| detail             | Display information about a specific virtual link ID or range of virtual link IDs. Displays information such as: local and remote IP address, link type, packets received and transmitted. |

**Mode** Privileged Exec

**Example 1** To display AMF virtual links, use the command:

```
node_1# show atmf virtual-links
```

Table 56-1: Example output from **show atmf virtual-links**

| ATMF Virtual-Link Information: |          |              |           |              |                |              |
|--------------------------------|----------|--------------|-----------|--------------|----------------|--------------|
| Local Port                     | Local ID | Local IP     | Remote ID | Remote IP    | Tunnel Protect | Tunnel State |
| vlink1                         | 1        | 172.16.24.2  | 2         | 1.0.0.2      | -              | Complete     |
| vlink2                         | 2        | 172.16.24.2* | 10        | 172.16.24.3* | ipsec          | Complete     |
| vlink3                         | 3        | (eth0)*      | 1         | 1.2.3.4      | -              | AcquireLocal |
| * = Dynamic Address.           |          |              |           |              |                |              |
| Virtual Links Configured: 3    |          |              |           |              |                |              |

In the above example, a centrally located switch has the IP address space 192.0.2.x/24. It has two VLANs assigned the subnets 192.0.2.33 and 192.0.2.65 using the prefix /27. Each subnet connects to a virtual link. The first link has the IP address 192.168.1.1 and has a Local ID of 1. The second has the IP address 192.168.2.1 and has the Local ID of 2.

**Example 2** To display details about AMF virtual link with ID 1, use the command:

```
node_1# show atmf virtual-links detail id 1
```

Table 56-2: Example output from **show atmf virtual-links**

| Virtual Link Detailed Information: |                     |                |
|------------------------------------|---------------------|----------------|
| ID 1                               | Description         | : None         |
| ID 1                               | Local IP Address    | : 192.168.5.1  |
| ID 1                               | Remote ID           | : 1            |
| ID 1                               | Remote IP Address   | : 192.168.5.20 |
| ID 1                               | Link Type           | : virtual-link |
| ID 1                               | Packets Received    | : 236465       |
| ID 1                               | Packets Transmitted | : 192626       |

**Example 3** To display AMF virtual links' MAC address information, use the command:

```
node_1# show atmf virtual-links macaddr
```

Table 56-3: Example output from **show atmf virtual-links macaddr**

| ATMF Link Remote Information:       |                   |           |              |
|-------------------------------------|-------------------|-----------|--------------|
| ATMF Management Bridge Information: |                   |           |              |
| Bridge: br-atmfmgmt                 |                   |           |              |
| port no                             | mac addr          | is local? | ageing timer |
| 1                                   | 00:00:cd:27:c2:07 | yes       | 0.00         |
| 2                                   | 8e:c7:ae:81:7e:68 | yes       | 0.00         |
| 2                                   | 00:00:cd:28:bf:e7 | no        | 0.01         |

Table 56-4: Parameters in the output from **show atmf virtual-links**

| Parameter      | Definition                                                                                                                                 |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Local Port     | The tunnel name e.g. vlink1, vlink2, equivalent to an L2TP tunnel.                                                                         |
| Local ID       | The local ID of the virtual link. This matches the vlink<number>                                                                           |
| Tunnel Protect | Tunnel protection protocol.                                                                                                                |
| Tunnel State   | The operational state of the vlink (either Up or Down). This state is always displayed once a vlink has been created.                      |
| mac addr       | AMF virtual links terminate on an internal soft bridge. The "show atmf virtual-links macaddress" command displays MAC Address information. |
| is local?      | Indicates whether the MAC displayed is for a local or a remote device.                                                                     |
| ageing timer   | Indicates the current aging state for each MAC address.                                                                                    |

**Related commands** [atmf virtual-link](#)

# show atmf working-set

**Overview** This command displays the nodes that form the current AMF working-set.

**Syntax** `show atmf working-set`

**Mode** Privileged Exec

**Example** To show current members of the working-set, use the command:

```
ATMF_NETWORK[6]# show atmf working-set
```

**Table 57:** Sample output from the **show atmf working-set** command.

```
ATMF Working Set Nodes:

10. DBE bitmap update
```

**Related commands** [debug atmf](#)  
[debug atmf packet](#)

# show running-config atmf

**Overview** This command displays the running system information that is specific to AMF.

**Syntax** `show running-config atmf`

**Mode** User Exec and Global Configuration

**Example** To display the current configuration of AMF, use the following commands:

```
node_1# show running-config atmf
```

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Related commands** `show running-config`  
`no debug all`

# state

**Overview** This command sets the running state of an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** `state {enable|disable}`

| Parameter | Description                                                        |
|-----------|--------------------------------------------------------------------|
| disable   | Stop the AMF container. The container's state changes to stopped.  |
| enable    | Start the AMF container. The container's state changes to running. |

**Default** By default, **state** is disabled.

**Mode** AMF Container Configuration

**Usage notes** The first time the **state enable** command is executed on a container it assigns the container to an area and configures it as an AMF master. This is achieved by automatically adding the following configuration to the AMF container:

```
atmf network-name <AMF network-name>
atmf master
atmf area <container area-name> <container area-id> local
atmf area <container area-name> password <container area-password>
atmf area <host area-name> <host area-id>

interface eth0
 atmf-arealink remote-area <host area-name> vlan 4094
```

For this reason the **state enable** command should be run after the container has been created with the [atmf container](#) command and an area-link configured with the [area-link](#) command.

Once the start-up configuration has been saved from within the AMF container, all further configuration changes need to be made manually.

**Example** To start the AMF container “vac-wlg-1” use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# state enable
```

To stop the AMF container “vac-wlg-1” use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# state disable
```

**Related commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# switchport atmf-agentlink

**Overview** Use this command to configure a link between this device and an x600 Series switch, in order to integrate the x600 Series switch into your AMF network. The x600 Series switch is called an “AMF agent”, and the link between the x600 and this device is called an “agent link”.

The x600 Series switch must be running version 5.4.2-3.16 or later.

Use the **no** variant of this command to remove the agent link. If the x600 Series switch is still connected to the switch port, it will no longer be part of the AMF network.

**Syntax** `switchport atmf-agentlink`  
`no switchport atmf-agentlink`

**Default** By default, no agent links exist and x600 Series switches are not visible to AMF networks.

**Mode** Interface mode for a switch port. Note that the link between the x600 and the AMF network must be a single link, not an aggregated link.

**Usage notes** The x600 Series switch provides the following information to the AMF node that it is connected to:

- The MAC address
- The IPv4 address
- The IPv6 address
- The name/type of the device (Allied Telesis x600)
- The name of the current firmware
- The version of the current firmware
- The configuration name

AMF guestnode also makes most of this information available from x600 Series switches, but requires configuration with DHCP and/or LLDP. AMF agent is simpler; as soon the x600 is connected to an appropriately configured port of an AMF node, it is immediately integrated into the AMF network.

To see information about the x600 Series switch, use the **show atmf links guest detail** command.

**Example** To configure port1.0.1 as an agent link, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport atmf-agentlink
```

**Related commands** [show atmf links guest](#)

# switchport atmf-arealink

**Overview** This command enables you to configure a port or aggregator to be an AMF area link. AMF area links are designed to operate between two nodes in different areas in an AMF network.

Use the **no** variant of this command to remove any AMF area link that may exist for the selected port or aggregated link.

This command is only available on AMF controllers and master nodes.

**Syntax** `switchport atmf-arealink remote-area <area-name> vlan <2-4094>`  
`no switchport atmf-arealink`

| Parameter   | Description                                                                                                                          |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <area-name> | The name of the remote area that the port is connecting to.                                                                          |
| <2-4094>    | The VLAN ID for the link. This VLAN cannot be used for any other purpose, and the same VLAN ID must be used at each end of the link. |

**Default** No arealinks are configured.

**Mode** Interface Configuration for a switchport, a static aggregator, or a dynamic channel group.

**Usage notes** Run this command on the port or aggregator at both ends of the link.  
Each area must have the area-name configured, and the same area password must exist on both ends of the link.

Running this command will automatically place the port or static aggregator into trunk mode (i.e. switchport mode trunk) and will synchronize the area information stored on the two nodes.

You can configure multiple arealinks between two area nodes, but only one arealink at any time will be in use. All other arealinks will block information, to prevent network storms.

For AMF links, we recommend not using VSTACK ports that are configured as network ports. During AMF recovery, these ports revert to their default state of being VSTACK ports, so AMF cannot use them for auto-recovery. We recommend using standard network ports instead of VSTACK ports for AMF links, so you can take advantage of AMF recovery.

**NOTE:** See the [atmf-arealink](#) command to configure an AMF area link on an AR-series Eth interface.

**Example** To make switchport port1.0.2 an arealink to the 'Auckland' area on VLAN 6, use the commands:

```
controller-1# configure terminal
controller-1(config)# interface port1.0.2
controller-1(config-if)# switchport atmf-arealink remote-area
Auckland vlan 6
```

To remove switchport port1.0.1 as an AMF area link, use the commands:

```
controller-1# configure terminal
controller-1(config)# interface port1.0.1
controller-1(config-if)# no switchport atmf-arealink
```

**Related commands**

- [atmf area](#)
- [atmf area password](#)
- [atmf virtual-link](#)
- [show atmf links](#)

# switchport atmf-crosslink

**Overview** This command configures the selected port, statically aggregated link or dynamic channel group (LACP) to be an AMF crosslink. Running this command will automatically place the port or aggregator into trunk mode (i.e. **switchport mode trunk**).

The connection between two AMF masters must utilize a crosslink. Crosslinks are used to carry the AMF control information between master nodes. Multiple crosslinks can be configured between two master nodes, but only one crosslink can be active at any particular time. All other crosslinks between masters will be placed in the blocking state, in order to prevent broadcast storms.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove any crosslink that may exist for the selected port or aggregated link.

**Syntax** `switchport atmf-crosslink`  
`no switchport atmf-crosslink`

**Mode** Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

**Usage notes** Crosslinks can be used anywhere within an AMF network. They have the effect of separating the AMF network into separate domains.

Where this command is used, it is also good practice to use the **switchport trunk native vlan** command with the parameter **none** selected. This is to prevent a network storm on a topology of ring connected devices.

For AMF links, we recommend not using VSTACK ports that are configured as network ports. During AMF recovery, these ports revert to their default state of being VSTACK ports, so AMF cannot use them for auto-recovery. We recommend using standard network ports instead of VSTACK ports for AMF links, so you can take advantage of AMF recovery.

**Example 1** To make switchport port1.0.1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-crosslink
```

**Example 2** This example is shown twice. Example 2A is the most basic command sequence. Example 2B is a good practice equivalent that avoids problems such as broadcast storms that can otherwise occur.

**Example 2A** To make static aggregator sa1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
```

**Example 2B** To make static aggregator sa1 an AMF crosslink, use the following commands for good practice:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
Node_1(config-if)# switchport trunk allowed vlan add 2
Node_1(config-if)# switchport trunk native vlan none
```

In this example VLAN 2 is assigned to the static aggregator, and the native VLAN (VLAN 1) is explicitly excluded from the aggregated ports and the crosslink assigned to it.

**NOTE:** *The AMF management and domain VLANs are automatically added to the aggregator and the crosslink.*

**Related commands** [show atmf links statistics](#)

# switchport atmf-guestlink

**Overview** Guest links are used to provide basic AMF functionality to non AMF capable devices. Guest links can be configured for either a selected switch port or a range of switch ports and use generic protocols to collect status and configuration information that the guest devices make available.

Use the **no** variant of this command to remove the guest node functionality from the selected port or ports.

**NOTE:** AMF guest nodes are not supported on ports using the OpenFlow protocol.

**Syntax** switchport atmf-guestlink [class <guest-class>] [ip <A.B.C.D> |  
ipv6 <X:X::X:X>]  
no switchport atmf-guestlink

| Parameter     | Description                                                   |
|---------------|---------------------------------------------------------------|
| class         | Set a guest class                                             |
| <guest-class> | The name of the guest class.                                  |
| ip            | Specifies that the address following will have an IPv4 format |
| <A.B.C.D>     | The guest node's IP address in IPv4 format.                   |
| ipv6          | Specifies that the address following will have an IPv6 format |
| <X:X::X:X>    | The guest node's IP address in IPv6 format.                   |

**Default** No guest links are configured.

**Mode** Interface

**Example 1** To configure switchport port1.0.1 to be a guest link, that will connect to a guest node having a guest class of **camera** and an IPv4 address of **192.168.3.3**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink class camera ip
192.168.3.3
```

**Example 2** To configure switchport port1.0.1 to be a guest link, which will connect to a guest node having a guest class of **phone** and an IPv6 address of **2001:db8:21e:10d::5**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink class phone ipv6
2000:db8:21e:10d::5
```

**Example 3** To configure switchport port1.0.1 to be a guest link, using the default model type and learning method address, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink
```

**Example 4** To configure switchports port1.0.1 to port1.0.3 to be guest links, for the guest class **camera**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1-port1.0.3
node1(config-if)# switchport atmf-guestlink class camera
```

**Example 5** To remove the guest-link functionality from switchport port1.0.1, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# no switchport atmf-guestlink
```

# switchport atmf-link

**Overview** This command enables you to configure a port or aggregator to be an up/down AMF link. Running this command will automatically place the port or aggregator into trunk mode. If the port was previously configured in access mode, the configured access VLAN will be removed.

Use the **no** variant of this command to remove any AMF link that may exist for the selected port or aggregated link.

**Syntax** `switchport atmf-link`  
`no switchport atmf-link`

**Mode** Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

**Usage notes** Up/down links and virtual links interconnect domains in a vertical hierarchy, with the highest domain being the core domain. In effect, they form a tree of interconnected AMF domains. This tree must be loop-free. Therefore you must configure your up/down and virtual links so that no loops are formed.

Within each domain, cross-links between AMF nodes define those nodes as siblings within the same domain. You can form rings by combining cross-links with up/down links and/or virtual links, as long as each AMF domain links upwards to only a single parent domain. Each domain may link downwards to multiple child domains.

For AMF links, we recommend not using VCStack ports that are configured as network ports. During AMF recovery, these ports revert to their default state of being VCStack ports, so AMF cannot use them for auto-recovery. We recommend using standard network ports instead of VCStack ports for AMF links, so you can take advantage of AMF recovery.

**NOTE:** See the [atmf-link](#) command to configure an AMF up/down link on an AR-series Eth interface.

**Example** To configure switchport port1.0.1 as an AMF up/down link, use the commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-link
```

To remove switchport port1.0.1 as an AMF up/down link, use the commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# no switchport atmf-link
```

**Related commands** [atmf-link](#)  
[show atmf detail](#)  
[show atmf links](#)

# type atmf guest

**Overview** This command configures a trigger to activate when an AMF guest node joins or leaves.

**Syntax** `type atmf guest {join|leave}`

| Parameter | Description            |
|-----------|------------------------|
| join      | AMF guest node joins.  |
| leave     | AMF guest node leaves. |

**Mode** Trigger Configuration

**Example** To configure trigger 86 to activate when an AMF guest node leaves, use the following commands:

```
awplus(config)# trigger 86
awplus(config-trigger)# type atmf guest leave
```

**Related commands** [show trigger](#)

**Command changes** Version 5.5.1-1.1: command added

# type atmf node

**Overview** This command configures a trigger to activate when an AMF node joins or leaves.

**Syntax** type atmf node {join|leave}

| Parameter | Description      |
|-----------|------------------|
| join      | AMF node joins.  |
| leave     | AMF node leaves. |

**Mode** Trigger Configuration

**Example 1** To configure trigger 5 to activate when an AMF node leaves, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger)# type atmf node leave
```

**Example 2** The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
=====
node1, node2, node3:
=====

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
AMF-Net[3](config)# trigger 5
AMF-Net[3](config-trigger)# type atmf node leave
AMF-Net[3](config-trigger)# description "E-mail on AMF Exit"
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp
AMF-Net[3](config-trigger)# end
```

### Display the trigger configurations

AMF-Net[3]# show trigger

This command returns the following display:

```
=====
node1:
=====
```

| TR# | Type & Details    | Description         | Ac | Te | Tr | Repeat     | #Scr | Days/Date |
|-----|-------------------|---------------------|----|----|----|------------|------|-----------|
| 001 | Periodic (2 min)  | Periodic Status Chk | Y  | N  | Y  | Continuous | 1    | smtwtfs   |
| 005 | ATMF node (leave) | E-mail on ATMF Exit | Y  | N  | Y  | Continuous | 1    | smtwtfs   |

```

=====
Node2, Node3,
=====
```

| TR# | Type & Details    | Description         | Ac | Te | Tr | Repeat     | #Scr | Days/Date |
|-----|-------------------|---------------------|----|----|----|------------|------|-----------|
| 005 | ATMF node (leave) | E-mail on ATMF Exit | Y  | N  | Y  | Continuous | 1    | smtwtfs   |

```

```

### Display the triggers configured on each of the nodes in the AMF Network.

AMF-Net[3]# show running-config trigger

This command returns the following display:

```
=====
Node1:
=====

trigger 1
 type periodic 2
 script 1 atmf.scp
trigger 5
 type atmf node leave
description "E-mail on ATMF Exit"
 script 1 email_me.scp
!

=====
Node2, Node3:
=====

trigger 5
 type atmf node leave
description "E-mail on ATMF Exit"
 script 1 email_me.scp
!
```

**Related commands** [show trigger](#)

# undebbug atmf

**Overview** This command is an alias for the **no** variant of the [debug atmf](#) command.

## username (atmf-guest)

**Overview** This command enables you to assign a **username** to a guest class. Guests may require a username and possibly also a password. The password must be between 1 and 32 characters and will allow spaces.

**Syntax** `username <name> password [8] <userpass>`  
`no username`

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <name>     | User name of the guest node.                                                                                                                                                                                                                                                                                                                |
| 8          | The parameter <b>8</b> means that the password that follows is in hashed form, not plain text. Do not type this 8 when creating a password with this command; it is only used in configuration files. In configuration files, the device prints 8 in front of passwords, to indicate that it is displaying the password in its hashed form. |
| <userpass> | The password to be entered for the guest node.                                                                                                                                                                                                                                                                                              |

**Default** No usernames are configured

**Mode** AMF Guest Configuration

**Example** To assign the user name 'reception' and the password of 'secret' to an AMF guest node that has the guest class of 'phone1' use the following commands:

```
node1# configure terminal
node1(config)# amf guest-class phone1
node1(config-atmf-guest)# username reception password secret
```

To remove a guest node username and password for the user guest class 'phone1', use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class phone1
node1(config-atmf-guest)# no username
```

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Device Discovery using STOAT (Standardized Topology Organizer and Transport).

Using LLDP and DHCP Snooping, STOAT can discover and gather information about devices in the local network. These devices may include IP cameras, IP phones, PCs, laptops, Wi-fi access points, printers, and so on.

Vista Manager EX merges the data from STOAT and existing discovery methods such as AMF, and AMF Plus Device Discovery, to provide a single, accurate and more complete view of the network.

For more information, see the [Device Discovery using STOAT Feature Overview and Configuration Guide](#).

# clear stoat collector session counters

**Overview** Use this command to clear the STOAT transport session counters.

**Syntax** `clear stoat collector session counters [<1-4294967295>]`

| Parameter      | Description |
|----------------|-------------|
| <1-4294967295> | Session ID  |

**Mode** Privileged Exec

**Example** To clear all STOAT transport session counters, use the command:

```
awplus# clear stoat collector session counters
```

To clear a specific STOAT transport session counter, use the command:

```
awplus# clear stoat collector session counters 234234234
```

# description (stoat-dest)

**Overview** Use this command to add an informative description to a STOAT destination.

Use the **no** variant of this command to remove a description from a STOAT destination.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description                                                                                                                                                                 |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;description&gt;</code> | A word or phrase that uniquely identifies this STOAT destination or its purpose. Valid characters are any printable character and spaces, up to a maximum of 40 characters. |

**Default** Not set.

**Mode** STOAT Destination Configuration

**Example** To add the description 'chc-collector-1' to a STOAT destination with IP address 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# description chc-collector-1
```

To remove the description from a STOAT destination with IP address 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# no description
```

**Related commands** [stoat destination](#)

**Command changes** Version 5.5.3-1.1: command added

# key (stoat-dest)

**Overview** Use this command to configure a key to use with a STOAT destination. The key allows the STOAT collector to authenticate this device as a valid source. The destination will not attempt to connect if no key is set.

A matching key must be configured on the STOAT collector device.

Use the **no** variant of this command to remove a key for a STOAT destination.

**Syntax** `key [8] <key-string>`  
`no key`

| Parameter    | Description                                                                                                                                                                                                                                      |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8            | Specifies that you are entering a password as a string that has already been encrypted instead of entering a plain text password. The running config displays the new password as an encrypted string even if password encryption is turned off. |
| <key-string> | Shared key string applied, a value in the range 8 to 80 characters.                                                                                                                                                                              |

**Default** Not set.

**Mode** STOAT Destination Configuration

**Example** To configure the key 'verysecret' for STOAT destination 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# key verysecret
```

To remove the key for STOAT destination 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# no key
```

**Related commands** [stoat collector key](#)  
[stoat destination](#)

**Command changes** Version 5.5.3-1.1: command added

# name-check (stoat-dest)

**Overview** Use this command to enable or disable certificate name checking for the server certificate received from the STOAT collector.

Use the **no** variant of this command to disable name checking for the server certificate received from the STOAT collector.

**Syntax** name-check  
no name-check

**Default** Disabled.

**Mode** STOAT Destination Configuration

**Usage notes** If enabled, the received server certificate must contain the address configured for this STOAT destination . This setting only takes effect if the STOAT destination has been configured with a trustpoint.

**Example** To enable name-check for STOAT destination 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-destination)# name-check
```

To disable name-check for STOAT destination 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-destination)# no name-check
```

**Related commands** [service stoat](#)

**Command changes** Version 5.5.3-1.1: command added

# service stoat

**Overview** Use this command to enable or disable Standardized Topology Organizer and Transport (STOAT) functionality on a device. Once enabled, the device will accept STOAT collector and STOAT source configuration.

Use the **no** variant of this command to disable STOAT functionality on a device.

**Syntax** `service stoat`  
`no service stoat`

**Default** Disabled.

**Mode** Global Configuration

**Example** To enable STOAT functionality on a device, use the commands:

```
awplus# configure terminal
awplus(config)# service stoat
```

To disable STOAT functionality on a device, use the commands:

```
awplus# configure terminal
awplus(config)# no service stoat
```

# show stoat collector

**Overview** Use this command to see the operational status of the STOAT collector.

**Syntax** `show stoat collector [sessions|keys]`

| Parameter | Description                    |
|-----------|--------------------------------|
| sessions  | Active session information     |
| keys      | Authentication key information |

**Mode** Privileged Exec

**Example** To show the STOAT collector status information, use the command:

```
awplus# show stoat collector
```

To show the STOAT collector active session information, use the command:

```
awplus# show stoat collector sessions
```

To show the STOAT collector authentication key information, use the command:

```
awplus# show stoat collector keys
```

**Output** Figure 57-1: Example output from **show stoat collector**

**Related commands**   [stoat destination shutdown \(stoat-dest\)](#)

**Command changes**   Version 5.5.3-1.1: command added

# shutdown (stoat-dest)

**Overview** Use this command to disable a STOAT destination.  
Use the **no** variant of this command to enable a STOAT destination.

**Syntax** shutdown  
no shutdown

**Default** Enabled (no shutdown)

**Mode** STOAT Destination Configuration

**Example** To enable the STOAT destination 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# no shutdown
```

**Related commands** [stoat destination](#)  
[show stoat destinations](#)

**Command changes** Version 5.5.3-1.1: command added

# stoat collector enable

**Overview** Use this command to start or stop the Standardized Topology Organizer and Transport (STOAT) collector functionality on a device.

Note: The device must be able to receive requests from STOAT sources before this command is used. To enable a device to receive requests from STOAT, use the [service stoat](#) command.

Use the **no** variant of this command to stop the STOAT collector functionality on a device.

**Syntax** `stoat collector enable`  
`no stoat collector enable`

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** The STOAT feature is responsible for discovering devices and network topology, organizing that information into a standardized format, and transporting it to a central location for use. AMF uses STOAT data to allow non-AMF devices and their links to be displayed in the AMF topology map.

There are two types of STOAT device:

- **Collector** - receives and aggregates topology data
- **Source** - sends data to a collector. The data contains information that it knows about itself and has learned through discovery protocols

**Example** To start the STOAT collector, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector enable
```

To stop the STOAT collector, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat collector enable
```

**Related commands** [stoat collector trustpoint](#)  
[show stoat collector](#)  
[stoat collector expiry-period](#)  
[stoat collector key](#)

**Command changes** Version 5.5.3-1.1: command added.

# stoat collector expiry-period

**Overview** Use this command to modify the session expiry-period for all of the STOAT collector's sessions.

Use the **no** variant of this command to revert to the default expiry-period of 60 seconds.

**Syntax** `stoat collector expiry-period <10-300>`  
`no stoat collector expiry-period`

| Parameter | Description                            |
|-----------|----------------------------------------|
| <10-300>  | Expiry-period in seconds (default: 60) |

**Default** 60 seconds.

**Mode** Global Configuration

**Example** To configure an expiry-period of 15 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector expiry-period 15
```

To revert the expiry-period to its default of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat collector expiry-period
```

**Related commands** [service stoat](#)  
[stoat collector trustpoint](#)  
[stoat collector key](#)  
[stoat collector enable](#)  
[show stoat collector](#)

**Command changes** Version 5.5.3-1.1: command added

# stoat collector key

**Overview** Use this command to configure the authentication key used by the STOAT collector.

Use the **no** variant of this command to remove a STOAT authentication key.

**Syntax** `stoat collector key [8]{auth-key|generate} [description <description>]`  
`no stoat collector key [8]{auth-key|generate} [description <description>]`

| Parameter     | Description                                                |
|---------------|------------------------------------------------------------|
| 8             | Specifies a key in encrypted format instead of plain text. |
| auth-key      | Authentication key                                         |
| generate      | Let STOAT generate a key                                   |
| description   | Add a useful description                                   |
| <description> | The useful description text                                |

**Default** Not set.

**Mode** Global Configuration

**Example** To configure a plain-text key 'secret-key' with no description, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector key secret-key
```

To configure a plain-text key 'secret-key' with a description, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector key secret-key description
'this is my secret key'
```

To **generate** a key with a description, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector key generate description 'my
generated key'
```

To configure an encrypted key with a description, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector key 8
CFWzNguaqyoPDqYoCBGzff07CfQZ0J-eJO0JslXON3E= description 'my
encrypted key'
```

To remove a configured encrypted key, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat collector key 8
CFWzNguaqyoPDqYoCBGzff07CfQZ0J-eJO0JslXON3E=
```

**Output** Figure 57-6: Example output from **stoat collector key generate**

```
awplus(config)# stoat collector key generate

**Command  
changes**

Version 5.5.3-1.1: command added

# stoat collector trustpoint

**Overview** Use this command to add a crypto PKI trustpoint containing a server certificate and a key to the STOAT collector. This enables secure HTTPS API communication between the STOAT collector and STOAT source.

Use the **no** variant of this command to remove a configured PKI trustpoint from a STOAT collector.

**Syntax** `stoat collector trustpoint <trustpoint-name>`  
`no stoat collector trustpoint`

| Parameter                            | Description          |
|--------------------------------------|----------------------|
| <code>&lt;trustpoint-name&gt;</code> | PKI trustpoint name. |

**Mode** Global Configuration

**Example** To add an existing PKI trustpoint called 'chc' to the STOAT collector, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector trustpoint chc
```

To remove a configured PKI trustpoint from the STOAT collector, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat collector trustpoint
```

**Related commands** [crypto pki authenticate](#)  
[crypto pki enroll](#)

**Command changes** Version 5.5.3-1.1: command added

# stoat destination

**Overview** Use this command to configure a remote STOAT collector destination.  
Use the **no** variant of this command to remove a STOAT collector destination.

**Syntax** `stoat destination {<ip-address>|<host-name>|<ipv6-address>}`  
`no stoat destination {<ip-address>|<host-name>|<ipv6-address>}`

| Parameter                         | Description                                                                                          |
|-----------------------------------|------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code>   | The IPv4 address, using the format A.B.C.D.                                                          |
| <code>&lt;host-name&gt;</code>    | The host name specified in FQDN (Fully Qualified Domain Name). For example, manager.your.domain.com. |
| <code>&lt;ipv6-address&gt;</code> | The IPv6 address, using the format X:X::X:X.                                                         |

**Default** Not set.

**Mode** Global Configuration

**Example** To configure a remote STOAT collector at IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 10.0.0.1
```

To remove a remote STOAT collector at IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat destination 10.0.0.1
```

To configure a remote STOAT collector at stoat.com, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination stoat.com
```

To remove a remote STOAT collector at stoat.com, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat destination stoat.com
```

To configure a remote STOAT collector at 2001:db8::1, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 2001:db8::1
```

To remove a remote STOAT collector at 2001:db8::1, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat destination 2001:db8::1
```

[stoat discovery](#)

**Command  
changes**

Version 5.5.3-1.1: command added

# stoat discovery

**Overview** Use this command to enable a device to import Standardized Topology Organizer and Transport (STOAT) discovery information learned by a given protocol. This command allows the device to act as a STOAT collector. STOAT collectors receive and aggregate topology data used in the AMF topology map.

Use the **no** variant of this command to disable the import of STOAT discovery information learned by a given protocol.

**Syntax**

```
stoat discovery {dhcp-snooping|lldp}
stoat discovery dot1x
no stoat discovery {dhcp-snooping|lldp}
no stoat discovery dot1x
```

| Parameter     | Description                                                       |
|---------------|-------------------------------------------------------------------|
| dhcp-snooping | Import information learned through the DHCP Snooping protocol.    |
| lldp          | Import information learned through the LLDP protocol.             |
| dot1x         | Import information learned through 802.1X and Port authentication |

**Default** Disabled.

**Mode** Global Configuration

**Example** To enable a device to import information learned by the DHCP Snooping protocol, use the commands:

```
awplus# configure terminal
awplus(config)# stoat discovery dhcp-snooping
```

To disable a device from importing information learned by the DHCP Snooping protocol, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat discovery dhcp-snooping
```

**Related commands**

**Command changes**

- Version 5.5.3-1.1: command added
- Version 5.5.3-2.1: **dot1x** and **wireless** parameters added

# trustpoint (stoat-dest)

**Overview** Use this command to specify the trustpoint to use when authenticating the STOAT collector. If no trustpoint is specified, the STOAT collector will be implicitly trusted without authentication.

Use the **no** variant of this command to stop the use of trustpoints with a specified STOAT destination.

**Syntax** `trustpoint <trustpoint-name>`  
`no trustpoint`

| Parameter                            | Description             |
|--------------------------------------|-------------------------|
| <code>&lt;trustpoint-name&gt;</code> | Name of the trustpoint. |

**Default** Not set.

**Mode** STOAT Destination Configuration

**Example** To configure the STOAT destination 192.0.2.6 to use trustpoint 'chc', use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# trustpoint chc
```

To stop the use of trustpoints with STOAT destination 192.0.2.6 use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# no trustpoint
```

**Related commands** [stoat collector trustpoint](#)  
[stoat destination](#)  
[name-check \(stoat-dest\)](#)

**Command changes** Version 5.5.3-1.1: command added

# unique-id

**Overview** Use this command to generate a new unique ID for a device. This ID is used to uniquely identify a device in the STOAT topology.

Some circumstances may require you to generate a new unique ID, for example after recovering a device from an AMF provisioned backup.

**Syntax** `unique-id`

**Mode** Privileged Exec

**Example** To generate a new unique ID for a STOAT device, use the command:

```
awplus# unique-id
```

**Related commands** [service stoat](#)

**Command changes** Version 5.5.3-1.1: command added

# bootfile

**Overview** This command sets the boot filename for a DHCP server pool. This is the name of the boot file that the client should use in its bootstrap process. It may need to include a path.

The **no** variant of this command removes the boot filename from a DHCP server pool.

**Syntax** bootfile <filename>  
no bootfile

| Parameter  | Description         |
|------------|---------------------|
| <filename> | The boot file name. |

**Mode** DHCP Configuration

**Example** To configure the boot filename for a pool P2, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# bootfile boot/main_boot.bt
```

# clear ip dhcp binding

**Overview** This command clears either a specific lease binding or the lease bindings specified by the command or DHCP server. The command will only take effect on dynamically allocated bindings, not statically configured bindings.

**Syntax** `clear ip dhcp binding {ip <ip-address>|mac  
<mac-address>|all|pool <pool-name>|range <low-ip-address>  
<high-ip-address>}`

| Parameter                                   | Description                                                                                                                                                                        |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip <ip-address>                             | IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D.                                                                                                 |
| mac <mac-address>                           | MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH.                                                                                              |
| all                                         | All DHCP bindings.                                                                                                                                                                 |
| pool <pool-name>                            | Description used to identify DHCP server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in "quotation marks". |
| range <low-ip-address><br><high-ip-address> | IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end of the range.             |

**Mode** User Exec and Privileged Exec

**Usage** A specific binding may be deleted by **ip** address or **mac** address, or several bindings may be deleted at once using **all**, **pool** or **range**.

Note that if you specify to clear the **ip** or **mac** address of what is actually a static DHCP binding, an error message is displayed. If **all**, **pool** or **range** are specified and one or more static DHCP bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

**Examples** To clear the specific IP address binding 192.168.1.1, use the command:

```
awplus# clear ip dhcp binding ip 192.168.1.1
```

To clear all dynamic DHCP entries, use the command:

```
awplus# clear ip dhcp binding all
```

**Related commands** [show ip dhcp binding](#)

# default-router

**Overview** This command adds a default router to the DHCP address pool you are configuring. You can use this command multiple times to create a list of default routers on the client's subnet. This sets the router details using the pre-defined option 3. Note that if you add a user-defined option 3 using the **option** command, then you will override any settings created with this command.

The **no** variant of this command removes either the specified default router, or all default routers from the DHCP pool.

**Syntax** `default-router <ip-address>`  
`no default-router [<ip-address>]`

| Parameter    | Description                                                     |
|--------------|-----------------------------------------------------------------|
| <ip-address> | IPv4 address of the default router, in dotted decimal notation. |

**Mode** DHCP Configuration

**Examples** To add a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# default-router 192.168.1.2
```

To remove a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router 192.168.1.2
```

To remove all routers from the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router
```

# dns-server

**Overview** This command adds a Domain Name System (DNS) server to the DHCP address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6.

Note that if you add a user-defined option 6 using the [option](#) command, then you will override any settings created with this command.

The **no** variant of this command removes either the specified DNS server, or all DNS servers from the DHCP pool.

**Syntax** `dns-server <ip-address>`  
`no dns-server [<ip-address>]`

| Parameter                       | Description                                                 |
|---------------------------------|-------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | IPv4 address of the DNS server, in dotted decimal notation. |

**Mode** DHCP Configuration

**Examples** To add the DNS server with the assigned IP address 192.168.1.1 to the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# dns-server 192.168.1.1
```

To remove the DNS server with the assigned IP address 192.168.1.1 from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server 192.168.1.1
```

To remove all DNS servers from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server
```

**Related commands** [default-router](#)  
[option](#)  
[service dhcp-server](#)  
[show ip dhcp pool](#)  
[subnet-mask](#)

# domain-name

**Overview** This command adds a domain name to the DHCP address pool you are configuring. Use this command to specify the domain name that a client should use when resolving host names using the Domain Name System. This sets the domain name details using the pre-defined option 15.

Note that if you add a user-defined option 15 using the [option](#) command, then you will override any settings created with this command.

The **no** variant of this command removes the domain name from the address pool.

**Syntax** `domain-name <domain-name>`  
`no domain-name`

| Parameter                        | Description                                                                                                                                                                |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;domain-name&gt;</code> | The domain name you wish to assign the DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". |

**Mode** DHCP Configuration

**Examples** To add the domain name Nerv\_Office to DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# domain-name Nerv_Office
```

To remove the domain name Nerv\_Office from DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no domain-name Nerv_Office
```

**Related commands** [default-router](#)  
[dns-server](#)  
[option](#)  
[service dhcp-server](#)  
[show ip dhcp pool](#)  
[subnet-mask](#)

# host (DHCP)

**Overview** This command adds a static host address to the DHCP address pool you are configuring. The client with the matching MAC address is permanently assigned this IP address. No other clients can request it.

The **no** variant of this command removes the specified host address from the DHCP pool. Use the **no host all** command to remove all static host addresses from the DHCP pool.

**Syntax** `host <ip-address> <mac-address>`  
`no host <ip-address>`  
`no host all`

| Parameter                        | Description                                                                          |
|----------------------------------|--------------------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code>  | IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D    |
| <code>&lt;mac-address&gt;</code> | MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH |

**Mode** DHCP Configuration

**Usage** Note that a network/mask must be configured using a **network** command before issuing a **host** command. Also note that a host address must match a network to add a static host address.

**Examples** To add the host at 192.168.1.5 with the MAC address 000a.451d.6e34 to DHCP pool 1, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# network 192.168.1.0/24
awplus(dhcp-config)# host 192.168.1.5 000a.451d.6e34
```

To remove the host at 192.168.1.5 with the MAC address 000a.451d.6e34 from DHCP pool 1, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# no host 192.168.1.5 000a.451d.6e34
```

**Related Commands** [lease](#)  
[range](#)  
[show ip dhcp pool](#)

# host client-id

**Overview** Use this command to add a static host address reservation to the DHCP address pool you are configuring for the DHCP client with the given client identifier.

Use the **no** variant of this command to remove the specified host address reservation from the DHCP pool. Use the **no host all** command to remove all static host addresses from the DHCP pool.

**Syntax** `host <ip-address> client-id <client-identifier>`  
`no host <ip-address>`

| Parameter                              | Description                                                                                                                                                                |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code>        | IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D                                                                                          |
| <code>&lt;client-identifier&gt;</code> | An alphanumeric string to be used as a client identifier. This is from 1 to 63 characters in length. This string can also contain special characters '#', '-', '_' and "." |

**Default** No host static IP address reservations are defined for a pool.

**Mode** DHCP Configuration

**Usage notes** The client with the matching client-id is permanently assigned this IP address. No other clients can request it. If a subscriber identifier for a client identifier substitution is enabled for a remote pool, the DHCP server will expect to see the subscriber identifier sub-option being included in the relay agent information option on the relay client packet. And the subscriber-id is matched against the static host reservation with the matching client identifier.

A network/mask must be configured using the **network** command before issuing a host command. Also note that a host address must match a network to add a static host address.

**Example** To add a static host address for client-id 'office-pc-21' to a pool, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Campus-1
awplus(dhcp-config)# host 192.168.2.5 client-id office-pc-21
```

**Output** Figure 58-1: Example output from **show ip dhcp binding**

```
awplus#show ip dhcp binding Campus-1

**Command changes** Version 5.5.2-0.1: command added

# ip address dhcp

**Overview** This command activates the DHCP client on the interface you are configuring. This allows the interface to use the DHCP client to obtain its IP configuration details from a DHCP server on its connected network.

The **client-id** and **hostname** parameters are identifiers that you may want to set in order to interoperate with your existing DHCP infrastructure. If neither option is needed, then the DHCP server uses the MAC address field of the request to identify the host.

The DHCP client supports the following IP configuration options:

- Option 1— the subnet mask for your device.
- Option 3— a list of default routers.
- Option 6 — a list of DNS servers. This list appends the DNS servers set on your device with the [ip name-server](#) command.
- Option 15—a domain name used to resolve host names. This option replaces the domain name set with the [ip domain-name](#) command. Your device ignores this domain name if it has a domain list set using the [ip domain-list](#) command.
- Option 51—lease expiration time.

The **no** variant of this command stops the interface from obtaining IP configuration details from a DHCP server.

**Syntax** `ip address dhcp [client-id <interface>] [hostname <hostname>]`  
`no ip address dhcp`

| Parameter                                                | Description                                                                                                                                                                                                                            |
|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>client-id</code><br><code>&lt;interface&gt;</code> | The name of the interface you are activating the DHCP client on. If you specify this, then the MAC address associated with the specified interface is sent to the DHCP server in the optional identifier field.<br>Default: no default |
| <code>hostname</code><br><code>&lt;hostname&gt;</code>   | The hostname for the DHCP client on this interface. Typically this name is provided by the ISP.<br>Default: no default                                                                                                                 |

**Mode** Interface Configuration for VLAN interfaces.

**Examples** To set the interface `vlan2` to use DHCP to obtain an IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip address dhcp
```

To stop the interface vlan2 from using DHCP to obtain its IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip address dhcp
```

**Related commands**

- [ip address \(IP Addressing and Protocol\)](#)
- [show ip interface](#)
- [show running-config](#)

# ip dhcp bootp ignore

**Overview** This command configures the DHCP server to ignore any BOOTP requests it receives. The DHCP server accepts BOOTP requests by default.

The **no** variant of this command configures the DHCP server to accept BOOTP requests. This is the default setting.

**Syntax** `ip dhcp bootp ignore`  
`no ip dhcp bootp ignore`

**Mode** Global Configuration

**Examples** To configure the DHCP server to ignore BOOTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp bootp ignore
```

To configure the DHCP server to respond to BOOTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp bootp ignore
```

**Related commands** [show ip dhcp server summary](#)

# ip dhcp leasequery enable

**Overview** Use this command to enable the DHCP server to respond to DHCPLEASEQUERY packets. Enabling the DHCP leasequery feature allows a DHCP Relay Agent to obtain IP address information directly from the DHCP server using DHCPLEASEQUERY messages.

Use the **no** variant of this command to disable the support of DHCPLEASEQUERY packets.

For more information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp leasequery enable`  
`no ip dhcp leasequery enable`

**Default** DHCP leasequery support is disabled by default.

**Mode** Global Configuration

**Examples** To enable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp leasequery enable
```

To disable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp leasequery enable
```

**Related commands** [show counter dhcp-server](#)  
[show ip dhcp server statistics](#)  
[show ip dhcp server summary](#)

# ip dhcp option

**Overview** This command creates a user-defined DHCP option. Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

You can use this option when configuring a DHCP pool, by using the [option](#) command.

The **no** variant of this command removes either the specified user-defined option, or removes all user-defined options. This also automatically removes the user-defined options from the associated DHCP address pools.

**Syntax** `ip dhcp option <1-254> [name <option-name>] [<option-type>]`  
`no ip dhcp option [<1-254>|<option-name>]`

| Parameter     | Description                                                                                                                                                                                                                          |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-254>       | The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.                                                                                               |
| <option-name> | Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”.<br>Default: no default |
| <option-type> | The option value. You must specify a value that is appropriate to the option type:                                                                                                                                                   |
| ascii         | An ASCII text string                                                                                                                                                                                                                 |
| hex           | A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.                                          |
| ip            | An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times.                                        |
| integer       | A number from 0 to 4294967295.                                                                                                                                                                                                       |
| flag          | A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag.                                            |

**Mode** Global Configuration

**Examples** To define a user-defined ASCII string option as option 66, without a name, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name `tcpip-node-type`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name `special-address`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number 12, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option 12
```

To remove the specific user-defined option with the option name `perform-router-discovery`, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option perform-router-discovery
```

To remove all user-defined option definitions, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option
```

# ip dhcp pool

**Overview** This command will enter the configuration mode for the pool name specified. If the name specified is not associated with an existing pool, the device will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCP configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCP pools on devices with multiple interfaces. This allows the device to act as a DHCP server on multiple interfaces to distribute different information to clients on the different networks.

The **no** variant of this command deletes the specific DHCP pool.

**Syntax** `ip dhcp pool <pool-name>`  
`no ip dhcp pool <pool-name>`

| Parameter                      | Description                                                                                                                                                           |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;pool-name&gt;</code> | Description used to identify this DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". |

**Mode** Global Configuration

**Example** To create the DHCP pool named P2 and enter DHCP Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)#
```

To delete the DHCP pool named P2, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp pool P2
```

**Related commands** [service dhcp-server](#)

# ip dhcp-client default-route distance

**Overview** Use this command to specify an alternative Administrative Distance (AD) for the current default route (from DHCP) for an interface.

Use the **no** variant of this command to set the AD back to the default of 1.

**Syntax** `ip dhcp-client default-route distance [<1-255>]`  
`no ip dhcp-client default-route distance`

| Parameter | Description                                               |
|-----------|-----------------------------------------------------------|
| <1-255>   | Administrative Distance (AD) from the range 1 though 255. |

**Default** 1

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** DHCP client interfaces can automatically add a default route with an AD of 1 into the IP Routing Information Base (RIB).

Any pre-existing default route(s) via alternative interfaces (configured with a higher AD) will no longer be selected as the preferred forwarding path for traffic when the DHCP based default route is added to the IP routing table.

This can be problematic if the DHCP client is operating via an interface that is only intended to be used for back-up interface redundancy purposes, such as an interface with lower bandwidth or a particular role like the management interface.

Use this command to set the AD of the default route (via a specific DHCP client interface) to a non-default (higher cost) value, ensuring any pre-existing default route(s) via any other interface(s) continue to be selected as the preferred forwarding path for network traffic.

When the command is used, the static default route is deleted from the RIB, the distance value of the route is modified to the configured distance value, then it is reinstalled into the RIB.

**Examples** To configure vlan10 as a DHCP client and to set the AD for the default route added by DHCP to 150, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# ip address dhcp
awplus(config-if)# ip dhcp-client default-route distance 150
```

To set the AD for the default route back to the default value of 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-client default-route distance
```

[show ip route database](#)

**Command  
changes**

Version 5.4.7-0.2 Command added.

# ip dhcp-client request vendor-identifying-specific

**Overview** Use this command to add vendor-identifying vendor-specific information (option 125) requests to the DHCP discovery packets sent by an interface. This option, along with option 124, can be used to send vendor-specific information back to a DHCP client.

See RFC3925 for more information on Vendor-Identifying Vendor Options for DHCPv4.

Use the **no** variant of this command to remove the vendor-identifying-specific request from an interface.

**Syntax** `ip dhcp-client request vendor-identifying-specific`  
`no ip dhcp-client request vendor-identifying-specific`

**Default** The vendor-identifying-specific request is not configured by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** The DHCP client must be activated on the interface, using the [ip address dhcp](#) command, so that DHCP discovery packets are sent.

**Example** To add the vendor-identifying-specific request on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-client request
vendor-identifying-specific
```

To remove the vendor-identifying-specific request on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-client request
vendor-identifying-specific
```

**Related commands** [ip address dhcp](#)  
[ip dhcp-client vendor-identifying-class](#)

**Command changes** Version 5.4.7-2.1: command added

# ip dhcp-client vendor-identifying-class

**Overview** Use this command to add a vendor-identifying vendor class (option 124) to the DHCP discovery packets sent by an interface. This option places the Allied Telesis Enterprise number (207) into the discovery packet. Option 124, along with option 125, can be used to send vendor-specific information back to a DHCP client.

See RFC3925 for more information on Vendor-Identifying Vendor Options for DHCPv4.

Use the **no** variant of this command to remove the vendor-identifying-class from an interface.

**Syntax** `ip dhcp-client vendor-identifying-class`  
`no ip dhcp-client vendor-identifying-class`

**Default** The vendor-identifying-class is not configured by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** The DHCP client must be activated on the interface, using the [ip address dhcp](#) command, so that DHCP discovery packets are sent.

**Example** To remove the vendor-identifying-class on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-client vendor-identifying-class
```

**Related commands** [ip address dhcp](#)  
[ip dhcp-client request vendor-identifying-specific](#)

**Command changes** Version 5.4.7-2.1: command added

# ip dhcp-relay agent-option

**Overview** This command enables the DHCP Relay Agent to insert the DHCP Relay Agent Information Option (Option 82) into the client-request packets that it relays to its DHCP server. This allows the DHCP Relay Agent to pass on information to the server about the network location of the client device. The DHCP Relay Agent strips the DHCP Relay Agent Option 82 field out of the DHCP server's response, so that the DHCP client never sees this field.

When the DHCP Relay Agent appends its DHCP Relay Agent Option 82 data into the packet, it first overwrites any pad options present; then if necessary, it increases the packet length to accommodate the DHCP Relay Agent Option 82 data.

The **no** variant of this command stops the DHCP Relay Agent from appending the Option 82 field onto DHCP requests before forwarding it to the server.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands [ip dhcp-relay agent-option](#) and [ip dhcp-relay information policy](#) have been configured.

**Syntax** `ip dhcp-relay agent-option`  
`no ip dhcp-relay agent-option`

**Default** DHCP Relay Agent Information Option (Option 82) insertion is disabled by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** Use this command to alter the DHCP Relay Agent Option 82 setting when your device is the first hop for the DHCP client. To limit the maximum length of the packet, use the [ip dhcp-relay max-message-length](#) command.

This command cannot be enabled if DHCP snooping is enabled on your device ([service dhcp-snooping](#) command), and vice versa.

**Examples** To make the DHCP Relay Agent listening on vlan2 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the DHCP Relay Agent from appending the DHCP Relay Agent Option 82 field on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option
```

**Related commands**

- [ip dhcp-relay agent-option remote-id](#)
- [ip dhcp-relay information policy](#)
- [ip dhcp-relay max-message-length](#)
- [service dhcp-relay](#)

# ip dhcp-relay agent-option checking

**Overview** This command enables the DHCP Relay Agent to check DHCP Relay Agent Information Option (Option 82) information in response packets returned from DHCP servers. If the information does not match the information it has for its own client (downstream) interface then the DHCP Relay Agent drops the packet. Note that [ip dhcp-relay agent-option](#) must be configured.

The DHCP Relay Agent Option 82 field is included in relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay agent-option checking`  
`no ip dhcp-relay agent-option checking`

**Mode** Interface Configuration for VLAN interfaces.

**Examples** To make the DHCP Relay Agent listening on vlan2 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the DHCP Relay Agent on vlan2 from checking the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option checking
```

**Related commands** [ip dhcp-relay agent-option](#)  
[ip dhcp-relay agent-option remote-id](#)  
[ip dhcp-relay information policy](#)  
[service dhcp-relay](#)

# ip dhcp-relay agent-option remote-id

**Overview** Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field the DHCP Relay Agent inserts into clients' request packets. The Remote ID identifies the device that is inserting the DHCP Relay Agent Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the device's MAC address.

Use the **no** variant of this command to return the Remote ID for an interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay agent-option remote-id <remote-id>`  
`no ip dhcp-relay agent-option remote-id`

| Parameter                      | Description                                                                                                                                                      |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;remote-id&gt;</code> | An alphanumeric (ASCII) string, 1 to 63 characters in length. Additional characters allowed are hyphen (-), underscore (_) and hash (#). Spaces are not allowed. |

**Default** The Remote ID is set to the device's MAC address by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

**Examples** To set the Remote ID to myid for client DHCP packets received on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

**Related commands** [ip dhcp-relay agent-option](#)  
[ip dhcp-relay agent-option checking](#)  
[show ip dhcp-relay](#)

# ip dhcp-relay agent-option subscriber-id

**Overview** Use this command to set an ASCII string as a subscriber identifier for a port.  
Use the **no** variant of this command to unset the string as a subscriber identifier for a port.

**Syntax** `ip dhcp-relay agent-option subscriber-id <subscriber-id>`  
`no ip dhcp-relay agent-option subscriber-id`

| Parameter                          | Description                                                                                                                                                           |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;subscriber-id&gt;</code> | An alphanumeric string to use as a client identifier. It is from 1 to 63 characters in length. This string may also contain special characters '#', '-', '_' and '.'. |

**Default** No string is set.

**Mode** Interface Configuration

**Usage notes** The subscriber identifier is used by the relay agent to add a subscriber identifier sub-option to the relay-agent information option added by the relay-agent before forwarding the client packets coming from the switch port to the server. The agent option fields in responses sent from the servers to clients are stripped before forwarding such responses back to the client.

**Example** To set subscriber identifier 'office-1' to packets coming from the client directly connected to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ip dhcp-relay agent-option subscriber-id
office-1
```

**Output** Figure 58-2: Example output from **show interface**

**Related commands** [show interface](#)

**Command changes** Version 5.5.2-0.1: command added

# ip dhcp-relay information policy

**Overview** This command sets the policy for how the DHCP relay deals with packets arriving from the client that contain DHCP Relay Agent Option 82 information.

If the command **ip dhcp-relay agent-option** has not been configured, then this command has no effect at all - no alteration is made to Option 82 information in packets arriving from the client side.

However, if the command **ip dhcp-relay agent-option** has been configured, this command modifies how the DHCP relay service deals with cases where the packet arriving from the client side already contains DHCP Relay Agent Option 82 information.

This command sets the action that the DHCP relay should take when a received DHCP client request contains DHCP Relay Agent Option 82 information.

By default, the DHCP Relay Agent replaces any existing DHCP Relay Agent Option 82 field with its own DHCP Relay Agent field. This is equivalent to the functionality of the **replace** parameter.

The **no** variant of this command returns the policy to the default behavior - i.e. replacing the existing DHCP Relay Agent Option 82 field.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands [ip dhcp-relay agent-option](#) and [ip dhcp-relay information policy](#) have been configured.

**Syntax**

```
ip dhcp-relay information policy {append|drop|keep|replace}
no ip dhcp-relay information policy
```

| Parameter | Description                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| append    | The DHCP Relay Agent appends the DHCP Relay Agent Option 82 field of the packet with its own DHCP Relay Agent Option 82 details.                               |
| drop      | The DHCP Relay Agent discards the packet.                                                                                                                      |
| keep      | The DHCP Relay Agent forwards the packet without altering the DHCP Relay Agent Option 82 field.                                                                |
| replace   | The DHCP Relay Agent replaces the existing DHCP Relay Agent details in the DHCP Relay Agent Option 82 field with its own details before forwarding the packet. |

**Mode** Interface Configuration for VLAN interfaces.

**Examples** To make the DHCP Relay Agent listening on vlan2 drop any client requests that already contain DHCP Relay Agent Option 82 information, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay information policy drop
```

To reset the DHCP relay information policy to the default policy for interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay information policy
```

**Related commands**

- [ip dhcp-relay agent-option](#)
- [ip dhcp-relay agent-option checking](#)
- [service dhcp-server](#)

# ip dhcp-relay maxhops

**Overview** This command sets the hop count threshold for discarding BOOTP messages. When the hops field in a BOOTP message exceeds the threshold, the DHCP Relay Agent discards the BOOTP message. The hop count threshold is set to 10 hops by default.

Use the **no** variant of this command to reset the hop count to the default.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay maxhops <1-255>`  
`no ip dhcp-relay maxhops`

| Parameter | Description                  |
|-----------|------------------------------|
| <1-255>   | The maximum hop count value. |

**Default** The default hop count threshold is 10 hops.

**Mode** Interface Configuration for VLAN interfaces.

**Example** To set the maximum number of hops to 5 for packets received on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay maxhops 5
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay max-message-length

**Overview** This command applies when the device is acting as a DHCP Relay Agent and DHCP Relay Agent Option 82 insertion is enabled. It sets the maximum DHCP message length (in bytes) for the DHCP packet with its DHCP Relay Agent Option 82 data inserted. From this value it calculates the maximum packet size that it will accept at its input. Packets that arrive greater than this value will be dropped.

The **no** variant of this command sets the maximum message length to its default of 1400 bytes.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay max-message-length <548-1472>`  
`no ip dhcp-relay max-message-length`

| Parameter  | Description                                                                                                 |
|------------|-------------------------------------------------------------------------------------------------------------|
| <548-1472> | The maximum DHCP message length (this is the message header plus the inserted DHCP option fields in bytes). |

**Default** The default is 1400 bytes.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** When a DHCP Relay Agent (that has DHCP Relay Agent Option 82 insertion enabled) receives a request packet from a DHCP client, it will append the DHCP Relay Agent Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the DHCP Relay Agent Option 82 data, the DHCP Relay Agent will increase the packet size to accommodate the DHCP Relay Agent Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, then the DHCP Relay Agent will drop the packet.

**NOTE:** Before setting this command, you must first run the `ip dhcp-relay agent-option` command. This will allow the DHCP Relay Agent Option 82 fields to be appended.

**Example** To set the maximum DHCP message length to 1200 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay max-message-length 1200
```

To reset the maximum DHCP message length to the default of 1400 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay max-message-length
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay server-address

**Overview** This command adds a DHCP server for the DHCP Relay Agent to forward client DHCP packets to on a particular interface. You can add up to five DHCP servers on each device interface that the DHCP Relay Agent is listening on.

The **no** variant of this command deletes the specified DHCP server from the list of servers available to the DHCP relay agent.

The **no ip dhcp-relay** command removes all DHCP relay settings from the interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax**

```
ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}

no ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}

no ip dhcp-relay
```

| Parameter          | Description                                                                                                                                                                   |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipv4-address>     | Specify the IPv4 address of the DHCP server for the DHCP Relay Agent to forward client DHCP packets to, in dotted decimal notation. The IPv4 address uses the format A.B.C.D. |
| <ipv6-address>     | Specify the IPv6 address of the DHCPv6 server for the DHCPv6 Relay Agent to forward client DHCP packets to, in hexadecimal notation.                                          |
| <server-interface> | Specify the interface name of the DHCPv6 server. It is only required for a DHCPv6 server with an IPv6 address.                                                                |

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** For a DHCP server with an IPv6 address you must specify the interface for the DHCP server. See examples below for configuration differences between IPv4 and IPv6 DHCP relay servers.

See also the [service dhcp-relay](#) command to enable the DHCP Relay Agent on your device. The [ip dhcp-relay server-address](#) command defines a relay destination on an interface on the device, needed by the DHCP Relay Agent to relay DHCP client packets to a DHCP server.

**Examples: DHCP for IPv4** To enable the DHCP Relay Agent to relay DHCP packets on interface vlan2 to the DHCP server with the IPv4 address 192.0.2.200, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay server-address 192.0.2.200
```

To remove the DHCP server with the IPv4 address 192.0.2.200 from the list of servers available to the DHCP Relay Agent on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay server-address 192.0.2.200
```

**Examples: DHCPv6** To enable the DHCP Relay Agent on your device to relay DHCP packets on interface vlan10 to the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To remove the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20 from the list of servers available to the DHCP Relay Agent on interface vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

**Example: disabling DHCP relay** To disable DHCP relay on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay short-lease

**Overview** Use this command to reduce the amount of time an IP address is assigned to a client device.

Long lease times can cause issues in dynamic networks where client devices frequently move between segments, such as VLANs. These device may retain an outdated IP address from its previous VLAN, disrupting communication.

This command is particularly useful in networks with a high turnover of devices or in environments where IP addresses are scarce.

Use the **no** variant of this command to remove the short lease time configuration.

**Syntax** `ip dhcp-relay short-lease <20-3600>`  
`no ip dhcp-relay short-lease`

| Parameter | Description                               |
|-----------|-------------------------------------------|
| <20-3600> | The lease time for DHCP relay in seconds. |

**Default** Not set

**Mode** Interface Configuration

**Example** To configure a DHCP Relay on interface vlan1 with a lease time of 200 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp-relay short-lease 200
```

**Related commands** [show ip dhcp-relay](#)

**Command changes** Version 5.5.4-2.1: command added

# ip dhcp-relay use-client-side-address

**Overview** Use this command to configure DHCP-Relay to use the client-side interface (that is the interface receiving the DHCP client packets) IP address as the source address of the relayed DHCP packets.

Use the **no** variant of this command to disable the use of the client-side interface IP address as the source IP address for relayed DHCP packets.

**Syntax** `ip dhcp-relay use-client-side-address`  
`no ip dhcp-relay use-client-side-address`

| Parameter                            | Description                                                                                 |
|--------------------------------------|---------------------------------------------------------------------------------------------|
| <code>use-client-side-address</code> | Use the client side interface IP address as the source IP address for relayed DHCP packets. |

**Default** By default, the server-side interface IP address is used as the source IP address of DHCP relayed packets.

**Mode** Global Configuration

**Usage notes** In most cases, there are filters placed between the DHCP relay and DHCP server which only allow DHCP packets from the client subnet to the server and back. This command allows you to configure the DHCP relay so that the relay will use the IP address of the interface **receiving** clients' DHCP requests to be used as the source IP address of the relayed DHCP packets.

**Example** To configure the client-side IP address as the source IP address of DHCP relayed packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp-relay use-client-side-address
```

**Output** Figure 58-3: Example output from **show ip dhcp-relay**

The second line of the display output shows the status of the client-side address being enabled as the source IP address.

```
awplus#sh ip dhcp-relay

DHCP Relay Service is enabled
Use of client side address as source address is enabled
...
```

**Related commands** [ip dhcp-relay server-address](#)

**Command changes** Version 5.4.9-0.7: command added

# ip dhcp use-subscriber-id

**Overview** Use this command in Global Configuration mode to configure the DHCP server to use the subscriber identifier substitution for the client identifier on all DHCP packets coming from all switch ports.

Use this command in Interface Configuration mode to configure a DHCP server to use the subscriber identifier substitution for the client identifier on all DHCP packets coming from a DHCP client directly connected to an interface.

Use the **no** variant of this command to disable the configuration.

**Syntax** `ip dhcp use-subscriber-id`  
`no ip dhcp use-subscriber-id`

**Default** Disabled

**Mode** Global Configuration  
Interface Configuration

**Usage notes** In Global Configuration mode, other DHCP packets coming from other interface types, for example Ethernet, are not affected by this command.

In Interface Configuration mode, the subscriber-id used in the substitution is derived from the port name of an interface. For example, for a DHCP packet coming in from a DHCP client directly attached to switchport port1.0.1, the subscriber-id is port1.0.1. This subscriber identifier for the client identifier substitution can only be applied to packets coming from switchport interfaces, consequently this command is only applicable to switchport interfaces.

**Example 1** In Global Configuration mode, to configure the subscriber-id client-id substitution for the DHCP packets coming from all switch port interfaces, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp use-subscriber-id
```

**Output** Figure 58-4: Example output from **show ip dhcp server summary**

```
awplus#show ip dhcp server summary

DHCP Server service is enabled
DHCP Server is running
BOOTP ignore is disabled
DHCP leasequery support is disabled
DHCP subscriber-id substitution for client-id is enabled
Pool list: pool_direct pool_relay Campus-1
```

**Example 2** In Interface Configuration mode, to configure subscriber identifier substitution for the client identifier on packets sent by a DHCP client directly attached to port port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ip dhcp use-subscriber-id
```

**Output** Figure 58-5: Example output from **show interface**

```
awplus#show interface port1.0.1
Interface port1.0.1
 Scope: both
 Link is DOWN, administrative state is UP
 Thrash-limiting
 Status Not Detected, Action learn-disable, Timeout 1(s)
 Hardware is Ethernet, address is e01a.ea60.087f
 index 5010 metric 1 mru 1500
 configured duplex auto, configured speed auto, configured
 polarity auto

 SNMP link-status traps: Disabled
 DHCP subscriber-id substitution for client-id is enabled
 DHCP subscriber-id is office-1
 input packets 0, bytes 0, dropped 0, multicast packets 0
 output packets 0, bytes 0, multicast packets 0, broadcast
 packets 0
 input average rate : 30 seconds 0 bps, 5 minutes 0 bps
 output average rate: 30 seconds 0 bps, 5 minutes 0 bps
 Time since last state change: 0 days 17:51:00
```

**Related commands** [show ip dhcp server summary](#)  
[show interface](#)

**Command changes** Version 5.5.2-0.1: command added

# lease

**Overview** This command sets the expiration time for a leased address for the DHCP address pool you are configuring. The time set by the days, hours, minutes and seconds is cumulative. The minimum total lease time that can be configured is 20 seconds. The maximum total lease time that can be configured is 120 days.

Note that if you add a user-defined option 51 using the [option](#) command, then you will override any settings created with this command. Option 51 specifies a lease time of 1 day.

Use the **infinite** parameter to set the lease expiry time to infinite (leases never expire).

Use the **no** variant of this command to return the lease expiration time back to the default of one day.

**Syntax** `lease <days> <hours> <minutes> [<seconds>]`  
`lease infinite`  
`no lease`

| Parameter | Description                                                                                    |
|-----------|------------------------------------------------------------------------------------------------|
| <days>    | The number of days, from 0 to 120, that the lease expiry time is configured for.<br>Default: 1 |
| <hours>   | The number of hours, from 0 to 24, that the lease expiry time is configured for.<br>Default: 0 |
| <minutes> | The number of minutes, from 0 to 60, the lease expiry time is configured for.<br>Default: 0    |
| <seconds> | The number of seconds, from 0 to 60, the lease expiry time is configured for.                  |
| infinite  | The lease never expires.                                                                       |

**Default** The default lease time is 1 day.

**Mode** DHCP Configuration

**Examples** To set the lease expiration time for address pool P2 to 35 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# lease 0 0 35
```

To set the lease expiration time for the address pool `Nerv_Office` to 1 day, 5 hours, and 30 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# lease 1 5 30
```

To set the lease expiration time for the address pool `P3` to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P3
awplus(dhcp-config)# lease 0 0 0 20
```

To set the lease expiration time for the pool to never expire, use the command:

```
awplus(dhcp-config)# lease infinite
```

To return the lease expiration time to the default of one day, use the command:

```
awplus(dhcp-config)# no lease
```

**Related  
commands**

[option](#)  
[service dhcp-server](#)  
[short-lease-threshold](#)

# network (DHCP)

**Overview** This command sets the network (subnet) that the DHCP address pool applies to. The **no** variant of this command removes the network (subnet) from the DHCP address pool.

**Syntax** `network`  
`{<ip-subnet-address/prefix-length>|<ip-subnet-address/mask>}`  
`no network`

| Parameter                                            | Description                                                                                                |
|------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-subnet-address/prefix-length&gt;</code> | The IPv4 subnet address in dotted decimal notation followed by the prefix length in slash notation.        |
| <code>&lt;ip-subnet-address/mask&gt;</code>          | The IPv4 subnet address in dotted decimal notation followed by the subnet mask in dotted decimal notation. |

**Mode** DHCP Configuration

**Usage notes** This command will fail if it would make existing ranges invalid. For example, if they do not lie within the new network you are configuring. The **no** variant of this command will fail if ranges still exist in the pool. You must remove all ranges in the pool before issuing a **no network** command to remove a network from the pool.

**Examples** To configure a network for the address pool P2, where the subnet is 192.0.2.5 and the mask is 255.255.255.0, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# network 192.0.2.5/24
```

or you can use dotted decimal notation instead of slash notation for the subnet-mask:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# network 192.0.2.5 255.255.255.0
```

**Related commands** [service dhcp-server](#)  
[subnet-mask](#)

## next-server

**Overview** This command sets the next server address for a DHCP server pool. It is the address of the next server that the client should use in its bootstrap process.

The **no** variant of this command removes the next server address from the DHCP address pool.

**Syntax** `next-server <ip-address>`  
`no next-server`

| Parameter                       | Description                                                |
|---------------------------------|------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | The server IP address, entered in dotted decimal notation. |

**Mode** DHCP Configuration

**Example** To set the next-server address for the address pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# next-server 192.0.2.2
```

# option

**Overview** This command adds a user-defined option to the DHCP address pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value. Options with an **ip** type can hold a list of IP addresses or masks (i.e. entries that have the A.B.C.D address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IP addresses.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

The **no** variant of this command removes the specified user-defined option from the DHCP pool, or all user-defined options from the DHCP pool.

**Syntax** `option [<1-254>|<option-name>] <option-value>`  
`no option [<1-254>|<option-value>]`

| Parameter      | Description                                                                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-254>        | The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.                                                                 |
| <option-name>  | Option name associated with the option.                                                                                                                                                                |
| <option-value> | The option value. You must specify a value that is appropriate to the option type:                                                                                                                     |
|                | <b>hex</b> A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long. |
|                | <b>ip</b> An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually using the option command multiple times.   |
|                | <b>integer</b> A number from 0 to 4294967295.                                                                                                                                                          |
|                | <b>flag</b> A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.                                                                                       |

**Mode** DHCP Configuration

**Examples** To add the ASCII-type option named `tftp-server-name` to the pool P2 and give the option the value `server1`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tftp-server-name server1
```

To add the hex-type option named `tcPIP-node-type` to the pool P2 and give the option the value `08af`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tcPIP-node-type 08af
```

To add multiple IP addresses for the ip-type option 175, use the command:

```
awplus(dhcp-config)# option 175 192.0.2.6
awplus(dhcp-config)# option 175 192.0.2.12
awplus(dhcp-config)# option 175 192.0.2.33
```

To add the option 179 to a pool, and give the option the value 123456, use the command:

```
awplus(dhcp-config)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the command:

```
awplus(dhcp-config)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the command:

```
awplus(dhcp-config)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the command:

```
awplus(dhcp-config)# no option tftp-server-name
```

[lease](#)

[service dhcp-server](#)

[show ip dhcp pool](#)

# probe enable

**Overview** Use this command to enable lease probing for a DHCP pool. Probing is used by the DHCP server to check if an IP address it wants to lease to a client is already being used by another host.

The **no** variant of this command disables probing for a DHCP pool.

**Syntax** `probe enable`  
`no probe enable`

**Default** Probing is enabled by default.

**Mode** DHCP Pool Configuration

**Examples** To enable probing for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe enable
```

To disable probing for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe enable
```

# probe packets

**Overview** Use this command to specify the number of packets sent for each lease probe. Lease probing is configured on a per-DHCP pool basis. When set to 0 probing is effectively disabled.

The **no** variant of this command sets the number of probe packets sent to the default of 5.

**Syntax** `probe packets <0-10>`  
`no probe packets`

| Parameter | Description                       |
|-----------|-----------------------------------|
| <0-10>    | The number of probe packets sent. |

**Default** The default is 5.

**Mode** DHCP Pool Configuration

**Examples** To set the number of probe packets to 2 for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe packets 2
```

To set the number of probe packets to the default 5 for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe packets
```

[probe timeout](#)  
[probe type](#)  
[show ip dhcp pool](#)

# probe timeout

**Overview** Use this command to set the timeout value in milliseconds that the server waits for a response after each probe packet is sent. Lease probing is configured on a per-DHCP pool basis.

The **no** variant of this command sets the probe timeout value to the default setting, 200 milliseconds.

**Syntax** `probe timeout <50-5000>`  
`no probe timeout`

| Parameter                    | Description                       |
|------------------------------|-----------------------------------|
| <code>&lt;50-5000&gt;</code> | Timeout interval in milliseconds. |

**Default** The default timeout interval is 200 milliseconds.

**Mode** DHCP Pool Configuration

**Examples** To set the probe timeout value to 500 milliseconds for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe timeout 500
```

To set the probe timeout value for pool P2 to the default, 200 milliseconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe timeout
```

# probe type

**Overview** Use this command to set the probe type for a DHCP pool. The probe type specifies how the DHCP server checks whether an IP address is being used by other hosts, referred to as lease probing. If **arp** is specified, the server sends an ARP request to determine if an address is in use. If **ping** is specified, the server will send an ICMP Echo Request (ping).

The **no** variant of this command sets the probe type to the default setting, ping.

**Syntax** probe type {arp|ping}  
no probe type

| Parameter | Description       |
|-----------|-------------------|
| arp       | Probe using ARP.  |
| ping      | Probe using ping. |

**Default** The default probe type is ping.

**Mode** DHCP Pool Configuration

**Examples** To set the probe type to arp for the pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe type arp
```

To set the probe type for the pool P2 to the default, ping, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe type
```

# range

**Overview** This command adds an address range to the DHCP address pool you are configuring. The DHCP server responds to client requests received from the pool's network. It assigns an IP addresses within the specified range. The IP address range must lie within the network. You can add multiple address ranges and individual IP addresses for a DHCP pool by using this command multiple times.

The **no** variant of this command removes an address range from the DHCP pool. Use the **no range all** command to remove all address ranges from the DHCP pool.

**Syntax** `range <ip-address> [<ip-address>]`  
`no range <ip-address> [<ip-address>]`  
`no range all`

| Parameter                       | Description                                                                                                                                                                                                                                |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end. Specify only one IP address to add an individual IP address to the address pool. |

**Mode** DHCP Configuration

**Examples** To add an address range of 192.0.2.5 to 192.0.2.16 to the pool Nerv\_Office, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# range 192.0.2.5 192.0.2.16
```

To add the individual IP address 192.0.2.2 to a pool, use the command:

```
awplus(dhcp-config)# range 192.0.2.2
```

To remove all address ranges from a pool, use the command:

```
awplus(dhcp-config)# no range all
```

**Related commands** [ip dhcp pool](#)  
[service dhcp-server](#)  
[show ip dhcp pool](#)

# route

**Overview** This command allows the DHCP server to provide static routes to clients.

**Syntax** route A.B.C.D/M A.B.C.D {both|opt249|rfc3442}

| Parameter | Description                            |
|-----------|----------------------------------------|
| A.B.C.D/M | Subnet for the route                   |
| A.B.C.D   | Next hop for the route                 |
| both      | opt249 and rfc3442                     |
| opt249    | Classless static route option for DHCP |
| rfc3442   | Classless static route option for DHCP |

**Mode** DHCP Configuration

**Examples** To distribute static routes for route 0.0.0.0/0 whose next hop is 192.16.1.1 to clients using both opt249 and rfc3442, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool pubic
awplus(dhcp-config)# route 0.0.0.0/0 192.16.1.1 both
```

**Related commands** [ip dhcp pool](#)

# service dhcp-relay

**Overview** This command enables the DHCP Relay Agent on the device. However, on a given IP interface, no DHCP forwarding takes place until at least one DHCP server is specified to forward/relay all clients' DHCP packets to.

The **no** variant of this command disables the DHCP Relay Agent on the device for all interfaces.

**Syntax** `service dhcp-relay`  
`no service dhcp-relay`

**Mode** Global Configuration

**Usage notes** A maximum number of 400 DHCP Relay Agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP Relay Agents will not be successful.

**Default** The DHCP-relay service is enabled by default.

**Examples** To enable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

To disable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-relay
```

# service dhcp-server

**Overview** This command enables the DHCP server on your device. The server then listens for DHCP requests on all IP interfaces. It will not run if there are no IP interfaces configured.

The **no** variant of this command disables the DHCP server.

**Syntax** `service dhcp-server`  
`no service dhcp-server`

**Mode** Global Configuration

**Example** To enable the DHCP server, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-server
```

**Related commands** [ip dhcp pool](#)  
[show ip dhcp server summary](#)  
[subnet-mask](#)

# short-lease-threshold

**Overview** Use this command to configure a short lease threshold.

Use the **no** variant of this command to return the short lease threshold to the default of one minute.

**Syntax** `short-lease-threshold <hours> <minutes>`  
`no short-lease-threshold`

| Parameter | Description                          |
|-----------|--------------------------------------|
| <hours>   | The number of hours, from 0 to 24.   |
| <minutes> | The number of minutes, from 0 to 60. |

**Default** 1 minute.

**Mode** DHCP Configuration

**Usage notes** DHCP leases need to be backed up in NVS so that when the DHCP server reboots or goes through a power cycle it won't lose all the knowledge of these leases.

Some networks have a high number of mobile devices repeatedly requesting DHCP leases every few seconds before their existing lease expires. This can happen for example, when mobile devices move in and out of a Wi-Fi zone or when Wi-Fi signal strength changes. This means the same IP address can have multiple lease entries which can take up unnecessary backup file space.

The **short-lease-threshold** command allows you to configure the threshold for a short lease, from 1 minute to 24 hours. Any lease less than the threshold is deemed to be a short lease and will NOT be backed up to NVS.

This is useful if you have:

- limited backup file space, and
- you don't need to restore leases after a device reboot or power cycle

**Example** To set the short lease threshold for address pool P2 to 40 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# short-lease-threshold 0 40
```

To set the short lease threshold for address pool Nerv\_Office to 5 hours and 35 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# short-lease-threshold 5 35
```

To return the short lease threshold to the default of one minute, use the following commands:

```
awplus# configure terminal
awplus(config)# no short-lease-threshold
```

Version 5.4.8-2.1: command added

# show counter dhcp-client

**Overview** This command shows counters for the DHCP client on your device.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter dhcp-client`

**Mode** User Exec and Privileged Exec

**Example** To display the message counters for the DHCP client on your device, use the command:

```
awplus# show counter dhcp-client
```

**Output** Figure 58-6: Example output from the **show counter dhcp-client** command

```
show counter dhcp-client

DHCPDISCOVER out 10
DHCPREQUEST out 34
DHCPDECLINE out 4
DHCPRELEASE out 0
DHCPPOFFER in 22
DHCPACK in 18
DHCPNAK in 0
```

**Table 1:** Parameters in the output of the **show counter dhcp-client** command

| Parameter        | Description                                                                  |
|------------------|------------------------------------------------------------------------------|
| DHCPDISCOVER out | The number of DHCP Discover messages sent by the client.                     |
| DHCPREQUEST out  | The number of DHCP Request messages sent by the client.                      |
| DHCPDECLINE out  | The number of DHCP Decline messages sent by the client.                      |
| DHCPRELEASE out  | The number of DHCP Release messages sent by the client.                      |
| DHCPPOFFER in    | The number of DHCP Offer messages received by the client.                    |
| DHCPACK in       | The number of DHCP Acknowledgement messages received by the client.          |
| DHCPNAK in       | The number of DHCP Negative Acknowledgement messages received by the client. |

|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Out To Server Failed | The number of failures when attempting to send request messages to servers. This is an internal debugging counter.                                                                                                                                                                                                                                                                                                                                                                 |
| Out To Client Failed | The number of failures when attempting to send reply messages to clients. This is an internal debugging counter.                                                                                                                                                                                                                                                                                                                                                                   |
| Invalid hlen         | The number of incoming messages dropped due to an invalid hlen field.                                                                                                                                                                                                                                                                                                                                                                                                              |
| Bogus giaddr         | The number of incoming DHCP Reply messages dropped due to the bogus giaddr field.                                                                                                                                                                                                                                                                                                                                                                                                  |
| Corrupt Agent Option | The number of incoming DHCP Reply messages dropped due to a corrupt relay agent information option field. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command. |
| Missing Agent Option | The number of incoming DHCP Reply messages dropped due to a missing relay agent information option field. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command. |
| Bad Circuit ID       | The number of incoming DHCP Reply messages dropped due to a bad circuit ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.                               |
| Missing Circuit ID   | The number of incoming DHCP Reply messages dropped due to a missing circuit ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.                           |

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bad Remote ID            | The number of incoming DHCP Reply messages dropped due to a bad remote ID.<br>Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command                                                                                                                                                |

| Option Insert Failed     | The number of incoming DHCP Request messages dropped due to an error adding the DHCP Relay Agent information (option-82). This counter increments when: <ul style="list-style-type: none"> <li>the DHCP Relay Agent is set to drop packets with the DHCP Relay Agent Option 82 field already filled by another DHCP Relay Agent. This policy is set with the <code>ip dhcp-relay information policy</code> command.</li> <li>there is a packet error that stops the DHCP Relay Agent from being able to append the packet with its DHCP Relay Agent Information Option (Option 82) field.</li> </ul> |
| DHCPv6 Requests In       | The number of incoming DHCPv6 Request messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DHCPv6 Replies In        | The number of incoming DHCPv6 Reply messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| DHCPv6 Relayed to Server | The number of DHCPv6 messages relayed to the server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| DHCPv6 Relayed to Client | The number of DHCPv6 messages relayed to the client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

# show counter dhcp-server

**Overview** This command shows counters for the DHCP server on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter dhcp-server`

**Mode** User Exec and Privileged Exec

**Example** To display counters for the DHCP server on your device, use the command:

```
awplus# show counter dhcp-server
```

**Output** Figure 58-8: Example output from the **show counter dhcp-server** command

|                      |       |    |
|----------------------|-------|----|
| DHCP server counters |       |    |
| DHCPDISCOVER in      | ..... | 20 |
| DHCPREQUEST in       | ..... | 12 |
| DHCPDECLINE in       | ..... | 1  |
| DHCPRELEASE in       | ..... | 0  |
| DHCPINFORM in        | ..... | 0  |
| DHCPOFFER out        | ..... | 8  |
| DHCPACK out          | ..... | 4  |
| DHCPNAK out          | ..... | 0  |
| BOOTREQUEST in       | ..... | 0  |
| BOOTREPLY out        | ..... | 0  |

**Table 2:** Parameters in the output of the **show counter dhcp-server** command

| Parameter       | Description                                                     |
|-----------------|-----------------------------------------------------------------|
| DHCPDISCOVER in | The number of Discover messages received by the DHCP server.    |
| DHCPREQUEST in  | The number of Request messages received by the DHCP server.     |
| DHCPDECLINE in  | The number of Decline messages received by the DHCP server.     |
| DHCPRELEASE in  | The number of Release messages received by the DHCP server.     |
| DHCPINFORM in   | The number of Inform messages received by the DHCP server.      |
| DHCPOFFER out   | The number of Offer messages sent by the DHCP server.           |
| DHCPACK out     | The number of Acknowledgement messages sent by the DHCP server. |

**Table 2:** Parameters in the output of the **show counter dhcp-server** command

| Parameter      | Description                                                                                                                                                                                                                                                                                                                     |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DHCPNAK out    | The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool. |
| BOOTREQUEST in | The number of bootp messages received by the DHCP server from bootp clients.                                                                                                                                                                                                                                                    |
| BOOTREPLY out  | The number of bootp messages sent by the DHCP server to bootp clients.                                                                                                                                                                                                                                                          |

# show dhcp lease

**Overview** This command shows details about the leases that the DHCP client has acquired from a DHCP server for interfaces on the device.

For information on filtering and saving command output, see “Controlling “show” Command Output” in the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

**Syntax** show dhcp lease [<interface>]

| Parameter   | Description                                       |
|-------------|---------------------------------------------------|
| <interface> | Interface name to display DHCP lease details for. |

**Mode** User Exec and Privileged Exec

**Example** To show the current lease expiry times for all interfaces, use the command:

```
awplus# show dhcp lease
```

To show the current lease for vlan2, use the command:

```
awplus# show dhcp lease vlan2
```

**Output** Figure 58-9: Example output from the **show dhcp lease vlan1** command

|                        |                             |
|------------------------|-----------------------------|
| Interface vlan1        |                             |
| -----                  |                             |
| IP Address:            | 192.168.22.4                |
| Expires:               | 13 Mar 2022 20:10:19        |
| Renew:                 | 13 Mar 2022 18:37:06        |
| Rebind:                | 13 Mar 2022 19:49:29        |
| Server:                |                             |
| Options:               |                             |
| subnet-mask            | 255.255.255.0               |
| routers                | 19.18.2.100,12.16.2.17      |
| dhcp-lease-time        | 3600                        |
| dhcp-message-type      | 5                           |
| domain-name-servers    | 192.168.100.50,19.88.200.33 |
| dhcp-server-identifier | 192.168.22.1                |
| domain-name            | alliedtelesis.com           |

**Related commands** [ip address dhcp](#)

# show ip dhcp binding

**Overview** This command shows the lease bindings that the DHCP server has allocated clients.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp binding [<ip-address>|<address-pool>]`

| Parameter                         | Description                                                                                                                        |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code>   | IPv4 address of a leased IP address, in dotted decimal notation. This displays the lease information for the specified IP address. |
| <code>&lt;address-pool&gt;</code> | Name of an address pool. This displays the lease information for all clients within the address pool.                              |

**Mode** User Exec and Privileged Exec

**Examples** To display all leases for every client in all address pools, use the command:

```
awplus# show ip dhcp binding
```

To display the details for the leased IP address 172.16.2.16, use the command:

```
awplus# show ip dhcp binding 172.16.2.16
```

To display the leases from the address pool MyPool, use the command:

```
awplus# show ip dhcp binding MyPool
```

**Output** Figure 58-10: Example output from the **show ip dhcp binding** command

| Pool 30_2_network Network 172.16.2.0/24 |                |         |                      |
|-----------------------------------------|----------------|---------|----------------------|
| DHCP Client Entries                     |                |         |                      |
| IP Address                              | ClientId       | Type    | Expiry               |

# show ip dhcp pool

**Overview** This command displays the configuration details and system usage of the DHCP address pools configured on the device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp pool [<address-pool>]`

| Parameter      | Description                                                                                          |
|----------------|------------------------------------------------------------------------------------------------------|
| <address-pool> | Name of a specific address pool. This displays the configuration of the specified address pool only. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip dhcp pool`

**Output** Figure 58-11: Example output from the **show ip dhcp pool** command

```
Pool p1 :
 network: 192.168.1.0/24
 address ranges:
 addr: 192.168.1.10 to 192.168.1.18
 static host addresses:
 addr: 192.168.1.12 MAC addr: 1111.2222.3333
 lease <days:hours:minutes:seconds> <1:0:0:0>
 subnet mask: 255.255.255.0 (pool's network mask)
 Probe: Default Values
 Status: Enabled [Enabled]
 Type: ARP [Ping]
 Packets: 2 [5]
 Timeout: 200 msec [200]
 Dynamic addresses:
 Total: 8
 Leased: 2
 Utilization: 25.0 %
 Static host addresses:
 Total: 1
 Leased: 1
```

**Output** Figure 58-12: Example output from the **show ip dhcp pool** command with IP address 192.168.1.12 assigned to a VLAN interface on the device:

```
Pool p1 :
network: 192.168.1.0/24
address ranges:
 addr: 192.168.1.10 to 192.168.1.18
 (interface addr 192.168.1.12 excluded)
 (static host addr 192.168.1.12 excluded)
static host addresses:
 addr: 192.168.1.12 MAC addr: 1111.2222.3333
 (= interface addr, so excluded)
lease <days:hours:minutes:seconds> <1:0:0:0>
subnet mask: 255.255.255.0 (pool's network mask)
Probe: Default Values
 Status: Enabled [Enabled]
 Type: ARP [Ping]
 Packets: 2 [5]
 Timeout: 200 msec [200]
Dynamic addresses:
 Total: 8
 Leased: 2
 Utilization: 25.0 %
Static host addresses:
 Total: 1
 Leased: 1
```

**Output** Figure 58-13: Example output from the **show ip dhcp pool** command when a host with MAC 0000.cd38.05f9 is registered as a static host by DHCP Framed IP Lease feature from AUTHD:

```
Pool p1 :
 network: 10.1.1.0/24
 address ranges:
 addr: 10.1.1.101 to 10.1.1.199
 (static host addr 10.1.1.122 excluded)
 (static host addr 10.1.1.111 excluded)
 static host addresses:
 addr: 10.1.1.122 MAC addr: 0000.1111.2222
 addr: 10.1.1.111 MAC addr: 0000.cd38.05f9
 Netmask : 255.255.255.0
 Gateway : 10.1.1.1
 Lease : 60 seconds
 Added by AUTHD

 lease <1:0:0:0>
 subnet mask: 255.255.255.0 (pool's network mask)
 Probe: Default Values
 Status: Enabled [Enabled]
 Type: Ping [Ping]
 Packets: 5 [5]
 Timeout: 200 msec [200]
 Dynamic addresses:
 Total: 97
 Leased: 1
 Utilization: 1.0 %
 Static host addresses:
 Total: 2
 Leased: 2
```

Table 58-1: Parameters in the output of **show ip dhcp pool**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pool           | Name of the pool.                                                                                                                                                                                                                                                                                                                                                                                     |
| network        | Subnet and mask length of the pool.                                                                                                                                                                                                                                                                                                                                                                   |
| address ranges | Individual IP addresses and address ranges configured for the pool. The DHCP server can offer clients an IP address from within the specified ranges only.<br>Any of these addresses that match an interface address on the device, or a static host address configured in the pool, will be automatically excluded from the range, and a message to this effect will appear beneath the range entry. |

Table 58-1: Parameters in the output of **show ip dhcp pool** (cont.)

| Parameter                          | Description                                                                                                                                                                                                                                                                                                         |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| static host addresses              | The static host addresses configured on the pool. Each IP address is permanently assigned to the client with the matching MAC address. Any of these addresses that match an interface address on the device will be automatically excluded, and a message to this effect will appear beneath the static host entry. |
| lease<br><days:hours:minutes>      | The lease duration for address allocated by this pool.                                                                                                                                                                                                                                                              |
| domain                             | The domain name sent by the pool to clients. This is the domain name that the client should use when resolving host names using DNS.                                                                                                                                                                                |
| subnet mask                        | The subnet mask sent by the pool to clients.                                                                                                                                                                                                                                                                        |
| Probe - Status                     | Whether lease probing is enabled or disabled.                                                                                                                                                                                                                                                                       |
| Probe - Type                       | The lease probe type configured. Either ping or ARP.                                                                                                                                                                                                                                                                |
| Probe - Packets                    | The number of packets sent for each lease probe in the range 0 to 10.                                                                                                                                                                                                                                               |
| Probe - Timeout                    | The timeout value in milliseconds to wait for a response after each probe packet is sent. In the range 50 to 5000.                                                                                                                                                                                                  |
| dns servers                        | The DNS server addresses sent to by the pool to clients.                                                                                                                                                                                                                                                            |
| default-router(s)                  | The default router addresses sent by the pool to clients.                                                                                                                                                                                                                                                           |
| user-defined options               | The list of user-defined options sent by the pool to clients.                                                                                                                                                                                                                                                       |
| Dynamic addresses-<br>Total        | The total number of IP addresses that have been configured in the pool for dynamic allocation to DHCP clients.                                                                                                                                                                                                      |
| Dynamic addresses-<br>Leased       | The number of IP addresses in the pool that have been dynamically allocated (leased) to DHCP clients.                                                                                                                                                                                                               |
| Dynamic addresses -<br>Utilization | The percentage of IP addresses in the pool that are currently dynamically allocated to clients.                                                                                                                                                                                                                     |
| Static host addresses-<br>Total    | The number of static IP addresses configured in the pool for specific DHCP client hosts.                                                                                                                                                                                                                            |
| Static host addresses<br>- Leased  | The number of static IP addresses assigned to specific DHCP client hosts.                                                                                                                                                                                                                                           |

# show ip dhcp-relay

**Overview** This command shows the configuration of the DHCP Relay Agent on each interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp-relay [interface <interface-name>]`

| Parameter        | Description                                                                                          |
|------------------|------------------------------------------------------------------------------------------------------|
| <interface-name> | Name of a specific interface. This displays the DHCP configuration for the specified interface only. |

**Mode** User Exec and Privileged Exec

**Example** To display the DHCP Relay Agent’s configuration on the interface vlan2, use the command:

```
awplus# show ip dhcp-relay interface vlan2
```

**Output** Figure 58-14: Example output from the **show ip dhcp-relay** command

```
DHCP Relay Service is enabled

vlan2 is up, line protocol is up
Maximum hop count is 10
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay information policy is to append new relay agent
information
List of servers : 192.168.1.200
```

# show ip dhcp server statistics

**Overview** This command shows statistics related to the DHCP server.

You can display the server counters using the [show counter dhcp-server](#) command as well as with this command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip dhcp server statistics

**Mode** User Exec and Privileged Exec

**Example** To display the server statistics, use the command:

```
awplus# show ip dhcp server statistics
```

**Output** Figure 58-15: Example output from the **show ip dhcp server statistics** command

| Parameter       | Description                                                  |
|-----------------|--------------------------------------------------------------|
| DHCPDISCOVER in | The number of Discover messages received by the DHCP server. |
| DHCPREQUEST in  | The number of Request messages received by the DHCP server.  |
| DHCPDECLINE in  | The number of Decline messages received by the DHCP server.  |
| DHCPRELEASE in  | The number of Release messages received by the DHCP server.  |

| Parameter               | Description                                                                                                                                                                                                                                                                                                                     |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DHCPINFORM in           | The number of Inform messages received by the DHCP server.                                                                                                                                                                                                                                                                      |
| DHCPOFFER out           | The number of Offer messages sent by the DHCP server.                                                                                                                                                                                                                                                                           |
| DHCPACK out             | The number of Acknowledgement messages sent by the DHCP server.                                                                                                                                                                                                                                                                 |
| DHCPNAK out             | The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool. |
| BOOTREQUEST in          | The number of bootp messages received by the DHCP server from bootp clients.                                                                                                                                                                                                                                                    |
| BOOTREPLY out           | The number of bootp messages sent by the DHCP server to bootp clients.                                                                                                                                                                                                                                                          |
| DHCPLEASEQUERY in       | The number of Lease Query messages received by the DHCP server from DHCP Relay Agents.                                                                                                                                                                                                                                          |
| DHCPLEASEUNKNOWN out    | The number of Lease Unknown messages sent by the DHCP server to DHCP Relay Agents.                                                                                                                                                                                                                                              |
| DHCPLEASEACTIVE out     | The number of Lease Active messages sent by the DHCP server to DHCP Relay Agents.                                                                                                                                                                                                                                               |
| DHCPLEASEUNASSIGNED out | The number of Lease Unassigned messages sent by the DHCP server to DHCP Relay Agents.                                                                                                                                                                                                                                           |

**Related commands**

- [show ip dhcp pool](#)

# show ip dhcp server summary

**Overview** This command shows the current configuration of the DHCP server. This includes:

- whether the DHCP server is enabled
- whether the DHCP server is configured to ignore BOOTP requests
- whether the DHCP server is configured to support DHCP lease queries
- the details of any user-defined options
- a list of the names of all DHCP address pools currently configured

This show command does not include any configuration details of the address pools. You can display these using the [show ip dhcp pool](#) command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp server summary`

**Mode** User Exec and Privileged Exec

**Example** To display the current configuration of the DHCP server, use the command:

```
awplus# show ip dhcp server summary
```

**Output** Figure 58-16: Example output from the **show ip dhcp server summary** command

```
DHCP Server service is disabled
BOOTP ignore is disabled
DHCP leasequery support is disabled
Pool list: p2
```

**Related commands**

- [ip dhcp leasequery enable](#)
- [ip dhcp pool](#)
- [service dhcp-server](#)

# subnet-mask

**Overview** This command sets the subnet mask option for a DHCP address pool you are configuring. Use this command to specify the client's subnet mask as defined in RFC 950. This sets the subnet details using the pre-defined option 1. Note that if you create a user-defined option 1 using the [option](#) command, then you will override any settings created with this command. If you do not specify a subnet mask using this command, then the pool's network mask (specified using the [next-server](#) command) is applied.

The **no** variant of this command removes a subnet mask option from a DHCP pool. The pool reverts to using the pool's network mask.

**Syntax** `subnet-mask <mask>`  
`no subnet-mask`

| Parameter                 | Description                                         |
|---------------------------|-----------------------------------------------------|
| <code>&lt;mask&gt;</code> | Valid IPv4 subnet mask, in dotted decimal notation. |

**Mode** DHCP Configuration

**Examples** To set the subnet mask option to 255.255.255.0 for DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# subnet-mask 255.255.255.0
```

To remove the subnet mask option from DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no subnet-mask
```

# use-subscriber-id

**Overview** Use this command to configure a DHCP server to use a subscriber identifier substitution for a client identifier on all DHCP packets for a given remote address pool.

Use the **no** variant of this command to remove the subscriber identifier substitution for a client identifier.

**Syntax** `use-subscriber-id`  
`no use-subscriber-id`

**Default** Disabled

**Mode** DHCP Configuration

**Usage notes** If the subscriber identifier for the client identifier substitution is enabled for a remote pool, then all relayed packets destined for the pool must contain the relay agent information option. This includes the subscriber identifier sub-option.

If not, then the relayed packet will be silently ignored as the situation is considered as an invalid operation.

**Example** To set the subscriber-id and client-id substitution for the DHCP pool 'Campus-1', use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Campus-1
awplus(dhcp-config)# use-subscriber-id
```

**Output** Figure 58-17: Example output from **show ip dhcp pool Campus-1**

```
awplus#show ip dhcp pool Campus-1
Pool Campus-1 :
 subscriber-id substitution for client-id is enabled
 network: 192.168.2.0/24
 address ranges:
 addr: 192.168.2.50 to 192.168.2.100
 static host addresses:
 addr: 192.168.2.5 Client-id: office-pc-21
 lease <1:0:0:0>
 subnet mask: 255.255.255.0 (pool's network mask)
 dns servers: 192.168.2.2
 default-router(s): 192.168.2.2
 Probe: Default Values
 Status: Enabled [Enabled]
 Type: Ping [Ping]
 Packets: 5 [5]
 Timeout: 200 msec [200]

# DHCP for IPv6 (DHCPv6) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure DHCPv6. For more information, see the [DHCPv6 Feature Overview and Configuration Guide](#).

DHCPv6 is a network protocol used to configure IPv6 hosts with IPv6 addresses and IPv6 prefixes for an IPv6 network. DHCPv6 is used instead of SLAAC (Stateless Address Autoconfiguration) at sites where centralized management of IPv6 hosts is needed. IPv6 routers require automatic configuration of IPv6 addresses and IPv6 prefixes.

DHCPv6 Prefix Delegation provides automatic configuration of IPv6 addresses and IPv6 prefixes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**NOTE:** The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

# address prefix

**Overview** Use this command in DHCPv6 Configuration mode to specify an address prefix for address assignment with DHCPv6 server pool configuration.

Use the **no** variant of this command to remove the address prefix from the DHCPv6 server pool.

**Syntax** `address prefix <ipv6-prefix/prefix-length> [lifetime {<valid-time>|infinite} {<preferred-time>|infinite}]`  
`no address prefix <ipv6-prefix/prefix-length>`

| Parameter                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-prefix/prefix-length&gt;</code> | Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.                                                                                                                                                                             |
| <code>lifetime</code>                          | Specify a time period for the hosts to remember router advertisements (RAs).<br>If you specify the optional lifetime parameter with this command then you must also specify a <i>valid-time</i> and a <i>preferred-time</i> value.<br>See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry. |
| <code>&lt;valid-time&gt;</code>                | Specify a valid lifetime in seconds in the range <5-315360000>.<br>The default valid lifetime is 2592000 seconds.                                                                                                                                                                                                                                                                                                 |
| <code>infinite</code>                          | Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.                                                                                                                                                                                                                                                                                                           |
| <code>&lt;preferred-time&gt;</code>            | Specify a preferred lifetime in seconds in the range <5-315360000>.<br>The default preferred lifetime is 604800 seconds.                                                                                                                                                                                                                                                                                          |

**Mode** DHCPv6 Configuration

**Default** The default valid lifetime is 2592000 seconds and the default preferred lifetime is 604800 seconds.

**Usage notes** This command creates a pool of prefixes from which addresses are assigned to clients on request, and allocates a network prefix from which the DHCPv6 Server leases addresses. This command is an alternative to using a range set using the [address range](#) command.

The DHCPv6 Server selects an IPv6 address from the range available allocated by the IPv6 prefix, randomly generating the suffix of the IPv6 address, with the specified preferred and valid lifetime leases. Leased IPv6 address are found in the

DHCPv6 Server REPLY packet, which is located within the IANA (Identity Association for Non-temporary Addresses) IA address field in the **REPLY** message.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Examples** To add IPv6 address prefix 2001:0db8:1::/48 for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# address prefix 2001:0db8:1::/48
```

To remove a configured IPv6 address prefix for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# no address prefix 2001:0db8:1::/48
```

**Validation Commands** [show ipv6 dhcp binding](#)  
[show ipv6 dhcp pool](#)

# address range

**Overview** Use this command in DHCPv6 Configuration mode to specify an address range for address assignment with DHCPv6 server pool configuration.

Use the **no** variant of this command to remove an address range from the DHCPv6 server pool.

**Syntax** `address range <first-ipv6-address>  
<last-ipv6-address>[lifetime {<valid-time>|infinite}  
{<preferred-time>|infinite}]`  
`no address range <first-ipv6-address> <last-ipv6-address>`

| Parameter                               | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;first-ipv6-address&gt;</code> | Specify the first IPv6 address of the IPv6 address range, in hexadecimal notation in the format <code>X:X::X:X</code> .                                                                                                                                                                                                                                                                  |
| <code>&lt;last-ipv6-address&gt;</code>  | Specify the last IPv6 address of the IPv6 address range, in hexadecimal notation in the format <code>X:X::X:X</code> .                                                                                                                                                                                                                                                                   |
| <code>lifetime</code>                   | Optional. Specify a time period for the hosts to remember router advertisements (RAs).<br>If you specify this parameter then you must also specify a <i>valid-time</i> and a <i>preferred-time</i> value.<br>See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry. |
| <code>&lt;valid-time&gt;</code>         | Specify a valid lifetime in seconds in the range <code>&lt;5-31536000&gt;</code> .<br>The default valid lifetime is 2592000 seconds.                                                                                                                                                                                                                                                     |
| <code>infinite</code>                   | Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.                                                                                                                                                                                                                                                                                  |
| <code>&lt;preferred-time&gt;</code>     | Specify a preferred lifetime in seconds in the range <code>&lt;5-31536000&gt;</code> .<br>The default preferred lifetime is 604800 seconds.                                                                                                                                                                                                                                              |

**Default** The default valid lifetime is 2592000 seconds and the default preferred lifetime is 604800 seconds.

**Mode** DHCPv6 Configuration

**Usage** Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Examples** To add the IPv6 address range 2001:0db8:1::1 to 2001:0db8:1fff::1 for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# address range 2001:0db8:1::1
2001:0db8:1fff::1
```

To remove a configured IPv6 address range for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# no address range
```

**Validation Commands** [show ipv6 dhcp binding](#)  
[show ipv6 dhcp pool](#)

# clear counter ipv6 dhcp-client

**Overview** Use this command in Privileged Exec mode to clear DHCPv6 client counters.

**Syntax** `clear counter ipv6 dhcp-client`

**Mode** Privileged Exec

**Example** To clear DHCPv6 client counters, use the following command:

```
awplus# clear counter ipv6 dhcp-client
```

**Related commands** [show counter ipv6 dhcp-client](#)

# clear counter ipv6 dhcp-server

**Overview** Use this command in Privileged Exec mode to clear DHCPv6 server counters.

**Syntax** `clear counter ipv6 dhcp-server`

**Mode** Privileged Exec

**Example** To clear DHCPv6 server counters, use the following command:

```
awplus# clear counter ipv6 dhcp-server
```

**Related commands** [show counter ipv6 dhcp-server](#)

# clear ipv6 dhcp binding

**Overview** Use this command in Privileged Exec mode to clear either a specific lease binding or the lease bindings as specified by the command parameters. The command will only take effect on dynamically allocated bindings, not statically configured bindings. This command clears binding entries on the DHCPv6 server binding table.

**Syntax** `clear ipv6 dhcp binding {ipv6 <prefix>|duid <DUID>|all|pool <name>}`

| Parameter     | Description                                                                                                                                                                          |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipv6 <prefix> | Optional. Specify the IPv6 prefix of the DHCPv6 client, in hexadecimal notation in the format X:X:X:X.                                                                               |
| duid <DUID>   | Specify the DUID (DHCPv6 unique ID) of the DHCPv6 client.                                                                                                                            |
| all           | All DHCPv6 bindings.                                                                                                                                                                 |
| pool <name>   | Description used to identify DHCPv6 server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in "quotation marks". |

**Mode** Privileged Exec

**Usage notes** A specific binding may be deleted by **ipv6** address or **duid** address, or several bindings may be deleted at once using **all** or **pool**.

Note that if you specify to clear the **ipv6** or **duid** address of what is actually a static DHCPv6 binding, an error message is displayed. If **all** or **pool** are specified and one or more static DHCPv6 bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

The clear ipv6 dhcp binding command is used as a server function. A binding table entry on the DHCPv6 server is automatically:

- Created whenever a prefix is delegated to a client from the configuration pool.
- Updated when the client renews, rebinds, or confirms the prefix delegation.
- Deleted when the client releases all the prefixes in the binding, all prefix lifetimes have expired, or when a user runs the clear ipv6 dhcp binding command.

If the **clear ipv6 dhcp binding** command is used with the optional IPv6 address parameter, only the binding for the specified client is deleted. If the **clear ipv6 dhcp binding** command is used without the optional IPv6 address parameter, then all automatic client bindings are deleted from the DHCPv6 bindings table.

**Example** To clear all dynamic DHCPv6 server binding entries, use the command:

```
awplus# clear ipv6 dhcp binding all
```

**Output** Figure 59-1: Example output from the **clear ipv6 dhcp binding all** command

```
awplus#clear ipv6 dhcp binding all
% Deleted 1 entries
```

**Related commands** [show ipv6 dhcp binding](#)

# clear ipv6 dhcp client

**Overview** Use this command in Privileged Exec mode to restart a DHCPv6 client on an interface.

**Syntax** `clear ipv6 dhcp client <interface>`

| Parameter   | Description                                               |
|-------------|-----------------------------------------------------------|
| <interface> | Specify the interface name to restart a DHCPv6 client on. |

**Mode** Privileged Exec

**Example** To restart a DHCPv6 client on interface vlan1, use the following command:

```
awplus# clear ipv6 dhcp client vlan1
```

**Related commands** [show ipv6 dhcp binding](#)

# dns-server (DHCPv6)

**Overview** Use this command to add a Domain Name System (DNS) server to the DHCPv6 address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6. Note that if you add a user-defined option 6 using the [option \(DHCPv6\)](#) command, then you will override any settings created with this command.

Use the **no** variant of this command to remove either the specified DNS server or all DNS servers from the DHCPv6 pool.

**Syntax** `dns-server <ipv6-address>`  
`no dns-server [<ipv6-address>]`

| Parameter                         | Description                                                                                                                                                                                                                                                                                                           |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-address&gt;</code> | Specify an IPv6 address of the DNS server, in hexadecimal notation in the format <code>X:X::X:X</code> . This parameter is required when adding a DNS server to the DHCPv6 address pool. All DNS servers are removed from the DHCPv6 pool if you enter the <code>no dns-server</code> command without this parameter. |

**Mode** DHCPv6 Configuration

**Examples** To add the DNS server with the assigned IPv6 address `2001:0db8:3000:3000::32` to the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# dns-server 2001:0db8:3000:3000::32
```

To remove the DNS server with the assigned IPv6 address `2001:0db8:3000:3000::32` from the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no dns-server 2001:0db8:3000:3000::32
```

To remove all DNS servers from the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no dns-server
```

**Related  
commands**    `ipv6 dhcp pool`  
                  `option (DHCPv6)`  
                  `show ipv6 dhcp pool`

# domain-name (DHCPv6)

**Overview** Use this command in DHCPv6 Configuration mode to add a domain name to the DHCPv6 server address pool you are configuring.

Use the **no** variant of this command to remove a domain name from the address pool.

**Syntax** `domain-name <domain-name>`  
`no domain-name`

| Parameter                        | Description                                                                                                                                                                                      |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;domain-name&gt;</code> | Specify the domain name you wish to assign the DHCPv6 server address pool. Valid characters are printable characters. If the name contains spaces then you must enclose it in "quotation marks". |

**Mode** DHCPv6 Configuration

**Usage** This command specifies the domain name that a client should use when resolving host names using the Domain Name System, and sets the domain name details using the pre-defined option 15. Note that if you add a user-defined option 15 using the [option \(DHCPv6\)](#) command, then you will override any settings created with this command.

**Examples** To add the domain name `Engineering` to DHCPv6 server pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# domain-name Engineering
```

To remove the domain name `Engineering` from DHCPv6 server pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no domain-name Engineering
```

**Related commands** [dns-server \(DHCPv6\)](#)  
[option \(DHCPv6\)](#)  
[show ipv6 dhcp pool](#)

# ip dhcp-relay agent-option

**Overview** This command enables the DHCP Relay Agent to insert the DHCP Relay Agent Information Option (Option 82) into the client-request packets that it relays to its DHCP server. This allows the DHCP Relay Agent to pass on information to the server about the network location of the client device. The DHCP Relay Agent strips the DHCP Relay Agent Option 82 field out of the DHCP server's response, so that the DHCP client never sees this field.

When the DHCP Relay Agent appends its DHCP Relay Agent Option 82 data into the packet, it first overwrites any pad options present; then if necessary, it increases the packet length to accommodate the DHCP Relay Agent Option 82 data.

The **no** variant of this command stops the DHCP Relay Agent from appending the Option 82 field onto DHCP requests before forwarding it to the server.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands [ip dhcp-relay agent-option](#) and [ip dhcp-relay information policy](#) have been configured.

**Syntax** `ip dhcp-relay agent-option`  
`no ip dhcp-relay agent-option`

**Default** DHCP Relay Agent Information Option (Option 82) insertion is disabled by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** Use this command to alter the DHCP Relay Agent Option 82 setting when your device is the first hop for the DHCP client. To limit the maximum length of the packet, use the [ip dhcp-relay max-message-length](#) command.

This command cannot be enabled if DHCP snooping is enabled on your device ([service dhcp-snooping](#) command), and vice versa.

**Examples** To make the DHCP Relay Agent listening on vlan2 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the DHCP Relay Agent from appending the DHCP Relay Agent Option 82 field on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option
```

**Related commands**

- [ip dhcp-relay information policy](#)
- [ip dhcp-relay max-message-length](#)
- [service dhcp-relay](#)

# ip dhcp-relay agent-option subscriber-id-auto-mac

**Overview** This command causes the relay agent to insert the requesting clients' MAC address into a subscriber ID field in the relay header. A suitably-configured server can then use this subscriber ID option to assign the same IPv6 address to that requesting client every time it requires an address.

Use the no form of this command to disable this feature.

**Syntax** `ip dhcp-relay agent-option subscriber-id-auto-mac`  
`no ip dhcp-relay agent-option subscriber-id-auto-mac`

**Default** Disabled

**Usage notes** By default, DHCPv6 uses a DUID-LLT client identifier instead of a MAC address. This is generated by the operating system when DHCP first starts. If the OS is reinstalled the DUID-LLT can change, and any multiple operating systems on the machine will all have different DUIDs.

Configuring the subscriber-id-auto-mac option causes the relay agent to insert the requesting client's MAC address into a subscriber ID field in the relay header. A suitably-configured server can then use this subscriber ID to assign the same IPv6 address to that requesting client every time it connects.

The client must be in the same L2 network as the relay. If there are multiple relays between the client and the server, only the first relay will add a subscriber ID option.

**Example** To enable this feature on VLAN1, use the following commands:

```
awplus(config)#int vlan1
awplus(config-if)#ip dhcp-relay agent-option
subscriber-id-auto-mac
```

For an example of how to configure a relay agent and server, see the document "How to use DHCPv6 to assign specific IPv6 addresses to specific devices", available from [www.alliedtelesis.com](http://www.alliedtelesis.com).

# ip dhcp-relay agent-option checking

**Overview** This command enables the DHCP Relay Agent to check DHCP Relay Agent Information Option (Option 82) information in response packets returned from DHCP servers. If the information does not match the information it has for its own client (downstream) interface then the DHCP Relay Agent drops the packet. Note that [ip dhcp-relay agent-option](#) must be configured.

The DHCP Relay Agent Option 82 field is included in relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay agent-option checking`  
`no ip dhcp-relay agent-option checking`

**Mode** Interface Configuration for VLAN interfaces.

**Examples** To make the DHCP Relay Agent listening on vlan2 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the DHCP Relay Agent on vlan2 from checking the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option checking
```

**Related commands** [ip dhcp-relay agent-option](#)  
[ip dhcp-relay agent-option remote-id](#)  
[ip dhcp-relay information policy](#)  
[service dhcp-relay](#)

# ip dhcp-relay agent-option remote-id

**Overview** Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field the DHCP Relay Agent inserts into clients' request packets. The Remote ID identifies the device that is inserting the DHCP Relay Agent Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the device's MAC address.

Use the **no** variant of this command to return the Remote ID for an interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay agent-option remote-id <remote-id>`  
`no ip dhcp-relay agent-option remote-id`

| Parameter                      | Description                                                                                                                                                      |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;remote-id&gt;</code> | An alphanumeric (ASCII) string, 1 to 63 characters in length. Additional characters allowed are hyphen (-), underscore (_) and hash (#). Spaces are not allowed. |

**Default** The Remote ID is set to the device's MAC address by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

**Examples** To set the Remote ID to myid for client DHCP packets received on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

**Related commands** [ip dhcp-relay agent-option](#)  
[ip dhcp-relay agent-option checking](#)  
[show ip dhcp-relay](#)

# ip dhcp-relay information policy

**Overview** This command sets the policy for how the DHCP relay deals with packets arriving from the client that contain DHCP Relay Agent Option 82 information.

If the command **ip dhcp-relay agent-option** has not been configured, then this command has no effect at all - no alteration is made to Option 82 information in packets arriving from the client side.

However, if the command **ip dhcp-relay agent-option** has been configured, this command modifies how the DHCP relay service deals with cases where the packet arriving from the client side already contains DHCP Relay Agent Option 82 information.

This command sets the action that the DHCP relay should take when a received DHCP client request contains DHCP Relay Agent Option 82 information.

By default, the DHCP Relay Agent replaces any existing DHCP Relay Agent Option 82 field with its own DHCP Relay Agent field. This is equivalent to the functionality of the **replace** parameter.

The **no** variant of this command returns the policy to the default behavior - i.e. replacing the existing DHCP Relay Agent Option 82 field.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands [ip dhcp-relay agent-option](#) and [ip dhcp-relay information policy](#) have been configured.

**Syntax**

```
ip dhcp-relay information policy {append|drop|keep|replace}
no ip dhcp-relay information policy
```

| Parameter | Description                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| append    | The DHCP Relay Agent appends the DHCP Relay Agent Option 82 field of the packet with its own DHCP Relay Agent Option 82 details.                               |
| drop      | The DHCP Relay Agent discards the packet.                                                                                                                      |
| keep      | The DHCP Relay Agent forwards the packet without altering the DHCP Relay Agent Option 82 field.                                                                |
| replace   | The DHCP Relay Agent replaces the existing DHCP Relay Agent details in the DHCP Relay Agent Option 82 field with its own details before forwarding the packet. |

**Mode** Interface Configuration for VLAN interfaces.

**Examples** To make the DHCP Relay Agent listening on vlan2 drop any client requests that already contain DHCP Relay Agent Option 82 information, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay information policy drop
```

To reset the DHCP relay information policy to the default policy for interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay information policy
```

**Related commands**

- [ip dhcp-relay agent-option](#)
- [ip dhcp-relay agent-option checking](#)
- [service dhcp-server](#)

# ip dhcp-relay maxhops

**Overview** This command sets the hop count threshold for discarding BOOTP messages. When the hops field in a BOOTP message exceeds the threshold, the DHCP Relay Agent discards the BOOTP message. The hop count threshold is set to 10 hops by default.

Use the **no** variant of this command to reset the hop count to the default.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay maxhops <1-255>`  
`no ip dhcp-relay maxhops`

| Parameter | Description                  |
|-----------|------------------------------|
| <1-255>   | The maximum hop count value. |

**Default** The default hop count threshold is 10 hops.

**Mode** Interface Configuration for VLAN interfaces.

**Example** To set the maximum number of hops to 5 for packets received on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay maxhops 5
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay max-message-length

**Overview** This command applies when the device is acting as a DHCP Relay Agent and DHCP Relay Agent Option 82 insertion is enabled. It sets the maximum DHCP message length (in bytes) for the DHCP packet with its DHCP Relay Agent Option 82 data inserted. From this value it calculates the maximum packet size that it will accept at its input. Packets that arrive greater than this value will be dropped.

The **no** variant of this command sets the maximum message length to its default of 1400 bytes.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay max-message-length <548-1472>`  
`no ip dhcp-relay max-message-length`

| Parameter  | Description                                                                                                 |
|------------|-------------------------------------------------------------------------------------------------------------|
| <548-1472> | The maximum DHCP message length (this is the message header plus the inserted DHCP option fields in bytes). |

**Default** The default is 1400 bytes.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** When a DHCP Relay Agent (that has DHCP Relay Agent Option 82 insertion enabled) receives a request packet from a DHCP client, it will append the DHCP Relay Agent Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the DHCP Relay Agent Option 82 data, the DHCP Relay Agent will increase the packet size to accommodate the DHCP Relay Agent Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, then the DHCP Relay Agent will drop the packet.

**NOTE:** Before setting this command, you must first run the `ip dhcp-relay agent-option` command. This will allow the DHCP Relay Agent Option 82 fields to be appended.

**Example** To set the maximum DHCP message length to 1200 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay max-message-length 1200
```

To reset the maximum DHCP message length to the default of 1400 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay max-message-length
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay server-address

**Overview** This command adds a DHCP server for the DHCP Relay Agent to forward client DHCP packets to on a particular interface. You can add up to five DHCP servers on each device interface that the DHCP Relay Agent is listening on.

The **no** variant of this command deletes the specified DHCP server from the list of servers available to the DHCP relay agent.

The **no ip dhcp-relay** command removes all DHCP relay settings from the interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax**

```
ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}

no ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}

no ip dhcp-relay
```

| Parameter          | Description                                                                                                                                                                   |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipv4-address>     | Specify the IPv4 address of the DHCP server for the DHCP Relay Agent to forward client DHCP packets to, in dotted decimal notation. The IPv4 address uses the format A.B.C.D. |
| <ipv6-address>     | Specify the IPv6 address of the DHCPv6 server for the DHCPv6 Relay Agent to forward client DHCP packets to, in hexadecimal notation.                                          |
| <server-interface> | Specify the interface name of the DHCPv6 server. It is only required for a DHCPv6 server with an IPv6 address.                                                                |

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** For a DHCP server with an IPv6 address you must specify the interface for the DHCP server. See examples below for configuration differences between IPv4 and IPv6 DHCP relay servers.

See also the [service dhcp-relay](#) command to enable the DHCP Relay Agent on your device. The [ip dhcp-relay server-address](#) command defines a relay destination on an interface on the device, needed by the DHCP Relay Agent to relay DHCP client packets to a DHCP server.

**Examples: DHCP for IPv4** To enable the DHCP Relay Agent to relay DHCP packets on interface vlan2 to the DHCP server with the IPv4 address 192.0.2.200, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay server-address 192.0.2.200
```

To remove the DHCP server with the IPv4 address 192.0.2.200 from the list of servers available to the DHCP Relay Agent on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay server-address 192.0.2.200
```

**Examples: DHCPv6** To enable the DHCP Relay Agent on your device to relay DHCP packets on interface vlan10 to the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To remove the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20 from the list of servers available to the DHCP Relay Agent on interface vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

**Example: disabling DHCP relay** To disable DHCP relay on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay short-lease-ipv6

**Overview** Use this command to reduce the amount of time an IPv6 address is assigned to a client device.

Long lease times can cause issues in dynamic networks where client devices frequently move between segments, such as VLANs. These device may retain an outdated IP address from its previous VLAN, disrupting communication.

This command is particularly useful in networks with a high turnover of devices or in environments where IP addresses are scarce.

Use the **no** variant of this command to remove the short lease time configuration.

**Syntax** `ip dhcp-relay short-lease-ipv6 [<20-3600> <20-3600>]`  
`no ip dhcp-relay short-lease-ipv6`

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| <20-3600> | The valid lease time for IPv6 DHCP relay in seconds.     |
| <20-3600> | The preferred lease time for IPv6 DHCP relay in seconds. |

**Default** Not set

**Mode** Interface Configuration

**Usage notes** The preferred lease time (the second parameter) must be less than the valid lease time (the first parameter).

- **Preferred lease time:** Indicates when preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.
- **Valid lease time:** Indicates when IPv6 addresses or prefixes must be abandoned. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires.

**Example** To configure a DHCP Relay on interface vlan1 with a valid lease time of 2000 seconds, and a preferred lease time of 1000 seconds for IPv6, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp-relay short-lease-ipv6 2000 1000
```

**Related commands** [show ip dhcp-relay](#)

**Command changes** Version 5.5.4-2.1: command added

## ipv6 address (DHCPv6 PD)

**Overview** Use this command to append an IPv6 address suffix to the IPv6 prefix provided by a DHCPv6 Prefix Delegation (PD) server.

Use the **no** variant of this command to remove the IPv6 address assigned and disable IPv6. Note that if no global addresses are left after removing the IPv6 address then IPv6 is disabled.

**Syntax** `ipv6 address [<ipv6-prefix-name>] <ipv6-addr/prefix-length> [eui64]`  
`no ipv6 address [<ipv6-prefix-name>] <ipv6-addr/prefix-length> [eui64]`

| Parameter                                    | Description                                                                                                                                                                                 |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-prefix-name&gt;</code>        | The IPv6 prefix name advertised on the router advertisement message sent from the device. The IPv6 prefix name is delegated from the DHCPv6 Server configured for DHCPv6 Prefix-Delegation. |
| <code>&lt;ipv6-addr/prefix-length&gt;</code> | Specifies the IPv6 address to be set, for example ::1/64. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.                       |
| <code>eui64</code>                           | EUI-64 is a method of automatically deriving the lower 64 bits of an IPv6 address, based on the switch's MAC address.                                                                       |

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** When specifying the **eui64** parameter, the interface identifier of the IPv6 address is derived from the MAC address of the device.

For more information about EUI64, see the [IPv6 Feature Overview and Configuration Guide](#).

**Examples** To assign the IPv6 address 2001:0db8::a2/48 to the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::a2/48
```

To remove the IPv6 address 2001:0db8::a2/48 from the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::a2/48
```

To assign the **eui64** derived address in the prefix 2001:0db8::/64 to VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::/64 eui64
```

To remove the **eui64** derived address in the prefix 2001:0db8::/64 from VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::/64 eui64
```

To configure a PD prefix named 'prefix1' on interface vlan2 and then add an IPv6 address, use the following commands. In this example, the prefix will be assigned from the pool on the PD client. The host portion or suffix will be ::1 for the last 64 bits:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 address prefix1::1/64
```

# ipv6 address dhcp

**Overview** Use this command to activate the DHCPv6 client on the interface that you are configuring. This allows the interface to use the DHCPv6 client to obtain its IPv6 configuration details from a DHCPv6 server on its connected network.

The command also enables IPv6 on the interface, which creates an EUI-64 link-local address as well as enabling RA processing and SLAAC.

Use the **no** variant of this command to stop the interface from obtaining IPv6 configuration details from a DHCPv6 server.

The DHCPv6 client supports the following IP configuration options:

- Option 1—the subnet mask for your device.
- Option 3—a list of default routers.
- Option 6—a list of DNS servers. This list appends the DNS servers set on your device with the [dns-server \(DHCPv6\)](#) command.
- Option 15—a domain name used to resolve host names. This option replaces any domain name that you have set with the [domain-name \(DHCPv6\)](#) command.
- Option 51—lease expiration time.

**Syntax** `ipv6 address dhcp [default-route-to-server]`  
`no ipv6 address dhcp`

| Parameter                            | Description                                                                                                                                                       |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>default-route-to-server</code> | Allow the automatic configuration of a default route to the DHCPv6 server. This option is not enabled by default when you enable the DHCP client on an interface. |

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** Use the **default-route-to-server** option to allow the automatic configuration of a default route to the DHCPv6 server. Note that this option is not enabled by default when you enable the DHCP client on an interface.

**Examples** To set the interface `vlan2` to use DHCPv6 to obtain an IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 address dhcp
```

To stop the interface vlan2 from using DHCPv6 to obtain its IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address dhcp
```

**Related  
commands**

[clear ipv6 dhcp client](#)  
[ipv6 address](#)  
[ipv6 address \(DHCPv6 PD\)](#)  
[show ipv6 dhcp interface](#)  
[show running-config](#)

# ipv6 dhcp client pd

**Overview** Use this command in Interface Configuration mode to enable the DHCPv6 client process and enable requests for prefix delegation through the interface that you are configuring.

Use the **no** variant of this command to disable requests for prefix delegation. This is the default setting.

For further information about DHCPv6 Prefix Delegation, which is used to automate the process of assigning prefixes, see the [DHCPv6 Feature Overview and Configuration Guide](#).

**Syntax** `ipv6 dhcp client pd <prefix-name> <default-route-to-server>`  
`no ipv6 dhcp client pd`

| Parameter                                    | Description                                                                                                                                                   |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;prefix-name&gt;</code>             | Specify an IPv6 general prefix name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". |
| <code>&lt;default-route-to-server&gt;</code> | Specify the default route to the DHCP server                                                                                                                  |

**Mode** Interface Configuration for VLAN interfaces.

**Default** Prefix delegation is disabled by default on an interface.

**Usage notes** Entering the **ipv6 dhcp client pd** command starts the DHCPv6 client process if not already running, and enables requests for prefix delegation through the interface on which the command is configured.

When prefix delegation is enabled and a prefix is acquired, the prefix is stored in the IPv6 prefix pool with an internal name defined by the required `<prefix-name>` placeholder parameter. The [ipv6 address](#) command can then refer to the prefixes stored in the IPv6 prefix pool.

**Examples** To enable prefix delegation with the prefix name my-prefix-name on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd my-prefix-name
```

To disable prefix delegation on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 dhcp client pd
```

**Related  
commands**

# ipv6 dhcp option

**Overview** Use this command in Global Configuration mode to create a user-defined DHCPv6 option. You can then use this option when configuring a DHCPv6 server address pool, by using the [option \(DHCPv6\)](#) command.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

Use the **no** variant of this command to remove either the specified user-defined option. This also removes user-defined options from the associated DHCPv6 server address pools.

**Syntax** `ipv6 dhcp option <1-254> [name <option-name>] [<option-type>]`  
`no ipv6 dhcp option <1-254>|<option-name>`

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |       |                      |     |                                                                                                                                                                                             |      |                                                                                                                                                                                                                                              |         |                                |      |                                                                                                                                                                                           |

| <1-254>       | The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |       |                      |     |                                                                                                                                                                                             |      |                                                                                                                                                                                                                                              |         |                                |      |                                                                                                                                                                                           |
| <option-name> | Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".<br>Default: no default                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |       |                      |     |                                                                                                                                                                                             |      |                                                                                                                                                                                                                                              |         |                                |      |                                                                                                                                                                                           |
| <option-type> | The option value. You must specify a value that is appropriate to the option type: <table><tr><td>ascii</td><td>An ASCII text string</td></tr><tr><td>hex</td><td>A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.</td></tr><tr><td>ipv6</td><td>An IPv6 address or prefix that has hexadecimal notation in the format <code>HHHH : HHHH : : HHHH : HHHH</code>. To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times.</td></tr><tr><td>integer</td><td>A number from 0 to 4294967295.</td></tr><tr><td>flag</td><td>A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b>, <b>on</b>, or <b>enabled</b> will set the flag. <b>false</b>, <b>off</b> or <b>disabled</b> will unset the flag.</td></tr></table> | ascii | An ASCII text string | hex | A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long. | ipv6 | An IPv6 address or prefix that has hexadecimal notation in the format <code>HHHH : HHHH : : HHHH : HHHH</code> . To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times. | integer | A number from 0 to 4294967295. | flag | A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag. |
| ascii         | An ASCII text string                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |       |                      |     |                                                                                                                                                                                             |      |                                                                                                                                                                                                                                              |         |                                |      |                                                                                                                                                                                           |
| hex           | A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |       |                      |     |                                                                                                                                                                                             |      |                                                                                                                                                                                                                                              |         |                                |      |                                                                                                                                                                                           |
| ipv6          | An IPv6 address or prefix that has hexadecimal notation in the format <code>HHHH : HHHH : : HHHH : HHHH</code> . To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |       |                      |     |                                                                                                                                                                                             |      |                                                                                                                                                                                                                                              |         |                                |      |                                                                                                                                                                                           |
| integer       | A number from 0 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |       |                      |     |                                                                                                                                                                                             |      |                                                                                                                                                                                                                                              |         |                                |      |                                                                                                                                                                                           |
| flag          | A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |       |                      |     |                                                                                                                                                                                             |      |                                                                                                                                                                                                                                              |         |                                |      |                                                                                                                                                                                           |

**Mode** Global Configuration

**Examples** To define a user-defined ASCII string option as option 66, without a name, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name "tcpip-node-type", use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name special-address, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number 12, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp option 12
```

To remove the specific user-defined option with the option name perform-router-discovery, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp option perform-router-discovery
```

**Related commands**

- [domain-name \(DHCPv6\)](#)
- [option \(DHCPv6\)](#)
- [show ipv6 dhcp](#)

# ipv6 dhcp pool

**Overview** Use this command in Global Configuration mode to enter the DHCPv6 Configuration mode for the DHCPv6 server pool name as specified in the required command parameter. If the name specified is not associated with an existing pool, the device will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCPv6 configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCPv6 server pools on devices with multiple interfaces. This allows the device to act as a DHCPv6 server on multiple interfaces to distribute different information to clients on the different networks.

Use the **no** variant of this command to delete the specific DHCPv6 pool.

**Syntax** `ipv6 dhcp pool <DHCPv6-poolname>`  
`no ipv6 dhcp pool <DHCPv6-poolname>`

| Parameter                            | Description                                                                                                                                                                    |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;DHCPv6-poolname&gt;</code> | Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". |

**Mode** Global Configuration

**Usage** All DHCPv6 prefix pool names must be unique. IPv6 prefix pools have a similar function to IPv4 address pools. Contrary to IPv4, a block of IPv6 addresses (an IPv6 address prefix) are assigned and not single IPv6 addresses. IPv6 prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, you must remove then recreate a IPv6 prefix pool. All IPv6 prefixes already allocated are also freed.

**Examples** To create the DHCPv6 pool named P2 and enter DHCPv6 configuration mode, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)#
```

To delete the DHCPv6 pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp pool P2
```

# ipv6 dhcp server

**Overview** Use this command in Interface Configuration mode to enable DHCPv6 server for the current IPv6 configured interface to use the specified DHCPv6 server pool name.

The DHCPv6 server service listens for DHCPv6 requests on the IPv6 configured interface. The DHCPv6 server service does not run on interfaces without IPv6 configured on them.

Use the **no** variant of this command to disable the DHCPv6 server.

**Syntax** `ipv6 dhcp-server [<DHCPv6-poolname>]`  
`no ipv6 dhcp-server`

| Parameter         | Description                                                                                                                                                                                                             |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <DHCPv6-poolname> | Specify a named DHCPv6 server pool as defined with the <a href="#">ipv6 dhcp pool</a> command. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". |

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** The **ipv6 dhcp server** command enables the DHCPv6 service on a specified interface using the pool for prefix delegation and configuration through the specified interface.

Note that DHCPv6 client, DHCPv6 server and DHCPv6 relay are mutually exclusive on an interface. When one of the DHCPv6 functions is enabled on an interface then another DHCPv6 function cannot be enabled on the same interface.

**Examples** To enable the DHCPv6 server service and use the DHCPv6 pool named P2 on VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 dhcp server P2
```

To disable the DHCPv6 server on VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 dhcp server
```

**Related commands** [ipv6 dhcp pool](#)  
[show ipv6 dhcp binding](#)  
[show ipv6 dhcp pool](#)

# ipv6 local pool

**Overview** Use this command in Global Configuration mode to configure a local DHCPv6 server prefix delegation pool specifying a poolname and a prefix/prefix length. You can optionally exclude the locally assigned prefix from the pool with the **exclude-local-prefix** keyword.

Use the **no** variant of this command to remove a local DHCPv6 server prefix delegation pool specifying the poolname.

**Syntax** `ipv6 local pool <DHCPv6-poolname> <delegated-prefix-name>  
<ipv6-prefix/prefix-length> <assigned-length>  
[exclude-local-prefix]`  
`no ipv6 local pool`

| Parameter                                      | Description                                                                                                                                                                                                                                                                                          |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;DHCPv6-poolname&gt;</code>           | Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".                                                                                                                       |
| <code>&lt;delegated-prefix-name&gt;</code>     | Description used to identify the delegated prefix name from the parent PD (Prefix Delegation) server. If the name contains spaces then you must enclose it in "quotation marks".                                                                                                                     |
| <code>&lt;ipv6-prefix/prefix-length&gt;</code> | Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool.<br>The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.                                                             |
| <code>&lt;assigned-length&gt;</code>           | Specify an IPv6 prefix length assigned to the user from the pool in the range <1-128>. Note that the value of the <i>assigned-length</i> parameter entered cannot be less than or equal to the <i>prefix-length</i> parameter value entered. An assigned length must be longer than a prefix length. |
| <code>exclude-local-prefix</code>              | Specify this keyword to exclude the locally assigned prefix from the pool.                                                                                                                                                                                                                           |

**Default** No DHCPv6 server prefix delegation pool is configured by default.

**Mode** Global Configuration

**Usage notes** All IPv6 prefix pool names must be unique. IPv6 prefix pools have a similar function to IPv4 address pools. Contrary to IPv4, a block of IPv6 addresses (an IPv6 address prefix) are assigned and not single IPv6 addresses. IPv6 prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, you must remove then recreate a IPv6 prefix pool. All IPv6 prefixes already allocated are also freed.

**Examples** To create a local DHCPv6 local pool named P2 with the IPv6 prefix and prefix length 2001:0db8::/32 with an assigned length of 64, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 local pool P2 2001:0db8::/32 64
```

To remove a configured DHCPv6 local pool, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 local pool
```

**Related commands** [ipv6 dhcp pool](#)  
[show ipv6 dhcp pool](#)

## ipv6 nd prefix (DHCPv6)

**Overview** Use this command to specify IPv6 RA (Router Advertisement) prefix information generated from the DHCPv6 server for DHCPv6 prefix-delegation for an interface.

Use the **no** variant of this command to remove IPv6 RA prefix information from the DHCPv6 Server for DHCPv6 Prefix-Delegation for the interface. Use the **all** parameter with the **no** variant of this command to remove all prefix names and all prefixes for an interface.

**Syntax** `ipv6 nd prefix <ipv6-prefix-name>  
<ipv6-prefix/length>{<valid-lifetime>|infinite}  
{<preferred-lifetime>|infinite} {off-link|no-autoconfig}`  
`no ipv6 nd prefix {<ipv6-prefix-name>|<ipv6-prefix/length>|all}`

| Parameter                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-prefix-name&gt;</code>   | The IPv6 prefix name advertised on the router advertisement message sent from the device.<br>The IPv6 prefix name is delegated from the DHCPv6 Server configured for DHCPv6 Prefix-Delegation.                                                                                                                                                                                                                                         |
| <code>&lt;ipv6-prefix/length&gt;</code> | The IPv6 prefix and prefix length advertised on the router advertisement message sent from the device.<br>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                                                                                                                                                                                                              |
| <code>&lt;valid-lifetime&gt;</code>     | The the period during which the specified IPv6 address prefix is valid. This can be set to a value between 5 and 315360000 seconds. Note that this period should be set to a value greater than that set for the prefix preferred-lifetime. See the Usage notes after this parameter table for a description of valid lifetime and how it determines invalid IPv6 addresses upon expiry.                                               |
| <code>infinite</code>                   | Specifying this keyword instead of entering a value for the <code>&lt;valid-lifetime&gt;</code> parameter applies an infinite valid lifetime.                                                                                                                                                                                                                                                                                          |
| <code>&lt;preferred-lifetime&gt;</code> | Specifies the IPv6 prefix preferred lifetime. This is the period during which the IPv6 address prefix is considered current. Set this to a value between 0 and 315360000 seconds. Note that this period should be set to a value less than that set for the prefix valid-lifetime. See the Usage notes after this parameter table for a description of preferred lifetime and how it determines deprecated IPv6 addresses upon expiry. |
| <code>infinite</code>                   | Specifying this keyword instead of entering a value for the <code>&lt;preferred-lifetime&gt;</code> parameter applies an infinite valid lifetime.                                                                                                                                                                                                                                                                                      |
| <code>off-link</code>                   | Specify the IPv6 prefix off-link flag.                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>no-autoconfig</code>              | Specify the IPv6 prefix no autoconfiguration flag. Setting this flag indicates that the prefix is not to be used for autoconfiguration.                                                                                                                                                                                                                                                                                                |
| <code>all</code>                        | Specify all prefix names and all prefixes are removed when used with the no variant of this command.                                                                                                                                                                                                                                                                                                                                   |

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** This command specifies the IPv6 prefix flags that are advertised by the router advertisement message.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Examples** The following example configures the device to issue RAs (Router Advertisements) on the VLAN interface vlan2, and advertises the DHCPv6 prefix name prefix1 and the IPv6 address prefix of 2001:0db8::/32.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 nd prefix prefix1 2001:0db8::/32
```

The following example resets router advertisements on the VLAN interface vlan2, so the address prefix of 2001:0db8::/32 is not advertised from the device.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd prefix 2001:0db8::/32
```

The following example removes all prefix names and prefixes from VLAN interface vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd prefix all
```

# link-address

**Overview** Use this command in DHCPv6 Configuration mode to specify a link-address prefix within a DHCPv6 Server pool.

Note that you can only configure one link address per DHCPv6 pool. Configuring another link address in the same DHCPv6 pool overwrites the previously configured link address.

Use the **no** variant of this command to remove the link-address prefix from the DHCPv6 Server pool.

**Syntax** `link-address <ipv6-prefix/prefix-length>`  
`no link-address`

| Parameter                                      | Description                                                                                                                                                                                                                         |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-prefix/prefix-length&gt;</code> | Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X/Prefix-Length. The prefix-length is usually set between 0 and 64. |

**Default** No DHCPv6 Server pool configuration link address prefix is configured by default.

**Mode** DHCPv6 Configuration

**Usage notes** Link addresses are configured in DHCPv6 Server address pools when there are remote clients that communicate via intermediate relay(s).

RELAY-FORW and RELAY-REPL relay packets contain the requesting link address source.

This command is used to match incoming requests from PD (Prefix Delegation) clients (received via an intermediate relay) to a configured delegation pool.

When an address on the incoming interface of the DHCPv6 server or a link address set in the incoming delegation request packet from the prefix delegation client matches the link-address prefix configured in the delegation pool, the DHCPv6 server is able to match and use the appropriate delegation pool for relayed delegation request messages.

If there is no match between incoming delegation request packets from the prefix delegation client and the link-address prefix configured in the delegation pool, the DHCPv6 Server does not delegate an IPv6 prefix to the requesting device.

The link address should be set to the network prefix where the prefix delegation client resides. The prefix delegation server will also need a forwarding path (IPv6 route) back to the network prefix where the prefix delegation client resides.

For more information, see the [DHCPv6 Feature Overview and Configuration Guide](#).

**Examples** To configure the IPv6 prefix and prefix length 2001:0db8:1::/48 as the link address for pool P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# address prefix 2001:0db8:2::/48
awplus(config-dhcp6)# link-address 2001:0db8:1::/48
```

To remove the link address, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no link-address
```

**Related commands** [ipv6 dhcp pool](#)  
[show ipv6 dhcp pool](#)

## option (DHCPv6)

**Overview** Use this command in DHCPv6 Configuration mode to add a user-defined option to the DHCPv6 prefix pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value.

Use the **no** variant of this command to remove the specified user-defined option from the DHCPv6 server pool, or to remove all user-defined options from the DHCPv6 server pool.

**Syntax** `option [<1-254>|<option-name>] <option-value>`  
`no option [<1-254>|<option-value>]`

| Parameter      | Description                                                                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-254>        | The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.                                                                 |
| <option-name>  | Option name associated with the option.                                                                                                                                                                |
| <option-value> | The option value. You must specify a value that is appropriate to the option type:                                                                                                                     |
|                | <b>hex</b> A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long. |
|                | <b>ipv6</b> An IPv6 prefix that has the hexadecimal X:X::X:X notation. To create a list of IPv6 prefixes, you must add each IPv6 prefix individually using this command multiple times.                |
|                | <b>integer</b> A number from 0 to 4294967295.                                                                                                                                                          |
|                | <b>flag</b> A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.                                                                                       |

**Mode** DHCPv6 Configuration

**Usage** You must define a DHCPv6 option using the `ipv6 dhcp option` command before using the `option (DHCPv6)` command.

Note that options with an **ipv6** type can hold a list of IPv6 prefix (i.e. entries that have the X:X::X:X address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IPv6 prefixes. Also note options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

**Examples** To add the IPv6 type option named `sntp-server-addr` to the pool P2 and give the option the value `ipv6`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 22 name sntp_server_addr ipv6
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option sntp_server_addr ipv6
```

To add the ASCII-type option named `tftp-server-name` to the pool P2 and give the option the value `server1`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option tftp-server-name server1
```

To add the hex-type option named `tcpip-node-type` to the pool P2 and give the option the value `08af`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option tcpip-node-type 08af
```

To add multiple IP addresses for the ip-type option 175, use the following commands:

```
awplus(config-dhcp6)# option 175 2001:0db8:3001::/64
awplus(config-dhcp6)# option 175 2001:0db8:3002::/64
awplus(config-dhcp6)# option 175 2001:0db8:3003::/64
```

To add the option 179 to a pool, and give the option the value 123456, use the following command:

```
awplus(config-dhcp6)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the following command:

```
awplus(config-dhcp6)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the following command:

```
awplus(config-dhcp6)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the following command:

```
awplus(config-dhcp6)# no option tftp-server-name
```

# prefix-delegation pool

**Overview** Use this command in DHCPv6 Configuration mode to add a DHCPv6 server prefix-delegation pool entry to the current DHCPv6 pool configuration. You must define a DHCPv6 server prefix-delegation pool using the [ipv6 dhcp pool](#) command before using this command.

Use the **no** variant of this command to remove a DHCPv6 server prefix-delegation pool from the current DHCPv6 pool configuration.

**Syntax** `prefix-delegation pool <DHCPv6-poolname> [lifetime {<valid-time>|infinite} {<preferred-time>|infinite}]`  
`no prefix-delegation pool <DHCPv6-poolname>`

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <DHCPv6-poolname> | Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".                                                                                                                                                                                                        |
| lifetime          | Optional. Specify a time period for the hosts to remember router advertisements (RAs). If you specify this parameter then you must also specify a <i>valid-time</i> and a <i>preferred-time</i> value.<br>See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry. |
| <valid-time>      | Specify a valid lifetime in seconds in the range <5-315360000>.                                                                                                                                                                                                                                                                                                                       |
| infinite          | Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.                                                                                                                                                                                                                                                                               |
| <preferred-time>  | Specify a valid lifetime in seconds in the range <5-315360000>.                                                                                                                                                                                                                                                                                                                       |

**Default** No IPv6 local prefix pool is specified by default.

**Mode** DHCPv6 Configuration

**Usage notes** The DHCPv6 server assigns prefixes dynamically from an IPv6 local prefix pool, which is configured using the [ipv6 local pool](#) command and is associated with a DHCPv6 configuration pool using this command. When the server receives a prefix request from a client, it attempts to obtain unassigned prefixes from the pool. After the client releases the previously assigned prefixes, the server returns the prefixes to the pool for reassignment.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source

address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Example** This example adds DHCPv6 Prefix Delegation pool pd\_pool1 to DHCPv6 pool pool1:

```
awplus# configure terminal
awplus(config)# ipv6 local pool pd_pool1 2001:0db8::/48 56
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# prefix-delegation pool pd_pool1
```

- [ipv6 local pool](#)
- [show ipv6 dhcp pool](#)

# service dhcp-relay

**Overview** This command enables the DHCP Relay Agent on the device. However, on a given IP interface, no DHCP forwarding takes place until at least one DHCP server is specified to forward/relay all clients' DHCP packets to.

The **no** variant of this command disables the DHCP Relay Agent on the device for all interfaces.

**Syntax** `service dhcp-relay`  
`no service dhcp-relay`

**Mode** Global Configuration

**Usage notes** A maximum number of 400 DHCP Relay Agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP Relay Agents will not be successful.

**Default** The DHCP-relay service is enabled by default.

**Examples** To enable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

To disable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-relay
```

# show counter dhcp-relay

**Overview** This command shows counters for the DHCP Relay Agent on your device.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter dhcp-relay`

**Mode** User Exec and Privileged Exec

**Examples** To display counters for the DHCP Relay Agent on your device, use the following command:

```
awplus# show counter dhcp-relay
```

**Output** Figure 59-2: Example output from the **show counter dhcp-relay** command

```
awplus#show counter dhcp-relay

| Replies In        | The number of DHCP Reply messages received from servers.   |
| Relayed To Server | The number of DHCP Request messages relayed to servers.    |
| Relayed To Client | The number of DHCP Reply messages relayed to clients.      |

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Out To Server Failed | The number of failures when attempting to send request messages to servers. This is an internal debugging counter.                                                                                                                                                                                                                                                                                                                                                                 |
| Out To Client Failed | The number of failures when attempting to send reply messages to clients. This is an internal debugging counter.                                                                                                                                                                                                                                                                                                                                                                   |
| Invalid hlen         | The number of incoming messages dropped due to an invalid hlen field.                                                                                                                                                                                                                                                                                                                                                                                                              |
| Bogus giaddr         | The number of incoming DHCP Reply messages dropped due to the bogus giaddr field.                                                                                                                                                                                                                                                                                                                                                                                                  |
| Corrupt Agent Option | The number of incoming DHCP Reply messages dropped due to a corrupt relay agent information option field. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command. |
| Missing Agent Option | The number of incoming DHCP Reply messages dropped due to a missing relay agent information option field. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command. |
| Bad Circuit ID       | The number of incoming DHCP Reply messages dropped due to a bad circuit ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.                               |
| Missing Circuit ID   | The number of incoming DHCP Reply messages dropped due to a missing circuit ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.                           |

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bad Remote ID            | The number of incoming DHCP Reply messages dropped due to a bad remote ID.<br>Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command                                                                                                                                                |
| Missing Remote ID        | The number of incoming DHCP Reply messages dropped due to a missing remote ID.<br>Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command                                                                                                                                            |
| Option Insert Failed     | The number of incoming DHCP Request messages dropped due to an error adding the DHCP Relay Agent information (option-82). This counter increments when: <ul style="list-style-type: none"> <li>the DHCP Relay Agent is set to drop packets with the DHCP Relay Agent Option 82 field already filled by another DHCP Relay Agent. This policy is set with the <code>ip dhcp-relay information policy</code> command.</li> <li>there is a packet error that stops the DHCP Relay Agent from being able to append the packet with its DHCP Relay Agent Information Option (Option 82) field.</li> </ul> |
| DHCPv6 Requests In       | The number of incoming DHCPv6 Request messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DHCPv6 Replies In        | The number of incoming DHCPv6 Reply messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| DHCPv6 Relayed to Server | The number of DHCPv6 messages relayed to the server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| DHCPv6 Relayed to Client | The number of DHCPv6 messages relayed to the client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

# show counter ipv6 dhcp-client

**Overview** Use this command in User Exec or Privilege Exec mode to show DHCPv6 client counter information. See [show counter ipv6 dhcp-server](#) for DHCPv6 server information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter ipv6 dhcp-client`

**Mode** User Exec and Privileged Exec

**Example** To display the DHCPv6 client counter information, use the command:

```
awplus# show counter ipv6 dhcp-client
```

**Output** Figure 59-3: Example output from the **show counter ipv6 dhcp-client** command

```
awplus#show counter ipv6 dhcp-client
SOLICIT out 20
ADVERTISE in 12
REQUEST out 1
CONFIRM out 0
RENEW out 0
REBIND out 0
REPLY in 0
RELEASE out 0
DECLINE out 0
INFORMATION-REQUEST out 0
```

**Table 1:** Parameters in the output of the **show counter ipv6 dhcp-client** command

| Parameter    | Description                                                             |
|--------------|-------------------------------------------------------------------------|
| SOLICIT out  | Displays the count of SOLICIT messages sent by the DHCPv6 client.       |
| ADVERTISE in | Displays the count of ADVERTISE messages received by the DHCPv6 client. |
| REQUEST out  | Displays the count of REQUEST messages sent by the DHCPv6 client.       |
| CONFIRM out  | Displays the count of CONFIRM messages sent by the DHCPv6 client.       |
| RENEW out    | Displays the count of RENEW messages sent by the DHCPv6 client.         |

**Table 1:** Parameters in the output of the **show counter ipv6 dhcp-client** command (cont.)

| Parameter               | Description                                                                   |
|-------------------------|-------------------------------------------------------------------------------|
| REBIND out              | Displays the count of REBIND messages sent by the DHCPv6 client.              |
| REPLY in                | Displays the count of REPLY messages received by the DHCPv6 client.           |
| RELEASE out             | Displays the count of RELEASE messages sent by the DHCPv6 client.             |
| DECLINE out             | Displays the count of DECLINE messages sent by the DHCPv6 client.             |
| INFORMATION-REQUEST out | Displays the count of INFORMATION-REQUEST messages sent by the DHCPv6 client. |

**Related commands** [show counter ipv6 dhcp-server](#)

# show counter ipv6 dhcp-server

**Overview** Use this command in User Exec or Privileged Exec mode to show DHCPv6 server counter information. See [show counter ipv6 dhcp-client](#) for DHCPv6 client information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show counter ipv6 dhcp-server

**Mode** User Exec and Privileged Exec

**Example** To display the DHCPv6 server counter information, use the command:

```
awplus# show counter ipv6 dhcp-server
```

**Output** Figure 59-4: Example output from the **show counter ipv6 dhcp-server** command

```
awplus#show counter ipv6 dhcp-server
SOLICIT in 20
ADVERTISE out 12
REQUEST in 1
CONFIRM in 0
RENEW in 0
REBIND in 0
REPLY out 0
RELEASE in 0
DECLINE in 0
INFORMATION-REQUEST in 0
RELAY FORWARD in 0
LEASEQUERY in 0
DHCPv4 QUERY in 0
```

**Table 2:** Parameters in the output of the **show counter ipv6 dhcp-server** command

| Parameter     | Description                                                           |
|---------------|-----------------------------------------------------------------------|
| SOLICIT in    | Displays the count of SOLICIT messages received by the DHCPv6 server. |
| ADVERTISE out | Displays the count of ADVERTISE messages sent by the DHCPv6 server.   |
| REQUEST in    | Displays the count of REQUEST messages received by the DHCPv6 server. |
| CONFIRM in    | Displays the count of CONFIRM messages received by the DHCPv6 server. |

**Table 2:** Parameters in the output of the **show counter ipv6 dhcp-server** command (cont.)

| Parameter              | Description                                                                      |
|------------------------|----------------------------------------------------------------------------------|
| RENEW in               | Displays the count of RENEW messages received by the DHCPv6 server.              |
| REBIND in              | Displays the count of REBIND messages received by the DHCPv6 server.             |
| REPLY out              | Displays the count of REPLY messages sent by the DHCPv6 server.                  |
| RELEASE in             | Displays the count of RELEASE messages received by the DHCPv6 server.            |
| DECLINE in             | Displays the count of DECLINE messages received by the DHCPv6 server.            |
| INFORMATION-REQUEST in | Displays the count of INFORMATION-REQUEST messages received by the DHCPv6 server |
| RELAY FORWARD in       | Displays the count of Relay forward in messages received by the DHCPv6 server    |
| LEASEQUERY in          | Displays the count of LEASE QUERY messages received by the DHCPv6 server         |
| DHCPv4 QUERY in        | Displays the count of DHCPv4 QUERY messages received by the DHCPv6 server        |

**Related commands** [show counter ipv6 dhcp-client](#)

# show ip dhcp-relay

**Overview** This command shows the configuration of the DHCP Relay Agent on each interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp-relay [interface <interface-name>]`

| Parameter        | Description                                                                                          |
|------------------|------------------------------------------------------------------------------------------------------|
| <interface-name> | Name of a specific interface. This displays the DHCP configuration for the specified interface only. |

**Mode** User Exec and Privileged Exec

**Example** To display the DHCP Relay Agent’s configuration on the interface vlan2, use the command:

```
awplus# show ip dhcp-relay interface vlan2
```

**Output** Figure 59-5: Example output from the **show ip dhcp-relay** command

```
DHCP Relay Service is enabled

vlan2 is up, line protocol is up
Maximum hop count is 10
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay information policy is to append new relay agent
information
List of servers : 192.168.1.200
```

# show ipv6 dhcp

**Overview** Use this command in User Exec or Privileged Exec mode to show the DHCPv6 unique identifier (DUID) configured on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp`

**Mode** User Exec and Privileged Exec

**Usage notes** The DUID is based on the link-layer address for both DHCPv6 client and DHCPv6 server identifiers. The device uses the MAC address from the lowest interface number for the DUID.

The DUID is used by a DHCPv6 client to obtain an IPv6 address from a DHCPv6 server. A DHCPv6 server compares the DUID with its database of DUIDs and sends configuration data for an IPv6 address plus the preferred and valid lease time values to a DHCPv6 client.

**Example** To display the DUID configured on your device, use the command:

```
awplus# show ipv6 dhcp
```

**Output** Figure 59-6: Example output from the **show ipv6 dhcp** command

```
awplus#show ipv6 dhcp
DHCPv6 Server DUID: 0001000117ab6876001577f7ba23
```

**Related commands** [ipv6 address dhcp](#)

# show ipv6 dhcp binding

**Overview** Use this command in User Exec or Privileged Exec mode to show the IPv6 address entries that the DHCPv6 server leases to DHCPv6 clients. Note that applying this command with the optional *summary* keyword parameter displays the number of addresses per pool, but not the address or prefix entries per pool.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp binding [summary]`

| Parameter            | Description                                                                                                                                                                                                |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>summary</code> | Optional. Specify the <b>summary</b> keyword to display summarized information for DHCPv6 server leases to client nodes, displaying the number of address entries per pool, not the addresses or prefixes. |

**Mode** User Exec and Privileged Exec

**Example 1** To display the total DHCPv6 leasing address entries for all pools, use the command:

```
awplus# show ipv6 dhcp binding summary
```

**Output** Figure 59-7: Example output from the **show ipv6 dhcp binding summary** command

|                                        |                            |
|----------------------------------------|----------------------------|
| awplus# show ipv6 dhcp binding summary |                            |
| Pool Name                              | Number of Leased Addresses |
| -----                                  |                            |
| ia-na1                                 | 3                          |
| ia-pd1                                 | 5                          |
| Total in all Pools:                    | 8                          |

**Table 3:** Parameters in the output of the **show ipv6 dhcp binding summary** command

| Parameter                  | Description                                                        |
|----------------------------|--------------------------------------------------------------------|
| Pool Name                  | Displays a list of all the pool names.                             |
| Number of Leased Addresses | Displays the number of leased address entries for the pool.        |
| Total in all Pools         | Displays the total number of leased address entries for all pools. |

**Example 2** To display addresses, prefixes, and lifetimes for all DHCPv6 leasing entries by pool, enter:

```
awplus# show ipv6 dhcp binding
```

**Output** Figure 59-8: Example output from the **show ipv6 dhcp binding** command

```
awplus#show ipv6 dhcp binding
Pool ia-na1
 Address 2002:0:3c0::1
 client IAID 77f7ba23, DUID 0001000117c4bbb4001577f7ba23
 preferred lifetime 604800, valid lifetime 2592000
 starts at 20 Aug 2012 18:38:29
 expires at 19 Sep 2012 18:38:29
Pool ia-pd1
 Prefix 2002:0:3c0::/42
 client IAID 77f7ba23, DUID 0001000117c4bbb4001577f7ba23
 preferred lifetime 604800, valid lifetime 2592000
 starts at 20 Aug 2012 18:38:29
 expires at 19 Sep 2012 18:38:29
```

**Table 4:** Parameters in the output of the **show ipv6 dhcp binding** command

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Address            | Address delegated to the indicated IAID and DUID.<br>See the IAID and DUID descriptions below for further information.                                                                                                                                                                                                                                                                                                                                                                       |
| Prefix             | Prefix delegated to the indicated IAID and DUID.<br>See the IAID and DUID descriptions below for further information.                                                                                                                                                                                                                                                                                                                                                                        |
| DUID               | DHCPv6 unique identifier (DUID) (see RFC 3315).<br>Each DHCPv6 client has as DUID. DHCPv6 servers use DUIDs to identify clients for the association of IAs (Identity Associations) with DHCPv6 clients. DHCPv6 clients use DUIDs to identify a DHCPv6 server.                                                                                                                                                                                                                                |
| IAID               | Identify Association Identifier (IAID) (see RFC 3315).<br>IAIDs are identifiers for IAs (Identity Associations), where an IA is a collection of IPv6 addresses assigned to a DHCPv6 client. Each IA has an associated IAD. Each DHCPv6 client may have more than one IA assigned to it. Each IA holds one type of address.                                                                                                                                                                   |
| preferred lifetime | The preferred lifetime setting in seconds for the specified IAID and DUID. Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires. Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected. |
| valid lifetime     | The valid lifetime setting in seconds for the specified IAID and DUID. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.                                                                                                                                                                                                      |

**Table 4:** Parameters in the output of the **show ipv6 dhcp binding** command

| Parameter  | Description                                            |
|------------|--------------------------------------------------------|
| starts at  | The date and time at which the valid lifetime expires. |
| expires at | The date and time at which the valid lifetime expires. |

**Related  
commands**

[clear ipv6 dhcp binding](#)

[ipv6 dhcp pool](#)

[show ipv6 dhcp pool](#)

# show ipv6 dhcp interface

**Overview** Use this command in User Exec or Privileged Exec mode to display DHCPv6 information for a specified interface, or all interfaces when entered without the interface parameter.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp interface [<interface-name>]`

| Parameter        | Description                                                                                                                                                                          |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface-name> | Optional. Specify the name of the interface to show DHCPv6 information about. Omit this optional parameter to display DHCPv6 information for all interfaces DHCPv6 is configured on. |

**Mode** User Exec and Privileged Exec

**Example** To display DHCPv6 information for all interfaces DHCPv6 is configured on, use the command:

```
awplus# show ipv6 dhcp interface
```

To display DHCPv6 information for interface vlan2, use the command:

```
awplus# show ipv6 dhcp interface vlan2
```

**Output** Figure 59-9: Example output from the **show ipv6 dhcp interface** command

```
awplus# show ipv6 dhcp interface
vlan1 is in client mode
 Address 1001::3c0:1
 preferred lifetime 9000, valid lifetime 5000
 starts at 20 Jan 2021 09:21:35
 expires at 20 Jan 2021 10:25:32
vlan2 is in client (Prefix-Delegation) mode
 Prefix name pd1
 prefix 2002:0:3c0::/42
 preferred lifetime 604800, valid lifetime 2592000
 starts at 20 Aug 2021 09:21:33
 expires at 19 Sep 2021 09:21:33
vlan3 is in server mode
 Using pool : pool-1; Preference:0
```

Figure 59-10: Example output from the **show ipv6 dhcp interface** command for a specific interface

```
awplus# show ipv6 dhcp interface vlan2
vlan2 is in client (Prefix-Delegation) mode
 Prefix name pd1
 prefix 2002:0:3c0::/42
 preferred lifetime 604800, valid lifetime 2592000
 starts at 20 Aug 2021 09:21:33
 expires at 19 Sep 2021 09:21:33
```

**Table 5:** Parameters in the output of the **show counter dhcp-client** command

| Parameter                                                | Description                                                                                                                    |
|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <interface> is in server/client/(Prefix-Delegation) mode | Displays whether the specified interface is in server or client mode and whether prefix-delegation is applied to an interface. |
| Address                                                  | Displays the address of the DHCPv6 server on the interface.                                                                    |
| Prefix name                                              | Displays the IPv6 general prefix pool name, where prefixes are stored for the interface.                                       |
| Using pool                                               | Displays the name of the pool used by the interface.                                                                           |
| Preference                                               | Displays the preference value for the DHCPv6 server.                                                                           |

**Related commands**    [ipv6 dhcp client pd](#)

# show ipv6 dhcp pool

**Overview** Use this command in User Exec or Privileged Exec mode to display the configuration details and system usage of the DHCPv6 address pools configured on the device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp pool [<DHCPv6-address-pool-name>]`

| Parameter                  | Description                                                                                                        |
|----------------------------|--------------------------------------------------------------------------------------------------------------------|
| <DHCPv6-address-pool-name> | Name of a specific DHCPv6 address pool. This displays the configuration of the specified DHCPv6 address pool only. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 dhcp pool`

**Output** Figure 59-11: Example output from the **show ipv6 dhcp pool** command

|                                              |
|----------------------------------------------|
| awplus# show ipv6 dhcp pool                  |
| DHCPv6 Pool: ia-na                           |
| Address Prefix : 1001::/64                   |
| Lifetime: 2592000(valid), 604800(preferred)  |
| DNS Server: 2001::1                          |
| DNS Server: 2001::2                          |
| Domain Name: example.com                     |
| Domain Name: example.co.jp                   |
| SNTP Server: 2001::5                         |
| SNTP Server: 2001::6                         |
| Option Code : 150                            |
| Value: [ASCII] test-test                     |
| DHCPv6 Pool: ia-pd                           |
| PD Pool Name: pd1                            |
| Prefix : 2002::/38-42                        |
| Lifetime : 2592000(valid), 604800(preferred) |

**Table 6:** Parameters in the output of the **show ipv6dhcp pool** command

| Parameter      | Description                        |
|----------------|------------------------------------|
| DHCPv6 Pool    | Name of the DHCPv6 pool.           |
| Address Prefix | Address prefix to the DHCPv6 pool. |

**Table 6:** Parameters in the output of the **show ipv6dhcp pool** command (cont.)

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Address<br>Lifetime | <p>Valid and preferred lifetimes to the DHCPv6 pool.</p> <p>Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.</p> <p>Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. | DNS Server          | IPv6 address of the DNS Server                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Domain name         | URL for the domain name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SNTP Server         | IPv6 address of the SNTP (Simple Network Time Protocol) Server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Option Code         | DHCP Option code (see RFC 2132).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Option Value        | DHCP Option value type (see RFC 2132).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Related commands**    [ipv6 dhcp pool](#)

# sntp-address

**Overview** Use this command in DHCPv6 Configuration mode to add an SNTP Server IPv6 address to a DHCPv6 Server pool.

Use the **no** variant of this command to remove an SNTP Server IPv6 address from a DHCPv6 Server pool.

**Syntax** `sntp-address <ipv6-address>`  
`no sntp-address <ipv6-address>`

| Parameter                         | Description                                                                          |
|-----------------------------------|--------------------------------------------------------------------------------------|
| <code>&lt;ipv6-address&gt;</code> | Specify an SNTP Server IPv6 address, in hexadecimal notation in the format X:X::X:X. |

**Mode** DHCPv6 Configuration

**Examples** The following example adds an SNTP Server IPv6 address of 2001:0db8::/32 to the DHCPv6 pool named P2:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# sntp-address 2001:0db8::/32
```

The following example removes an SNTP Server IPv6 address of 2001:0db8::/32 to the DHCPv6 pool named P2:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no sntp-address 2001:0db8::/32
```

# NTP Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure the Network Time Protocol (NTP). For more information, see the [NTP Feature Overview and Configuration Guide](#).

The device can act as an NTP client to receive time from one or more NTP servers, and as an NTP server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

# ntp authentication-key

**Overview** This command defines each of the authentication keys. Each key has a key number, a type (MD5 or SHA1), and a value.

The **no** variant of this disables the authentication key.

**Syntax** `ntp authentication-key <keynumber> md5 <key-string> [trusted]`  
`ntp authentication-key <keynumber> sha1 <key-string> [trusted]`

When in secure mode, MD5 is not available and the syntax in config files will be:

```
ntp authentication-key <keynumber> sha1-encrypted
<encrypted-key-string> [trusted]

no ntp authentication-key <keynumber>
```

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <keynumber>            | <1-4294967295> An identification number for the key.                                                                                                                                                                                                                                                                                                                                                |
| md5                    | Define an MD5 key.                                                                                                                                                                                                                                                                                                                                                                                  |
| sha1                   | Define an SHA1 key.                                                                                                                                                                                                                                                                                                                                                                                 |
| <key-string>           | The authentication key. For SHA1, this is a 20 hexadecimal character string. For MD5, this is a string of up to 31 ASCII characters.                                                                                                                                                                                                                                                                |
| sha1-encrypted         | This parameter indicates in running config that the key is in its encrypted form instead of in plaintext. If secure mode is enabled and you enter a SHA1 key, the running config will display this sha1-encrypted parameter instead of sha1, and will display the key in encrypted form. Do not enter a key using the sha1-encrypted parameter. Instead, enter sha1 and the unencrypted key string. |
| <encrypted-key-string> | The encrypted authentication key.                                                                                                                                                                                                                                                                                                                                                                   |
| trusted                | Add this key to the list of authentication keys that this server trusts.                                                                                                                                                                                                                                                                                                                            |

**Mode** Global Configuration

**Examples** To define an MD5 authentication key number 134343 and a key value 'mystring', use the commands:

```
awplus# configure terminal
awplus(config)# ntp authentication-key 134343 md5 mystring
```

To disable the authentication key number 134343 with the key value 'mystring', use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ntp authentication-key 134343
```

**Command  
changes**

Version 5.4.9-2.1 sha1-encrypted parameter added.

# ntp broadcastdelay

**Overview** Use this command to set the estimated round-trip delay for broadcast packets. Use the **no** variant of this command to reset the round-trip delay for broadcast packets to the default offset of 0 microseconds.

**Syntax** `ntp broadcastdelay <delay>`  
`no ntp broadcastdelay`

| Parameter | Description                                     |
|-----------|-------------------------------------------------|
| <delay>   | <1-999999> The broadcast delay in microseconds. |

**Default** 0 microsecond offset, which can only be applied with the **no** variant of this command.

**Mode** Global Configuration

**Examples** To set the estimated round-trip delay to 23464 microseconds for broadcast packets, use these commands:

```
awplus# configure terminal
awplus(config)# ntp broadcastdelay 23464
```

To reset the estimated round-trip delay for broadcast packets to the default setting (0 microseconds), use these commands:

```
awplus# configure terminal
awplus(config)# no ntp broadcastdelay
```

# ntp master

**Overview** Use this command to make the device to be an authoritative NTP server, even if the system is not synchronized to an outside time source.

Use the **no** variant of this command to stop the device being the designated NTP server.

**Syntax** `ntp master [<stratum>]`  
`no ntp master`

| Parameter | Description                                                                                                                                    |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <stratum> | <1-15> The stratum number defines the configured level that is set for this master within the NTP hierarchy. The default stratum number is 12. |

**Mode** Global Configuration

**Usage notes** The stratum levels define the distance from the reference clock and exist to prevent cycles in the hierarchy. Stratum 1 is used to indicate time servers, which are more accurate than Stratum 2 servers. For more information on the Network Time Protocol go to: [www.ntp.org](http://www.ntp.org)

**Examples** To stop the device from being the designated NTP server, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp master
```

To make the device the designated NTP server with stratum number 2, use the commands:

```
awplus# configure terminal
awplus(config)# ntp master 2
```

# ntp peer

**Overview** Use this command to configure an NTP peer association. An NTP association is a peer association if this system is willing to either synchronize to the other system, or allow the other system to synchronize to it.

Use the **no** variant of this command to remove the configured NTP peer association.

**Syntax** `ntp peer {<peeraddress>|<peername>} [prefer] [key <key>]  
[version <version>]  
no ntp peer {<peeraddress>|<peername>}`

| Parameter         | Description                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <peeraddress>     | Specify the IP address of the peer, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X:X for an IPv6 address. |
| <peername>        | Specify the peer hostname. The peer hostname can resolve to an IPv4 and an IPv6 address.                                          |
| prefer            | Prefer this peer when possible.                                                                                                   |
| key <key>         | <1-4294967295><br>Configure the peer authentication key.                                                                          |
| version <version> | <1-4><br>Configure for this NTP version.                                                                                          |

**Mode** Global Configuration

**Examples** To set an NTP peer association for this peer with an IPv4 address of 192.0.2.23, use the commands:

```
awplus# configure terminal
awplus(config)# ntp peer 192.0.2.23
```

To remove an NTP peer association for this peer with an IPv4 address of 192.0.2.23, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 192.0.2.23
```

To set an NTP peer association for this peer with an IPv6 address of 2001:0db8:010d::1, use the commands:

```
awplus# configure terminal
awplus(config)# ntp peer 2001:0db8:010d::1
```

To remove an NTP peer association for this peer with an IPv6 address of 2001:0db8:010d::1, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 2001:0db8:010d::1
```

To set the preferred peer to be IPv4 192.0.2.23 and the version to 4, with the authentication key '1234', use the commands:

```
awplus# configure terminal
awplus(config)# ntp peer 192.0.2.23 prefer version 4 key 1234
```

**Related  
commands**   [ntp server](#)  
              [ntp source](#)

# ntp rate-limit

**Overview** Use this command to enable NTP server response rate-limiting. Limiting NTP server responses can reduce network traffic when occurrences such as misconfigured or broken NTP clients poll the NTP server too frequently. Excessive polling can lead to network overload.

Use the **no** variant of this command to remove the rate-limit configuration.

**Syntax** `ntp rate-limit {interval<1-4096>|burst <1-255>|leak <2-16>}`  
`no ntp rate-limit`

| Parameter | Description                                                                                                                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interval  | The minimum interval between responses configured in seconds. The default interval is 8 seconds.                                                                                                           |
| burst     | The maximum number of responses that can be sent in a burst, temporarily exceeding the limit specified by the interval option. The default burst is 8 responses.                                           |
| leak      | The rate at which responses are randomly allowed even if the limits specified by the interval and burst options are exceeded. The default leak is 4, i.e. on average, every fourth request has a response. |

**Mode** Global Configuration

**Default** Interval - 8 seconds.

Burst - 8 responses.

Leak - 4.

**Example** To configure an NTP rate-limiting interval of 30 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# ntp rate-limit interval 30
```

**Related commands** [ntp restrict](#)

**Command changes** Version 5.4.8-1.1: command added

# ntp restrict

**Overview** Use this command to configure a restriction (allow or deny) on NTP packets or NTP functionality for a specific host/network or all hosts of a given IP family.

This means you can control host access to NTP service and NTP server status queries.

Use the **no** variant of this command to remove a restriction from one or more hosts.

**Syntax**

```
ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>}
{allow|deny}

ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>} query
{allow|deny}

ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>} serve
{allow|deny}

no ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>}
```

| Parameter      | Description                                                                                                                                                          |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| default-v4     | Apply this restriction to all IPv4 hosts.                                                                                                                            |
| default-v6     | Apply this restriction to all IPv6 hosts.                                                                                                                            |
| <host-address> | Apply this restriction to the specified IPv4 or IPv6 host.<br>Enter an IPv4 address in the format A.B.C.D.<br>Enter an IPv6 address in the format X:X::X:X.          |
| <host-subnet>  | Apply this restriction to the specified IPv4 subnet or IPv6 prefix.<br>Enter an IPv4 subnet in the format A.B.C.D/M.<br>Enter an IPv6 prefix in the format X:X::X/X. |
| query          | Control NTP server status queries to matching hosts.                                                                                                                 |
| serve          | Control NTP time service to matching hosts.                                                                                                                          |
| allow          | Allow the configured restriction.                                                                                                                                    |
| deny           | Deny the configured restriction.                                                                                                                                     |

**Default** By default, time service is allowed to all hosts, and NTP server status querying is denied to all hosts.

**Mode** Global Configuration

**Example** To prevent all IPv4 hosts from accessing a device for NTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict default-v4 deny
```

To prevent the host 192.168.1.1 from accessing a device for NTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict 198.168.1.1 deny
```

To allow all hosts in the 10.10.10.0/24 subnet to access a device for NTP server status, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict 10.10.10.0/24 query allow
```

**Related commands** [ntp rate-limit](#)

**Command changes** Version 5.4.8-1.1: command added

# ntp server

**Overview** Use this command to configure an NTP server. This means that this system will synchronize to the other system, and not vice versa. You can configure an NTP server association by hostname or IP address.

Use the **no** variant of this command to remove the configured NTP server.

**Syntax** `ntp server {<serveraddress>|<servername>} [prefer] [key <key>]  
[version <version>]`  
`no ntp server {<serveraddress>|<servername>}`

| Parameter         | Description                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <serveraddress>   | Specify the IP address of the peer, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X.X for an IPv6 address. |
| <servername>      | Specify the server hostname. The server hostname can resolve to an IPv4 and an IPv6 address.                                      |
| prefer            | Prefer this server when possible.                                                                                                 |
| key <key>         | Configure the server authentication key from the range 1 to 4294967295.                                                           |
| version <version> | Configure for this NTP version from the range 1 to 4.                                                                             |

**Mode** Global Configuration

**Examples** To obtain the time by synchronizing with the server at 192.0.1.23, use the commands:

```
awplus# configure terminal
awplus(config)# ntp server 192.0.1.23
```

To obtain the time by synchronizing with the server at 192.0.1.23, and specify that this is the best server to use, use the commands:

```
awplus# configure terminal
awplus(config)# ntp server 192.0.1.23 prefer
```

To obtain the time by synchronizing with the server at 2001:0db8:010e::2, use the commands:

```
awplus# configure terminal
awplus(config)# ntp server 2001:0db8:010e::2
```

To obtain the time by synchronizing with the server at 2001:0db8:010e::2, and specify that this is the best server to use, use the commands:

```
awplus# configure terminal
awplus(config)# ntp server 2001:0db8:010e::2 prefer
```

To stop using the time server at 2001:0db8:010e::2, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ntp server 2001:0db8:010e::2
```

**Related  
commands**

[ntp peer](#)

[ntp source](#)

# ntp source

**Overview** Use this command to configure an IPv4 or an IPv6 address for the NTP source interface. This command defines the socket used for NTP messages, and only applies to NTP client behavior.

Note that you cannot use this command when using AMF (Allied Telesis Management Framework) or VCStack.

Use the **no** variant of this command to remove the configured IPv4 or IPv6 address from the NTP source interface.

**Syntax** `ntp source <source-address>`  
`no ntp source`

| Parameter                           | Description                                                                                                                                       |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;source-address&gt;</code> | Specify the IP address of the NTP source interface, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X.X for an IPv6 address. |

**Default** An IP address is selected based on the most appropriate egress interface used to reach the NTP peer if a configured NTP client source IP address is unavailable or invalid.

**Mode** Global Configuration

**Usage notes** Adding an IPv4 or an IPv6 address allows you to select which source interface NTP uses for peering. The IPv4 or IPv6 address configured using this command is matched to the interface.

When selecting a source IP address to use for NTP messages to the peer, if the configured NTP client source IP address is unavailable then default behavior will apply, and an alternative source IP address is automatically selected. This IP address is based on the most appropriate egress interface used to reach the NTP peer. The configured NTP client source IP may be unavailable if the interface is down, or an invalid IP address is configured that does not reside on the device.

Note that this command only applies to NTP client behavior. The egress interface that the NTP messages use to reach the NTP server is determined by the [ntp peer](#) and [ntp server](#) commands.

**Examples** To configure the NTP source interface with the IPv4 address 192.0.2.23, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 192.0.2.23
```

To configure the NTP source interface with the IPv6 address 2001:0db8:010e::2, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 2001:0db8:010e::2
```

To remove a configured address for the NTP source interface, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp source
```

**Related  
commands**    [ntp peer](#)  
              [ntp server](#)

# show ntp associations

**Overview** Use this command to display the status of NTP associations.

**Syntax** show ntp associations

**Mode** User Exec and Privileged Exec

**Example** See the sample output of the **show ntp associations** command displaying the status of NTP associations.

Table 60-1: Example output from **show ntp associations**

|                                                                 |             |  |    |   |      |      |       |       |              |

Table 60-2: Parameters in the output from **show ntp associations**

| Parameter      | Description                                                                                                                                                                                                                                      |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| * system peer  | The peer that NTP uses to calculate variables like the offset and root dispersion of this AlliedWare Plus device. NTP passes these variables to the clients using this AlliedWare Plus device.                                                   |
| # backup       | Peers that are usable, but are not among the first six peers sorted by synchronization distance. These peers may not be used.                                                                                                                    |
| + candidate    | Peers that the NTP algorithm has determined can be used, along with the system peer, to discipline the clock (i.e. to set the time on the AlliedWare Plus device).                                                                               |
| - outlier      | Peers that are not used because their time is significantly different from the other peers.                                                                                                                                                      |
| x false ticker | Peers that are not used because they are not consider trustworthy.                                                                                                                                                                               |
| space          | Peers that are not used because they are, for example, unreachable.                                                                                                                                                                              |
| remote         | The peer IP address                                                                                                                                                                                                                              |
| refid          | The IP address of the reference clock, or an abbreviation indicating the type of clock (e.g. GPS indicates that the server uses GPS for the reference clock). INIT indicates that the reference clock is initializing, so it is not operational. |

Table 60-2: Parameters in the output from **show ntp associations** (cont.)

| Parameter | Description                                                                                                                                                                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| st        | The stratum, which is the number of hops between the server and the accurate time source such as an atomic clock.                                                                                                                                                                      |
| t         | Type, one of:<br>u: unicast or manycast client<br>b: broadcast or multicast client<br>l: local reference clock<br>s: symmetric peer<br>A: manycast server<br>B: broadcast server<br>M: multicast server                                                                                |
| when      | When last polled (seconds ago, h hours ago, or d days ago).                                                                                                                                                                                                                            |
| poll      | Time between NTP requests from the device to the server.                                                                                                                                                                                                                               |
| reach     | An indication of whether or not the NTP server is responding to requests. 0 indicates there has never been a successful poll; 1 indicates that the last poll was successful; 3 indicates that the last two polls were successful; 377 indicates that the last 8 polls were successful. |
| delay     | The round trip communication delay to the remote peer or server, in milliseconds.                                                                                                                                                                                                      |
| offset    | The mean offset (phase) in the times reported between this local host and the remote peer or server (root mean square, milliseconds).                                                                                                                                                  |
| disp      | The amount of clock error (in milliseconds) of the server due to clock resolution, network congestion, etc.                                                                                                                                                                            |

# show ntp counters

**Overview** This command displays packet counters for NTP.

**Syntax** show ntp counters

**Mode** Privileged Exec

**Example** To display counters for NTP use the command:

```
awplus# show ntp counters
```

Figure 60-1: Example output from **show ntp counters**

```
awplus#show ntp counters
Server Received 4
Server Dropped 0
Client Sent 90
Client Received 76
Client Valid Received 76
```

Table 60-3: Parameters in the output from **show ntp counters**

| Parameter             | Description                                                  |
|-----------------------|--------------------------------------------------------------|
| Server Received       | Number of NTP packets received from NTP clients.             |
| Server Dropped        | Number of NTP packets received from NTP clients but dropped. |
| Client Sent           | Number of NTP packets sent to servers.                       |
| Client Received       | Number of NTP packets received from servers                  |
| Client Valid Received | Number of valid NTP packets received from servers.           |

# show ntp counters associations

**Overview** Use this command to display NTP packet counters for individual servers and peers.

**Syntax** `show ntp counters associations`

**Mode** Privileged Exec

**Examples** To display packet counters for each NTP server and peer that is associated with a device, use the command:

```
awplus# show ntp counters associations
```

**Output** Figure 60-2: Example output from **show ntp counters associations**

```
awplus#show ntp counters associations
Peer 2001::1
 sent: -
 received: -
Peer 10.37.219.100
 sent: 7
 received: 7
```

Table 60-4: Parameters in the output from **show ntp counters associations**

| Parameter | Description                                                        |
|-----------|--------------------------------------------------------------------|
| Peer      | An NTP peer or server that the device is associated with.          |
| sent      | The number of NTP packets that this device sent to the peer.       |
| received  | The number of NTP packets that this device received from the peer. |

**Related commands** [ntp restrict](#)

# show ntp status

**Overview** Use this command to display the status of the Network Time Protocol (NTP).

**Syntax** show ntp status

**Mode** User Exec and Privileged Exec

**Example** To see information about NTP status, use the command:

```
awplus# show ntp status
```

For information about the output displayed by this command, see [ntp.org](http://ntp.org).

Figure 60-3: Example output from **show ntp status**

```
awplus#show ntp status
Reference ID : C0A8010A (192.168.1.10)
Stratum : 4
Ref time (UTC) : Fri Jun 15 05:32:38 2018
System time : 0.000002004 seconds fast of NTP time

# SNMP Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure SNMP. For more information, see:

- the [Support for Allied Telesis Enterprise\\_MIBs in AlliedWare Plus](#), for information about which MIB objects are supported.
- the [SNMP Feature Overview and Configuration\\_Guide](#).

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

- Command List**
- [“alias \(interface\)”](#) on page 2984

# alias (interface)

**Overview** Use this command to set an alias name for a port, as returned by the SNMP ifMIB in OID 1.3.6.1.2.1.31.1.1.1.18.

Use the **no** variant of this command to remove an alias name from a port.

**Syntax** `alias <ifAlias>`  
`no alias`

| Parameter | Description                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------|
| <ifAlias> | 64 character name for an interface in a network management system. All printable characters are valid. |

**Default** Not set.

**Mode** Interface Configuration

**Usage notes** The interface alias can also be set via SNMP.  
Third-party management systems often use standard MIBs to access device information. Network managers can specify an alias interface name to provide a non-volatile way to access the interface.

**Example** To configure the alias interface name 'uplink\_a' for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# alias uplink_a
```

To remove an alias interface name from port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no alias
```

**Command changes** Version 5.4.8-2.1: command added

# clear mac address-table notification mac-change

**Overview** Use this command to clear the MAC address table change history and counters. This command clears the change history and resets the counters to zero.

**Syntax** `clear mac address-table notification mac-change`

**Mode** User Exec

**Example** To clear the MAC address table change history and counters, use the command:

```
awplus# clear mac address-table notification mac-change
```

**Related commands**

- [mac address-table notification mac-change interval](#)
- [mac address-table notification mac-change history-size](#)
- [show mac address-table notification mac-change](#)
- [snmp trap mac-change](#)

**Command changes** Version 5.5.1-2.1: command added

# debug snmp

**Overview** This command enables SNMP debugging.

The **no** variant of this command disables SNMP debugging.

**Syntax** debug snmp  
[all|detail|error-string|process|receive|send|xdump]

no debug snmp  
[all|detail|error-string|process|receive|send|xdump]

| Parameter    | Description                                                                               |
|--------------|-------------------------------------------------------------------------------------------|
| all          | Enable or disable the display of all SNMP debugging information.                          |
| detail       | Enable or disable the display of detailed SNMP debugging information.                     |
| error-string | Enable or disable the display of debugging information for SNMP error strings.            |
| process      | Enable or disable the display of debugging information for processed SNMP packets.        |
| receive      | Enable or disable the display of debugging information for received SNMP packets.         |
| send         | Enable or disable the display of debugging information for sent SNMP packets.             |
| xdump        | Enable or disable the display of hexadecimal dump debugging information for SNMP packets. |

**Mode** Privileged Exec and Global Configuration

**Example** To start SNMP debugging, use the command:

```
awplus# debug snmp
```

To start SNMP debugging, showing detailed SNMP debugging information, use the command:

```
awplus# debug snmp detail
```

To start SNMP debugging, showing all SNMP debugging information, use the command:

```
awplus# debug snmp all
```

**Related commands** [show debugging snmp](#)  
[terminal monitor](#)  
[undebug snmp](#)

# mac address-table notification mac-change

**Overview** Use this command to enable the mac-change history table. You also need to use the command `snmp trap mac-change` to set up the trap and `snmp-server enable trap` to enable the trap for transmission.

Use the **no** variant of this command to disable the mac-change history table.

**Syntax** `mac address-table notification mac-change`  
`no mac address-table notification mac-change`

**Default** Disabled

**Mode** Global Configuration

**Usage notes** To set up the mac-change trap use the command:

- `snmp trap mac-change`

To enable transmission of the mac-change trap, specify the parameter **mac-change**, use the command:

- `snmp-server enable trap`

**Example** To enable the mac-change history table, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-change
```

**Related commands** `clear mac address-table notification mac-change`  
`mac address-table notification mac-change history-size`  
`mac address-table notification mac-change interval`  
`mac address-table notification mac-threshold`  
`show mac address-table notification mac-change`  
`snmp-server enable trap`  
`snmp trap mac-change`

**Command changes** Version 5.5.1-2.1: command added

# mac address-table notification mac-change history-size

**Overview** Use this command to set the MAC address table history size to an upper limit on the number of entries that the SNMP table may contain.

Use the **no** variant of this command to set the history size back to the default (1).

**Syntax** `mac address-table notification mac-change history-size <0-500>`  
`no mac address-table notification mac-change history-size`

| Parameter                  | Description                                                                               |
|----------------------------|-------------------------------------------------------------------------------------------|
| <code>&lt;0-500&gt;</code> | Set the upper limit on the number of entries that the SNMP MAC address table may contain. |

**Default** Table size is set at 1 entry.

**Mode** Global Configuration

**Usage notes** If the mac-change history table is not enabled, then the history size is stored for when it is enabled.

To enable the mac-change history table, use the command:

- [mac address-table notification mac-change](#)

**Example** To configure the size of the MAC change history table to 40, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-change
history-size 40
```

**Related commands** [clear mac address-table notification mac-change](#)  
[mac address-table notification mac-change](#)  
[mac address-table notification mac-change interval](#)  
[mac address-table notification mac-threshold](#)  
[show mac address-table notification mac-change](#)  
[snmp trap mac-change](#)

**Command changes** Version 5.5.1-2.1: command added

# mac address-table notification mac-change interval

**Overview** Use this command to set the maximum time that a MAC change SNMP notification is delayed in the MAC address table.

Use the **no** variant of this command to set the interval back to the default (1).

**Syntax** `mac address-table notification mac-change interval`  
`<0-2147483647>`  
`no mac address-table notification mac-change interval`

| Parameter                         | Description                  |
|-----------------------------------|------------------------------|
| <code>&lt;0-2147483647&gt;</code> | Set the interval in seconds. |

**Default** Interval is set at 1 second.

**Mode** Global Configuration

**Usage notes** If the mac-change history table is not enabled, then the interval is stored for when it is enabled.

To enable the mac-change history table, use the command:

- [mac address-table notification mac-change](#)

**Example** To configure an interval of 5 seconds for the time between two MAC change SNMP notifications being sent, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-change
interval 5
```

**Related commands**

- [clear mac address-table notification mac-change](#)
- [mac address-table notification mac-change](#)
- [mac address-table notification mac-change history-size](#)
- [mac address-table notification mac-threshold](#)
- [show mac address-table notification mac-change](#)
- [snmp trap mac-change](#)

**Command changes** Version 5.5.1-2.1: command added

# mac address-table notification mac-threshold

**Overview** Use this command to change the default interval and threshold values for storing and sending Layer 2 forwarding database (FDB) utilization information. These settings are stored in the running configuration.

Use the **no** variant of this command to set the threshold configuration back to the default.

**Syntax** `mac address-table notification mac-threshold {interval <120-214783647>|limit <0-100>}`  
`no mac address-table notification mac-threshold`

| Parameter       | Description                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------|
| interval        | Change the default interval value. The interval value controls the interval between utilization checks. |
| <120-214783647> | Set the interval in seconds.                                                                            |
| limit           | Change the limit value. When this limit is reached, an SNMP trap is sent.                               |
| <0-100>         | Set the limit as a percentage.                                                                          |

**Default** Interval default is 120 seconds and the limit default is 50 percent.

**Mode** Global Configuration

**Usage notes** To enable transmission of the mac-threshold trap, specify the parameter **mac-threshold**, use the command:

- [snmp-server enable trap](#)

**Example** To configure the MAC threshold notifications to be sent if the L2 FDB table utilization is more than or equal to 70%, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-threshold
limit 70
```

To set the MAC threshold notifications interval and limit back to default values, use the commands:

```
awplus# configure terminal
awplus(config)# no mac address-table notification mac-threshold
```

**Related commands** [show running-config](#)  
[snmp-server enable trap](#)

**Command changes** Version 5.5.1-2.1: command added

# show counter snmp-server

**Overview** This command displays counters for SNMP messages received by the SNMP agent.

**Syntax** `show counter snmp-server`

**Mode** User Exec and Privileged Exec

**Example** To display the counters for the SNMP agent, use the command:

```
awplus# show counter snmp-server
```

**Output** Figure 61-1: Example output from the **show counter snmp-server** command

**Table 1:** Parameters in the output of the **show counter snmp-server** command

| Parameter           | Meaning                                                                                                                                                                                                                                                                                            |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| inPkts              | The total number of SNMP messages received by the SNMP agent.                                                                                                                                                                                                                                      |
| inBadVersions       | The number of messages received by the SNMP agent for an unsupported SNMP version. It drops these messages. The SNMP agent on your device supports versions 1, 2C, and 3.                                                                                                                          |
| inBadCommunityNames | The number of messages received by the SNMP agent with an unrecognized SNMP community name. It drops these messages.                                                                                                                                                                               |
| inBadCommunityUses  | The number of messages received by the SNMP agent where the requested SNMP operation is not permitted from SNMP managers using the SNMP community named in the message.                                                                                                                            |
| inASNParseErrs      | The number of ASN.1 or BER errors that the SNMP agent has encountered when decoding received SNMP Messages.                                                                                                                                                                                        |
| inTooBigs           | The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'tooBig'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.                                                                         |
| inNoSuchNames       | The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'noSuchName'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.                                                                     |
| inBadValues         | The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'badValue'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.                                                                       |
| inReadOnlys         | The number of valid SNMP PDUs received by the SNMP agent where the value of the error-status field is 'readOnly'. The SNMP manager should not generate a PDU which contains the value 'readOnly' in the error-status field. This indicates that there is an incorrect implementations of the SNMP. |
| inGenErrs           | The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'genErr'.                                                                                                                                                                                          |

**Table 1:** Parameters in the output of the **show counter snmp-server** command

| Parameter      | Meaning                                                                                                                                                                                                                              |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| inTotalReqVars | The number of MIB objects that the SNMP agent has successfully retrieved after receiving valid SNMP Get-Request and Get-Next PDUs.                                                                                                   |
| inTotalSetVars | The number of MIB objects that the SNMP agent has successfully altered after receiving valid SNMP Set-Request PDUs.                                                                                                                  |
| inGetRequests  | The number of SNMP Get-Request PDUs that the SNMP agent has accepted and processed.                                                                                                                                                  |
| inGetNexts     | The number of SNMP Get-Next PDUs that the SNMP agent has accepted and processed.                                                                                                                                                     |
| inSetRequests  | The number of SNMP Set-Request PDUs that the SNMP agent has accepted and processed.                                                                                                                                                  |
| inGetResponses | The number of SNMP Get-Response PDUs that the SNMP agent has accepted and processed.                                                                                                                                                 |
| inTraps        | The number of SNMP Trap PDUs that the SNMP agent has accepted and processed.                                                                                                                                                         |
| outPkts        | The number of SNMP Messages that the SNMP agent has sent.                                                                                                                                                                            |
| outTooBigs     | The number of SNMP PDUs that the SNMP agent has generated with the value 'tooBig' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.     |
| outNoSuchNames | The number of SNMP PDUs that the SNMP agent has generated with the value 'noSuchName' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager. |
| outBadValues   | The number of SNMP PDUs that the SNMP agent has generated with the value 'badValue' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.   |
| outGenErrs     | The number of SNMP PDUs that the SNMP agent has generated with the value 'genErr' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.     |
| outGetRequests | The number of SNMP Get-Request PDUs that the SNMP agent has generated.                                                                                                                                                               |

**Table 1:** Parameters in the output of the **show counter snmp-server** command

| Parameter            | Meaning                                                                                                                                           |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| outGetNexts          | The number of SNMP Get-Next PDUs that the SNMP agent has generated.                                                                               |
| outSetRequests       | The number of SNMP Set-Request PDUs that the SNMP agent has generated.                                                                            |
| outGetResponses      | The number of SNMP Get-Response PDUs that the SNMP agent has generated.                                                                           |
| outTraps             | The number of SNMP Trap PDUs that the SNMP agent has generated.                                                                                   |
| UnsupportedSecLevels | The number of received packets that the SNMP agent has dropped because they requested a securityLevel unknown or not available to the SNMP agent. |
| NotInTimeWindows     | The number of received packets that the SNMP agent has dropped because they appeared outside of the authoritative SNMP agent's window.            |
| UnknownUserNames     | The number of received packets that the SNMP agent has dropped because they referenced an unknown user.                                           |
| UnknownEngineIDs     | The number of received packets that the SNMP agent has dropped because they referenced an unknown snmpEngineID.                                   |
| WrongDigest          | The number of received packets that the SNMP agent has dropped because they didn't contain the expected digest value.                             |
| DecryptionErrors     | The number of received packets that the SNMP agent has dropped because they could not be decrypted.                                               |
| UnknownSecModels     | The number of messages received that contain a security model that is not supported by the server. Valid for SNMPv3 messages only.                |
| InvalidMsgs          | The number of messages received where the security model is supported but the authentication fails. Valid for SNMPv3 messages only.               |
| UnknownPDUHandlers   | The number of times the SNMP handler has failed to process a PDU. This is a system debugging counter.                                             |

# show debugging snmp

**Overview** This command displays whether SNMP debugging is enabled or disabled.

**Syntax** show debugging snmp

**Mode** User Exec and Privileged Exec

**Example** To display the status of SNMP debugging, use the command:

```
awplus# show debugging snmp
```

**Output** Figure 61-2: Example output from the **show debugging snmp** command

```
Sntp (SMUX) debugging status:
Sntp debugging is on
```

**Related commands** [debug snmp](#)

# show mac address-table notification mac-change

**Overview** Use this command to show the MAC change configuration. It includes the MAC change history.

**Syntax** show mac address-table notification mac-change

**Mode** User Exec

**Example** To show the MAC change configuration and history, use the command:

```
awplus# show mac address-table notification mac-change
```

**Output** Figure 61-3: Example output from **show mac address-table notification mac-change**

```
awplus#show mac address-table notification mac-change
MAC Change Feature: Enabled
MAC Change Notification Traps: Enabled
Wait time for MAC Change Notification Traps: 1 seconds
Number of MAC Address Add events: 1
Number of MAC Address Remove events: 0
Number of MAC Change Notification Traps sent: 1
Maximum Number of entries configured in History Table: 1
Number of entries currently in History Table: 1
History Table contents

History Index 1, Timestamp(uptime) 0 days 00:39:25 (236500)
MAC Change message:
 Operation: Added Vlan: 2 MAC Addr: 000d.b950.0c26
 Dot1dBasePort: 2
```

Table 61-1: Parameters in the output from **show mac address-table notification mac-change**

| Parameter                                   | Description                                                                                                                                                                                              |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAC Change Feature                          | Displays if the feature is enabled or not. If this is disabled, then no more MAC change events will be generated, no events are added to the history, and no traps are logged.                           |
| MAC Change Notification Traps               | Displays if MAC change traps are sent when MAC change events are generated. This only affects traps, (MAC change history is not affected).                                                               |
| Wait time for MAC Change Notification Traps | The maximum time a MAC change event waits before a MAC change trap is sent. This is also the maximum time a MAC change event waits before being added to the MAC change history. The time is in seconds. |

Table 61-1: Parameters in the output from **show mac address-table notification mac-change** (cont.)

| Parameter                                             | Description                                                    |
|-------------------------------------------------------|----------------------------------------------------------------|
| Number of MAC Address Add events                      | The number of MAC-added events processed by the feature.       |
| Number of MAC Address Remove events                   | The number of MAC-removed events processed by the feature.     |
| Number of MAC Change Notification Traps sent          | The number of MAC notification traps sent by the feature.      |
| Maximum Number of entries configured in History Table | The maximum number of entries present in the MAC change table. |

- `snmp-server engineID local`
- `snmp-server engineID local reset`

# show snmp-server community

**Overview** This command displays the SNMP server communities configured on the device. SNMP communities are specific to v1 and v2c.

**Syntax** `show snmp-server community`

**Mode** Privileged Exec

**Example** To display the SNMP server communities, use the command:

```
awplus# show snmp-server community
```

**Output** Figure 61-6: Example output from the **show snmp-server community** command

```
SNMP community information:
Community Name public
Access Read-only
View none
```

# show snmp-server view

**Overview** This command displays the SNMP server views and is used with SNMP version 3 only.

**Syntax** `show snmp-server view`

**Mode** Privileged Exec

**Example** To display the SNMP server views configured on the device, use the command:

```
awplus# show snmp-server view
```

**Output** Figure 61-10: Example output from the **show snmp-server view** command

```
SNMP view information:
View Name view1
OID 1
Type included
```

**Related commands** [show snmp-server](#)  
[snmp-server view](#)

# snmp trap link-status

**Overview** Use this command to enable SNMP to send link status notifications (traps) for the interfaces when an interface goes up (linkUp) or down (linkDown).

Use the **no** variant of this command to disable the sending of link status notifications.

**Syntax** `snmp trap link-status [enterprise]`  
`no snmp trap link-status`

| Parameter  | Description                                          |
|------------|------------------------------------------------------|
| enterprise | Send an Allied Telesis enterprise type of link trap. |

**Default** Disabled

**Mode** Interface Configuration

**Usage notes** The link status notifications can be enabled for the following interface types:

- switch port (e.g. port1.0.1)
- VLAN (e.g. vlan2)
- static and dynamic link aggregation (e.g. sa2, po2)

To specify where notifications are sent, use the [snmp-server host](#) command. To configure the device globally to send other notifications, use the [snmp-server enable trap](#) command.

**Examples** To enable SNMP to send link status notifications for port1.0.1 to port1.0.3 use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.3
awplus(config-if)# snmp trap link-status
```

To disable the sending of link status notifications for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no snmp trap link-status
```

**Related commands** [show interface](#)  
[snmp trap link-status suppress](#)  
[snmp-server enable trap](#)  
[snmp-server host](#)

# snmp trap link-status suppress

**Overview** Use this command to enable the suppression of link status notifications (traps) for the interfaces beyond the specified threshold, in the specified interval.

Use the **no** variant of this command to disable the suppression of link status notifications for the ports.

**Syntax** `snmp trap link-status suppress {time {<1-60>|default}|threshold {<1-20>|default}}`  
`no snmp trap link-status suppress`

| Parameter | Description                                                                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| time      | Set the suppression timer for link status notifications.                                                                                                                                          |
| <1-60>    | The suppress time in seconds.                                                                                                                                                                     |
| default   | The default suppress time in seconds (60).                                                                                                                                                        |
| threshold | Set the suppression threshold for link status notifications. This is the number of link status notifications after which to suppress further notifications within the suppression timer interval. |
| <1-20>    | The number of link status notifications.                                                                                                                                                          |
| default   | The default number of link status notifications (20).                                                                                                                                             |

**Default** By default, if link status notifications are enabled (they are enabled by default), the suppression of link status notifications is enabled: notifications that exceed the notification threshold (default 20) within the notification timer interval (default 60 seconds) are not sent.

**Mode** Interface Configuration

**Usage notes** An unstable network can generate many link status notifications. When notification suppression is enabled, a suppression timer is started when the first link status notification of a particular type (linkUp or linkDown) is sent for an interface.

If the threshold number of notifications of this type is sent before the timer reaches the suppress time, any further notifications of this type generated for the interface during the interval are not sent. At the end of the interval, the sending of link status notifications resumes, until the threshold is reached in the next interval.

**Examples** To suppress link status notifications for port1.0.1 to port1.0.3 after 10 notifications in 40 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.3
awplus(config-if)# snmp trap link-status suppress time 40
threshold 10
```

To stop suppressing link status notifications for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no snmp trap link-status suppress
```

# snmp trap mac-change

**Overview** Use this command to enable the MAC notification feature to apply mac-change notifications via the mac-change trap. This command configures the trap so that you are notified when MAC addresses are added or removed from the forwarding database (FDB). This is applied to interfaces via a specified port or a range of ports. Use the **no** variant of this command to disable the MAC notification feature.

**Syntax** `snmp trap mac-change {[add] [remove]}`  
`no snmp trap mac-change [add] [remove]`

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| add       | Enable SNMP mac-change traps when a MAC address is added.   |
| remove    | Enable SNMP mac-change traps when a MAC address is removed. |

**Default** Disabled

**Mode** Interface Configuration

**Usage notes** To enable transmission of the mac-change trap, specify the parameter **mac-change**, use the command:

- [snmp-server enable trap](#)

To enable the mac-change history table, use the command:

- [mac address-table notification mac-change](#)

**Example** To get mac-change notifications whenever a MAC address associated with port1.0.1 is added or removed from the FDB table, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# snmp trap mac-change add remove
```

**Related commands** [clear mac address-table notification mac-change](#)

[snmp-server enable trap](#)

**Command changes** Version 5.5.1-2.1: command added

# snmp-server

**Overview** Use this command to enable the SNMP agent (server) on the device. The SNMP agent receives and processes SNMP packets sent to the device, and generates notifications (traps) that have been enabled by the [snmp-server enable trap](#) command.

Use the **no** variant of this command to disable the SNMP agent on the device. When SNMP is disabled, SNMP packets received by the device are discarded, and no notifications are generated. This does not remove any existing SNMP configuration.

**Syntax** `snmp-server [ip|ipv6]`  
`no snmp-server [ip|ipv6]`

| Parameter | Description                                |
|-----------|--------------------------------------------|
| ip        | Enable or disable the SNMP agent for IPv4. |
| ipv6      | Enable or disable the SNMP agent for IPv6. |

**Default** By default, the SNMP agent is enabled for both IPv4 and IPv6. If neither the **ip** parameter nor the **ipv6** parameter is specified for this command, then SNMP is enabled or disabled for both IPv4 and IPv6.

**Mode** Global Configuration

**Examples** To enable SNMP on the device for both IPv4 and IPv6, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server
```

To enable the SNMP agent for IPv4 on the device, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server ip
```

To disable the SNMP agent for both IPv4 and IPv6 on the device, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-server
```

To disable the SNMP agent for IPv4, use the commands:

```
awplus(config)# no snmp-server ipv4
```

# snmp-server community

**Overview** This command creates an SNMP community, optionally setting the access mode for the community. The default access mode is read-only. If the view parameter is not specified, the community allows access to all the MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used when operating SNMPv3.

The **no** variant of this command removes an SNMP community. The specified community must already exist on the device.

**Syntax** `snmp-server community <community-name> [view <view-name>|ro|rw|<access-list>]`  
`no snmp-server community <community-name>`

| Parameter        | Description                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------------------|
| <community-name> | Community name. The community name is a case sensitive string of up to 20 characters.                                 |
| view             | Configure SNMP view. If view is not specified, the community allows access to all the MIB objects.                    |
| <view-name>      | View name. The view name is a string up to 20 characters long and is case sensitive.                                  |
| ro               | Read-only community.                                                                                                  |
| rw               | Read-write community.                                                                                                 |
| <access-list>    | <1-99> Access list number. Warning: Do not use an ACL with deny rules. This is because only permit rules are applied. |

**Default** The default access mode is Read-only.

**Mode** Global Configuration

**Example** Use the following commands to create an SNMP community called 'public' with read-only access to all MIB variables from any management station:

```
awplus# configure terminal
awplus(config)# snmp-server community public ro
```

Use the following commands to remove an SNMP community called 'public'

```
awplus# configure terminal
awplus(config)# no snmp-server community public
```

[show snmp-server community](#)  
[snmp-server view](#)

# snmp-server contact

**Overview** This command sets the contact information for the system. The contact name is:

- displayed in the output of the [show system](#) command
- stored in the MIB object sysContact

The **no** variant of this command removes the contact information from the system.

**Syntax** `snmp-server contact <contact-info>`  
`no snmp-server contact`

| Parameter                         | Description                                                                                                                     |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;contact-info&gt;</code> | The contact information for the system, from 0 to 255 characters long. Valid characters are any printable character and spaces. |

**Mode** Global Configuration

**Example** To set the system contact information to “support@alliedtelesis.co.nz”, use the command:

```
awplus# configure terminal
awplus(config)# snmp-server contact
support@alliedtelesis.co.nz
```

**Related commands** [show system](#)  
[snmp-server location](#)  
[snmp-server group](#)

# snmp-server enable trap

**Overview** Use this command to enable the transmission of the specified notifications (traps) on your device.

Note that the Environmental Monitoring traps defined in the AT-ENVMONv2-MIB are enabled by default.

Use the **no** variant of this command to disable the transmission of the specified notifications.

**Syntax** `snmp-server enable trap <trap-list>`  
`no snmp-server enable trap <trap-list>`

Depending on your device model, you can enable some or all of the traps in the following table:

| Parameter     | Description                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| atmf          | AMF traps.                                                                                                                                                                          |
| atmfguestnode | AMF guest node traps.                                                                                                                                                               |
| atmflink      | AMF link traps.                                                                                                                                                                     |
| atmfnode      | AMF node traps.                                                                                                                                                                     |
| atmfrr        | AMF reboot-rolling traps.                                                                                                                                                           |
| auth          | Authentication failure.                                                                                                                                                             |
| bgp           | BGP traps.                                                                                                                                                                          |
| chassis       | Chassis traps.                                                                                                                                                                      |
| cwmap         | Access Point traps with the AWC wireless manager.                                                                                                                                   |
| dhcpsnooping  | DHCP snooping and ARP security traps. These notifications must also be set using the <b>ip dhcp snooping violation</b> command, and/or the <b>arp security violation</b> command.   |
| epsr          | EPSR traps.                                                                                                                                                                         |
| g8032         | G.8032 ERP traps.                                                                                                                                                                   |
| lldp          | Link Layer Discovery Protocol (LLDP) traps. These notifications must also be enabled using the <b>lldp notifications</b> command, and/or the <b>lldp med-notifications</b> command. |
| loopprot      | Loop Protection traps.                                                                                                                                                              |

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| low-memory    | Traps that are generated when available memory drops beneath low, very low, and critical thresholds, and when it returns to normal. The traps are: <ul style="list-style-type: none"> <li>• 1.3.6.1.4.1.207.8.4.4.3.7.0 memoryTraps</li> <li>• 1.3.6.1.4.1.207.8.4.4.3.7.0.1 memoryLowTrap</li> <li>• 1.3.6.1.4.1.207.8.4.4.3.7.0.2 memoryVeryLowTrap</li> <li>• 1.3.6.1.4.1.207.8.4.4.3.7.0.3 memoryCriticalTrap (However, note that when the system reaches the critical memory threshold, it reboots before a trap can be sent.)</li> <li>• 1.3.6.1.4.1.207.8.4.4.3.7.0.4 memoryReturnToNormalTrap</li> <li>• 1.3.6.1.4.1.207.8.4.4.3.7.0.5 vcstackId</li> </ul> |
| mac-change    | MAC address changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| thrash-limit  | MAC address Thrash Limiting traps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| vcs           | VCS traps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| vrrp          | Virtual Router Redundancy (VRRP) traps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| ufo           | Upstream Forwarding Only (UFO) traps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Default** Disabled

**Mode** Global Configuration

**Usage notes** This command cannot be used to enable link status notifications globally. To enable link status notifications for particular interfaces, use the [snmp trap link-status](#) command.

To specify where notifications are sent, use the [snmp-server host](#) command.

Note that you can enable (or disable) multiple traps with a single command, by specifying a space-separated list of traps.

**Examples** To enable the device to send a notification if an AMF node changes its status, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap atmfnode
```

To enable the device to send PoE related traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap power-inline
```

To disable PoE traps being sent out by the device, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap power-inline
```

To enable the device to send MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap thrash-limit
```

To disable the device from sending MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap thrash-limit
```

To enable the device to send OSPF and VRRP-related traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap ospf vrrp
```

To disable OSPF traps being sent out by the device, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap ospf
```

**Related commands**

**Command changes**

- Version 5.5.4-2.3: **low-memory** parameter added
- Version 5.5.1-2.1: **mac-change**, **mac-move**, and **mac-threshold** parameters added
- Version 5.5.1-1.1: **atmfguestnode** and **cwmap** parameters added
- Version 5.4.7-2.1: **ufo** parameter added

# snmp-server engineID local

**Overview** Use this command to configure the SNMPv3 engine ID. The SNMPv3 engine ID is used to uniquely identify the SNMPv3 agent on a device when communicating with SNMP management clients. Once an SNMPv3 engine ID is assigned, this engine ID is permanently associated with the device until you change it.

Use the **no** variant of this command to set the user defined SNMPv3 engine ID to a system generated pseudo-random value by resetting the SNMPv3 engine. The **no snmp-server engineID local** command has the same effect as the **snmp-server engineID local default** command.

Note that the [snmp-server engineID local reset](#) command is used to force the system to generate a new engine ID when the current engine ID is also system generated.

**Syntax** `snmp-server engineID local {<engine-id>|default}`  
`no snmp-server engineID local`

| Parameter                      | Description                                                                                                                                                                                                                                                                                      |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;engine-id&gt;</code> | Specify SNMPv3 Engine ID value, a string of up to 27 characters.                                                                                                                                                                                                                                 |
| <code>default</code>           | Set SNMPv3 engine ID to a system generated value by resetting the SNMPv3 engine, provided the current engine ID is user defined. If the current engine ID is system generated, use the <a href="#">snmp-server engineID local reset</a> command to force the system to generate a new engine ID. |

**Mode** Global Configuration

**Usage notes** All devices must have a unique engine ID which is permanently set unless it is configured by the user.

In a stacked environment, if the same engine ID was automatically generated for all members of the stack, conflicts would occur if the stack was dismantled. Therefore, each member of the stack will generate its own engine ID and the stack master's ID is used when transmitting SNMPv3 packets. Should a master failover occur, a different engine ID is transmitted. You can modify this behavior by manually assigning all stack members the same engine ID using the [snmp-server engineID local](#) command. However, should you decide to separate the stack and use the devices individually, you must remember to change or remove this configuration to prevent conflicts.

**Example** To set the SNMPv3 engine ID to 800000cf030000cd123456, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local
800000cf030000cd123456
```

To set a user defined SNMPv3 engine ID back to a system generated value, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server engineID local
```

**Output** The following example shows the engine ID values after configuration:

```
awplus(config)#snmp-server engineid local asdgdfh231234d
awplus(config)#exit
awplus#show snmp-server

SNMP Server Enabled
IP Protocol IPv4
SNMPv3 Engine ID (configured name) ... asdgdfh231234d
SNMPv3 Engine ID (actual) 0x80001f888029af52e149198483

awplus(config)#no snmp-server engineid local
awplus(config)#exit
awplus#show snmp-server

SNMP Server Enabled
IP Protocol IPv4
SNMPv3 Engine ID (configured name) ... Not set
SNMPv3 Engine ID (actual) 0x80001f888029af52e149198483
```

**Related commands**

- [snmp-server engineID local reset](#)
- [snmp-server group](#)

# snmp-server engineID local reset

**Overview** Use this command to force the device to generate a new pseudo-random SNMPv3 engine ID by resetting the SNMPv3 engine. If the current engine ID is user defined, use the [snmp-server engineID local](#) command to set SNMPv3 engine ID to a system generated value.

**Syntax** `snmp-server engineID local reset`

**Mode** Global Configuration

**Example** To force the SNMPv3 engine ID to be reset to a system generated value, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local reset
```

**Related commands** [snmp-server engineID local](#)  
[show snmp-server](#)

## snmp-server group

**Overview** This command is used with SNMP version 3 only, and adds an SNMP group, optionally setting the security level and view access modes for the group. The security and access views defined for the group represent the minimum required of its users in order to gain access.

The **no** variant of this command deletes an SNMP group, and is used with SNMPv3 only. The group with the specified authentication/encryption parameters must already exist.

**Syntax** `snmp-server group <groupname> {auth|noauth|priv} [read <readname>|write <writename>|notify <notifysname>]`  
`no snmp-server group <groupname>`

| Parameter     | Description                                                                                 |
|---------------|---------------------------------------------------------------------------------------------|
| <groupname>   | Group name. The group name is a string up to 20 characters long and is case sensitive.      |
| auth          | Authentication.                                                                             |
| noauth        | No authentication and no encryption.                                                        |
| priv          | Authentication and encryption.                                                              |
| read          | Configure read view.                                                                        |
| <readname>    | Read view name.                                                                             |
| write         | Configure write view.                                                                       |
| <writename>   | Write view name. The view name is a string up to 20 characters long and is case sensitive.  |
| notify        | Configure notify view.                                                                      |
| <notifysname> | Notify view name. The view name is a string up to 20 characters long and is case sensitive. |

**Mode** Global Configuration

**Examples** To add SNMP group, for ordinary users, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server group usergroup noauth read
useraccess write useraccess
```

To delete the SNMP group called 'usergroup', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server group usergroup
```

**Related  
commands**

snmp-server  
show snmp-server  
show snmp-server group  
show snmp-server user

# snmp-server host

**Overview** This command specifies an SNMP trap host destination to which Trap or Inform messages generated by the device are sent.

For SNMP version 1 and 2c you must specify the community name parameter. For SNMP version 3, specify the authentication/encryption parameters and the user name. If the version is not specified, the default is SNMP version 1. Inform messages can be sent instead of traps for SNMP version 2c and 3.

Use the **no** variant of this command to remove an SNMP trap host. The trap host must already exist.

The trap host is uniquely identified by:

- host IP address (IPv4 or IPv6)
- inform or trap messages
- community name (SNMPv1 or SNMP v2c) or the authentication/encryption parameters and user name (SNMP v3).

**Syntax**

```
snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
[version 1] <community-name>

snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 2c <community-name>

snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>

no snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
[version 1] <community-name>

no snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 2c <community-name>

no snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>
```

| Parameter      | Description                                                                    |
|----------------|--------------------------------------------------------------------------------|
| <ipv4-address> | IPv4 trap host address in the format A.B.C.D, for example, 192.0.2.2.          |
| <ipv6-address> | IPv6 trap host address in the format x::x::x for example, 2001:db8::8a2e:7334. |
| informs        | Send Inform messages to this host.                                             |
| traps          | Send Trap messages to this host (default).                                     |
| version        | SNMP version to use for notification messages. Default: version 1.             |
| 1              | Use SNMPv1 (default).                                                          |
| 2c             | Use SNMPv2c.                                                                   |
| 3              | Use SNMPv3.                                                                    |

| Parameter        | Description                           |
|------------------|---------------------------------------|
| auth             | Authentication.                       |
| noauth           | No authentication.                    |
| priv             | Encryption.                           |
| <community-name> | The SNMPv1 or SNMPv2c community name. |
| <user-name>      | SNMPv3 user name.                     |

**Default** No host is defined.

**Mode** Global Configuration

**Usage notes** You can test connectivity to the host by using the command [test snmp trap snmp](#).

**Examples** To configure the device to send generated traps to the IPv4 host destination 192.0.2.5 with the SNMPv2c community name 'public', use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server host 192.0.2.5 version 2c public
```

To configure the device to send generated traps to the IPv6 host destination 2001:db8::8a2e:7334 with the SNMPv2c community name 'private', use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server host 2001:db8::8a2e:7334 version 2c private
```

To remove a configured trap host of 192.0.2.5 with the SNMPv2c community name 'public', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server host 192.0.2.5 version 2c public
```

**Related commands**

- [snmp-server enable trap](#)
- [snmp-server view](#)
- [test snmp trap snmp](#)

**Command changes** Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

# snmp-server legacy-ifadminstatus

**Overview** Use this command to set the ifAdminStatus to reflect the operational state of the interface, rather than the administrative state.

The **no** variant of this command sets the ifAdminStatus to reflect the administrative state of the interface.

**Syntax** `snmp-server legacy-ifadminstatus`  
`no snmp-server legacy-ifadminstatus`

**Default** Legacy ifAdminStatus is turned off by default, so by default the SNMP ifAdminStatus reflects the administrative state of the interface.

**Mode** Global Configuration

**Usage notes** Note that if you enable Legacy ifAdminStatus, the ifAdminStatus will report a link's status as Down when the link has been blocked by a process such as loop protection.

**Example** To turn on Legacy ifAdminStatus, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server legacy-ifadminstatus
```

**Related commands** [show interface](#)

# snmp-server location

**Overview** This command sets the location of the system. The location is:

- displayed in the output of the [show system](#) command
- stored in the MIB object sysLocation

The **no** variant of this command removes the configured location from the system.

**Syntax** `snmp-server location <location-name>`  
`no snmp-server location`

| Parameter                          | Description                                                                                                         |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <code>&lt;location-name&gt;</code> | The location of the system, from 0 to 255 characters long. Valid characters are any printable character and spaces. |

**Mode** Global Configuration

**Example** To set the location to “server room 523”, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server location server room 523
```

**Related commands** [show snmp-server](#)  
[show system](#)  
[snmp-server contact](#)

# snmp-server source-interface

**Overview** Use this command to specify the originating interface for SNMP traps or informs. An interface specified by this command must already have an IP address assigned to it.

Use the **no** variant of this command to reset the interface to its default value (the originating egress interface).

**Syntax** `snmp-server source-interface {traps|informs} <interface-name>`  
`no snmp-server source-interface {traps|informs}`

| Parameter        | Description                                                |
|------------------|------------------------------------------------------------|
| traps            | SNMP traps.                                                |
| informs          | SNMP informs.                                              |
| <interface-name> | Interface name (must already have an IP address assigned). |

**Default** The originating egress interface of the traps and informs messages

**Mode** Global Configuration

**Usage notes** When an SNMP server sends an SNMP trap or inform message, the message carries the notification IP address of its originating interface. Use this command to assign this interface.

**Example** The following commands set vlan2 to be the interface whose IP address is used as the originating address in SNMP informs packets.

```
awplus# configure terminal
awplus(config)# snmp-server source-interface informs vlan2
```

The following commands reset the originating source interface for SNMP trap messages to be the default interface (the originating egress interface):

```
awplus# configure terminal
awplus(config)# no snmp-server source-interface traps
```

**Validation Commands** [show running-config](#)

# snmp-server startup-trap-delay

**Overview** Use this command to set the time in seconds after following completion of the device startup sequence before the device sends any SNMP traps (or SNMP notifications).

Use the no variant of this command to restore the default startup delay of 30 seconds.

**Syntax** `snmp-server startup-trap-delay <delay-time>`  
`no snmp-server startup-trap-delay`

| Parameter                       | Description                                                                   |
|---------------------------------|-------------------------------------------------------------------------------|
| <code>&lt;delay-time&gt;</code> | Specify an SNMP trap delay time in seconds in the range of 30 to 600 seconds. |

**Default** The SNMP server trap delay time is 30 seconds. The no variant restores the default.

**Mode** Global Configuration

**Example** To delay the device sending SNMP traps until 60 seconds after device startup, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server startup-trap-delay 60
```

To restore the sending of SNMP traps to the default of 30 seconds after device startup, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server startup-trap-delay
```

**Validation  
Commands** `show snmp-server`

## snmp-server user

**Overview** Use this command to create or move users as members of specified groups. This command is used with SNMPv3 only.

The **no** variant of this command removes an SNMPv3 user. The specified user must already exist.

**Syntax** `snmp-server user <username> <groupname> [encrypted] [auth {md5|sha|sha-256} <auth-password>] [priv {des|aes} <privacy-password>]`  
`no snmp-server user <username>`

| Parameter          | Description                                                                                            |
|--------------------|--------------------------------------------------------------------------------------------------------|
| <username>         | User name. The user name is a string up to 20 characters long and is case sensitive.                   |
| <groupname>        | Group name. The group name is a string up to 20 characters long and is case sensitive.                 |
| encrypted          | Use the encrypted parameter when you want to enter encrypted passwords.                                |
| auth               | Authentication protocol.                                                                               |
| md5                | MD5 Message Digest Algorithms.                                                                         |
| sha                | SHA Secure Hash Algorithm.                                                                             |
| sha-256            | SHA-256 Secure Hash Algorithm. Note: SHA-256 authentication is required in crypto secure-mode.         |
| <auth-password>    | Authentication password. The password is a string of 8 to 20 characters long and is case sensitive.    |
| priv               | Privacy protocol.                                                                                      |
| des                | DES: Data Encryption Standard. DES is not available if you enable <a href="#">crypto secure-mode</a> . |
| aes                | AES: Advanced Encryption Standards.                                                                    |
| <privacy-password> | Privacy password. The password is a string of 8 to 20 characters long and is case sensitive.           |

**Mode** Global Configuration

**Usage notes** Additionally this command provides the option of selecting an authentication protocol and (where appropriate) an associated password. Similarly, options are offered for selecting a privacy protocol and password.

- Note that each SNMP user must be configured on both the manager and agent entities. Where passwords are used, these passwords must be the same for both entities.

- Use the **encrypted** parameter when you want to enter already encrypted passwords in encrypted form as displayed in the running and startup configs stored on the device. For example, you may need to move a user from one group to another group and keep the same passwords for the user instead of removing the user to apply new passwords.
- User passwords are entered using plaintext without the **encrypted** parameter and are encrypted according to the authentication and privacy protocols selected.
- User passwords are viewed as encrypted passwords in running and startup configs shown from **show running-config** and **show startup-config** commands respectively. Copy and paste encrypted passwords from running-configs or startup-configs to avoid entry errors.

**Examples** To add SNMP user authuser as a member of group 'usergroup', with authentication protocol MD5, authentication password 'Authpass', privacy protocol AES and privacy password 'Privpass' use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# snmp-server user authuser usergroup auth md5
Authpass priv aes Privpass
```

Validate the user is assigned to the group using the **show snmp-server user** command:

| awplus#show snmp-server user |            |       |         |
|------------------------------|------------|-------|---------|
| Name                         | Group name | Auth  | Privacy |
| -----                        | -----      | ----- | -----   |
| authuser                     | usergroup  | md5   | aes     |

To enter existing SNMP user 'authuser' with existing passwords as a member of group 'newusergroup' with authentication protocol MD5 with the encrypted authentication password 0x1c74b9c22118291b0ce0cd883f8dab6b74, and privacy protocol AES with the encrypted privacy password 0x0e0133db5453ebd03822b004eeacb6608f, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# snmp-server user authuser newusergroup
encrypted auth md5 0x1c74b9c22118291b0ce0cd883f8dab6b74 priv
aes 0x0e0133db5453ebd03822b004eeacb6608f
```

**NOTE:** Copy and paste the encrypted passwords from the **running-config** or the **startup-config** displayed, using the **show running-config** and **show startup-config** commands respectively, into the command line to avoid key stroke errors issuing this command.

Validate the user has been moved from the first group using the **show snmp-server user** command:

```
awplus#show snmp-server user
Name Group name Auth Privacy

authuser newusergroup md5 aes
```

To delete SNMP user 'authuser', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server user authuser
```

**Related  
commands**

[show snmp-server user](#)  
[snmp-server view](#)

# snmp-server view

**Overview** Use this command to create an SNMP view that specifies a sub-tree of the MIB. Further sub-trees can then be added by specifying a new OID to an existing view. Views can be used in SNMP communities or groups to control the remote manager's access.

**NOTE:** *The object identifier must be specified in a sequence of integers separated by decimal points.*

The **no** variant of this command removes the specified view on the device. The view must already exist.

**Syntax** `snmp-server view <view-name> <mib-name> {included|excluded}`  
`no snmp-server view <view-name>`

| Parameter   | Description                                                                                         |
|-------------|-----------------------------------------------------------------------------------------------------|
| <view-name> | SNMP server view name.<br>The view name is a string up to 20 characters long and is case sensitive. |
| <mib-name>  | Object identifier of the MIB.                                                                       |
| included    | Include this OID in the view.                                                                       |
| excluded    | Exclude this OID in the view.                                                                       |

**Mode** Global Configuration

**Examples** The following command creates a view called "loc" that includes the system location MIB sub-tree.

```
awplus(config)# snmp-server view loc 1.3.6.1.2.1.1.6.0 included
```

To remove the view "loc" use the following command

```
awplus(config)# no snmp-server view loc
```

**Related commands** [show snmp-server view](#)  
[snmp-server community](#)

# test snmp trap snmp

**Overview** Use this command to test connectivity between the AlliedWare Plus device and an SNMP manager. The command tests the connectivity by sending a one-off coldStart or warmStart trap.

It does not matter whether you send a coldStart or warmStart trap; either trap lets you test the connectivity.

**Syntax** test snmp trap snmp coldstart  
test snmp trap snmp warmstart

| Parameter | Description                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------|
| coldstart | Send a one-off coldStart trap. This trap indicates that the SNMP agent is restarting with a configuration change.    |
| warmstart | Send a one-off warmStart trap. This trap indicates that the SNMP agent is restarting without a configuration change. |

**Default** n/a

**Mode** Privileged Exec

**Example** To send a one-off coldStart trap to the SNMP manager configured on the device, use the command:

```
awplus# test snmp trap snmp coldstart
```

**Related commands** [snmp-server host](#)

**Command changes** Version 5.5.4-2.3: command added

# undebbug snmp

**Overview** This command applies the functionality of the no [debug snmp](#) command.

## Introduction

**Overview** LLDP and LLDP-MED can be configured using the commands in this chapter, or by using SNMP with the LLDP-MIB and LLDP-EXT-DOT1-MIB (see the [Support for Allied Telesis Enterprise MIBs in AlliedWare Plus](#)).

The Voice VLAN feature can be configured using commands in the [VLAN Commands](#) chapter.

For more information about LLDP, see the [LLDP Feature Overview and Configuration Guide](#).

LLDP can transmit a lot of data about the network. Typically, the network information gathered using LLDP is transferred to a Network Management System by SNMP. For security reasons, we recommend using SNMPv3 for this purpose (see the [SNMP Feature Overview and Configuration Guide](#)).

LLDP operates over physical ports only. For example, it can be configured on switch ports that belong to static or dynamic channel groups, but not on the channel groups themselves.

# clear lldp statistics

**Overview** This command clears all LLDP statistics (packet and event counters) associated with specified ports. If no port list is supplied, LLDP statistics for all ports are cleared.

**Syntax** `clear lldp statistics [interface <port-list>]`

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| <port-list> | The ports for which the statistics are to be cleared. |

**Mode** Privileged Exec

**Examples** To clear the LLDP statistics on port1.0.1 and port1.0.4 use the command:

```
awplus# clear lldp statistics interface port1.0.1,port1.0.4
```

To clear all LLDP statistics for all ports, use the command:

```
awplus# clear lldp statistics
```

**Related commands** [show lldp statistics](#)  
[show lldp statistics interface](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V  
Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# clear lldp table

**Overview** This command clears the table of LLDP information received from neighbors through specified ports. If no port list is supplied, neighbor information is cleared for all ports.

**Syntax** `clear lldp table [interface <port-list>]`

| Parameter   | Description                                                          |
|-------------|----------------------------------------------------------------------|
| <port-list> | The ports for which the neighbor information table is to be cleared. |

**Mode** Privileged Exec

**Examples** To clear the table of neighbor information received on port1.0.1 and port1.0.4, use the command:

```
awplus#clear lldp table interface port1.0.1,port1.0.4
```

To clear the entire table of neighbor information received through all ports, use the command:

```
awplus# clear lldp table
```

**Related commands** [show lldp neighbors](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# debug lldp

**Overview** This command enables specific LLDP debug for specified ports. When LLDP debugging is enabled, diagnostic messages are entered into the system log. If no port list is supplied, the specified debugging is enabled for all ports.

The **no** variant of this command disables specific LLDP debug for specified ports. If no port list is supplied, the specified debugging is disabled for all ports.

**Syntax** debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]  
debug lldp operation  
no debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]  
no debug lldp operation  
no debug lldp all

| Parameter   | Description                                      |
|-------------|--------------------------------------------------|
| rx          | LLDP receive debug.                              |
| rxpkt       | Raw LLDPDUs received in hex format.              |
| tx          | LLDP transmit debug.                             |
| txpkt       | Raw Tx LLDPDUs transmitted in hex format.        |
| <port-list> | The ports for which debug is to be configured.   |
| operation   | Debug for LLDP internal operation on the switch. |
| all         | Disables all LLDP debugging for all ports.       |

**Default** By default no debug is enabled for any ports.

**Mode** Privileged Exec

**Examples** To enable debugging of LLDP receive on port1.0.1 and port1.0.4, use the command:

```
awplus# debug lldp rx interface port1.0.1,port1.0.4
```

To enable debugging of LLDP transmit with packet dump on all ports, use the command:

```
awplus# debug lldp tx txpkt
```

To disable debugging of LLDP receive on port1.0.1 and port1.0.4, use the command:

```
awplus# no debug lldp rx interface port1.0.1,port1.0.4
```

To turn off all LLDP debugging on all ports, use the command:

```
awplus# no debug lldp all
```

**Related commands** [show debugging lldp](#)  
[show running-config lldp](#)  
[terminal monitor](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# lldp faststart-count

**Overview** Use this command to configure the fast start count for LLDP-MED. The fast start count determines the number of fast start advertisements a port sends when initiating LLDP-MED advertisements. This occurs, for example, when a new LLDP-MED capable device is detected.

The **no** variant of this command resets the LLDP-MED fast start count to the default (3).

**Syntax** `lldp faststart-count <1-10>`  
`no lldp faststart-count`

| Parameter | Description                                      |
|-----------|--------------------------------------------------|
| <1-10>    | The number of fast start advertisements to send. |

**Default** The default fast start count is 3.

**Mode** Global Configuration

**Examples** To set the fast start count to 5, use the command:

```
awplus# configure terminal
awplus(config)# lldp faststart-count 5
```

To reset the fast start count to the default setting (3), use the command:

```
awplus# configure terminal
awplus(config)# no lldp faststart-count
```

**Related commands** [show lldp](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# lldp holdtime-multiplier

**Overview** This command sets the holdtime multiplier value. This value is multiplied by the transmit interval to determine the advertised Time To Live (TTL) value advertised to neighbors.

The **no** variant of this command sets the multiplier back to its default.

**Syntax** `lldp holdtime-multiplier <2-10>`  
`no lldp holdtime-multiplier`

| Parameter | Description            |
|-----------|------------------------|
| <2-10>    | The multiplier factor. |

**Default** The default holdtime multiplier value is 4.

**Mode** Global Configuration

**Usage** The Time-To-Live (TTL) specifies how long the advertised information remains valid for neighbors. If the TTL expires before receiving an update, the neighbor removes the information from its database.

**Examples** To set the holdtime multiplier to 2, use the commands:

```
awplus# configure terminal
awplus(config)# lldp holdtime-multiplier 2
```

To set the holdtime multiplier back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp holdtime-multiplier 2
```

**Related commands** [show lldp](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# lldp management-address

**Overview** This command sets the IPv4 address to be advertised to neighbors (in the Management Address TLV) via the specified ports. This address will override the default address for these ports.

The **no** variant of this command clears the user-configured management IP address advertised to neighbors via the specified ports. The advertised address reverts to the default.

**Syntax** `lldp management-address <ipaddr>`  
`no lldp management-address`

| Parameter                   | Description                                                                                                                                      |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipaddr&gt;</code> | The IPv4 address to be advertised to neighbors, in dotted decimal format. This must be one of the IP addresses already configured on the device. |

**Default** The local loopback interface's primary IPv4 address, if configured. Alternatively, the primary IPv4 interface address of the lowest numbered VLAN that the port belongs to, or if no VLAN IP addresses are configured, the MAC address of the device's baseboard.

**Mode** Interface Configuration

**Usage notes** To see the management address that will be advertised, use the [show lldp interface](#) command or [show lldp local-info](#) command.

**Examples** To set the management address advertised by port1.0.1 and port1.0.2 to 192.168.1.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp management-address 192.168.1.6
```

To clear the user-configured management address advertised by port1.0.1 and port1.0.2, and revert to using the default address, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp management-address
```

**Related commands** [show lldp interface](#)  
[show lldp local-info](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V  
Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# lldp med-notifications

**Overview** Use this command to enable LLDP to send LLDP-MED Topology Change Detected SNMP notifications relating to the specified ports. The switch sends an SNMP event notification when a new LLDP-MED compliant IP Telephony device is connected to or disconnected from a port on the switch.

Use the **no** variant of this command to disable the sending of LLDP-MED Topology Change Detected notifications relating to the specified ports.

**Syntax** `lldp med-notifications`  
`no lldp med-notifications`

**Default** The sending of LLDP-MED notifications is disabled by default.

**Mode** Interface Configuration

**Examples** To enable the sending of LLDP-MED Topology Change Detected notifications relating to ports port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp med-notifications
```

To disable the sending of LLDP-MED notifications relating to port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-notifications
```

**Command changes** Version 5.5.3-1.1: Command added to AR1050V  
Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# lldp med-tlv-select

**Overview** Use this command to enable LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via the specified ports. The LLDP-MED Capabilities TLV must be enabled before any of the other LLDP-MED Organizationally Specific TLVs are enabled.

Use the **no** variant of this command to disable the specified LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via these ports. In order to disable the LLDP-MED Capabilities TLV, you must also disable the rest of these TLVs. Disabling all these TLVs disables LLDP-MED advertisements.

**Syntax**

```
lldp med-tlv-select [capabilities] [network-policy] [location]
[inventory-management]

lldp med-tlv-select all

no lldp med-tlv-select [capabilities] [network-policy]
[location] [inventory-management]

no lldp med-tlv-select all
```

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| capabilities   | LLDP-MED Capabilities TLV. When this is enabled, the MAC/PHY Configuration/Status TLV from IEEE 802.3 Organizationally Specific TLVs is also automatically included in LLDP-MED advertisements, whether or not it has been explicitly enabled by the <a href="#">lldp tlv-select</a> command.                                                                                                                                                                                                                               |
| network-policy | Network Policy TLV. This TLV is transmitted if Voice VLAN parameters have been configured using the commands: <ul style="list-style-type: none"><li>• <a href="#">switchport voice dscp</a></li><li>• <a href="#">switchport voice vlan</a></li><li>• <a href="#">switchport voice vlan priority</a></li></ul>                                                                                                                                                                                                              |
| location       | Location Identification TLV. This TLV is transmitted if location information has been configured using the commands: <ul style="list-style-type: none"><li>• <a href="#">location elin-location-id</a></li><li>• <a href="#">location civic-location identifier</a></li><li>• <a href="#">location civic-location configuration</a></li><li>• <a href="#">location coord-location identifier</a></li><li>• <a href="#">location coord-location configuration</a></li><li>• <a href="#">location elin-location</a></li></ul> |

| Parameter            | Description                                                                                                                                                                                                                                                                                 |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| inventory-management | Inventory Management TLV Set, including the following TLVs: <ul style="list-style-type: none"> <li>• Hardware Revision</li> <li>• Firmware Revision</li> <li>• Software Revision</li> <li>• Serial Number</li> <li>• Manufacturer Name</li> <li>• Model Name</li> <li>• Asset ID</li> </ul> |
| all                  | All LLDP-MED Organizationally Specific TLVs.                                                                                                                                                                                                                                                |

**Default** By default, LLDP-MED Capabilities, Network Policy, Location Identification, and Extended Power-via-MDI TLVs are enabled. Therefore, if LLDP is enabled using the [lldp run](#) command, by default LLDP-MED advertisements are transmitted on ports that detect LLDP-MED neighbors connected to them.

**Mode** Interface Configuration

**Usage notes** LLDP-MED TLVs are only sent in advertisements via a port if there is an LLDP-MED-capable device connected to it. To see whether there are LLDP-MED capable devices connected to the ports, use the [show lldp neighbors](#) command.

**Examples** To enable inclusion of the Inventory TLV Set in advertisements transmitted via port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp med-tlv-select inventory-management
```

To exclude the Inventory TLV Set in advertisements transmitted via port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-tlv-select inventory-management
```

To disable LLDP-MED advertisements transmitted via port1.0.1 and port1.0.2, disable all these TLVs using the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-tlv-select all
```

# lldp non-strict-med-tlv-order-check

**Overview** Use this command to enable non-strict order checking for LLDP-MED advertisements it receives. That is, use this command to enable LLDP to receive and store TLVs from LLDP-MED advertisements even if they do not use standard TLV order.

Use the **no** variant of this command to disable non-strict order checking for LLDP-MED advertisements, that is, to set strict TLV order checking, so that LLDP discards any LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement.

**Syntax** `lldp non-strict-med-tlv-order-check`  
`no lldp non-strict-med-tlv-order-check`

**Default** By default TLV non-strict order checking for LLDP-MED advertisements is disabled. That is, strict order checking is applied to LLDP-MED advertisements, according to ANSI/TIA-1057, and LLDP-MED TLVs in non-standard order are discarded.

**Mode** Global Configuration

**Usage notes** The ANSI/TIA-1057 specifies standard order for TLVs in LLDP-MED advertisements, and specifies that if LLDP receives LLDP advertisements with non-standard LLDP-MED TLV order, the TLVs in non-standard order should be discarded. This implementation of LLDP-MED follows the standard: it transmits TLVs in the standard order, and by default discards LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement. However, some implementations of LLDP transmit LLDP-MED advertisements with non-standard TLV order. To receive and store the data from these non-standard advertisements, enable non-strict order checking for LLDP-MED advertisements using this command.

**Examples** To enable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tlv-order-check
```

To disable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tlv-order-check
```

# lldp notification-interval

**Overview** This command sets the notification interval. This is the minimum interval between LLDP SNMP notifications (traps) of each kind (LLDP Remote Tables Change Notification and LLDP-MED Topology Change Notification).

The **no** variant of this command sets the notification interval back to its default.

**Syntax** `lldp notification-interval <5-3600>`  
`no lldp notification-interval`

| Parameter | Description              |
|-----------|--------------------------|
| <5-3600>  | The interval in seconds. |

**Default** The default notification interval is 5 seconds.

**Mode** Global Configuration

**Examples** To set the notification interval to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp notification-interval 20
```

To set the notification interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp notification-interval
```

**Related commands** [lldp notifications](#)  
[show lldp](#)

# lldp notifications

**Overview** This command enables the sending of LLDP SNMP notifications (traps) relating to specified ports.

The **no** variant of this command disables the sending of LLDP SNMP notifications for specified ports.

**Syntax** `lldp notifications`  
`no lldp notifications`

**Default** The sending of LLDP SNMP notifications is disabled by default.

**Mode** Interface Configuration

**Examples** To enable sending of LLDP SNMP notifications for port1.0.1 and port1.0.2, use the commands:

```
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp notifications
```

To disable sending of LLDP SNMP notifications for port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp notifications
```

**Related commands** [lldp notification-interval](#)

[snmp-server enable trap](#)

# lldp port-number-type

**Overview** This command sets the type of port identifier used to enumerate, that is to count, the LLDP MIB local port entries. The LLDP MIB (IEEE Standard 802.1AB-2005, Section 12, LLDP MIB Definitions.) requires the port number value to count LLDP local port entries.

This command also enables you to optionally set an interface index to enumerate the LLDP MIB local port entries, if required by your management system.

The **no** variant of this command resets the type of port identifier back to the default setting (number).

**Syntax** `lldp port-number-type [number|ifindex]`  
`no lldp port-number-type`

| Parameter | Description                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------|
| number    | Set the type of port identifier to a port number to enumerate the LLDP MIB local port entries.      |
| ifindex   | Set the type of port identifier to an interface index to enumerate the LLDP MIB local port entries. |

**Default** The default port identifier type is number. The no variant of this command sets the port identifier type to the default.

**Mode** Global Configuration

**Examples** To set the type of port identifier used to enumerate LLDP MIB local port entries to port numbers, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type number
```

To set the type of port identifier used to enumerate LLDP MIB local port entries to interface indexes, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type ifindex
```

To reset the type of port identifier used to enumerate LLDP MIB local port entries the default (port numbers), use the commands:

```
awplus# configure terminal
awplus(config)# no lldp port-number-type
```

# lldp reinit

**Overview** This command sets the value of the reinitialization delay. This is the minimum time after disabling LLDP on a port before it can reinitialize.

The **no** variant of this command sets the reinitialization delay back to its default setting.

**Syntax** `lldp reinit <1-10>`  
`no lldp reinit`

| Parameter | Description           |
|-----------|-----------------------|
| <1-10>    | The delay in seconds. |

**Default** The default reinitialization delay is 2 seconds.

**Mode** Global Configuration

**Examples** To set the reinitialization delay to 3 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp reinit 3
```

To set the reinitialization delay back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp reinit
```

# lldp run

**Overview** This command enables the operation of LLDP on the device.

The **no** variant of this command disables the operation of LLDP on the device. The LLDP configuration remains unchanged.

**Syntax** `lldp run`  
`no lldp run`

**Default** LLDP is disabled by default.

**Mode** Global Configuration

**Examples** To enable LLDP operation, use the commands:

```
awplus# configure terminal
awplus(config)# lldp run
```

To disable LLDP operation, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp run
```

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# lldp timer

**Overview** This command sets the value of the transmit interval. This is the interval between regular transmissions of LLDP advertisements.

The **no** variant of this command sets the transmit interval back to its default.

**Syntax** `lldp timer <5-32768>`  
`no lldp timer`

| Parameter                    | Description                                                                                                                                                |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;5-32768&gt;</code> | The transmit interval in seconds. The transmit interval must be at least four times the transmission delay timer ( <a href="#">lldp tx-delay</a> command). |

**Default** The default transmit interval is 30 seconds.

**Mode** Global Configuration

**Examples** To set the transmit interval to 90 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp timer 90
```

To set the transmit interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp timer
```

**Related commands** [lldp tx-delay](#)  
[show lldp](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# lldp tlv-select

**Overview** This command enables one or more optional TLVs, or all TLVs, for transmission in LLDP advertisements via the specified ports. The TLVs can be specified in any order; they are placed in LLDP frames in a fixed order (as described in IEEE 802.1AB). The mandatory TLVs (Chassis ID, Port ID, Time To Live, End of LLDPDU) are always included in LLDP advertisements.

In LLDP-MED advertisements the MAC/PHY Configuration/Status TLV will be always be included regardless of whether it is selected by this command.

The **no** variant of this command disables the specified optional TLVs, or all optional TLVs, for transmission in LLDP advertisements via the specified ports.

**Syntax**

```
lldp tlv-select { [<tlv>]... }
lldp tlv-select all
no lldp tlv-select { [<tlv>]... }
no lldp tlv-select all
```

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <tlv>     | The TLV to transmit in LLDP advertisements. One of these keywords: <ul style="list-style-type: none"><li>• port-description (specified by the <a href="#">description (interface)</a> command)</li><li>• system-name (specified by the <a href="#">hostname</a> command)</li><li>• system-description</li><li>• system-capabilities</li><li>• management-address</li><li>• port-vlan</li><li>• port-and-protocol-vlans</li><li>• vlan-names</li><li>• protocol-ids</li><li>• mac-phy-config</li><li>• power-management (Power Via MDI TLV)</li><li>• link-aggregation</li><li>• max-frame-size</li></ul> |
| all       | All TLVs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Default** By default, no optional TLVs are included in LLDP advertisements. The MAC/PHY Configuration/Status TLV (**mac-phy-config**) is included in LLDP-MED advertisements whether or not it is selected by this command.

**Mode** Interface Configuration

**Examples** To include the management-address and system-name TLVs in advertisements transmitted via port1.0.1 and port1.0.4, use the commands:

```
awplus#configure terminal
awplus(config)# interface port1.0.1,port1.0.4
awplus(config-if)# lldp tlv-select management-address
system-name
```

To include all optional TLVs in advertisements transmitted via port1.0.1 and port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.4
awplus(config-if)# lldp tlv-select all
```

To exclude the management-address and system-name TLVs from advertisements transmitted via port1.0.1 and port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.4
awplus(config-if)# no lldp tlv-select management-address
system-name
```

To exclude all optional TLVs from advertisements transmitted via port1.0.1 and port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.4
awplus(config-if)# no lldp tlv-select all
```

# lldp transmit receive

**Overview** This command enables transmission and/or reception of LLDP advertisements to or from neighbors through the specified ports.

The **no** variant of this command disables transmission and/or reception of LLDP advertisements through specified ports.

**Syntax** `lldp {[transmit] [receive]}`  
`no lldp {[transmit] [receive]}`

| Parameter | Description                                                                   |
|-----------|-------------------------------------------------------------------------------|
| transmit  | Enable or disable transmission of LLDP advertisements via this port or ports. |
| receive   | Enable or disable reception of LLDP advertisements via this port or ports.    |

**Default** LLDP advertisement transmission and reception are enabled on all ports by default.

**Mode** Interface Configuration

**Examples** To enable transmission of LLDP advertisements on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp transmit
```

To enable LLDP advertisement transmission and reception on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp transmit receive
```

To disable LLDP advertisement transmission and reception on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp transmit receive
```

**Related commands** [show lldp interface](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V  
Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# lldp tx-delay

**Overview** This command sets the value of the transmission delay timer. This is the minimum time interval between transmitting LLDP advertisements due to a change in LLDP local information.

The **no** variant of this command sets the transmission delay timer back to its default setting.

**Syntax** `lldp tx-delay <1-8192>`  
`no lldp tx-delay`

| Parameter | Description                                                                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-8192>  | The transmission delay in seconds. The transmission delay cannot be greater than a quarter of the transmit interval ( <a href="#">lldp timer</a> command). |

**Default** The default transmission delay timer is 2 seconds.

**Mode** Global Configuration

**Examples** To set the transmission delay timer to 12 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tx-delay 12
```

To set the transmission delay timer back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tx-delay
```

# location civic-location configuration

**Overview** Use these commands to configure a civic address location. The country parameter must be specified first, and at least one of the other parameters must be configured before the location can be assigned to a port.

Use the **no** variants of this command to delete civic address parameters from the location.

**Syntax**

```
country <country>
state <state>
no state
county <county>
no county
city <city>
no city
division <division>
no division
neighborhood <neighborhood>
no neighborhood
street-group <street-group>
no street-group
leading-street-direction <leading-street-direction>
no leading-street-direction
trailing-street-suffix <trailing-street-suffix>
no trailing-street-suffix
street-suffix <street-suffix>
no street-suffix
house-number <house-number>
no house-number
house-number-suffix <house-number-suffix>
no house-number-suffix
landmark <landmark>
no landmark
additional-information <additional-information>
no additional-information
```

**Syntax (cont.)**    `name <name>`  
                    `no name`  
                    `postalcode <postalcode>`  
                    `no postalcode`  
                    `building <building>`  
                    `no building`  
                    `unit <unit>`  
                    `no unit`  
                    `floor <floor>`  
                    `no floor`  
                    `room <room>`  
                    `no room`  
                    `place-type <place-type>`  
                    `no place-type`  
                    `postal-community-name <postal-community-name>`  
                    `no postal-community-name`  
                    `post-office-box <post-office-box>`  
                    `no post-office-box`  
                    `additional-code <additional-code>`  
                    `no additional-code`  
                    `seat <seat>`  
                    `no seat`  
                    `primary-road-name <primary-road-name>`  
                    `no primary-road-name`  
                    `road-section <road-section>`  
                    `no road-section`  
                    `branch-road-name <branch-road-name>`  
                    `no branch-road-name`  
                    `sub-branch-road-name <sub-branch-road-name>`  
                    `no sub-branch-road-name`  
                    `street-name-pre-modifier <street-name-pre-modifier>`  
                    `no street-name-pre-modifier`  
                    `streetname-post-modifier <streetname-post-modifier>`  
                    `no streetname-post-modifier`

| Parameter                                     | Description                                                                        |
|-----------------------------------------------|------------------------------------------------------------------------------------|
| <code>&lt;country&gt;</code>                  | Upper-case two-letter country code, as specified in ISO 3166.                      |
| <code>&lt;state&gt;</code>                    | State (Civic Address (CA) Type 1): national subdivisions (state, canton, region).  |
| <code>&lt;county&gt;</code>                   | County (CA Type 2): County, parish, gun (JP), district (IN).                       |
| <code>&lt;city&gt;</code>                     | City (CA Type 3): city, township, shi (JP).                                        |
| <code>&lt;division&gt;</code>                 | City division (CA Type 4): City division, borough, city district, ward, chou (JP). |
| <code>&lt;neighborhood&gt;</code>             | Neighborhood (CA Type 5): neighborhood, block.                                     |
| <code>&lt;street-group&gt;</code>             | Street group (CA Type 6): group of streets below the neighborhood level.           |
| <code>&lt;leading-street-direction&gt;</code> | Leading street direction (CA Type 16).                                             |
| <code>&lt;trailing-street-suffix&gt;</code>   | Trailing street suffix (CA Type 17).                                               |
| <code>&lt;street-suffix&gt;</code>            | Street suffix (CA Type 18): street suffix or type.                                 |
| <code>&lt;house-number&gt;</code>             | House number (CA Type 19).                                                         |
| <code>&lt;house-number-suffix&gt;</code>      | House number suffix (CA Type 20).                                                  |
| <code>&lt;landmark&gt;</code>                 | Landmark or vanity address (CA Type 21).                                           |
| <code>&lt;additional-information&gt;</code>   | Additional location information (CA Type 22).                                      |
| <code>&lt;name&gt;</code>                     | Name (CA Type 23): residence and office occupant.                                  |
| <code>&lt;postal-code&gt;</code>              | Postal/zip code (CA Type 24).                                                      |
| <code>&lt;building&gt;</code>                 | Building (CA Type 25): structure.                                                  |
| <code>&lt;unit&gt;</code>                     | Unit (CA Type 26): apartment, suite.                                               |
| <code>&lt;floor&gt;</code>                    | Floor (CA Type 27).                                                                |
| <code>&lt;room&gt;</code>                     | Room (CA Type 28).                                                                 |
| <code>&lt;place-type&gt;</code>               | Type of place (CA Type 29).                                                        |
| <code>&lt;postal-community-name&gt;</code>    | Postal community name (CA Type 30).                                                |
| <code>&lt;post-office-box&gt;</code>          | Post office box (P.O. Box) (CA Type 31).                                           |
| <code>&lt;additional-code&gt;</code>          | Additional code (CA Type 32).                                                      |
| <code>&lt;seat&gt;</code>                     | Seat (CA Type 33): seat (desk, cubicle, workstation).                              |
| <code>&lt;primary-road-name&gt;</code>        | Primary road name (CA Type 34).                                                    |
| <code>&lt;road-section&gt;</code>             | Road section (CA Type 35).                                                         |

| Parameter                   | Description                             |
|-----------------------------|-----------------------------------------|
| <branch-road-name>          | Branch road name (CA Type 36).          |
| <sub-branch-road-name>      | Sub-branch road name (CA Type 37).      |
| <street-name-pre-modifier>  | Street name pre-modifier (CA Type 38).  |
| <street-name-post-modifier> | Street name post-modifier (CA Type 39). |

**Default** By default no civic address location information is configured.

**Mode** Civic Address Location Configuration

**Usage notes** The **country** parameter must be configured before any other parameters can be configured; this creates the location. The country parameter cannot be deleted. One or more of the other parameters must be configured before the location can be assigned to a port. The country parameter must be entered as an upper-case two-letter country code, as specified in ISO 3166. All other parameters are entered as alpha-numeric strings. Do not configure all the civic address parameters (this would generate TLVs that are too long). Configure a subset of these parameters—enough to consistently and precisely identify the location of the device. If the location is to be used for Emergency Call Service (ECS), the particular ECS application may have guidelines for configuring the civic address location. For more information about civic address format, see the [LLDP Feature Overview and Configuration Guide](#).

To specify the civic address location, use the [location civic-location identifier](#) command. To delete the civic address location, use the **no** variant of the **location civic-location identifier** command.

To assign the civic address location to particular ports, so that it can be advertised in TLVs from those ports, use the command [location civic-location-id](#) command.

**Examples** To configure civic address location 1 with location "27 Nazareth Avenue, Christchurch, New Zealand" in civic-address format, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)# country NZ
awplus(config-civic)# city Christchurch
awplus(config-civic)# primary-road-name Nazareth
awplus(config-civic)# street-suffix Avenue
awplus(config-civic)# house-number 27
```

**Related commands**

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# location civic-location identifier

**Overview** Use this command to enter the Civic Address Location Configuration mode to configure the specified location.

Use the **no** variant of this command to delete a civic address location. This also removes the location from any ports it has been assigned to.

**Syntax** `location civic-location identifier <civic-loc-id>`  
`no location civic-location identifier <civic-loc-id>`

| Parameter                         | Description                                                 |
|-----------------------------------|-------------------------------------------------------------|
| <code>&lt;civic-loc-id&gt;</code> | A unique civic address location ID, in the range 1 to 4095. |

**Default** By default there are no civic address locations.

**Mode** Global Configuration

**Usage notes** To configure the location information for this civic address location identifier, use the [location civic-location configuration](#) command.

To associate this civic location identifier with particular ports, use the [location elin-location-id](#) command.

Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

**Examples** To enter Civic Address Location Configuration mode for the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)#
```

To delete the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location civic-location identifier 1
```

**Related commands** [location civic-location-id](#)  
[location civic-location configuration](#)  
[show location](#)  
[show running-config lldp](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# location civic-location-id

**Overview** Use this command to assign a civic address location identifier to the ports. The civic address location must already exist. This replaces any previous assignment of civic address location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location identifier from the ports.

**Syntax** `location civic-location-id <civic-loc-id>`  
`no location civic-location-id [<civic-loc-id>]`

| Parameter                         | Description                                        |
|-----------------------------------|----------------------------------------------------|
| <code>&lt;civic-loc-id&gt;</code> | Civic address location ID, in the range 1 to 4095. |

**Default** By default no civic address location is assigned to ports.

**Mode** Interface Configuration

**Usage notes** The civic address location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, create the location using the following commands:

- [location civic-location identifier](#) command
- [location civic-location configuration](#) command

If a civic-address location is deleted using the **no** variant of the [location civic-location identifier](#) command, it is automatically removed from all ports.

**Examples** To assign the civic address location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location civic-location-id 1
```

To remove a civic address location from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location civic-location-id
```

**Related commands** [lldp med-tlv-select](#)

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# location coord-location configuration

**Overview** Use this command to configure a coordinate-based location. All parameters must be configured before assigning this location identifier to a port.

**Syntax**

```
latitude <latitude>
lat-resolution <lat-resolution>
longitude <longitude>
long-resolution <long-resolution>
altitude <altitude> {meters|floor}
alt-resolution <alt-resolution>
datum {wgs84|nad83-navd|nad83-mllw}
```

| Parameter         | Description                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <lat-resolution>  | Latitude resolution, as a number of valid bits, in the range 0 to 34.                                                             |
| <latitude>        | Latitude value in degrees in the range -90.0 to 90.0                                                                              |
| <long-resolution> | Longitude resolution, as a number of valid bits, in the range 0 to 34.                                                            |
| <longitude>       | Longitude value in degrees, in the range -180.0 to 180.0.                                                                         |
| <alt-resolution>  | Altitude resolution, as a number of valid bits, in the range 0 to 30. A resolution of 0 can be used to indicate an unknown value. |
| <altitude>        | Altitude value, in meters or floors.                                                                                              |
| meters            | The altitude value is in meters.                                                                                                  |
| floors            | The altitude value is in floors.                                                                                                  |
| datum             | The geodetic system (or datum) that the specified coordinate values are based on.                                                 |
| wgs84             | World Geodetic System 1984.                                                                                                       |
| nad83-navd        | North American Datum 1983 - North American Vertical Datum.                                                                        |
| nad83-mllw        | North American Datum 1983 - Mean Lower Low Water vertical datum.                                                                  |

**Default** By default no coordinate location information is configured.

**Mode** Coordinate Configuration

**Usage** Latitude and longitude values are always stored internally, and advertised in the Location Identification TLV, as 34-bit fixed-point binary numbers, with a 25-bit fractional part, irrespective of the number of digits entered by the user. Likewise

altitude is stored as a 30-bit fixed point binary number, with an 8-bit fractional part. Because the user-entered decimal values are stored as fixed point binary numbers, they cannot always be represented exactly—the stored binary number is converted to a decimal number for display in the output of the [show location](#) command. For example, a user-entered latitude value of “2.77” degrees is displayed as “2.7699999809265136718750000”.

The **lat-resolution**, **long-resolution**, and **alt-resolution** parameters allow the user to specify the resolution of each coordinate element as the number of valid bits in the internally-stored binary representation of the value. These resolution values can be used by emergency services to define a search area.

To specify the coordinate identifier, use the [location coord-location identifier](#) command. To remove coordinate information, delete the coordinate location by using the **no** variant of that command.

To associate the coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the [location coord-location-id](#) command.

**Example** To configure the location for the White House in Washington DC, which has the coordinates based on the WGS84 datum of 38.89868 degrees North (with 22 bit resolution), 77.03723 degrees West (with 22 bit resolution), and 15 meters height (with 9 bit resolution), use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)# lat-resolution 22
awplus(config-coord)# latitude 38.89868
awplus(config-coord)# long-resolution 22
awplus(config-coord)# longitude -77.03723
awplus(config-coord)# alt-resolution 9
awplus(config-coord)# altitude 15 meters
awplus(config-coord)# datum wgs84
```

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# location coord-location identifier

**Overview** Use this command to enter Coordinate Location Configuration mode for this coordinate location.

Use the **no** variant of this command to delete a coordinate location. This also removes the location from any ports it has been assigned to.

**Syntax** `location coord-location identifier <coord-loc-id>`  
`no location coord-location identifier <coord-loc-id>`

| Parameter                         | Description                                                      |
|-----------------------------------|------------------------------------------------------------------|
| <code>&lt;coord-loc-id&gt;</code> | A unique coordinate location identifier, in the range 1 to 4095. |

**Default** By default there are no coordinate locations.

**Mode** Global Configuration

**Usage** Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To configure this coordinate location, use the [location coord-location configuration](#) command.

To associate this coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the [location coord-location-id](#) command.

**Examples** To enter Coordinate Location Configuration mode to configure the coordinate location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)#
```

To delete coordinate location 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location coord-location identifier 1
```

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# location coord-location-id

**Overview** Use this command to assign a coordinate location to the ports. The coordinate location must already exist. This replaces any previous assignment of coordinate location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location from the ports.

**Syntax** `location coord-location-id <coord-loc-id>`  
`no location coord-location-id [<coord-loc-id>]`

| Parameter                         | Description                                     |
|-----------------------------------|-------------------------------------------------|
| <code>&lt;coord-loc-id&gt;</code> | Coordinate location ID, in the range 1 to 4095. |

**Default** By default no coordinate location is assigned to ports.

**Mode** Interface Configuration

**Usage notes** The coordinate location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, configure the location using the following commands:

- [location coord-location identifier](#) command
- [location coord-location configuration](#) command

If a coordinate location is deleted using the **no** variant of the [location coord-location identifier](#) command, it is automatically removed from all ports.

**Examples** To assign coordinate location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location coord-location-id 1
```

To remove a coordinate location from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location coord-location-id 1
```

# location elin-location

**Overview** Use this command to create or modify an ELIN location.

Use the **no** variant of this command to delete an ELIN location, and remove it from any ports it has been assigned to.

**Syntax** `location elin-location <elin> identifier <elin-loc-id>`  
`no location elin-location identifier <elin-loc-id>`

| Parameter     | Description                                                                                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <elin>        | Emergency Location Identification Number (ELIN) for Emergency Call Service (ECS), in the range 10 to 25 digits long. In North America, ELINs are typically 10 digits long. |
| <elin-loc-id> | A unique ELIN location identifier, in the range 1 to 4095.                                                                                                                 |

**Default** By default there are no ELIN location identifiers.

**Mode** Global Configuration

**Usage** Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To assign this ELIN location to particular ports, so that it can be advertised in TLVs from those ports, use the [location elin-location-id](#) command.

**Examples** To create a new ELIN location with ID 1, and configure it with ELIN "1234567890", use the commands:

```
awplus# configure terminal
awplus(config)# location elin-location 1234567890 identifier 1
```

To delete existing ELIN location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location elin-location identifier 1
```

**Related commands** [location elin-location-id](#)

# show debugging lldp

**Overview** This command displays LLDP debug settings for specified ports. If no port list is supplied, LLDP debug settings for all ports are displayed.

**Syntax** `show debugging lldp [interface <port-list>]`

| Parameter   | Description                                            |
|-------------|--------------------------------------------------------|
| <port-list> | The ports for which the LLDP debug settings are shown. |

**Mode** User Exec and Privileged Exec

**Examples** To display LLDP debug settings for all ports, use the command:

```
awplus# show debugging lldp
```

To display LLDP debug settings for port1.0.1 to port1.0.4, use the command:

```
awplus# show debugging lldp interface port1.0.1-port1.0.4
```

**Output** Figure 62-1: Example output from the **show debugging lldp** command

|                                                                     |     |       |     |       |

**Table 3:** Parameters in the output of the **show lldp** command

| Parameter              | Description                                                                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LLDP Status            | Whether LLDP is enabled. Default is disabled.                                                                                                                 |
| Notification Interval  | Minimum interval between LLDP notifications.                                                                                                                  |
| Tx Timer Interval      | Transmit interval between regular transmissions of LLDP advertisements.                                                                                       |
| Hold-time Multiplier   | The holdtime multiplier. The transmit interval is multiplied by the holdtime multiplier to give the Time To Live (TTL) value that is advertised to neighbors. |
| Reinitialization Delay | The reinitialization delay. This is the minimum time after disabling LLDP transmit on a port before it can reinitialize again.                                |

**Table 3:** Parameters in the output of the **show lldp** command (cont.)

| Parameter                    | Description                                                                                                                              |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Tx Delay                     | The transmission delay. This is the minimum time interval between transmitting advertisements due to a change in LLDP local information. |
| Port Number Type             | The type of port identifier used to enumerate LLDP MIB local port entries, as set by the lldp port-number-type command.                  |
| Fast Start Count             | The number of times fast start advertisements are sent for LLDP-MED.                                                                     |
| Total Neighbor Count         | Number of LLDP neighbors discovered on all ports.                                                                                        |
| Neighbors table last updated | The time since the LLDP neighbor table was last updated.                                                                                 |

Version 5.5.3-1.1: Command added to AR1050V

# show lldp interface

**Overview** This command displays LLDP configuration settings for specified ports. If no port list is specified, LLDP configuration for all ports is displayed.

**Syntax** `show lldp interface [<port-list>]`

| Parameter                      | Description                                                          |
|--------------------------------|----------------------------------------------------------------------|
| <code>&lt;port-list&gt;</code> | The ports for which the LLDP configuration settings are to be shown. |

**Mode** User Exec and Privileged Exec

**Examples** To display LLDP configuration settings for port1.0.1 to port1.0.4, use the command:

```
awplus# show lldp interface port1.0.1-port1.0.4
```

To display LLDP configuration settings for all ports, use the command:

```
awplus# show lldp interface
```

**Output** Figure 62-2: Example output from the **show lldp interface** command

```
awplus# show lldp interface port1.0.1-1.0.4

**Related commands** [show lldp](#)  
[show running-config lldp](#)

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# show lldp local-info

**Overview** This command displays local LLDP information that can be transmitted through specified ports. If no port list is entered, local LLDP information for all ports is displayed.

**Syntax** `show lldp local-info [base] [dot1] [dot3] [med] [interface <port-list>]`

| Parameter   | Description                                               |
|-------------|-----------------------------------------------------------|
| base        | Information for base TLVs.                                |
| dot1        | Information for 802.1 TLVs.                               |
| dot3        | Information for 802.3 TLVs.                               |
| med         | Information for LLDP-MED TLVs.                            |
| <port-list> | The ports for which the local information is to be shown. |

**Mode** User Exec and Privileged Exec

**Usage notes** Whether and which local information is transmitted in advertisements via a port depends on:

- whether the port is set to transmit LLDP advertisements ([lldp transmit receive](#) command)
- which TLVs it is configured to send ([lldp tlv-select](#) command, [lldp med-tlv-select](#) command)

**Examples** To display local information transmitted via port1.0.1, use the command:

```
awplus# show lldp local-info interface port1.0.1
```

To display local information transmitted via all ports, use the command:

```
awplus# show lldp local-info
```

**Output** Figure 62-3: Example output from **show lldp local-info**

```
LLDP Local Information:

Local port1.0.1:
 Chassis ID Type MAC address
 Chassis ID 0015.77c9.7453
 Port ID Type Interface alias
 Port ID port1.0.1
 TTL 120
 Port Description [not configured]
```

```

System Name awplus
System Description Allied Telesis router/switch, AW+
 v5.5.2
System Capabilities - Supported .. Bridge, Router
 - Enabled Bridge, Router
Management Address 192.168.1.6
Port VLAN ID (PVID) 1
Port & Protocol VLAN - Supported . Yes
 - Enabled ... No
 - VIDs 0
VLAN Names default
Protocol IDs 9000, 0026424203000000, 888e01, aaaa03,
 88090101, 00540000e302, 0800, 0806, 86dd
MAC/PHY Auto-negotiation Supported, Enabled
 Advertised Capability 1000BaseTFD, 100BaseTXFD, 100BaseTX,
 10BaseTFD, 10BaseT
 Operational MAU Type 1000BaseTFD (30)
Power Via MDI (PoE) Supported, Enabled
 Port Class PSE
 Pair Control Ability Disabled
 Power Class Unknown
Link Aggregation Supported, Disabled
Maximum Frame Size 1522
LLDP-MED Device Type Network Connectivity
LLDP-MED Capabilities LLDP-MED Capabilities, Network Policy,
 Location Identification,
 Extended Power - PSE, Inventory
Network Policy [not configured]
Location Identification Civic Address
 Country Code NZ
 City Christchurch
 Street Suffix Avenue
 House Number 27
 Primary Road Name Nazareth
Location Identification ELIN
 ELIN 123456789012
LLDP-MED Device Type Network Connectivity
LLDP-MED Capabilities LLDP-MED Capabilities, Network Policy,
 Location Identification,
 Extended Power - PSE, Inventory
Extended Power Via MDI (PoE) PSE
 Power Source Primary Power
 Power Priority Low
 Power Value 4.4 Watts
Inventory Management:
 Hardware Revision A-0
 Firmware Revision 1.1.0
 Software Revision v5.5.2
 Serial Number G1Q78900B
 Manufacturer Name Allied Telesis Inc.
 Model Name AT-x930-52GPX
 Asset ID [zero length]

```

Table 62-1: Parameters in the output of **show lldp local-info**

| Parameter                        | Description                                                                                                                 |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Chassis ID Type                  | Type of the Chassis ID.                                                                                                     |
| Chassis ID                       | Chassis ID that uniquely identifies the local device.                                                                       |
| Port ID Type                     | Type of the Port ID.                                                                                                        |
| Port ID                          | Port ID of the local port through which advertisements are sent.                                                            |
| TTL                              | Number of seconds that the information advertised by the local port remains valid.                                          |
| Port Description                 | Port description of the local port, as specified by the <a href="#">description (interface)</a> command.                    |
| System Name                      | System name, as specified by the <a href="#">hostname</a> command.                                                          |
| System Description               | System description.                                                                                                         |
| System Capabilities (Supported)  | Capabilities that the local port supports.                                                                                  |
| System Capabilities (Enabled)    | Enabled capabilities on the local port.                                                                                     |
| Management Addresses             | Management address associated with the local port. To change this, use the <a href="#">lldp management-address</a> command. |
| Port VLAN ID (PVID)              | VLAN identifier associated with untagged or priority tagged frames received via the local port.                             |
| Port & Protocol VLAN (Supported) | Whether Port & Protocol VLANs (PPV) is supported on the local port.                                                         |
| Port & Protocol VLAN (Enabled)   | Whether the port is in one or more Port & Protocol VLANs.                                                                   |
| Port & Protocol VLAN (VIDs)      | List of identifiers for Port & Protocol VLANs that the port is in.                                                          |
| VLAN Names                       | List of VLAN names for VLANs that the local port is assigned to.                                                            |
| Protocol IDs                     | List of protocols that are accessible through the local port.                                                               |
| MAC/PHY Auto-negotiation         | Auto-negotiation support and current status of the 802.3 LAN on the local port.                                             |

Table 62-1: Parameters in the output of **show lldp local-info** (cont.)

| Parameter                    | Description                                                                                                     |
|------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Power Via MDI (PoE)          | PoE-capability and current status on the local port.                                                            |
| Port Class                   | Whether the device is a PSE (Power Sourcing Entity) or a PD (Powered Device).                                   |
| Pair Control Ability         | Whether power pair selection can be controlled.                                                                 |
| Power Pairs                  | Which power pairs are selected for power ("Signal Pairs" or "Spare Pairs") if pair selection can be controlled. |
| Power Class                  | The power class of the PD device on the port (class 0, 1, 2, 3 or 4).                                           |
| Link Aggregation             | Whether the link is capable of being aggregated and it is currently in an aggregation.                          |
| Aggregated Port-ID           | Aggregated port identifier.                                                                                     |
| Maximum Frame Size           | The maximum frame size capability of the implemented MAC and PHY.                                               |
| LLDP-MED Device Type         | LLDP-MED device type.                                                                                           |
| LLDP-MED Capabilities        | Capabilities LLDP-MED capabilities supported on the local port.                                                 |
| Network Policy               | List of network policies configured on the local port.                                                          |
| VLAN ID                      | VLAN identifier for the port for the specified application type.                                                |
| Tagged Flag                  | Whether the VLAN ID is to be used as tagged or untagged.                                                        |
| Layer-2 Priority:            | Layer 2 User Priority (in the range 0 to 7).                                                                    |
| DSCP Value                   | Diffserv codepoint (in the range 0 to 63).                                                                      |
| Location Identification      | Location configured on the local port.                                                                          |
| Extended Power Via MDI (PoE) | PoE-capability and current status of the PoE parameters for Extended Power-Via-MDI TLV on the local port.       |
| Power Source                 | The power source the switch currently uses; either primary power or backup power.                               |
| Power Priority               | The power priority configured on the port; either critical, high or low.                                        |

Table 62-1: Parameters in the output of **show lldp local-info** (cont.)

| Parameter            | Description                                                                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Power Value          | The total power the switch can source over a maximum length cable to a PD device on the port. The value shows the power value in Watts from the PD side. |
| Inventory Management | Inventory information for the device.                                                                                                                    |

**Command changes**

Version 5.5.3-1.1: Command added to AR1050V

# show lldp neighbors

**Overview** This command displays a summary of information received from neighbors via specified ports. If no port list is supplied, neighbor information for all ports is displayed.

**Syntax** `show lldp neighbors [interface <port-list>]`

| Parameter   | Description                                                  |
|-------------|--------------------------------------------------------------|
| <port-list> | The ports for which the neighbor information is to be shown. |

**Mode** User Exec and Privileged Exec

**Examples** To display neighbor information received via all ports, use the command:

```
awplus# show lldp neighbors
```

To display neighbor information received via port1.0.1 and port1.0.4 with LLDP-MED configuration, use the command:

```
awplus# show lldp neighbors interface port1.0.1,port1.0.4
```

**Output** Figure 62-4: Example output from the **show lldp neighbors** command

**Table 63:** Parameters in the output of the **show lldp neighbors** command

| Parameter           | Description                                                      |
|---------------------|------------------------------------------------------------------|
| Local Port          | Local port on which the neighbor information was received.       |
| Neighbor Chassis ID | Chassis ID that uniquely identifies the neighbor.                |
| Neighbor Port Name  | Port ID of the neighbor.                                         |
| Neighbor Sys Name   | System name of the LLDP neighbor.                                |
| Neighbor Capability | Capabilities that are supported and enabled on the neighbor.     |
| System Capability   | System Capabilities of the LLDP neighbor.                        |
| MED Device Type     | LLDP-MED Device class (Class I, II, III or Network Connectivity) |
| MED Power Source    | LLDP-MED Power Source                                            |

**Command changes**    Version 5.5.3-1.1: Command added to AR1050V

# show lldp neighbors detail

**Overview** This command displays in detail the information received from neighbors via specified ports. If no port list is supplied, detailed neighbor information for all ports is displayed.

**Syntax** `show lldp neighbors detail [base] [dot1] [dot3] [med] [interface <port-list>]`

| Parameter   | Description                                                  |
|-------------|--------------------------------------------------------------|
| base        | Information for base TLVs.                                   |
| dot1        | Information for 802.1 TLVs.                                  |
| dot3        | Information for 803.1 TLVs.                                  |
| med         | Information for LLDP-MED TLVs.                               |
| <port-list> | The ports for which the neighbor information is to be shown. |

**Mode** User Exec and Privileged Exec

**Examples** To display detailed neighbor information received via all ports, use the command:

```
awplus# show lldp neighbors detail
```

To display detailed neighbor information received via port1.0.1, use the command:

```
awplus# show lldp neighbors detail interface port1.0.1
```

**Output** Figure 62-5: Example output from the **show lldp neighbors detail** command

```
awplus#show lldp neighbors detail interface port1.0.1
LLDP Detailed Neighbor Information:

Local port1.0.1:
 Neighbors table last updated 0 hrs 0 mins 40 secs ago
 Chassis ID Type MAC address
 Chassis ID 0004.cd28.8754
 Port ID Type Interface alias
 Port ID port1.0.6
 TTL 120 (secs)
 Port Description [zero length]
 System Name awplus
 System Description Allied Telesis router/switch, AW+ v5.4.6
 System Capabilities - Supported .. Bridge, Router
 - Enabled Bridge, Router
 Management Addresses 0004.cd28.8754
 Port VLAN ID (PVID) 1
 Port & Protocol VLAN - Supported . Yes
 - Enabled ... Yes
 - VIDs 5
 VLAN Names default, vlan5
 Protocol IDs 9000, 0026424203000000, 888e01, 8100,
 88090101, 00540000e302, 0800, 0806, 86dd
 MAC/PHY Auto-negotiation Supported, Enabled
 Advertised Capability 100BaseTFD, 100BaseTXFD, 100BaseTX,
 10BaseTFD, 10BaseT
 Operational MAU Type 1000BaseTFD (30)
 Power Via MDI (PoE) [not advertised]
 Link Aggregation Supported, Disabled
 Maximum Frame Size 1522 (Octets)
 LLDP-MED Device Type Network Connectivity
 LLDP-MED Capabilities LLDP-MED Capabilities, Network Policy,
 Location Identification,
 Extended Power - PSE, Inventory
 Network Policy [not advertised]
 Location Identification [not advertised]
 Extended Power Via MDI (PoE) PD
 Power Source PSE
 Power Priority High
 Power Value 4.4 Watts
 Inventory Management:
 Hardware Revision X1-0
 Firmware Revision 1.1.0
 Software Revision v5.4.6
 Serial Number M1NB73008
 Manufacturer Name Allied Telesis Inc.
 Model Name x230-28GP
 Asset ID [zero length]
```

**Table 64:** Parameters in the output of the **show lldp neighbors detail** command

| Parameter                        | Description                                                                               |
|----------------------------------|-------------------------------------------------------------------------------------------|
| Chassis ID Type                  | Type of the Chassis ID.                                                                   |
| Chassis ID                       | Chassis ID that uniquely identifies the neighbor.                                         |
| Port ID Type                     | Type of the Port ID.                                                                      |
| Port ID                          | Port ID of the neighbor.                                                                  |
| TTL                              | Number of seconds that the information advertised by the neighbor remains valid.          |
| Port Description                 | Port description of the neighbor's port.                                                  |
| System Name                      | Neighbor's system name.                                                                   |
| System Description               | Neighbor's system description.                                                            |
| System Capabilities (Supported)  | Capabilities that the neighbor supports.                                                  |
| System Capabilities (Enabled)    | Capabilities that are enabled on the neighbor.                                            |
| Management Addresses             | List of neighbor's management addresses.                                                  |
| Port VLAN ID (PVID)              | VLAN identifier associated with untagged or priority tagged frames for the neighbor port. |
| Port & Protocol VLAN (Supported) | Whether Port & Protocol VLAN is supported on the LLDP neighbor.                           |
| Port & Protocol VLAN (Enabled)   | Whether Port & Protocol VLAN is enabled on the LLDP neighbor.                             |
| Port & Protocol VLAN (VIDs)      | List of Port & Protocol VLAN identifiers.                                                 |
| VLAN Names                       | List of names of VLANs that the neighbor's port belongs to.                               |
| Protocol IDs                     | List of protocols that are accessible through the neighbor's port.                        |
| MAC/PHY Auto-negotiation         | Auto-negotiation configuration and status                                                 |
| Power Via MDI (PoE)              | PoE configuration and status of 802.3 Power-Via-MDI TLV                                   |
| Link Aggregation                 | Link aggregation information                                                              |

**Table 64:** Parameters in the output of the **show lldp neighbors detail** command (cont.)

| Parameter                    | Description                       |
|------------------------------|-----------------------------------|
| Maximum Frame Size           | The maximum frame size capability |
| LLDP-MED Device Type         | LLDP-MED Device type              |
| LLDP-MED Capabilities        | LLDP-MED capabilities supported   |
| Network Policy               | List of network policies          |
| Location Identification      | Location information              |
| Extended Power Via MDI (PoE) | PoE-capability and current status |
| Inventory Management         | Inventory information             |

**Command changes** Version 5.5.3-1.1: Command added to AR1050V

# show lldp statistics

**Overview** This command displays the global LLDP statistics (packet and event counters).

**Syntax** show lldp statistics

**Mode** User Exec and Privileged Exec

**Example** To display global LLDP statistics information, use the command:

```
awplus# show lldp statistics
```

## Output

**Table 65:** Example output from the **show lldp statistics** command

```
awplus# show lldp statistics

Global LLDP Packet and Event counters:

Frames: Out 345
 In 423
 In Errored 0
 In Dropped 0
TLVs: Unrecognized 0
 Discarded 0
Neighbors: New Entries 20
 Deleted Entries 20
 Dropped Entries 0
 Entry Age-outs 20
```

**Table 66:** Parameters in the output of the **show lldp statistics** command

| Parameter             | Description                                                                                                  |
|-----------------------|--------------------------------------------------------------------------------------------------------------|
| Frames Out            | Number of LLDPDU frames transmitted.                                                                         |
| Frames In             | Number of LLDPDU frames received.                                                                            |
| Frames In Errored     | Number of invalid LLDPDU frames received.                                                                    |
| Frames In Dropped     | Number of LLDPDU frames received and discarded for any reason.                                               |
| TLVs Unrecognized     | Number of LLDP TLVs received that are not recognized but the TLV type is in the range of reserved TLV types. |
| TLVs Discarded        | Number of LLDP TLVs discarded for any reason.                                                                |
| Neighbors New Entries | Number of times the information advertised by neighbors has been inserted into the neighbor table.           |

**Table 66:** Parameters in the output of the **show lldp statistics** command (cont.)

| Parameter                        | Description                                                                                                                                        |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbors Deleted Entries        | Number of times the information advertised by neighbors has been removed from the neighbor table.                                                  |
| Neighbors Dropped Entries        | Number of times the information advertised by neighbors could not be entered into the neighbor table because of insufficient resources.            |
| Neighbors Entry Age-outs Entries | Number of times the information advertised by neighbors has been removed from the neighbor table because the information TTL interval has expired. |

changes**

Version 5.5.3-1.1: Command added to AR1050V

# show lldp statistics interface

**Overview** This command displays the LLDP statistics (packet and event counters) for specified ports. If no port list is supplied, LLDP statistics for all ports are displayed.

**Syntax** `show lldp statistics interface [<port-list>]`

| Parameter   | Description                                         |
|-------------|-----------------------------------------------------|
| <port-list> | The ports for which the statistics are to be shown. |

**Mode** User Exec and Privileged Exec

**Examples** To display LLDP statistics information for all ports, use the command:

```
awplus# show lldp statistics interface
```

To display LLDP statistics information for port1.0.1 and port1.0.4, use the command:

```
awplus# show lldp statistics interface port1.0.1,port1.0.4
```

## Output

| Frames In Errored                | Number of invalid LLDPDU frames received.                                                                                                          |
| Frames In Dropped                | Number of LLDPDU frames received and discarded for any reason.                                                                                     |
| TLVs Unrecognized                | Number of LLDP TLVs received that are not recognized but the TLV type is in the range of reserved TLV types.                                       |
| TLVs Discarded                   | Number of LLDP TLVs discarded for any reason.                                                                                                      |
| Neighbors New Entries            | Number of times the information advertised by neighbors has been inserted into the neighbor table.                                                 |
| Neighbors Deleted Entries        | Number of times the information advertised by neighbors has been removed from the neighbor table.                                                  |
| Neighbors Dropped Entries        | Number of times the information advertised by neighbors could not be entered into the neighbor table because of insufficient resources.            |
| Neighbors Entry Age-outs Entries | Number of times the information advertised by neighbors has been removed from the neighbor table because the information TTL interval has expired. |

# show location

**Overview** Use this command to display selected location information configured on the switch.

**Syntax**

```
show location {civic-location|coord-location|elin-location}
show location {civic-location|coord-location|elin-location}
identifier {<civic-loc-id>|<coord-loc-id>|<elin-loc-id>}
show location {civic-location|coord-location|elin-location}
interface <port-list>
```

| Parameter      | Description                                                      |
|----------------|------------------------------------------------------------------|
| civic-location | Display civic location information.                              |
| coord-location | Display coordinate location information.                         |
| elin-location  | Display ELIN (Emergency Location Identifier Number) information. |
| <civic-loc-id> | Civic address location identifier, in the range 1 to 4095.       |
| <coord-loc-id> | Coordinate location identifier, in the range 1 to 4095.          |
| <elin-loc-id>  | ELIN location identifier, in the range 1 to 4095.                |
| <port-list>    | Ports to display information about.                              |

**Mode** User Exec and Privileged Exec

**Examples** To display a civic address location configured on port1.0.1, use the command:

```
awplus# show location civic-location interface port1.0.1
```

**Table 69:** Example output from the **show location** command

| awplus# show location civic-location interface port1.0.1 |    |                   |      |               |
|----------------------------------------------------------|----|-------------------|------|---------------|
| Port                                                     | ID | Element           | Type | Element Value |
| -----                                                    |    |                   |      |               |
| 1.0.1                                                    | 1  | Country           |      | NZ            |
|                                                          |    | City              |      | Christchurch  |
|                                                          |    | Street-suffix     |      | Avenue        |
|                                                          |    | House-number      |      | 27            |
|                                                          |    | Primary-road-name |      | Nazareth      |

To display coordinate location information configured on the identifier 1, use the command:

```
awplus# show location coord-location identifier 1
```

**Table 70:** Example output from the **show location** command

| awplus# show location coord-location identifier 1 |           |            |                                       |
|---------------------------------------------------|-----------|------------|---------------------------------------|
| ID                                                | Element   | Type       | Element Value                         |
| -----                                             |           |            |                                       |
| 1                                                 | Latitude  | Resolution | 15 bits                               |
|                                                   | Latitude  |            | 38.8986481130123138427734375 degrees  |
|                                                   | Longitude | Resolution | 15 bits                               |
|                                                   | Longitude |            | 130.2323232293128967285156250 degrees |
|                                                   | Altitude  | Resolution | 10 bits                               |
|                                                   | Altitude  |            | 2.50000000 meters                     |
|                                                   | Map       | Datum      | WGS 84                                |

The coordinate location information displayed may differ from the information entered because it is stored in binary format. For more information, see the [location coord-location configuration](#) command.

To display all ELIN location information configured on the switch, use the command:

```
awplus# show location elin-location
```

**Table 71:** Example output from the **show location elin-location** command

| awplus# show location elin-location |            |
|-------------------------------------|------------|
| ID                                  | ELIN       |
| -----                               |            |
| 1                                   | 1234567890 |
| 2                                   | 5432154321 |

# Mail (SMTP) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure mail. The mail feature uses Simple Mail Transfer Protocol (SMTP) to transfer mail from an internal email client operating within the AlliedWare Plus device. This feature is typically used to email event notifications to an external email server from the AlliedWare Plus device.

For information on using the mail feature, see the [Mail \(SMTP\) Feature Overview and Configuration Guide](#).

# debug mail

**Overview** This command turns on debugging for sending emails.  
The **no** variant of this command turns off debugging for sending emails.

**Syntax** debug mail  
no debug mail

**Mode** Privileged Exec

**Examples** To turn on debugging for sending emails, use the command:  
awplus# debug mail  
To turn off debugging for sending emails, use the command:  
awplus# no debug mail

**Related commands** delete mail  
mail  
mail from  
mail smtpserver  
show counter mail  
show mail  
undebug mail

# delete mail

**Overview** This command deletes mail from the queue.

You need the *mail-id* from the **show mail** command output to delete specific emails, or use the **all** parameter to clear all messages in the queue completely.

**Syntax** `delete mail [mail-id <mail-id>|all]`

| Parameter | Description                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------|
| mail-id   | Deletes a single mail from the mail queue.                                                                        |
|           | <mail-id> A unique mail ID number. Use the <a href="#">show mail</a> command to display this for an item of mail. |
| all       | Delete all the mail in the queue.                                                                                 |

**Mode** Privileged Exec

**Examples** To delete the unique mail item “20060912142356.1234” from the queue, use the command:

```
awplus# delete mail 20060912142356.1234
```

To delete all mail from the queue, use the command:

```
awplus# delete mail all
```

**Related commands**

- [mail from](#)
- [mail smtpserver](#)
- [show mail](#)

# mail

**Overview** This command sends an email using the SMTP protocol. If you specify a file the text inside the file is sent in the message body.

If you do not specify the **to**, **file**, or **subject** parameters, the CLI prompts you for the missing information.

Before you can send mail using this command, you must specify the sending email address using the [mail from](#) command and a mail server using the [mail smtpserver](#) command.

**Syntax** mail [to <to>] [subject <subject>] [file <filename>]

| Parameter | Description                                                                                      |
|-----------|--------------------------------------------------------------------------------------------------|
| to        | The email recipient.                                                                             |
|           | <to> Email address.                                                                              |
| subject   | Description of the subject of this email. Use quote marks when the subject text contains spaces. |
|           | <subject> String.                                                                                |
| file      | File to insert as text into the message body.                                                    |
|           | <filename> String.                                                                               |

**Mode** Privileged Exec

**Usage notes** When you use the **mail** command you can use parameter substitutions in the subject field. The following table lists the parameters that can be substituted and their descriptions:

| Parameter            | Description                                                                                                            |
|----------------------|------------------------------------------------------------------------------------------------------------------------|
| <%N>                 | When this parameter is specified, the %N is replaced by the host name of your device.                                  |
| <%S>                 | When this parameter is specified, the %S is replaced by the serial number of your device.                              |
| <%D><br><%L><br><%T> | When any of these parameters is specified, they are replaced by the current date and time (local time) on your device. |
| <%U>                 | When this parameter is specified, the %U is replaced by the current date and time (UTC time) on your device.           |

**NOTE:** If no local time is configured, it will use UTC.

**Examples** To send an email to "admin@example.com" with the subject "test email" and with the message body inserted from the file "test.conf", use the command:

```
awplus# mail to admin@example.com subject "test email" filename
test.conf
```

To send an email using parameter substitutions for the host name, serial number and date, use the commands:

```
awplus# mail to admin@example.com subject "Sending email from
Hostname:%N Serial Number:%S Date:%T"
```

**Related  
commands**

[mail smtpserver port](#)

[show counter mail](#)

[show mail](#)

# mail from

**Overview** This command sets an email address as the sender. You must specify a sending email address with this command before you can send email.

Use the **no** variant of this command to remove the “mail from” address.

**Syntax** `mail from <from>`  
`no mail from`

| Parameter                 | Description                                                                |
|---------------------------|----------------------------------------------------------------------------|
| <code>&lt;from&gt;</code> | The email address that the mail is sent from (also known as the hostname). |

**Mode** Global Configuration

**Example** To set up your email address as the sender “kaji@nerv.com”, use the command:

```
awplus(config)# mail from kaji@nerv.com
```

- [show mail](#)
- [undebug mail](#)

# mail smtpserver

**Overview** This command specifies the IP address or domain name of the SMTP server that your device sends email to. You must specify a mail server with this command before you can send email.

Use the **no** variant of this command to remove the configured mail server.

**Syntax** mail smtpserver {<ip-address>|<name>}  
no mail smtpserver

| Parameter    | Description                                                           |
|--------------|-----------------------------------------------------------------------|
| <ip-address> | Internet Protocol (IP) address for the mail server.                   |
| <name>       | Domain name (FQDN) for the mail server (also known as the host name). |

**Mode** Global Configuration

**Usage notes** If you specify the server by specifying its domain name, you must also ensure that the DNS client on your device is enabled. It is enabled by default but if it has been disabled, you can re-enable it by using the [ip domain-lookup](#) command.

**Examples** To specify a mail server at "192.168.0.1", use the command:

```
awplus(config)# mail smtpserver 192.168.0.1
```

To specify a mail server that has a host name of "smtp.example.com", use the command:

```
awplus(config)# mail smtpserver smtp.example.com
```

To remove the configured mail server, use the command:

```
awplus(config)# no mail smtpserver
```

**Related commands**

- [debug mail](#)
- [delete mail](#)
- [mail](#)
- [mail from](#)
- [show counter mail](#)
- [show mail](#)

# mail smtpserver authentication

**Overview** Use this command to configure SMTP mail server authentication.

Use the **no** variant of this command to remove the configured SMTP mail server authentication.

**Syntax** `mail smtpserver authentication {crammd5|login|plain} username <username> password [8] <password>`  
`no mail smtpserver authentication`

| Parameter  | Description                                                                                                                                                                |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| crammd5    | This is a Challenge Request Authentication Mechanism based on the HMAC-MD5 mechanism and is the most secure option.                                                        |
| login      | A BASE64 encryption method                                                                                                                                                 |
| plain      | A BASE64 encryption method                                                                                                                                                 |
| <username> | Registered user name                                                                                                                                                       |
| 8          | The registered user password is presented in an already encrypted format. This is how the running configuration stores the plain text password and is not for general use. |
| <password> | Registered user password                                                                                                                                                   |

**Default** No authentication option is set by default.

**Mode** Global Configuration

**Usage notes** You cannot change the IP address or Domain Name of the SMTP server if authentication is configured. If you attempt to change it when authentication is configured, the following error message is displayed:

```
% Error: authentication configuration still exists
```

**Examples** To configure the SMTP mail server authentication to crammd5, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver authentication crammd5 username
admin password unguessablePassword
```

To remove SMTP mail server authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no mail smtpserver authentication
```

**Output** Figure 63-1: Example output from **show mail**:

```
awplus#show mail
Mail Settings

State : Alive
SMTP Server : 1.2.3.4
Host Name : admin@example.com
Authentication : crammd5
Username : admin
Debug : Disabled

awplus#show running-config
!
mail smtpserver authentication plain username admin password 8
aF0a9pkjbmXGfl6TlSk/GakeIK5tMYN6LqMYT8Ia2qw=
!
```

**Command changes** Version 5.4.8-1.1: command added

# mail smtpserver port

**Overview** Use this command to configure the SMTP mail client/server communication port.

Use the **no** variant of this command to remove the configured port and set it back to the default port.

**Syntax** mail smtpserver port <port>  
no mail smtpserver port

| Parameter | Description                           |
|-----------|---------------------------------------|
| <port>    | Port number from the range 1 to 65535 |

**Default** The default port value is 25 if TLS is not enabled for the SMTP server, 587 if TLS is enabled with STARTTLS, and 465 if TLS is enabled with SMTPS.

**Mode** Global Configuration

**Examples** To configure the mail server communication over port 587, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver port 587
```

To revert to the default SMTP mail server communication port, use the commands:

```
awplus# configure terminal
awplus(config)# no mail smtpserver port
```

**Output** Figure 63-2: Example output from **show mail**:

```
awplus#show mail
Mail Settings

State : Alive
SMTP Server : 10.24.165.4
Host Name : admin@example.com
Authentication : plain
Username : admin
Port : 587
Use TLS : STARTTLS
Debug : Disabled

awplus#show running-config
!
mail smtpserver port 587
!
```

**Command changes** Version 5.4.8-1.1: command added

# mail smtpserver tls

**Overview** Use this command to configure the device to send emails over a TLS connection to the SMTP server instead of sending in clear-text. If the SMTP server does not support receiving emails over a TLS connection, sending emails from the device will fail.

Use the **no** variant of this command to configure the device to send emails over an unencrypted TCP connection (clear text).

**Syntax** mail smtpserver tls [starttls|smtps]  
no mail smtpserver tls

| Parameter | Description                                                                                                                   |
|-----------|-------------------------------------------------------------------------------------------------------------------------------|
| starttls  | The connection starts as clear-text SMTP first and then the client establishes a TLS connection using the STARTTLS extension. |
| smtps     | Use a TLS connection from the start.                                                                                          |

**Default** By default, TLS is disabled and the device sends emails in clear-text.

**Mode** Global Configuration

**Examples** To send emails to the SMTP server over a TLS connection that will be established by the STARTTLS method, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver tls starttls
```

To send emails to the SMTP server over a TLS connection from the beginning, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver tls smtps
```

To send emails to the SMTP server in clear text, use the commands:

```
awplus# configure terminal
awplus(config)# no mail smtpserver tls
```

**Command changes** Version 5.5.3-0.1: command added

# show counter mail

**Overview** This command displays the mail counters.

**Syntax** show counter mail

**Mode** User Exec and Privileged Exec

**Example** To show the emails in the queue use the command:

```
awplus# show counter mail
```

**Output** Figure 63-3: Example output from the **show counter mail** command

```
Mail Client (SMTP) counters
Mails Sent 2
Mails Sent Fails 1
```

**Table 1:** Parameters in the output of the **show counter mail** command

| Parameter        | Description                                                                   |
|------------------|-------------------------------------------------------------------------------|
| Mails Sent       | The number of emails sent successfully since the last device restart.         |
| Mails Sent Fails | The number of emails the device failed to send since the last device restart. |

# RMON Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure Remote Monitoring (RMON).

For an introduction to RMON and an RMON configuration example, see the [RMON Feature Overview and Configuration Guide](#).

RMON is disabled by default in AlliedWare Plus™. No RMON alarms or events are configured.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

# rmon alarm

**Overview** Use this command to configure an RMON alarm to monitor the value of an SNMP object, and to trigger specified events when the monitored object crosses specified thresholds.

To specify the action taken when the alarm is triggered, use the event index of an event defined by the [rmon event](#) command.

Use the **no** variant of this command to remove the alarm configuration.

**NOTE:** You can only configure alarms for switch port interfaces, not for VLANs.

**Syntax** User-defined alarm:

```
rmon alarm <alarm-index> <oid.index> interval <1-2147483647>
{delta|absolute} rising-threshold <1-2147483647> event
<rising-event-index> falling-threshold <1-2147483647> event
<falling-event-index> [alarmstartup {1|2|3}] [owner <owner>]
```

**Eventwatch alarm, do not use (used by Vista Manager EX only):**

```
rmon alarm <alarm-index> <oid.index> interval <1-4294967295>
{delta|absolute} rising-threshold <1-2147483647> event
eventwatch falling-threshold <1-2147483647> event eventwatch
[owner <owner>]
```

```
no rmon alarm <alarm-index>
```

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <alarm-index>              | Alarm entry index value from the range 1 to 65535 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <oid.index>                | The variable SNMP MIB Object Identifier (OID) name to be monitored, for either etherStats or etherHistory entries. The entries can be either of the following formats:<br>- etherStatsEntry.<field>.<stats-index> or<br>etherHistoryEntry.<field>.<history-index>, or<br>- etherStatsFieldName.<stats-index> or<br>etherHistoryFieldName.<history-index>.<br>To define the <stats-index>, use the <a href="#">rmon collection stats</a> command.<br>To define the <history-index>, use the <a href="#">rmon collection history</a> command. |
| interval<br><1-2147483647> | Polling interval in seconds from the range 1 to 2147483647.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| delta                      | The RMON MIB alarmSampleType: the change in the monitored MIB object value between the beginning and end of the polling interval.                                                                                                                                                                                                                                                                                                                                                                                                           |
| absolute                   | The RMON MIB alarmSampleType: the value of the monitored MIB object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Parameter                           | Description                                                                                                                                                                                                               |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rising-threshold<br><1-2147483647>  | Rising threshold value of the alarm entry in seconds from the range 1 to 2147483647.                                                                                                                                      |
| <rising-event-index>                | From the range 1 to 65535 seconds. The event to be triggered when the monitored object value reaches the rising threshold value. This is the event index of an event specified by the <a href="#">rmon event</a> command. |
| eventwatch                          | The alarm triggers an eventwatch event. This mechanism is used by Vista Manager EX, the Allied Telesis network management and monitoring tool. Do not use this parameter; use the <rising-event-index> parameter instead. |
| falling-threshold<br><1-2147483647> | Falling threshold value of the alarm entry in seconds from the range 1 to 2147483647.                                                                                                                                     |
| <falling-event-index>               | From the range 1 to 65535 seconds. The event to be triggered when the monitored object value reaches the falling threshold value. This is an event index of an event specified by the <a href="#">rmon event</a> command. |
| eventwatch                          | The alarm triggers an eventwatch event. This mechanism is used by Vista Manager EX, the Allied Telesis network management and monitoring tool. Do not use this parameter; use the <rising-event-index> parameter instead. |
| alarmstartup {1 2 3}                | Whether RMON can trigger a falling alarm (1), a rising alarm (2) or either (3) when you first start monitoring. See the Usage section for more information. The default is setting 3 (either).                            |
| owner <owner>                       | Arbitrary owner name to identify the alarm entry.                                                                                                                                                                         |

**Default** By default, there are no alarms.

**Mode** Global Configuration

**Usage notes** RMON alarms have a rising and falling threshold. Once the alarm monitoring is operating, you cannot have a falling alarm unless there has been a rising alarm and vice versa.

However, when you start RMON alarm monitoring, an alarm must be generated without the other type of alarm having first been triggered. The **alarmstartup** parameter allows this. It is used to say whether RMON can generate a rising alarm (1), a falling alarm (2) or either alarm (3) as the first alarm.

Note that you specify the SNMP MIB Object Identifier (OID) as a dotted decimal value, using one of the following forms:

- etherStatsEntry.<field>.<stats-index> or  
etherHistoryEntry.<field>.<history-index>.  
For example, etherHistoryEntry.8.8

- or, etherStatsFieldName.<stats-index> or etherHistoryFieldName.<history-index>. For example, etherHistoryMulticastPkts.8

If you enter the first form (etherHistoryEntry.8.8), the device will save it as the second form (etherHistoryMulticastPkts.8) in the running-config.

**Example** To configure an alarm to:

- monitor the change per minute in the etherStatsPkt value for interface 22 (defined by stats-index 22 in the [rmon collection stats](#) command)
- and trigger event 2 (defined by the [rmon event](#) command) when the change reaches the rising threshold 400
- and trigger event 3 when it reaches the falling threshold 200
- and identify this alarm as belonging to the user with username Maria

use the following commands:

```
awplus# configure terminal
awplus(config)# rmon alarm 229 etherStatsEntry.22.5 interval 60
delta rising-threshold 400 event 2 falling-threshold 200 event
3 alarmstartup 3 owner maria
```

To configure an alarm that:

- every 10 seconds, checks the number of multicast packets
- in the latest history control table entry controlled by history-index 8
- to see if the number of packets has increased to 15 or dropped to 5
- and if it has, triggers event 10

use either of the following commands:

```
awplus(config)# rmon alarm 56 etherHistoryMulticastPkts.8
interval 10 absolute rising-threshold 15 event 10
falling-threshold 5 event 10

awplus(config)# rmon alarm 56 etherHistoryEntry.8.8 interval 10
absolute rising-threshold 15 event 10 falling-threshold 5 event
10
```

**Related commands** [rmon collection history](#)  
[rmon collection stats](#)  
[rmon event](#)

# rmon collection history

**Overview** Use this command to create a history statistics control group to store a specified number of snapshots (buckets) of the standard RMON statistics for the switch port, and to collect these statistics at specified intervals. If there is sufficient memory available, then the device will allocate memory for storing the set of buckets that comprise this history control.

Use the **no** variant of this command to remove the specified history control configuration.

**NOTE:** A history can only be collected for switch port interfaces, not for VLANs.

**Syntax** `rmon collection history <history-index> [buckets <1-65535>]  
[interval <1-3600>] [owner <owner>]  
no rmon collection history <history-index>`

| Parameter         | Description                                                                                          |
|-------------------|------------------------------------------------------------------------------------------------------|
| <history-index>   | A unique RMON history control entry index value from the range 1 to 65535.                           |
| buckets <1-65535> | Number of requested buckets to store snapshots from the range 1 to 65535. The default is 50 buckets. |
| interval <1-3600> | Polling interval in seconds. Default 1800 second polling interval from the range 1 to 3600.          |
| owner <owner>     | Owner name to identify the entry.                                                                    |

**Default** The default interval is 1800 seconds and the default number of buckets is 50.

**Mode** Interface Configuration

**Example** To create a history statistics control group with ID 200 to store 500 snapshots with an interval of 600 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# rmon collection history 200 buckets 500
interval 600 owner herbert
```

To disable the history statistics control group, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no rmon collection history 200
```

**Related commands** [rmon alarm](#)  
[rmon collection stats](#)  
[rmon event](#)

# rmon collection stats

**Overview** Use this command to enable the collection of RMON statistics on a switch port, and assign an index number by which to access these collected statistics.

Use the **no** variant of this command to stop collecting RMON statistics on this switch port.

**NOTE:** Statistics can only be collected for switch port interfaces, not for VLANs.

**Syntax** `rmon collection stats <collection-index> [owner <owner>]`  
`no rmon collection stats <collection-index>`

| Parameter          | Description                                                                                                                                                                                            |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <collection-index> | Give this collection of statistics an index number to uniquely identify it. This is the index to use to access the statistics collected for this switch port. Use a number in the range of 1 to 65535. |
| owner <owner>      | An arbitrary owner name to identify this statistics collection entry.                                                                                                                                  |

**Default** RMON statistics are not enabled by default.

**Mode** Interface Configuration

**Example** To enable the collection of RMON statistics with a statistics index of 200, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# rmon collection stats 200 owner myrtle
```

To stop collecting RMON statistics, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no rmon collection stats 200
```

**Related commands** [rmon alarm](#)  
[rmon collection history](#)  
[rmon event](#)

# rmon event

**Overview** Use this command to create an event definition for a log or a trap or both. Then you can use this event index in the [rmon alarm](#) command to indicate whether to send an SNMP trap or log message (or both) when an alarm is triggered.

Use the **no** variant of this command to remove the event definition.

**Syntax**

```
rmon event <event-index> [description <description>|owner <owner>| trap <trap>]
```

```
rmon event <event-index> [log [description <description>|owner <owner>|trap <trap>]]
```

```
rmon event <event-index> [log trap [description <description>|owner <owner>]]
```

```
no rmon event <event-index>
```

| Parameter                | Description                               |
|--------------------------|-------------------------------------------|
| <event-index>            | <1-65535> Unique event entry index value. |
| log                      | Log event type.                           |
| trap                     | Trap event type.                          |
| log trap                 | Log and trap event type.                  |
| description<description> | Event entry description.                  |
| owner <owner>            | Owner name to identify the entry.         |

**Default** No event is configured by default.

**Mode** Global Configuration

**Example** To create an event definition with an index of 299 for a log, use this command:

```
awplus# configure terminal
awplus(config)# rmon event 299 log description cond3 owner alfred
```

To remove the event definition, use the command:

```
awplus# configure terminal
awplus(config)# no rmon event 299
```

**Related commands** [rmon alarm](#)

# show rmon alarm

**Overview** Use this command to display the alarms and threshold configured for the RMON probe.

**Syntax** `show rmon alarm`

**Mode** User Exec and Privileged Exec

**Example** To display the alarms and threshold, use this command:

```
awplus# show rmon alarm
```

**Related commands** [rmon alarm](#)

# show rmon event

**Overview** Use this command to display the events configured for the RMON probe.

**Syntax** `show rmon event`

**Mode** User Exec and Privileged Exec

**Output** Figure 64-1: Example output from the **show rmon event** command

```
awplus#sh rmon event
event Index = 787
 Description TRAP
 Event type log & trap
 Event community name gopher
 Last Time Sent = 0
 Owner RMON_SNMP

event Index = 990
 Description TRAP
 Event type trap
 Event community name teabo
 Last Time Sent = 0
 Owner RMON_SNMP
```

**NOTE:** The following etherStats counters are not currently available for Layer 3 interfaces:

- etherStatsPkts256to511Octets
- etherStatsPkts512to1023Octets
- etherStatsPkts1024to1518Octets

**Example** To display the events configured for the RMON probe, use this command:

```
awplus# show rmon event
```

**Related  
commands** [rmon event](#)

# show rmon history

**Overview** Use this command to display the parameters specified on all the currently defined RMON history collections on the device.

**Syntax** `show rmon history`

**Mode** User Exec and Privileged Exec

**Output** Figure 64-2: Example output from the **show rmon history** command

```
awplus#sh rmon history
 history index = 56
 data source ifindex = 4501
 buckets requested = 34
 buckets granted = 34
 Interval = 2000
 Owner Andrew

 history index = 458
 data source ifindex = 5004
 buckets requested = 400
 buckets granted = 400
 Interval = 1500
 Owner trev
=====
```

# banner login (SSH)

**Overview** This command configures a login banner on the SSH server. This displays a message on the remote terminal of the SSH client before the login prompt. SSH client version 1 does not support this banner.

To add a banner, first enter the command **banner login**, and hit [Enter]. Write your message. You can use any character and spaces. Use Ctrl+D at the end of your message to save the text and re-enter the normal command line mode.

The banner message is preserved if the device restarts.

The **no** variant of this command deletes the login banner from the device.

**Syntax** `banner login`  
`no banner login`

**Default** No banner is defined by default.

**Mode** Global Configuration

**Examples** To set a login banner message, use the commands:

```
awplus# configure terminal
awplus(config)# banner login
```

The screen will prompt you to enter the message:

Type CNTL/D to finish.

... banner message comes here ...

Enter the message. Use Ctrl+D to finish, like this:

```
^D
awplus(config)#
```

To remove the login banner message, use the commands:

```
awplus# configure terminal
awplus(config)# no banner login
```

**Related commands** [show banner login](#)

# clear ssh

**Overview** This command deletes Secure Shell sessions currently active on the device. This includes both incoming and outgoing sessions. The deleted sessions are closed. You can only delete an SSH session if you are a system manager or the user who initiated the session. If **all** is specified then all active SSH sessions are deleted.

**Syntax** `clear ssh {<1-65535>|all}`

| Parameters | Description                                                                |
|------------|----------------------------------------------------------------------------|
| <1-65535>  | Specify a session ID in the range 1 to 65535 to delete a specific session. |
| all        | Delete all SSH sessions.                                                   |

**Mode** Privileged Exec

**Examples** To stop the current SSH session 123, use the command:

```
awplus# clear ssh 123
```

To stop all SSH sessions active on the device, use the command:

```
awplus# clear ssh all
```

**Related commands** [service ssh](#)  
[ssh](#)

# crypto key destroy hostkey

**Overview** This command deletes the existing public and private keys of the SSH server.

**Syntax** `crypto key destroy hostkey {dsa|ecdsa|ed25519|rsa|rsa1}`

| Parameters | Description                                                                                                                                                                          |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dsa        | Deletes the existing DSA public and private keys.                                                                                                                                    |
| ecdsa      | Deletes the existing ECDSA public and private keys.                                                                                                                                  |
| ed25519    | Deletes the existing Ed25519 public and private keys.                                                                                                                                |
| rsa        | Deletes the existing RSA public and private keys that were configured for SSH version 2 connections.                                                                                 |
| rsa1       | Deletes the existing RSA public and private keys that were configured for SSH version 1 connections. From AlliedWare Plus version 5.5.1-1.1 onwards, SSH version 1 is not supported. |

**Mode** Global Configuration

**Example** To destroy the RSA host key used for SSH version 2 connections, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy hostkey rsa
```

**Related commands** [crypto key generate hostkey](#)  
[service ssh](#)

**Command changes** Version 5.5.2-2.1: **ed25519** parameter added

# crypto key destroy userkey

**Overview** This command destroys the existing public and private keys of an SSH user configured on the device.

**Syntax** `crypto key destroy userkey <username>  
{dsa|ecdsa|ed25519|rsa|rsa1}`

| Parameters | Description                                                                                                                                                                            |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <username> | Name of the user whose userkey you are destroying. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. |
| dsa        | Deletes the existing DSA userkey.                                                                                                                                                      |
| ecdsa      | Deletes the existing ECDSA userkey.                                                                                                                                                    |
| ed25519    | Deletes the existing Ed25519 userkey.                                                                                                                                                  |
| rsa        | Deletes the existing RSA userkey that was configured for SSH version 2 connections.                                                                                                    |
| rsa1       | Deletes the existing RSA userkey that was configured for SSH version 1 connections. From AlliedWare Plus version 5.5.1-1.1 onwards, SSH version 1 is not supported.                    |

**Mode** Global Configuration

**Example** To destroy the RSA user key for the SSH user `remoteuser`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy userkey remoteuser rsa
```

**Related commands**

- [crypto key generate hostkey](#)
- [crypto key generate userkey](#)
- [show ssh](#)
- [show crypto key hostkey](#)

**Command changes** Version 5.5.2-2.1: **ed25519** parameter added

# crypto key generate hostkey

**Overview** This command generates public and private keys for the SSH server.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using Ed25519 with a keysize of 256, ECDSA with a curve length of 384, and RSA with a 2048-bit key (unless in secure mode, when it only generates the ECDSA key).

If you need a key with different parameters than this, you can use this command to generate that key before you enable the SSH server. If a host key exists with the same cryptography algorithm, this command replaces the old host key with the new key.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

**Syntax**

```
crypto key generate hostkey rsa [<1024-16384>]
crypto key generate hostkey ecdsa [<256|384|521>]
crypto key generate hostkey ed25519
```

| Parameters    | Description                                       |
|---------------|---------------------------------------------------|
| rsa           | Creates an RSA hostkey.                           |
| ecdsa         | Creates an ECDSA hostkey.                         |
| ed25519       | Creates an Ed25519 hostkey with a keysize of 256. |
| <1024-16384>  | The length in bits of the generated key.          |
| <256 384 521> | The ECDSA key size in bits.                       |

**Default** The default key length for RSA is 2048 bits.

The default key size for ECDSA is 384 bits.

**Mode** Global Configuration

**Examples** To generate an RSA host key that is 4096 bits in length, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey rsa 4096
```

To generate an ECDSA host key with an elliptic curve size of 521 bits, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey ecdsa 521
```

To generate an Ed25519 host key with a keysize of 256, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey ed25519
```

**Related commands** `crypto key destroy hostkey`  
`service ssh`  
`show crypto key hostkey`

**Command changes** Version 5.5.2-2.1: **ed25519** parameter added  
Version 5.5.2-0.1: changes to key length and key size ranges and defaults  
Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# crypto key generate userkey

**Overview** This command generates public and private keys for an SSH user using an RSA, ECDSA, or ED25519 cryptography algorithm. To use public key authentication, copy the public key of the user onto the remote SSH server.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

**Syntax** `crypto key generate userkey <username> rsa [<1024-16384>]`  
`crypto key generate userkey <username> ecdsa [<256|384|521>]`  
`crypto key generate userkey <username> ed25519`

| Parameters    | Description                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <username>    | Name of the user that the user key is generated for. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. |
| rsa           | Creates an RSA userkey.                                                                                                                                                                  |
| ecdsa         | Creates an ECDSA userkey.                                                                                                                                                                |
| ed25519       | Creates an Ed25519 userkey with a keysize of 256.                                                                                                                                        |
| <1024-16384>  | The length in bits of the generated key. The default is 2048 bits.                                                                                                                       |
| <256 384 521> | The ECDSA key size in bits. The default is 384.                                                                                                                                          |

**Default** The default key length for RSA is 2048 bits.  
The default key size for ECDSA is 384 bits.

**Mode** Global Configuration

**Examples** To generate a 4096-bit RSA user key for SSH version 2 connections for the user 'bob', use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey bob rsa 4096
```

To generate an ECDSA user key of key size 521 for the user 'lapo', use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey lapo ecdsa 521
```

To generate an Ed25519 user key of key size 256 for the user 'lapo', use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey lapo ed25519
```

**Related commands** `crypto key pubkey-chain userkey`  
`show crypto key userkey`

**Command changes** Version 5.5.2-2.1: **ed25519** parameter added  
Version 5.5.2-0.1: changes to key length and key size ranges and defaults  
Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# crypto key pubkey-chain knownhosts

**Overview** This command adds a public key of the specified SSH server to the known host database on your device. The SSH client on your device uses this public key to verify the remote SSH server.

The key is retrieved from the server. Before adding a key to this database, check that the key sent to you is correct.

If the server's key changes, or if your SSH client does not have the public key of the remote SSH server, then your SSH client will inform you that the public key of the server is unknown or altered.

The **no** variant of this command deletes the public key of the specified SSH server from the known host database on your device.

**Syntax** `crypto key pubkey-chain knownhosts [ip|ipv6] <hostname>  
[ecdsa|rsa]  
no crypto key pubkey-chain knownhosts <1-65535>`

| Parameter  | Description                                                                                                                                |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| ip         | Keyword used prior to specifying an IPv4 address                                                                                           |
| ipv6       | Keyword used prior to specifying an IPv6 address                                                                                           |
| <hostname> | IPv4/IPv6 address or hostname of a remote server in the format a.b.c.d for an IPv4 address, or in the format x:x::x:x for an IPv6 address. |
| ecdsa      | Specify the ECDSA public key of the server to be added to the known host database.                                                         |
| rsa        | Specify the RSA public key of the server to be added to the known host database.                                                           |
| <1-65535>  | Specify a key identifier when removing a key using the <b>no</b> parameter.                                                                |

**Default** If no cryptography algorithm is specified, then **rsa** is used as the default cryptography algorithm.

**Mode** Privilege Exec

**Usage notes** This command adds a public key of the specified SSH server to the known host database on the device. The key is retrieved from the server. The remote SSH server is verified by using this public key. The user is requested to check the key is correct before adding it to the database.

If the remote server's host key is changed, or if the device does not have the public key of the remote server, then SSH clients will inform the user that the public key of the server is altered or unknown.

**Examples** To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts 192.0.2.11
```

To delete the second entry in the known host database, use the command:

```
awplus# no crypto key pubkey-chain knownhosts 2
```

**Validation Commands** [show crypto key pubkey-chain knownhosts](#)

# crypto key pubkey-chain userkey

**Overview** This command adds a public key for an SSH user on the SSH server. This allows the SSH server to support public key authentication for the SSH user. When configured, the SSH user can access the SSH server without providing a password from the remote host.

The **no** variant of this command removes a public key for the specified SSH user that has been added to the public key chain. When a SSH user's public key is removed, the SSH user can no longer login using public key authentication.

**Syntax** `crypto key pubkey-chain userkey <username> [<filename>]`  
`no crypto key pubkey-chain userkey <username> <1-65535>`

| Parameters | Description                                                                                                                                                                                                           |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <username> | Name of the user that the SSH server associates the key with. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. Default: no default |
| <filename> | Filename of a key saved in flash. Valid characters are any printable character. You can add a key as a hexadecimal string directly into the terminal if you do not specify a filename.                                |
| <1-65535>  | The key ID number of the user's key. Specify the key ID to delete a key.                                                                                                                                              |

**Mode** Global Configuration

**Usage notes** You should import the public key file from the client node. The device can read the data from a file on the flash or user terminal.

Or you can add a key as text into the terminal. To add a key as text into the terminal, first enter the command **crypto key pubkey-chain userkey <username>**, and hit [Enter]. Enter the key as text. Note that the key you enter as text must be a valid SSH RSA key, not random ASCII text. Use [Ctrl]+D after entering it to save the text and re-enter the normal command line mode.

Note you can generate a valid SSH RSA key on the device first using the **crypto key generate host rsa** command. View the SSH RSA key generated on the device using the **show crypto hostkey rsa** command. Copy and paste the displayed SSH RSA key after entering the **crypto key pubkey-chain userkey <username>** command. Use [Ctrl]+D after entering it to save it.

**Examples** To generate a valid SSH RSA key on the device and add the key, use the following commands:

```
awplus# configure terminal
awplus(config)# crypto key generate host rsa
awplus(config)# exit

awplus# show crypto key hostkey
rsaAAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aW2fcOw1TStpb9J20bWlunUC768EoWhyPW6FZ2t5360O5M29EpKBmGqlkQaz5V0mU9IQe66+5YyD4UxOKSDtTI+7jtjDcoGWHb2u4sFwRpXwJZcgYrXW16+6NvNbk+h+c/pqGDijj4SvfZZfeITzvvyZW4/I4pbN8=

awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey joeType CNTRL/D
to
finish:AAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aW2fcOw1TStpb9J20bWlunUC768EoWhyPW6FZ2t5360O5M29EpKBmGqlkQaz5V0mU9IQe66+5YyD4UxOKSDtTI+7jtjDcoGWHb2u4sFwRpXwJZcgYrXW16+6NvNbk+h+c/pqGDijj4SvfZZfeITzvvyZW4/I4pbN8=control-D

awplus(config)#
```

To add a public key for the user `graydon` from the file `key.pub`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey graydon key.pub
```

To add a public key for the user `tamara` from the terminal, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey tamara
```

and enter the key. Use Ctrl+D to finish.

To remove the first key entry from the public key chain of the user `john`, use the commands:

```
awplus# configure terminal
awplus(config)# no crypto key pubkey-chain userkey john 1
```

**Related commands** [show crypto key pubkey-chain userkey](#)

# debug ssh client

**Overview** This command enables the SSH client debugging facility. When enabled, any SSH, SCP and SFTP client sessions send diagnostic messages to the login terminal.

The **no** variant of this command disables the SSH client debugging facility. This stops the SSH client from generating diagnostic debugging message.

**Syntax** `debug ssh client [brief|full]`  
`no debug ssh client`

| Parameter | Description               |
|-----------|---------------------------|
| brief     | Enables brief debug mode. |
| full      | Enables full debug mode.  |

**Default** SSH client debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Examples** To start SSH client debugging, use the command:

```
awplus# debug ssh client
```

To start SSH client debugging with extended output, use the command:

```
awplus# debug ssh client full
```

To disable SSH client debugging, use the command:

```
awplus# no debug ssh client
```

**Related commands** [debug ssh server](#)  
[show ssh client](#)  
[undebug ssh client](#)

**Command changes** Version 5.5.3-1.1: added to AR1050V

# debug ssh server

**Overview** This command enables the SSH server debugging facility. When enabled, the SSH server sends diagnostic messages to the system log. To display the debugging messages on the terminal, use the **terminal monitor** command.

The **no** variant of this command disables the SSH server debugging facility. This stops the SSH server from generating diagnostic debugging messages.

**Syntax** `debug ssh server [brief|full]`  
`no debug ssh server`

| Parameter | Description               |
|-----------|---------------------------|
| brief     | Enables brief debug mode. |
| full      | Enables full debug mode.  |

**Default** SSH server debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Examples** To start SSH server debugging, use the command:

```
awplus# debug ssh server
```

To start SSH server debugging with extended output, use the command:

```
awplus# debug ssh server full
```

To disable SSH server debugging, use the command:

```
awplus# no debug ssh server
```

**Related commands** [debug ssh client](#)  
[show ssh server](#)  
[undebug ssh server](#)

# service ssh

**Overview** Use this command to enable the Secure Shell server on the device. Once enabled, connections coming from SSH clients are accepted.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using ECDSA with a curve length of 384, and RSA with a 1024-bit key (unless in secure mode, when it only generates the ECDSA key).

If you need a key with different parameters than this, you can use the [crypto key generate hostkey](#) command to generate that key before you enable the SSH server.

Use the **no** variant of this command to disable the Secure Shell server. When the Secure Shell server is disabled, connections from SSH, SCP, and SFTP clients are not accepted. This command does not affect existing SSH sessions. To terminate existing sessions, use the [clear ssh](#) command.

**Syntax** `service ssh [ip|ipv6]`  
`no service ssh [ip|ipv6]`

**Default** The Secure Shell server is disabled by default. Both IPv4 and IPv6 Secure Shell server are enabled when you issue **service ssh** without specifying the optional **ip** or **ipv6** parameters.

The server supports SSH version 2 only (not SSH version 1).

**Mode** Global Configuration

**Examples** To enable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh
```

To enable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ip
```

To enable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ipv6
```

To disable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh
```

To disable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ip
```

To disable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ipv6
```

**Command  
changes**

Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# show banner login

**Overview** This command displays the banner message configured on the device. The banner message is displayed to the remote user before user authentication starts.

**Syntax** `show banner login`

**Mode** User Exec, Privileged Exec, Global Configuration, Interface Configuration, Line Configuration

**Example** To display the current login banner message, use the command:

```
awplus# show banner login
```

**Related commands** [banner login \(SSH\)](#)

# show crypto key hostkey

**Overview** This command displays the public keys generated on the device for the SSH server.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using ECDSA with a curve length of 384, and RSA with a 1024-bit key (unless in secure mode, when it only generates the ECDSA key).

The private key remains on the device secretly. The public key is copied to SSH clients to identify the server. This command displays the public key.

**Syntax** `show crypto key hostkey [dsa|ecdsa|rsa|rsa1]`

| Parameter | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| dsa       | Displays the DSA algorithm public key.                                                                                                       |
| ecdsa     | Displays the ECDSA algorithm public key.                                                                                                     |
| rsa       | Displays the RSA algorithm public key for SSH version 2 connections.                                                                         |
| rsa1      | Displays the RSA algorithm public key for SSH version 1 connections. From AlliedWare Plus 5.5.1-1.1 onwards, SSH version 1 is not supported. |

**Mode** User Exec, Privileged Exec and Global Configuration

**Examples** To show the public keys generated on the device for SSH server, use the command:

```
awplus# show crypto key hostkey
```

To display the RSA public key of the SSH server, use the command:

```
awplus# show crypto key hostkey rsa
```

**Output** Figure 65-1: Example output from the **show crypto key hostkey** command

| Type  | Bits | Fingerprint                                        |
|-------|------|----------------------------------------------------|
| rsa   | 1024 | SHA256:T/sVz5OoA1HHXcov9dXzGGQg8avRUYh1psxNSUcSOvs |
| ecdsa | 384  | SHA256:qVn/KpN5X5ct5CJakxE4OmPWmPvW2vIbBjF4SA2bZkM |

**Table 1:** Parameters in output of the **show crypto key hostkey** command

| Parameter   | Description                         |
|-------------|-------------------------------------|
| Type        | Algorithm used to generate the key. |
| Bits        | Length in bits of the key.          |
| Fingerprint | Checksum value for the public key.  |

**Related  
commands**   [crypto key destroy hostkey](#)  
                  [crypto key generate hostkey](#)

# show crypto key pubkey-chain knownhosts

**Overview** This command displays the list of public keys maintained in the known host database on the device.

**Syntax** show crypto key pubkey-chain knownhosts [<1-65535>]

| Parameter | Description                                                                           |
|-----------|---------------------------------------------------------------------------------------|
| <1-65535> | Key identifier for a specific key. Displays the public key of the entry if specified. |

**Default** Display all keys.

**Mode** User Exec, Privileged Exec and Global Configuration

**Examples** To display public keys of known SSH servers, use the command:

```
awplus# show crypto key pubkey-chain knownhosts
```

To display the key data of the first entry in the known host data, use the command:

```
awplus# show crypto key pubkey-chain knownhosts 1
```

**Output** Figure 65-2: Example output from the **show crypto key public-chain knownhosts** command

| No | Hostname                                 | Type | Fingerprint                                     |

# show crypto key pubkey-chain userkey

**Overview** This command displays the public keys registered with the SSH server for SSH users. These keys allow remote users to access the device using public key authentication. By using public key authentication, users can access the SSH server without providing password.

**Syntax** `show crypto key pubkey-chain userkey <username> [<1-65535>]`

| Parameter  | Description                                                                                                                                                                                          |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <username> | User name of the remote SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. |
| <1-65535>  | Key identifier for a specific key.                                                                                                                                                                   |

**Default** Display all keys.

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the public keys for the user `manager` that are registered with the SSH server, use the command:

```
awplus# show crypto key pubkey-chain userkey manager
```

**Output** Figure 65-3: Example output from the **show crypto key public-chain userkey** command

| No | Type | Bits | Fingerprint                                     |
|----|------|------|-------------------------------------------------|
| 1  | dsa  | 1024 | 2b:cc:df:a8:f8:2e:8f:a4:a5:4f:32:ea:67:29:78:fd |

**Table 3:** Parameters in the output of the **show crypto key userkey** command

| Parameter   | Description                             |
|-------------|-----------------------------------------|
| No          | Number ID of the key.                   |
| Type        | The algorithm used to generate the key. |
| Bits        | Length in bits of the key.              |
| Fingerprint | Checksum value for the key.             |

**Related commands** [crypto key pubkey-chain userkey](#)

# show crypto key userkey

**Overview** This command displays the public keys created on this device for the specified SSH user.

**Syntax** `show crypto key userkey <username> [dsa|rsa|rsal]`

| Parameter  | Description                                                                                                                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <username> | User name of the local SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. |
| dsa        | Displays the DSA public key.                                                                                                                                                                        |
| rsa        | Displays the RSA public key used for SSH version 2 connections.                                                                                                                                     |
| rsal       | Displays the RSA key used for SSH version 1 connections.                                                                                                                                            |

**Mode** User Exec, Privileged Exec and Global Configuration

**Examples** To show the public key generated for the user, use the command:

```
awplus# show crypto key userkey manager
```

To store the RSA public key generated for the user manager to the file "user.pub", use the command:

```
awplus# show crypto key userkey manager rsa > manager-rsa.pub
```

**Output** Figure 65-4: Example output from the **show crypto key userkey** command

| Type | Bits | Fingerprint                                     |
|------|------|-------------------------------------------------|
| rsa  | 2048 | e8:d6:1b:c0:f4:b6:e6:7d:02:2e:a9:d4:a1:ca:3b:11 |
| rsal | 1024 | 12:25:60:95:64:08:8e:a1:8c:3c:45:1b:44:b9:33:9b |

**Table 4:** Parameters in the output of the **show crypto key userkey** command

| Parameter   | Description                             |
|-------------|-----------------------------------------|
| Type        | The algorithm used to generate the key. |
| Bits        | Length in bits of the key.              |
| Fingerprint | Checksum value for the key.             |

**Related commands** [crypto key generate userkey](#)

# show running-config ssh

**Overview** This command displays the current running configuration of Secure Shell (SSH).

**Syntax** `show running-config ssh`

**Mode** Privileged Exec and Global Configuration

**Example** To display the current configuration of SSH, use the command:

```
awplus# show running-config ssh
```

**Output** Figure 65-5: Example output from the **show running-config ssh** command

```
!
ssh server session-timeout 600
ssh server login-timeout 30
ssh server allow-users manager 192.168.1.*
ssh server allow-users john
ssh server deny-user john*.a-company.com
ssh server
```

**Table 5:** Parameters in the output of the **show running-config ssh** command

| Parameter                              | Description                                                                 |
|----------------------------------------|-----------------------------------------------------------------------------|
| ssh server                             | SSH server is enabled.                                                      |
| ssh server v2                          | SSH server is enabled and only support SSHv2.                               |
| ssh server<port>                       | SSH server is enabled and listening on the specified TCP port.              |
| no ssh server scp                      | SCP service is disabled.                                                    |
| no ssh server sftp                     | SFTP service is disabled.                                                   |
| ssh server session-timeout             | Configure the server session timeout.                                       |
| ssh server login-timeout               | Configure the server login timeout.                                         |
| ssh server max-startups                | Configure the maximum number of concurrent sessions waiting authentication. |
| no ssh server authentication password  | Password authentication is disabled.                                        |
| no ssh server authentication publickey | Public key authentication is disabled.                                      |

**Table 5:** Parameters in the output of the **show running-config ssh** command

| Parameter              | Description                                    |
|------------------------|------------------------------------------------|
| ssh server allow-users | Add the user (and hostname) to the allow list. |
| ssh server deny-users  | Add the user (and hostname) to the deny list.  |

**Table 6:** Parameters in the output of the **show ssh** command

| Parameter | Description                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------|
| ID        | Unique identifier for each SSH session.                                                                  |
| Type      | Session type; either SSH, SCP, or SFTP.                                                                  |
| Mode      | Whether the device is acting as an SSH client (client) or SSH server (server) for the specified session. |
| Peer Host | The hostname or IP address of the remote server or client.                                               |
| Username  | Login user name of the server.                                                                           |

**Table 6:** Parameters in the output of the **show ssh** command (cont.)

| Parameter | Description                                                           |                                                 |
|-----------|-----------------------------------------------------------------------|-------------------------------------------------|
| State     | The current state of the SSH session. One of:                         |                                                 |
|           | connecting                                                            | The device is looking for a remote server.      |
|           | connected                                                             | The device is connected to the remote server.   |
|           | accepted                                                              | The device has accepted a new session.          |
|           | host-auth                                                             | host-to-host authentication is in progress.     |
|           | user-auth                                                             | User authentication is in progress.             |
|           | authenticated                                                         | User authentication is complete.                |
|           | open                                                                  | The session is in progress.                     |
|           | download                                                              | The user is downloading a file from the device. |
|           | upload                                                                | The user is uploading a file from the device.   |
|           | closing                                                               | The user is terminating the session.            |
|           | closed                                                                | The session is closed.                          |
| Filename  | Local filename of the file that the user is downloading or uploading. |                                                 |

**Related commands**   [clear ssh](#)

# show ssh client

**Overview** This command displays the current configuration of the Secure Shell client.

**Syntax** `show ssh client`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the current configuration for SSH clients on the login shell, use the command:

```
awplus# show ssh client
```

**Output** Figure 65-7: Example output from the **show ssh client** command

```
Secure Shell Client Configuration

Port : 22
Version : 2,1
Connect Timeout : 30 seconds
Session Timeout : 0 (off)
Debug : NONE
```

**Table 7:** Parameters in the output of the **show ssh client** command

| Parameter       | Description                                                                                                                                                 |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port            | SSH server TCP port where the SSH client connects to. The default is port 22.                                                                               |
| Version         | SSH server version, either "2" or "2,1". From AlliedWare Plus 5.5.1-1.1 onwards, SSH version 1 is not supported.                                            |
| Connect Timeout | Time in seconds that the SSH client waits for an SSH session to establish. If the value is 0, the connection is terminated when it reaches the TCP timeout. |
| Debug           | Whether debugging is active on the client.                                                                                                                  |

**Related commands** [show ssh server](#)

**Command changes** Version 5.5.3-1.1: added to AR1050V

# show ssh server

**Overview** This command displays the current configuration of the Secure Shell server.

Note that changes to the SSH configuration affects only new SSH sessions coming from remote hosts, and does not affect existing sessions.

**Syntax** `show ssh server`

**Mode** User Exec, Privileged Exec, and Global Configuration

**Example** To display the current configuration of the Secure Shell server, use the command:

```
awplus# show ssh server
```

**Output** Figure 65-8: Example output from the **show ssh server** command

```
Secure Shell Server Configuration

SSH Server : Enabled
Protocol : IPv4,IPv6
Port : 22
Version : 2
Services : scp, sftp
User Authentication : publickey, password
Resolve Hosts : Disabled

 diffie-hellman-group-exchange-sha1,
 diffie-hellman-group14-sha1
```

**Table 8:** Parameters in the output of the **show ssh server** command

| Parameter  | Description                                                                                                      |
|------------|------------------------------------------------------------------------------------------------------------------|
| SSH Server | Whether the Secure Shell server is enabled or disabled.                                                          |
| Port       | TCP port where the Secure Shell server listens for connections. The default is port 22.                          |
| Version    | SSH server version; either '2' or '2,1'. From AlliedWare Plus 5.5.1-1.1 onwards, SSH version 1 is not supported. |
| Services   | List of the available Secure Shell services; one or more of SHELL, SCP or SFTP.                                  |

**Table 8:** Parameters in the output of the **show ssh server** command (cont.)

| Parameter           | Description                                                                                                                                                                          |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Authentication | List of available authentication methods.                                                                                                                                            |
| Login Timeout       | Time (in seconds) that the SSH server will wait the SSH session to establish. If the value is 0, the client login will be terminated when TCP timeout reaches.                       |
| Idle Timeout        | Time (in seconds) that the SSH server will wait to receive data from the SSH client. The server disconnects if this timer limit is reached. If set at 0, the idle timer remains off. |
| Maximum Startups    | The maximum number of concurrent connections that are waiting authentication. The default is 10.                                                                                     |
| Debug               | Whether debugging is active on the server.                                                                                                                                           |
| Ciphers             | List of ciphers permitted.                                                                                                                                                           |
| KEX                 | List of available Key Exchange algorithms.                                                                                                                                           |

**Table 9:** Parameters in the output of the **show ssh server allow-users** command

| Parameter                 | Description                                                                                                                                                                               |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Username                  | User name that is allowed to access the SSH server.                                                                                                                                       |
| Remote Hostname (pattern) | IP address or hostname pattern of the remote client. The user is allowed requests from a host that matches this pattern. If no hostname is specified, the user is allowed from all hosts. |

**Related commands** [ssh server allow-users](#)  
[ssh server deny-users](#)

# show ssh server deny-users

**Overview** This command displays the user entries in the deny list of the SSH server. The user in the deny list is rejected to access the SSH server. If a user is not included in the access list of the SSH server, the user is also rejected.

**Syntax** `show ssh server deny-users`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the user entries in the deny list of the SSH server, use the command:

```
awplus# show ssh server deny-users
```

**Output** Figure 65-10: Example output from the **show ssh server deny-users** command

| Username | Remote Hostname (pattern) |
|----------|---------------------------|
| john     | *.b-company.com           |
| manager  | 192.168.2.*               |

**Table 10:** Parameters in the output of the **show ssh server deny-user** command

| Parameter                 | Description                                                                                                                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Username                  | The user that this rule applies to.                                                                                                                                                     |
| Remote Hostname (pattern) | IP address or hostname pattern of the remote client. The user is denied requests from a host that matches this pattern. If no hostname is specified, the user is denied from all hosts. |

**Related commands** [ssh server allow-users](#)  
[ssh server deny-users](#)

# ssh

**Overview** Use this command to initiate a Secure Shell connection to a remote SSH server.

If the server requests a password to login, you need to type in the correct password at the "Password:" prompt.

An SSH client identifies the remote SSH server by its public key registered on the client device. If the server identification is changed, server verification fails. If the public key of the server has been changed, the public key of the server must be explicitly added to the known host database.

**NOTE:** A hostname specified with SSH cannot begin with a hyphen (-) character.

**Syntax** `ssh [ip|ipv6] [user <username>|port <1-65535>|version 2]  
<remote-device> [<command>]`

**Syntax in secure mode** `ssh [cipher  
{aes128-cbc|aes256-cbc|aes128-ctr|aes192-ctr|aes256-ctr}]  
[hmac {hmac-sha2-256}]  
[public-key {ecdsa-sha2-nistp256|ecdsa-sha2-nistp384}]  
[key-exchange {ecdh-sha2-nistp256|ecdh-sha2-nistp384}]  
[ip|ipv6] [user <username>|port <1-65535>|version 2]  
<remote-device> [<command>]`

| Parameter    | Description                                                                                                                                                                                                                                         |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cipher       | The supported cipher name.<br>Select either: aes128-cbc or aes256-cbc.                                                                                                                                                                              |
| hmac         | The supported hmac name: hmac-sha2-256                                                                                                                                                                                                              |
| public-key   | The supported public-key name.<br>Select either:<br>ecdsa-sha2-nistp256 or ecdsa-sha2-nistp384                                                                                                                                                      |
| key-exchange | The supported key-exchange name.<br>Select either:<br>ecdsa-sha2-nistp256 or ecdsa-sha2-nistp384                                                                                                                                                    |
| ip           | Specify IPv4 SSH.                                                                                                                                                                                                                                   |
| ipv6         | Specify IPv6 SSH.                                                                                                                                                                                                                                   |
| user         | Login user. If user is specified, the username is used for login to the remote SSH server when user authentication is required. Otherwise the current user name is used.<br><br><username> User name to login on the remote server.                 |
| port         | SSH server port. If port is specified, the SSH client connects to the remote SSH server with the specified TCP port. Otherwise, the client port configured by "ssh client" command or the default TCP port (22) is used.<br><br><1-65535> TCP port. |

| Parameter       | Description                                                                                                                                                                                                                                  |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| version         | SSH client version. From 5.5.1-1.1 onwards, SSH only supports version 2.                                                                                                                                                                     |
| <remote-device> | IPv4/IPv6 address or hostname of a remote server. The address is in the format A.B.C.D for an IPv4 address, or in the format X:X::X:X for an IPv6 address. Note that a hostname specified with SSH cannot begin with a hyphen (-) character. |
| <command>       | A command to execute on the remote server. If a command is specified, the command is executed on the remote SSH server and the session is disconnected when the remote command finishes.                                                     |

**Mode** User Exec and Privileged Exec

**Usage notes** This command contains some additional security parameters (cipher, hmac, public-key, and key exchange). To access these parameters you must enable Secure Mode on the device by using the command: **crypto secure-mode**.

```
awplus(config)# crypto secure-mode
```

**Examples** To login to the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 as user 'manager', use the command:

```
awplus# ssh ip user manager 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 that is listening on TCP port 2000, use the command:

```
awplus# ssh port 2000 192.0.2.5
```

To login to the remote SSH server 'example\_host' using an IPv6 session, use the command:

```
awplus# ssh ipv6 example_host
```

To run the **cmd** command on the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5 cmd
```

**Command changes**

- Version 5.5.3-1.1: added to AR1050V
- Version 5.5.1-1.1: support removed for SSH protocol v1
- Version 5.4.8-2.1: secure mode syntax added for x950, SBx908 GEN2.

Version 5.4.8-1.2: secure mode syntax added for x220, x930, x550, XS900MX.

Version 5.4.6-2.1: VRF-lite support added for AR-Series devices.

# ssh client

**Overview** This command modifies the default configuration parameters of the Secure Shell (SSH) client. The configuration is used for any SSH client on the device to connect to remote SSH servers. Any parameters specified on SSH client explicitly override the default configuration parameters.

The change affects the current user shell only. When the user exits the login session, the configuration does not persist. This command does not affect existing SSH sessions.

The **no** variant of this command resets configuration parameters of the Secure Shell (SSH) client changed by the [ssh client](#) command, and restores the defaults.

This command does not affect the existing SSH sessions.

**Syntax** `ssh client {port <1-65535>|version 2|session-timeout <0-3600>|connect-timeout <1-600>}`  
`no ssh client {port|version|session-timeout|connect-timeout}`

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| port            | The default TCP port of the remote SSH server. If an SSH client specifies an explicit port of the server, it overrides the default TCP port.<br>Default: 22                                                                                                                                                                                                     |
|                 | <1-65535> TCP port number.                                                                                                                                                                                                                                                                                                                                      |
| version         | The SSH version used by the client for SSH sessions.<br>From 5.5.1-1.1 onwards, the SSH client supports only version 2                                                                                                                                                                                                                                          |
| session-timeout | The global session timeout for SSH sessions. If the session timer lapses since the last time an SSH client received data from the remote server, the session is terminated. If the value is 0, then the client does not terminate the session. Instead, the connection is terminated when it reaches the TCP timeout.<br>Default: 0 (session timer remains off) |
|                 | <0-3600> Timeout in seconds.                                                                                                                                                                                                                                                                                                                                    |
| connect-timeout | The maximum time period that an SSH session can take to become established. The SSH client terminates the SSH session if this timeout expires and the session is still not established.<br>Default: 30                                                                                                                                                          |
|                 | <1-600> Timeout in seconds.                                                                                                                                                                                                                                                                                                                                     |

**Mode** Privileged Exec

**Examples** To configure the default TCP port for SSH clients to 2200, and the session timer to 10 minutes, use the command:

```
awplus# ssh client port 2200 session-timeout 600
```

To configure the connect timeout of SSH client to 10 seconds, use the command:

```
awplus# ssh client connect-timeout 10
```

To restore the connect timeout to its default, use the command:

```
awplus# no ssh client connect-timeout
```

commands**    [show ssh client](#)  
              [ssh](#)

**Command  
changes**    Version 5.5.3-1.1: added to AR1050V  
              Version 5.5.2-1.1: **vrf** parameter added for products that support VRF  
              Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for  
              SSH protocol v1

# ssh client allow-legacy-ssh-rsa

**Overview** Use this command to enable support for the legacy ssh-rsa algorithm on the SSH client. Support for this algorithm was removed in version 5.5.1-1.1 due to security concerns. Support for it is still disabled by default and you should only enable it if you cannot avoid using ssh-rsa. It cannot be enabled when the device is in Secure Mode.

Use the **no** variant of this command to disable support for the legacy ssh-rsa algorithm on the SSH client.

**Syntax** `ssh client allow-legacy-ssh-rsa`  
`no ssh client allow-legacy-ssh-rsa`

**Default** Disabled

**Mode** Global Configuration

**Example** To enable SSH client support for the legacy ssh-rsa algorithm, use the commands:

```
awplus# configure terminal
awplus(config)# ssh client allow-legacy-ssh-rsa
```

**Related commands** [show ssh client](#)  
[ssh client](#)  
[ssh server allow-legacy-ssh-rsa](#)

**Command changes** Version 5.5.3-1.1: added to AR1050V  
Version 5.5.3-0.1: command added

# ssh server

**Overview** Use this command to modify the configuration of the SSH server. Changing these parameters affects new SSH sessions connecting to the device.

Use the **no** variant of this command to restore the configuration of a specified parameter to its default. The change affects the SSH server immediately if the server is running. Otherwise, the configuration is used when the server starts.

To enable the SSH server, use the [service ssh](#) command.

**Syntax** `ssh server <1-65535>`

`ssh server {[session-timeout <0-3600>] [login-timeout <1-600>]  
[max-startups <1-128>]}`

`no ssh server {[session-timeout] [login-timeout]  
[max-startups]}`

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-65535>       | The TCP port number that the server listens to for incoming SSH sessions.<br>Default: 22                                                                                                                                                                                                                                                                               |
| session-timeout | The maximum time period that the server waits before deciding that a session is inactive and should be terminated. The server considers the session inactive when it has not received any data from the client, and when the client does not respond to keep alive messages.<br>Default: 0 (session timer remains off).<br><br>Enter a timeout between 0-3600 seconds. |
| login-timeout   | The maximum time period the server waits before disconnecting an unauthenticated client.<br>Default: 60<br><br>Enter a timeout between 1- 600 seconds.                                                                                                                                                                                                                 |
| max-startups    | The maximum number of concurrent unauthenticated connections the server accepts. When the number of SSH connections awaiting authentication reaches the limit, the server drops any additional connections until authentication succeeds or the login timer expires for a connection.<br>Default: 10<br><br>Enter a number of sessions in the range of 1-128.          |

**Mode** Global Configuration

**Examples** To set the session timer of the SSH server to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server session-timeout 600
```

To set the login timeout of the SSH server to 30 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server login-timeout 30
```

To limit the number of SSH client connections waiting for authentication from the SSH server to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-startups 3
```

To return the limit on the number of waiting connections to the default of 10, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server max-startups
```

To support the SSH server with TCP port 2200, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server 2200
```

                          [ssh client](#)

**Command changes**   Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# ssh server allow-legacy-ssh-rsa

**Overview** Use this command to enable support for the legacy ssh-rsa algorithm on the SSH server. Support for this algorithm was removed in version 5.5.1-1.1 due to security concerns. Support for it is still disabled by default and you should only enable it if you cannot avoid using ssh-rsa. It cannot be enabled when the device is in Secure Mode.

Use the **no** variant of this command to disable support for the legacy ssh-rsa algorithm on the SSH server.

**Syntax** `ssh server allow-legacy-ssh-rsa`  
`no ssh server allow-legacy-ssh-rsa`

**Default** Disabled

**Mode** Global Configuration

**Example** To enable SSH server support for the legacy ssh-rsa algorithm, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-legacy-ssh-rsa
```

**Related commands** [show ssh server](#)  
[ssh server](#)  
[ssh client allow-legacy-ssh-rsa](#)

**Command changes** Version 5.5.3-0.1: command added

# ssh server allow-users

- Overview** This command adds a username pattern to the allow list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is accepted.
- When there are no registered users in the server's database of allowed users, the SSH server does not accept SSH sessions even when enabled.
- SSH server also maintains the deny list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.
- The **no** variant of this command deletes a username pattern from the allow list of the SSH server. To delete an entry from the allow list, the username and hostname pattern should match exactly with the existing entry.

**Syntax** `ssh server allow-users <username-pattern> [<hostname-pattern>]`  
`no ssh server allow-users <username-pattern>`  
`[<hostname-pattern>]`

| Parameter                             | Description                                                                                                                                                                                                              |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;username-pattern&gt;</code> | The username pattern that users can match to. An asterisk acts as a wildcard character that matches any string of characters.                                                                                            |
| <code>&lt;hostname-pattern&gt;</code> | The host name pattern that hosts can match to. If specified, the server allows the user to connect only from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters. |

**Mode** Global Configuration

**Examples** To allow the user `john` to create an SSH session from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john
```

To allow the user `john` to create an SSH session from a range of IP address (from 192.168.1.1 to 192.168.1.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john 192.168.1.*
```

To allow the user `john` to create a SSH session from `a-company.com` domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john *.a-company.com
```

To delete the existing user entry `john 192.168.1.*` in the allow list, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ssh server allow-users john 192.168.1.*
```

**Related  
commands**

[show running-config ssh](#)

[show ssh server allow-users](#)

[ssh server deny-users](#)

# ssh server authentication

**Overview** This command enables RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **ssh server authentication** command to enable password authentication for users. Apply the **publickey** keyword with the **ssh server authentication** command to enable RSA public-key authentication for users.

Use the **no** variant of this command to disable RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **no ssh authentication** command to disable password authentication for users. Apply the required **publickey** keyword with the **no ssh authentication** command to disable RSA public-key authentication for users.

**Syntax** `ssh server authentication {password|publickey}`  
`no ssh server authentication {password|publickey}`

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| password  | Specifies user password authentication for SSH server.  |
| publickey | Specifies user publickey authentication for SSH server. |

**Default** Both RSA public-key authentication and password authentication are enabled by default.

**Mode** Global Configuration

**Usage** For password authentication to authenticate a user, password authentication for a user must be registered in the local user database or on an external RADIUS server, before using the **ssh server authentication password** command.

For RSA public-key authentication to authenticate a user, a public key must be added for the user, before using the **ssh server authentication publickey** command.

**Examples** To enable `password` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication password
```

To enable `publickey` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication publickey
```

To disable password authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server authentication password
```

To disable publickey authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server authentication publickey
```

**Related  
commands**

[crypto key pubkey-chain userkey](#)  
[service ssh](#)  
[show ssh server](#)

# ssh server deny-users

**Overview** This command adds a username pattern to the deny list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is rejected.

SSH server also maintains the allow list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

If a hostname pattern is specified, the user is denied from the hosts matching the pattern.

The **no** variant of this command deletes a username pattern from the deny list of the SSH server. To delete an entry from the deny list, the username and hostname pattern should match exactly with the existing entry.

**Syntax** `ssh server deny-users <username-pattern> [<hostname-pattern>]`  
`no ssh server deny-users <username-pattern>`  
`[<hostname-pattern>]`

| Parameter                             | Description                                                                                                                                                                                                                                                                 |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;username-pattern&gt;</code> | The username pattern that users can match to. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen, full stop and asterisk symbols. An asterisk acts as a wildcard character that matches any string of characters. |
| <code>&lt;hostname-pattern&gt;</code> | The host name pattern that hosts can match to. If specified, the server denies the user only when they connect from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.                                             |

**Mode** Global Configuration

**Examples** To deny the user `john` to access SSH login from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john
```

To deny the user `john` to access SSH login from a range of IP address (from 192.168.2.1 to 192.168.2.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john 192.168.2.*
```

To deny the user `john` to access SSH login from `b-company.com` domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john*.b-company.com
```

To delete the existing user entry `john 192.168.2.*` in the deny list, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ssh server deny-users john 192.168.2.*
```

**Related  
commands**

[show ssh server deny-users](#)

[ssh server allow-users](#)

# ssh server disallow-cbc-ciphers

**Overview** Use this command to disallow CBC mode ciphers on SSH servers. You can only use this command when your device is in Secure Mode (see the [crypto secure-mode](#) command).

Use the **no** variant of this command to allow CBC mode ciphers.

**Syntax** `ssh server disallow-cbc-ciphers`  
`no ssh server disallow-cbc-ciphers`

**Default** CBC mode ciphers are allowed by default.

**Mode** Global Configuration

**Example** To disallow CBC mode ciphers for SSH server in Secure Mode, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server disallow-cbc-ciphers
```

**Related commands** [crypto secure-mode](#)  
[service ssh](#)  
[ssh server](#)

**Command changes** Version 5.5.1-2.1: command added

# ssh server max-auth-tries

**Overview** Use this command to specify the maximum number of SSH authentication attempts that the device will allow.

Use the **no** variant of this command to return the maximum number of attempts to its default value of 6.

**Syntax** `ssh server max-auth-tries <1-32>`  
`no ssh server max-auth-tries`

| Parameter | Description                                                          |
|-----------|----------------------------------------------------------------------|
| <1-32>    | Maximum number of SSH authentication attempts the device will allow. |

**Default** 6 attempts

**Mode** Global Configuration

**Usage** By default, users must wait one second after a failed login attempt before trying again. You can increase this gap by using the command [aaa login fail-delay](#).

**Example** To set the maximum number of SSH authentication attempts to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-auth-tries 3
```

**Related commands** [show ssh server](#)

# ssh server resolve-host

**Overview** This command enables resolving an IP address from a host name using a DNS server for client host authentication.

The **no** variant of this command disables this feature.

**Syntax** `ssh server resolve-hosts`  
`no ssh server resolve-hosts`

**Default** This feature is disabled by default.

**Mode** Global Configuration

**Usage notes** Your device has a DNS Client that is enabled automatically when you add a DNS server to your device. Use the [ip name-server](#) command to add a DNS server to the list of servers that the device queries.

**Example** To resolve a host name using a DNS server, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server resolve-hosts
```

**Related commands** [ip name-server](#)  
[show ssh server](#)  
[ssh server allow-users](#)  
[ssh server deny-users](#)

# ssh server scp

- Overview** This command enables the Secure Copy (SCP) service on the SSH server. Once enabled, the server accepts SCP requests from remote clients.
- You must enable the SSH server as well as this service before the device accepts SCP connections. The SCP service is enabled by default as soon as the SSH server is enabled.
- The **no** variant of this command disables the SCP service on the SSH server. Once disabled, SCP requests from remote clients are rejected.

**Syntax** `ssh server scp`  
`no ssh server scp`

**Mode** Global Configuration

**Examples** To enable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server scp
```

To disable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server scp
```

**Related commands** [show running-config ssh](#)  
[show ssh server](#)

# ssh server secure-algs

**Overview** Use this command to force the SSH server to only use ciphers, key exchange algorithms and Message Authentication Code (MAC) algorithms that are currently considered best-practice.

This command is the same as using all of the commands [ssh server secure-ciphers](#), [ssh server secure-hostkey](#), [ssh server secure-mac](#), and [ssh server secure-kex](#). However, it does not include the optional **exclude-nist-curves** parameter of [ssh server secure-kex](#).

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of algorithms.

**Syntax** `ssh server secure-algs`  
`no ssh server secure-algs`

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** To see the list of algorithms, use the [show ssh server](#) command.

This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

**Example** To force the SSH server to use best-practice algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-algs
```

**Related commands** [show ssh server](#)  
[ssh server](#)  
[ssh server secure-ciphers](#)  
[ssh server secure-hostkey](#)  
[ssh server secure-kex](#)  
[ssh server secure-mac](#)

**Command changes** Version 5.5.1-1.1: command added

# ssh server secure-ciphers

**Overview** Use this command to force the SSH server to only negotiate ciphers regarded as current best-practice.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of ciphers.

**Syntax** `ssh server secure-ciphers`  
`no ssh server secure-ciphers`

**Default** Not set

**Mode** Global Configuration

**Usage notes** To see the list of ciphers, use the [show ssh server](#) command.

This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

**Example** To configure the SSH server to use best-practice ciphers, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-ciphers
```

**Related commands** [show ssh server](#)  
[ssh server](#)  
[ssh server secure-algs](#)  
[ssh server secure-hostkey](#)  
[ssh server secure-kex](#)  
[ssh server secure-mac](#)

**Command changes** Version 5.5.0-1.1: command added

# ssh server secure-hostkey

**Overview** Use this command to force the SSH server to only use hostkey algorithms that are currently considered best-practice. This excludes NIST curve-based hostkey algorithms.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of hostkey algorithms.

**Syntax** `ssh server secure-hostkey`  
`no ssh server secure-hostkey`

**Default** Disabled

**Mode** Global Configuration

**Usage notes** Using this command may reduce compatibility with older SSH clients.

To see the list of hostkey algorithms, use the [show ssh server](#) command.

This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

**Example** To force the SSH server to use best-practice hostkey algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-hostkey
```

**Related commands** [show ssh server](#)  
[ssh server](#)  
[ssh server secure-algs](#)  
[ssh server secure-ciphers](#)  
[ssh server secure-kex](#)  
[ssh server secure-mac](#)

**Command changes** Version 5.5.2-2.1: command added

# ssh server secure-kex

**Overview** Use this command to force the SSH server to only use key exchange algorithms that are currently considered best-practice.

For example, using this command stops the device from using the diffie-hellman-group-exchange-sha1 key exchange algorithm.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of key-exchange algorithms.

**Syntax** `ssh server secure-kex [exclude-nist-curves]`  
`no ssh server secure-kex`

| Parameter                        | Description                                                                                                          |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <code>exclude-nist-curves</code> | Also exclude all NIST key exchange algorithms. Using this parameter may reduce compatibility with older SSH clients. |

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** To see the list of key exchange algorithms, use the [show ssh server](#) command. This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

**Example** To force the SSH server to use best-practice key-exchange algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-kex
```

**Related commands** [show ssh server](#)  
[ssh server](#)

[ssh server secure-ciphers](#)  
[ssh server secure-hostkey](#)  
[ssh server secure-mac](#)

**Command changes** Version 5.5.2-2.1: **exclude-nist-curves** parameter added  
Version 5.5.0-2.3: command added

# ssh server secure-mac

**Overview** Use this command to force the SSH server to only use Message Authentication Code (MAC) algorithms that are currently considered best-practice.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of MAC algorithms.

**Syntax** `ssh server secure-mac`  
`no ssh server secure-mac`

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** To see the list of MAC algorithms, use the [show ssh server](#) command.  
This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

**Example** To force the SSH server to use best-practice MAC algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-mac
```

**Related commands** [show ssh server](#)

**Command changes** Version 5.5.1-1.1: command added

# ssh server sftp

**Overview** This command enables the Secure FTP (SFTP) service on the SSH server. Once enabled, the server accepts SFTP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SFTP connections. The SFTP service is enabled by default as soon as the SSH server is enabled. If the SSH server is disabled, SFTP service is unavailable.

The **no** variant of this command disables SFTP service on the SSH server. Once disabled, SFTP requests from remote clients are rejected.

**Syntax** `ssh server sftp`  
`no ssh server sftp`

**Mode** Global Configuration

**Examples** To enable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server sftp
```

To disable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server sftp
```

**Related commands** [show running-config ssh](#)  
[show ssh server](#)

# ssh server tcpforwarding

**Overview** Use this command to enable TCP port forwarding on the SSH server. It is disabled by default, to enhance security.

Use the **no** variant of this command to disable TCP port forwarding again.

**Syntax** `ssh server tcpforwarding`  
`no ssh server tcpforwarding`

**Default** Disabled

**Mode** Global Configuration

**Example** To enable TCP port forwarding, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server tcpforwarding
```

To disable it again, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server tcpforwarding
```

# active (trigger)

**Overview** This command enables a trigger. This allows the trigger to activate when its trigger conditions are met.

The **no** variant of this command disables a trigger. While in this state the trigger cannot activate when its trigger conditions are met.

**Syntax** active  
no active

**Default** Active, which means that triggers are enabled by default

**Mode** Trigger Configuration

**Usage notes** Configure a trigger first before you use this command to activate it.

For information about configuring a trigger, see the [Triggers\\_Feature Overview and Configuration Guide](#).

**Examples** To enable trigger 172, so that it can activate when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 172
awplus(config-trigger)# active
```

To disable trigger 182, preventing it from activating when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 182
awplus(config-trigger)# no active
```

**Related commands** [show trigger](#)

[trigger activate](#)

# day

**Overview** This command specifies the days or date that the trigger can activate on. You can specify one of:

- A specific date
- A specific day of the week
- A list of days of the week
- A day of any month of any year
- A day of a specific month in any year
- Every day

By default, the trigger can activate on any day.

**Syntax** `day every-day`  
`day <1-31>`  
`day <1-31> <month>`  
`day <1-31> <month> <year>`  
`day <weekday>`

| Parameter                    | Description                                                                                                                                                                                                                 |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>every-day</code>       | Sets the trigger so that it can activate on any day.                                                                                                                                                                        |
| <code>&lt;1-31&gt;</code>    | Day of the month the trigger is permitted to activate on.                                                                                                                                                                   |
| <code>&lt;month&gt;</code>   | Sets the month that the trigger is permitted to activate on. Valid keywords are: <b>january, february, march, april, may, june, july, august, september, october, november, and december.</b>                               |
| <code>&lt;year&gt;</code>    | Sets the year that the trigger is permitted to activate in, between 2000 and 2035.                                                                                                                                          |
| <code>&lt;weekday&gt;</code> | Sets the days of the week that the trigger can activate on. You can specify one or more week days in a space separated list. Valid keywords are: <b>monday, tuesday, wednesday, thursday, friday, saturday, and sunday.</b> |

**Default** **every-day**, so by default, the trigger can activate on any day.

**Mode** Trigger Configuration

**Usage notes** For example trigger configurations that use the **day** command, see “Restrict Internet Access” and “Turn off Power to Port LEDs” in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To permit trigger 55 to activate on the 1 June 2019, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 55
awplus(config-trigger)# day 1 jun 2019
```

To permit trigger 12 to activate on Mondays, Wednesdays and Fridays, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# day monday wednesday friday
```

To permit trigger 17 to activate on the 5th day of any month, in any year, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 17
awplus(config-trigger)# day 5
```

To permit trigger 6 to activate on the 20th day of September, in any year, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
awplus(config-trigger)# day 20 september
```

To permit trigger 14 to activate on the 1st day of each month, in any year, at 11.00am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 14
awplus(config-trigger)# day 1
awplus(config-trigger)# type time 11:00
```

**Related commands** [show trigger](#)

**Command changes** Version 5.4.8-2.1: day of the month functionality added

# debug trigger

**Overview** This command enables trigger debugging. This generates detailed messages about how your device is processing the trigger commands and activating the triggers.

The **no** variant of this command disables trigger debugging.

**Syntax** `debug trigger`  
`no debug trigger`

**Mode** Privilege Exec

**Examples** To start trigger debugging, use the command:

```
awplus# debug trigger
```

To stop trigger debugging, use the command:

```
awplus# no trigger
```

**Related commands** [show debugging trigger](#)  
[show trigger](#)  
[test](#)  
[trigger](#)  
[undebug trigger](#)

# description (trigger)

**Overview** This command adds an optional description to help you identify the trigger. This description is displayed in show command outputs and log messages.

The **no** variant of this command removes a trigger's description. The show command outputs and log messages stop displaying a description for this trigger.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description                                                                                                                                                       |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;description&gt;</code> | A word or phrase that uniquely identifies this trigger or its purpose. Valid characters are any printable character and spaces, up to a maximum of 40 characters. |

**Mode** Trigger Configuration

**Examples** To give trigger 240 the description `daily status report`, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 240
awplus(config-trigger)# description daily status report
```

To remove the description from trigger 36, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 36
awplus(config-trigger)# no description
```

**Related commands** [show trigger](#)  
[test](#)  
[trigger](#)

# repeat

**Overview** This command specifies the number of times that a trigger is permitted to activate. This allows you to specify whether you want the trigger to activate:

- only the first time that the trigger conditions are met
- a limited number of times that the trigger conditions are met
- an unlimited number of times

Once the trigger has reached the limit set with this command, the trigger remains in your configuration but cannot be activated. Use the **repeat** command again to reset the trigger so that it is activated when its trigger conditions are met.

By default, triggers can activate an unlimited number of times. To reset a trigger to this default, specify either **yes** or **forever**.

**Syntax** `repeat {forever|no|once|yes|<1-4294967294>}`

| Parameter                         | Description                                          |
|-----------------------------------|------------------------------------------------------|
| <code>yes forever</code>          | The trigger repeats indefinitely, or until disabled. |
| <code>no once</code>              | The trigger activates only once.                     |
| <code>&lt;1-4292967294&gt;</code> | The trigger repeats the specified number of times.   |

**Mode** Trigger Configuration

**Examples** To allow trigger 21 to activate only once, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 21
awplus(config-trigger)# repeat no
```

To allow trigger 22 to activate an unlimited number of times whenever its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 22
awplus(config-trigger)# repeat forever
```

To allow trigger 23 to activate only the first 10 times the conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 23
awplus(config-trigger)# repeat 10
```

**Related commands** [show trigger](#)  
[trigger](#)

# script

**Overview** This command specifies one or more scripts that are to be run when the trigger activates. You can add up to five scripts to a single trigger.

The sequence in which the trigger runs the scripts is specified by the number you set before the name of the script file. One script is executed completely before the next script begins.

Scripts may be either ASH shell scripts, indicated by a **.sh** filename extension suffix, or AlliedWare Plus scripts, indicated by a **.scp** filename extension suffix. AlliedWare Plus scripts only need to be readable. You can't use ASH scripts when the device is in Secure Mode.

The **no** variant of this command removes one or more scripts from the trigger's script list. The scripts are identified by either their name, or by specifying their position in the script list. The **all** parameter removes all scripts from the trigger.

**Syntax** `script <1-5> {<filename>}`  
`no script {<1-5>|<filename>|all}`

| Parameter  | Description                                                                                          |
|------------|------------------------------------------------------------------------------------------------------|
| <1-5>      | The position of the script in execution sequence. The trigger runs the lowest numbered script first. |
| <filename> | The path to the script file.                                                                         |

**Mode** Trigger Configuration

**Examples** To configure trigger 71 to run the script `flash:/cpu_trig.sh` in position 3 when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# script 3 flash:/cpu_trig.sh
```

To configure trigger 99 to run the scripts `flash:reconfig.scp`, `flash:cpu_trig.sh` and `flash:email.scp` in positions 2, 3 and 5 when the trigger activates, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 99
awplus(config-trigger)# script 2 flash:/reconfig.scp 3
flash:/cpu_trig.sh 5 flash:/email.scp
```

To remove the scripts 1, 3 and 4 from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script 1 3 4
```

To remove the script flash:/cpu\_trig.sh from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script flash:/cpu_trig.sh
```

To remove all the scripts from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script all
```

commands**   [show trigger](#)  
[trigger](#)

# show debugging trigger

**Overview** This command displays the current status for trigger utility debugging. Use this command to show when trigger debugging has been turned on or off from the [debug trigger](#) command.

**Syntax** show debugging trigger

**Mode** User Exec and Privileged Exec

**Example** To display the current configuration of trigger debugging, use the command:  
awplus# show debugging trigger

**Output** Figure 66-1: Example output from the **show debugging trigger** command

```
awplus#debug trigger
awplus#show debugging trigger
Trigger debugging status:
 Trigger debugging is on

awplus#no debug trigger
awplus#show debugging trigger
Trigger debugging status:
 Trigger debugging is off
```

**Related commands** [debug trigger](#)

# show running-config trigger

**Overview** This command displays the current running configuration of the trigger utility.

**Syntax** `show running-config trigger`

**Mode** Privileged Exec

**Example** To display the current configuration of the trigger utility, use the command:

```
awplus# show running-config trigger
```

**Related commands** [show trigger](#)

# show trigger

**Overview** This command displays configuration and diagnostic information about the triggers configured on the device. Specify the **show trigger** command without any options to display a summary of the configuration of all triggers.

**Syntax** `show trigger [<1-250>|counter|full]`

| Parameter | Description                                                                           |
|-----------|---------------------------------------------------------------------------------------|
| <1-250>   | Displays detailed information about a specific trigger, identified by its trigger ID. |
| counter   | Displays statistical information about all triggers.                                  |
| full      | Displays detailed information about all triggers.                                     |

**Mode** Privileged Exec

**Example** To get summary information about all triggers, use the following command:

```
awplus# show trigger
```

Table 66-1: Example output from **show trigger**

| awplus#show trigger |                   |                      |    |    |            |      |           |

Table 66-2: Parameters in the output of **show trigger**

| Parameter      | Description                                                                                        |
|----------------|----------------------------------------------------------------------------------------------------|
| TR#            | Trigger identifier (ID).                                                                           |
| Type & Details | The trigger type, followed by the trigger details in brackets.                                     |
| Name           | Descriptive name of the trigger configured with the <a href="#">description (trigger)</a> command. |
| Ac             | Whether the trigger is active (Y), or inactive (N).                                                |
| Te             | Whether the trigger is in test mode (Y) or not (N).                                                |

Table 66-2: Parameters in the output of **show trigger** (cont.)

| Parameter | Description                                                                                                                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Repeat    | Whether the trigger repeats continuously, and if not, the configured repeat count for the trigger. To see the number of times a trigger has activated, use the <b>show trigger</b> <1-250> command.                 |
| #Scr      | Number of scripts associated with the trigger.                                                                                                                                                                      |
| Days/Date | Days or date when the trigger may be activated. For the days options, the days are shown as a seven character string representing Sunday to Saturday. A hyphen indicates days when the trigger cannot be activated. |

To display detailed information about trigger 3, use the command:

```
awplus# show trigger 3

**Table 67:** Parameters in the output of **show trigger full** and **show trigger** for a specific trigger

| Parameter        | Description                                             |
|------------------|---------------------------------------------------------|
| Trigger          | The ID of the trigger.                                  |
| Name             | Descriptive name of the trigger.                        |
| Type and details | The trigger type and its activation conditions.         |
| Days             | The days on which the trigger is permitted to activate. |

**Table 67:** Parameters in the output of **show trigger full** and **show trigger** for a specific trigger (cont.)

| Parameter             | Description                                                                                                                                                                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Date                  | The date on which the trigger is permitted to activate. Only displayed if configured, in which case it replaces "Days".                                                                                                                       |
| Active                | Whether or not the trigger is permitted to activate.                                                                                                                                                                                          |
| Test                  | Whether or not the trigger is operating in diagnostic mode.                                                                                                                                                                                   |
| Trap                  | Whether or not the trigger is enabled to send SNMP traps.                                                                                                                                                                                     |
| Repeat                | Whether the trigger repeats an unlimited number of times (Continuous) or for a set number of times. When the trigger can repeat only a set number of times, then the number of times the trigger has been activated is displayed in brackets. |
| Modified              | The date and time of the last time that the trigger was modified.                                                                                                                                                                             |
| Number of activations | Number of times the trigger has been activated since the last restart of the device.                                                                                                                                                          |
| Last activation       | The date and time of the last time that the trigger was activated.                                                                                                                                                                            |
| Number of scripts     | How many scripts are associated with the trigger, followed by the names of the script files in the order in which they run.                                                                                                                   |

To display counter information about all triggers use the command:

```
awplus# show trigger counter
```

**Figure 66-3:** Example output from **show trigger counter**

```
awplus# show trigger counter
Trigger Module Counters

- [debug trigger](#)
- [script](#)
- [trigger](#)
- [trigger activate](#)

# test

**Overview** This command puts the trigger into a diagnostic mode. In this mode the trigger may activate but when it does it will not run any of the trigger's scripts. A log message will be generated to indicate when the trigger has been activated.

The **no** variant of this command takes the trigger out of diagnostic mode, restoring normal operation. When the trigger activates, the scripts associated with the trigger will be run, as normal.

**Syntax** test  
no test

**Mode** Trigger Configuration

**Usage notes** Configure a trigger first before you use this command to diagnose it. For information about configuring a trigger, see the [Triggers\\_Feature Overview and Configuration Guide](#).

**Examples** To put trigger 5 into diagnostic mode, where no scripts will be run when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# test
```

To take trigger 205 out of diagnostic mode, restoring normal operation, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no test
```

**Related commands** [show trigger](#)  
[trigger](#)

# time (trigger)

**Overview** This command specifies the time of day when the trigger is permitted to activate. The **after** parameter specifies the start of a time period that extends to midnight during which trigger may activate. By default the value of this parameter is 00:00:00 (am); that is, the trigger may activate at any time. The **before** parameter specifies the end of a time period beginning at midnight during which the trigger may activate. By default the value of this parameter is 23:59:59; that is, the trigger may activate at any time. If the value specified for **before** is later than the value specified for **after**, a time period from “after” to “before” is defined, during which the trigger may activate. This command is not applicable to time triggers ( **type time** ).

The following figure illustrates how the **before** and **after** parameters operate.

**Syntax** `time {[after <hh:mm:ss>] [before <hh:mm:ss>]}`

| Parameter        | Description                                                 |
|------------------|-------------------------------------------------------------|
| after<hh:mm:ss>  | The earliest time of day when the trigger may be activated. |
| before<hh:mm:ss> | The latest time of day when the trigger may be activated.   |

**Mode** Trigger Configuration

**Usage notes** For example trigger configurations that use the **time (trigger)** command, see “Restrict Internet Access” and “Turn off Power to Port LEDs” in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To allow trigger 63 to activate between midnight and 10:30am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 63
awplus(config-trigger)# time before 10:30:00
```

To allow trigger 64 to activate between 3:45pm and midnight, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 64
awplus(config-trigger)# time after 15:45:00
```

To allow trigger 65 to activate between 10:30am and 8:15pm, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 65
awplus(config-trigger)# time after 10:30:00 before 20:15:00
```

**Related commands** [show trigger](#)  
[trigger](#)

# trap

**Overview** This command enables the specified trigger to send SNMP traps.  
Use the **no** variant of this command to disable the sending of SNMP traps from the specified trigger.

**Syntax** trap  
no trap

**Default** SNMP traps are enabled by default for all defined triggers.

**Mode** Trigger Configuration

**Usage notes** You must configure SNMP before using traps with triggers. For more information, see:

- [Support for Allied Telesis Enterprise\\_MIBs\\_in\\_AlliedWare Plus](#), for information about which MIB objects are supported.
- the [SNMP Feature Overview and Configuration\\_Guide](#).
- the [SNMP Commands](#) chapter.

Since SNMP traps are enabled by default for all defined triggers, a common usage will be for the **no** variant of this command to disable SNMP traps from a specified trap if the trap is only periodic. Refer in particular to AT-TRIGGER-MIB in the [Support for Allied Telesis Enterprise\\_MIBs\\_in AlliedWare Plus](#) for further information about the relevant SNMP MIB.

**Examples** To enable SNMP traps to be sent from trigger 5, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# trap
```

To disable SNMP traps being sent from trigger 205, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no trap
```

**Related commands** trigger  
show trigger

# trigger

**Overview** This command is used to access the Trigger Configuration mode for the specified trigger. Once Trigger Configuration mode has been entered the trigger type information can be configured and the trigger scripts and other operational parameters can be specified. At a minimum the trigger type information must be specified before the trigger can become active.

The **no** variant of this command removes a specified trigger and all configuration associated with it.

**Syntax** trigger <1-250>  
no trigger <1-250>

| Parameter | Description   |
|-----------|---------------|
| <1-250>   | A trigger ID. |

**Mode** Global Configuration

**Examples** To enter trigger configuration mode for trigger 12, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 12
```

To completely remove all configuration associated with trigger 12, use the commands:

```
awplus# configure terminal
awplus(config)# no trigger 12
```

**Related commands** [show trigger](#)  
[trigger activate](#)

# trigger activate

**Overview** This command is used to manually activate a specified trigger from the Privileged Exec mode, which has been configured with the **trigger** command from the Global Configuration mode.

**Syntax** `trigger activate <1-250>`

| Parameter | Description   |
|-----------|---------------|
| <1-250>   | A trigger ID. |

**Mode** Privileged Exec

**Usage notes** This command manually activates a trigger without the normal trigger conditions being met.

The trigger is activated even if it has been configured as inactive by using the command **no active**. The scripts associated with the trigger will be executed even if the trigger is in the diagnostic test mode.

Triggers activated manually do not have their repeat counts decremented or their 'last triggered' time updated, and do not result in updates to the '[type] triggers today' counters.

**Example** To manually activate trigger 12 use the command:

```
awplus# trigger activate 12
```

**Related commands** [active \(trigger\)](#)  
[show trigger](#)  
[trigger](#)

# type atmf guest

**Overview** This command configures a trigger to activate when an AMF guest node joins or leaves.

**Syntax** `type atmf guest {join|leave}`

| Parameter | Description            |
|-----------|------------------------|
| join      | AMF guest node joins.  |
| leave     | AMF guest node leaves. |

**Mode** Trigger Configuration

**Example** To configure trigger 86 to activate when an AMF guest node leaves, use the following commands:

```
awplus(config)# trigger 86
awplus(config-trigger)# type atmf guest leave
```

**Related commands** [show trigger](#)

**Command changes** Version 5.5.1-1.1: command added

# type atmf node

**Overview** This command configures a trigger to activate when an AMF node joins or leaves.

**Syntax** type atmf node {join|leave}

| Parameter | Description      |
|-----------|------------------|
| join      | AMF node joins.  |
| leave     | AMF node leaves. |

**Mode** Trigger Configuration

**Example 1** To configure trigger 5 to activate when an AMF node leaves, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger)# type atmf node leave
```

**Example 2** The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
=====
node1, node2, node3:
=====

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
AMF-Net[3](config)# trigger 5
AMF-Net[3](config-trigger)# type atmf node leave
AMF-Net[3](config-trigger)# description "E-mail on AMF Exit"
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp
AMF-Net[3](config-trigger)# end
```

## Display the trigger configurations

AMF-Net[3]# show trigger

This command returns the following display:

```
=====
node1:
=====
```

| TR# | Type & Details    | Description         | Ac | Te | Tr | Repeat     | #Scr | Days/Date |
|-----|-------------------|---------------------|----|----|----|------------|------|-----------|
| 001 | Periodic (2 min)  | Periodic Status Chk | Y  | N  | Y  | Continuous | 1    | smtwtfs   |
| 005 | ATMF node (leave) | E-mail on ATMF Exit | Y  | N  | Y  | Continuous | 1    | smtwtfs   |

```

=====
Node2, Node3,
=====
```

| TR# | Type & Details    | Description         | Ac | Te | Tr | Repeat     | #Scr | Days/Date |
|-----|-------------------|---------------------|----|----|----|------------|------|-----------|
| 005 | ATMF node (leave) | E-mail on ATMF Exit | Y  | N  | Y  | Continuous | 1    | smtwtfs   |

```

```

## Display the triggers configured on each of the nodes in the AMF Network.

AMF-Net[3]# show running-config trigger

This command returns the following display:

```
=====
Node1:
=====

trigger 1
 type periodic 2
 script 1 atmf.scp
trigger 5
 type atmf node leave
description "E-mail on ATMF Exit"
 script 1 email_me.scp
!

=====
Node2, Node3:
=====

trigger 5
 type atmf node leave
description "E-mail on ATMF Exit"
 script 1 email_me.scp
!
```

**Related commands** [show trigger](#)

# type cpu

**Overview** This command configures a trigger to activate based on CPU usage level. Selecting the **up** option causes the trigger to activate when the CPU usage exceeds the specified usage level. Selecting the **down** option causes the trigger to activate when CPU usage drops below the specified usage level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

**Syntax** `type cpu <1-100> [up|down|any]`

| Parameter | Description                                                            |
|-----------|------------------------------------------------------------------------|
| <1-100>   | The percentage of CPU usage at which to trigger.                       |
| up        | Activate when CPU usage exceeds the specified level.                   |
| down      | Activate when CPU usage drops below the specified level                |
| any       | Activate when CPU usage passes the specified level in either direction |

**Mode** Trigger Configuration

**Usage notes** For an example trigger configuration that uses the **type cpu** command, see “Capture Unusual CPU and RAM Activity” in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To configure trigger 28 to be a CPU trigger that activates when CPU usage exceeds 80% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 28
awplus(config-trigger)# type cpu 80 up
```

To configure trigger 5 to be a CPU trigger that activates when CPU usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65

or

awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65 any
```

**Related commands** [show trigger](#)  
[trigger](#)

# type env-sensor

**Overview** Use this command to create a trigger that will run a script when the device's environment sensors detect an event. Environment sensors are shown in the output of the command [show system environment](#), and include things like device temperature, power settings and voltage.

Depending on the device and sensor, you can create a trigger to run when:

- the sensor's state changes, for example when a loss of power is detected for a power supply, or when power is restored, or both.
- the sensor's reading crosses a high or low threshold, for example when the device temperature becomes too high, or returns to normal, or both.

## Syntax when a sensor changes state

```
type env-sensor [node <number>] resource <resource-id> sensor
<sensor-id> state {true|false|any}
```

| Parameter              | Description                                                                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| node <number>          | The VCStack member ID that the sensor is on, for example, 3 for stack member 3. You can leave this parameter out on standalone devices. |
| resource <resource-id> | The 'Resource ID' for the device, as shown in output of the command <a href="#">show system environment</a> .                           |
| sensor <sensor-id>     | The 'ID' for the sensor, as shown in output of the command <a href="#">show system environment</a> .                                    |
| state true             | The trigger will activate if this sensor reading changes to 'Yes' or 'Open' in the output of <a href="#">show system environment</a> .  |
| state false            | The trigger will activate if this sensor reading changes to 'No' or 'Closed' in the output of <a href="#">show system environment</a> . |
| state any              | The trigger will activate if this sensor reading changes to any of 'Yes', 'Open', 'No', or 'Closed'.                                    |

## Syntax when a sensor crosses a threshold

```
type env-sensor [node <number>] resource <resource-id> sensor
<sensor-id> {low-limit|high-limit} {exceeded|cleared|any}
```

| Parameter              | Description                                                                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| node <number>          | The VCStack member ID that the sensor is on, for example, 3 for stack member 3. You can leave this parameter out on standalone devices. |
| resource <resource-id> | The 'Resource ID' for the device, as shown in output of the command <a href="#">show system environment</a> .                           |
| sensor <sensor-id>     | The 'ID' for the sensor, as shown in output of the command <a href="#">show system environment</a> .                                    |

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| low-limit  | The trigger will activate when the sensor reading falls below the 'Low Limit' alarm threshold shown in <a href="#">show system environment</a> , or returns to an acceptable value after being too low, or both. The alarm threshold values are pre-defined within the device and cannot be changed.                                                                                                                                                                                                                                    |
| high-limit | The trigger will activate when the sensor reading rises above the 'High Limit' alarm threshold shown in <a href="#">show system environment</a> , or returns to an acceptable value after being too high, or both. The alarm threshold values are pre-defined within the device and cannot be changed.                                                                                                                                                                                                                                  |
| exceeded   | If you chose low-limit, the trigger will trigger if the sensor's reading falls below the low limit.<br>If you chose high-limit, the trigger will trigger if the sensor's reading goes above the high limit.                                                                                                                                                                                                                                                                                                                             |
| cleared    | If you chose low-limit, the trigger will trigger if the sensor's reading rises to above the low limit again.<br>If you chose high-limit, the trigger will trigger if the sensor's reading falls below the high limit again.<br>Some temperature sensors include a hysteresis value and will not clear until the temperature has changed significantly. For example, if a sensor has a high alarm threshold of 75 degrees Celsius, the hysteresis value may mean that the alarm clears when the temperature falls to 63 degrees Celsius. |
| any        | The trigger will trigger if the low or high limit is either exceeded or cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Mode** Trigger Configuration

**Example** To configure trigger 1, which will activate when the internal temperature becomes too high or drops to a low-enough value after being too high, use the following commands. This example monitors the internal temperature of stack member 2, and has a resource ID of 3 and a sensor ID of 8:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type env-sensor node 2 resource 3
sensor 8 high-limit any
```

**Related commands** [show system environment](#)  
[show trigger](#)  
[trigger](#)

**Command changes** Version 5.5.2-1.1: command added

# type interface

**Overview** This command configures a trigger to activate based on the link status of an interface. The trigger can be activated when the interface becomes operational by using the **up** option, or when the interface closes by using the **down** option. The trigger can also be configured to activate when either one of these events occurs by using the **any** option.

**Syntax** `type interface <interface> {up|down|any}`

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| <interface> | Interface name.                                       |
| up          | Activate when interface becomes operational.          |
| down        | Activate when the interface closes.                   |
| any         | Activate when any interface link status event occurs. |

**Mode** Trigger Configuration

**Example** To configure trigger 19 to be an interface trigger that activates when port1.0.1 becomes operational, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 19
awplus(config-trigger)# type interface port1.0.1 up
```

**Related commands** [show trigger](#)  
[trigger](#)

# type linkmon-probe

**Overview** Use this command to create a trigger that will run a script when a Link Health Monitoring probe reports that a link becomes “good”, “bad”, or “unreachable”.

**Syntax** type linkmon-probe <probename> <profilename>  
{good|bad|unreachable|any}

| Parameter     | Description                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <probename>   | The name of the Link Health Monitoring probe that will be used for executing the trigger.                                                                    |
| <profilename> | The name of the Link Health Monitoring performance profile that will be used for determine if the Link Health Monitoring probe is good, bad, or unreachable. |
| good          | If the Link Health Monitoring probe becomes 'good' according to the Link Health Monitoring performance profile then the trigger will be executed.            |
| bad           | If the Link Health Monitoring probe goes 'bad' according to the Link Health Monitoring performance profile then the trigger will be executed.                |
| unreachable   | If the Link Health Monitoring probe becomes 'unreachable' according to the Link Health Monitoring performance profile then the trigger will be executed.     |
| any           | If the Link Health Monitoring probe changes state according to the Link Health Monitoring performance profile then the trigger will be executed.             |

**Mode** Trigger Configuration

**Example** When the Link Health Monitoring probes sent to the “test-probe” destination no longer meet the performance profile “test-profile” the link will be deemed “bad”. To create a trigger that will run a script when a Link Health Monitoring probe is deemed “bad”, use the following commands:

```
awplus(config)# trigger 1
awplus(config-trigger)# script 1 link-bad.scp
awplus(config-trigger)# type linkmon-probe test-probe
test-profile bad
```

To create a trigger that will run a script when the link is deemed “good” again, use the following commands:

```
awplus(config)# trigger 2
awplus(config-trigger)# script 1 link-good.scp
awplus(config-trigger)# type linkmon-probe test-probe
test-profile good
```

**Related commands** [trigger](#)

**Command changes** Version 5.4.8-1.1: command added

# type log

**Overview** Use this command to configure a trigger to activate based on the content of log messages matching a string or regular expression.

**Syntax** `type log <log-message-string>`

| Parameter                               | Description                                                                              |
|-----------------------------------------|------------------------------------------------------------------------------------------|
| <code>&lt;log-message-string&gt;</code> | A string or a regular expression (PCRE) to match a log message or part of a log message. |

**Default** There is no type or log message string set by default.

**Mode** Trigger Configuration

**Usage notes** Log type triggers fully support regular expressions using PCRE (Perl-Compatible Regular Expression) syntax.

Only log messages of severity level notice or higher can activate a trigger.

Note that any command executed by the script will generate a log message with level notice, and will include '[SCRIPT]' before the command string. Therefore, if something in the script matches the configured log message trigger string, it will retrigger indefinitely.

**Example** To configure trigger 6 to activate when a log message of level notice or higher indicates that any port has 'failed', use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
awplus(config-trigger)# type log port.+ failed
```

**Related commands** [show trigger](#)  
[trigger](#)

**Command changes** Version 5.4.7-2.1: command added

# type memory

**Overview** This command configures a trigger to activate based on RAM usage level. Selecting the **up** option causes the trigger to activate when memory usage exceeds the specified level. Selecting the **down** option causes the trigger to activate when memory usage drops below the specified level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

**Syntax** `type memory <1-100> [up|down|any]`

| Parameter | Description                                                                |
|-----------|----------------------------------------------------------------------------|
| <1-100>   | The percentage of memory usage at which to trigger.                        |
| up        | Activate when memory usage exceeds the specified level.                    |
| down      | Activate when memory usage drops below the specified level.                |
| any       | Activate when memory usage passes the specified level in either direction. |

**Mode** Trigger Configuration

**Examples** To configure trigger 12 to be a memory trigger that activates when memory usage exceeds 50% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# type memory 50 up
```

To configure trigger 40 to be a memory trigger that activates when memory usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65
```

or

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65 any
```

**Related commands** [show trigger](#)  
[trigger](#)

# type periodic

**Overview** This command configures a trigger to be activated at regular intervals. The time period between activations is specified in minutes.

**Syntax** type periodic <1-1440>

| Parameter | Description                                |
|-----------|--------------------------------------------|
| <1-1440>  | The number of minutes between activations. |

**Mode** Trigger Configuration

**Usage notes** A combined limit of 10 triggers of the type periodic and time can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or
periodic
```

For an example trigger configuration that uses the **type periodic** command, see “See Daily Statistics” in the [Triggers\\_Feature Overview and Configuration Guide](#).

**Example** To configure trigger 44 to activate periodically at 10 minute intervals use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 44
awplus(config-trigger)# type periodic 10
```

**Related commands** [show trigger](#)  
[trigger](#)

# type ping-poll

**Overview** This command configures a trigger that activates when Ping Polling identifies that a target device's status has changed. This allows you to run a configuration script when a device becomes reachable or unreachable.

**Syntax** `type ping-poll <1-100> {up|down}`

| Parameter | Description                                                                     |
|-----------|---------------------------------------------------------------------------------|
| <1-100>   | The ping poll ID.                                                               |
| up        | The trigger activates when ping polling detects that the target is reachable.   |
| down      | The trigger activates when ping polling detects that the target is unreachable. |

**Mode** Trigger Configuration

**Example** To configure trigger 106 to activate when ping poll 12 detects that its target device is now unreachable, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 106
awplus(config-trigger)# type ping-poll 12 down
```

**Related commands** [show trigger](#)  
[trigger](#)

# type reboot

**Overview** This command configures a trigger that activates when your device is rebooted.

**Syntax** type reboot

**Mode** Trigger Configuration

**Example** To configure trigger 32 to activate when your device reboots, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 32
awplus(config-trigger)# type reboot
```

**Related commands** [show trigger](#)  
[trigger](#)

# type stack disabled-master

**Overview** This command (configured to the stack) configures a trigger to activate on a stack member if it becomes the disabled master.

A disabled master has the same configuration as the active master, but has all its links shutdown.

Although this command could activate any trigger script, the intention here is that the script will reactivate the links from their previously shutdown state, to enable the user to manage the device. An appropriate trigger script must already exist that will apply the [shutdown](#) command on the deactivated links.

**CAUTION:** *It is important that any ports that are configured as trunked ports across master and stack members are disabled at their stack member termination when operating in the fallback configuration. Otherwise, the trunked ports will not function correctly on the device that is connected downstream.*

If the [stack virtual-mac](#) command is enabled, the stack uses a virtual MAC address. The stack will always use this MAC address and the new elected master will still retain the originally configured virtual MAC address. If the **stack virtual-mac** command is disabled, the stack will use the MAC address of the current master. If the stack master fails, the stack MAC address changes to reflect the new master's MAC address. For more information about virtual MAC addresses, see the [VCStack Feature Overview and Configuration Guide](#).

**Syntax** `type stack disabled-master`

**Mode** Trigger Configuration

**Examples** To configure trigger 82 to activate on a device if it becomes the disabled master, use the following commands. These commands enter the Trigger Configuration mode for trigger 82, specify the trigger type, and then specify the script to run.

```
awplus# configure terminal
awplus(config)# trigger 82
awplus(config-trigger)# type stack disabled master
awplus(config-trigger)# script 1 flash:/disabled.scp
awplus(config-trigger)# exit
```

**Related commands** [stack disabled-master-monitoring](#)  
[trigger](#)  
[type stack master-fail](#)  
[type stack member](#)  
[type stack link](#)

# type stack link

**Overview** This command (configured to the stack) initiates the action of a pre-configured trigger to occur when a stacking link is either activated or deactivated.

**Syntax** `type stack link {up|down}`

| Parameter | Description           |
|-----------|-----------------------|
| up        | Stack link up event   |
| down      | Stack link down event |

**Mode** Trigger Configuration

**Example** To configure trigger 86 to activate when the stack link down event occurs, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack link down
```

**Related commands** [show trigger](#)  
[trigger](#)  
[type stack master-fail](#)

# type stack master-fail

**Overview** This command (configured to the stack) initiates the action of a pre-configured trigger to occur when the stack enters the fail-over state.

**Syntax** `type stack master-fail`

**Mode** Trigger Configuration

**Example** To configure trigger 86 to activate when stack master fail-over event occurs, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack master-fail
```

**Related commands**

- [stack disabled-master-monitoring](#)
- [trigger](#)
- [type stack disabled-master](#)
- [type stack member](#)
- [type stack link](#)

# type stack member

**Overview** This command (configured to the stack) initiates the action of a pre-configured trigger to occur when a device either joins or leaves the stack.

**Syntax** `type stack member {join|leave}`

| Parameter | Description          |
|-----------|----------------------|
| join      | Neighbor join event  |
| leave     | Neighbor leave event |

**Mode** Trigger Configuration

**Example** To configure a pre-configured trigger number 86 to activate when a new device joins the stack.

Note that the number 86 has no particular significance: you can assign any (previously created) numbered trigger.

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack member join
```

**Related commands** [trigger](#)  
[type stack master-fail](#)  
[type stack link](#)

# type time

**Overview** This command configures a trigger that activates at a specified time of day.

**Syntax** `type time <hh:mm>`

| Parameter                  | Description                       |
|----------------------------|-----------------------------------|
| <code>&lt;hh:mm&gt;</code> | The time to activate the trigger. |

**Mode** Trigger Configuration

**Usage** A combined limit of 10 triggers of the type time and type periodic can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or
periodic
```

**Example** To configure trigger 86 to activate at 15:53, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type time 15:53
```

**Related commands** [show trigger](#)  
[trigger](#)

# type usb

**Overview** Use this command to configure a trigger that activates on either the removal or the insertion of a USB storage device.

**Syntax** `type usb {in|out}`

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| in        | Trigger activates on insertion of a USB storage device. |
| out       | Trigger activates on removal of a USB storage device.   |

**Mode** Trigger Configuration

**Usage notes** USB triggers cannot execute script files from a USB storage device.

**Examples** To configure trigger 1 to activate on the insertion of a USB storage device, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type usb in
```

**Related commands** [trigger](#)

[show trigger](#)

# undebug trigger

**Overview** This command applies the functionality of the **no debug trigger** command.

# 67

# Ping-Polling Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure Ping Polling. For more information, see the [Ping Polling Feature Overview and Configuration Guide](#).

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Table 67-1: The following table lists the default values when configuring a ping poll

| Default           | Value                                                                       |
|-------------------|-----------------------------------------------------------------------------|
| Critical-interval | 1 second                                                                    |
| Description       | No description                                                              |
| Fail-count        | 5                                                                           |
| Length            | 32 bytes                                                                    |
| Normal-interval   | 30 seconds                                                                  |
| Sample-size       | 5                                                                           |
| Source-ip         | The IP address of the interface from which the ping packets are transmitted |
| Time-out          | 1 second                                                                    |
| Up-count          | 30                                                                          |

# active (ping-polling)

**Overview** This command enables a ping-poll instance. The polling instance sends ICMP echo requests to the device with the IP address specified by the [ip \(ping-polling\)](#) command.

By default, polling instances are disabled. When a polling instance is enabled, it assumes that the device it is polling is unreachable.

The **no** variant of this command disables a ping-poll instance. The polling instance no longer sends ICMP echo requests to the polled device. This also resets all counters for this polling instance.

**Syntax** `active`  
`no active`

**Mode** Ping-Polling Configuration

**Examples** To activate the ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# active
```

To disable the ping-poll instance 43 and reset its counters, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no active
```

**Related commands** [debug ping-poll](#)  
[ip \(ping-polling\)](#)  
[ping-poll](#)  
[show ping-poll](#)

# clear ping-poll

**Overview** This command resets the specified ping poll, or all ping poll instances. This clears the ping counters, and changes the status of polled devices to unreachable. The polling instance changes to the polling frequency specified with the [critical-interval](#) command. The device status changes to reachable once the device responses have reached the [up-count](#).

**Syntax** `clear ping-poll {<1-100>|all}`

| Parameter | Description                                                                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-100>   | A ping poll ID number. The specified ping poll instance has its counters cleared, and the status of the device it polls is changed to unreachable. |
| all       | Clears the counters and changes the device status of all polling instances.                                                                        |

**Mode** Privileged Exec

**Examples** To reset the ping poll instance 12, use the command:

```
awplus# clear ping-poll 12
```

To reset all ping poll instances, use the command:

```
awplus# clear ping-poll all
```

**Related commands** [active \(ping-polling\)](#)  
[ping-poll](#)  
[show ping-poll](#)

# critical-interval

**Overview** This command specifies the time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable.

This command enables the device to quickly observe changes in state, and should be set to a much lower value than the [normal-interval](#) command.

The **no** variant of this command sets the critical interval to the default of one second.

**Syntax** `critical-interval <1-65536>`  
`no critical-interval`

| Parameter | Description                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------|
| <1-65536> | Time in seconds between pings, when the device has failed to a ping, or the device is unreachable. |

**Default** The default is 1 second.

**Mode** Ping-Polling Configuration

**Examples** To set the critical interval to 2 seconds for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# critical-interval 2
```

To reset the critical interval to the default of one second for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# no critical-interval
```

**Related commands**

- [fail-count](#)
- [normal-interval](#)
- [sample-size](#)
- [show ping-poll](#)
- [timeout \(ping polling\)](#)
- [up-count](#)

# debug ping-poll

**Overview** This command enables ping poll debugging for the specified ping-poll instance. This generates detailed messages about ping execution.

The **no** variant of this command disables ping-poll debugging for the specified ping-poll.

**Syntax** `debug ping-poll <1-100>`  
`no debug ping-poll {<1-100>|all}`

| Parameter | Description                       |
|-----------|-----------------------------------|
| <1-100>   | A unique ping poll ID number.     |
| all       | Turn off all ping-poll debugging. |

**Mode** Privileged Exec

**Examples** To enable debugging for ping-poll instance 88, use the command:

```
awplus# debug ping-poll 88
```

To disable all ping poll debugging, use the command:

```
awplus# no debug ping-poll all
```

To disable debugging for ping-poll instance 88, use the command:

```
awplus# no debug ping-poll 88
```

[show ping-poll](#)  
[undebug ping-poll](#)

## description (ping-polling)

**Overview** This command specifies a string to describe the ping-polling instance. This allows the ping-polling instance to be recognized easily in show commands. Setting this command is optional.

By default ping-poll instances do not have a description.

Use the **no** variant of this command to delete the description set.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description                                                                                                                   |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;description&gt;</code> | The description of the target. Valid characters are any printable character and spaces. There is no maximum character length. |

**Mode** Ping-Polling Configuration

**Examples** To add the text "Primary Gateway" to describe the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# description Primary Gateway
```

To delete the description set for the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no description
```

**Related commands** [ping-poll](#)  
[show ping-poll](#)

# fail-count

**Overview** This command specifies the number of pings that must be unanswered, within the total number of pings specified by the [sample-size](#) command, for the ping-polling instance to consider the device unreachable.

If the number set by the [sample-size](#) command and the **fail-count** commands are the same, then the unanswered pings must be consecutive. If the number set by the [sample-size](#) command is greater than the number set by the **fail-count** command, then a device that does not always reply to pings may be declared unreachable.

The **no** variant of this command resets the fail count to the default.

**Syntax** `fail-count <1-100>`  
`no fail-count`

| Parameter                  | Description                                                                                                                        |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;1-100&gt;</code> | The number of pings within the sample size that a reachable device must fail to respond to before it is classified as unreachable. |

**Default** The default is 5.

**Mode** Ping-Polling Configuration

**Examples** To specify the number of pings that must fail within the sample size to determine that a device is unreachable for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# fail-count 5
```

To reset the fail-count to its default of 5 for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no fail-count
```

# ip (ping-polling)

**Overview** This command specifies the IPv4 address of the device you are polling.

**Syntax** `ip {<ip-address>|<ipv6-address>}`

| Parameter                         | Description                                        |
|-----------------------------------|----------------------------------------------------|
| <code>&lt;ip-address&gt;</code>   | An IPv4 address in dotted decimal notation A.B.C.D |
| <code>&lt;ipv6-address&gt;</code> | An IPv6 address in hexadecimal notation X:X::X:X   |

**Mode** Ping-Polling Configuration

**Examples** To set ping-poll instance 5 to poll the device with the IP address 192.168.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 5
awplus(config-ping-poll)# ip 192.168.0.1
```

To set ping-poll instance 10 to poll the device with the IPv6 address 2001:db8::, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 10
awplus(config-ping-poll)# ip 2001:db8::
```

# length (ping-poll data)

**Overview** This command specifies the number of data bytes to include in the data portion of the ping packet. This allows you to set the ping packets to a larger size if you find that larger packet types in your network are not reaching the polled device, while smaller packets are getting through. This encourages the polling instance to change the device's status to unreachable when the network is dropping packets of the size you are interested in.

The **no** variant of this command resets the data bytes to the default of 32 bytes.

**Syntax** `length <4-1500>`  
`no length`

| Parameter                   | Description                                                                 |
|-----------------------------|-----------------------------------------------------------------------------|
| <code>&lt;4-1500&gt;</code> | The number of data bytes to include in the data portion of the ping packet. |

**Default** The default is 32.

**Mode** Ping-Polling Configuration

**Examples** To specify that ping-poll instance 12 sends ping packet with a data portion of 56 bytes, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length 56
```

To reset the number of data bytes in the ping packet to the default of 32 bytes for ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length
```

**Related commands** [ping-poll](#)  
[show ping-poll](#)

# normal-interval

**Overview** This command specifies the time period between pings when the device is reachable.

The **no** variant of this command resets the time period to the default of 30 seconds.

**Syntax** `normal-interval <1-65536>`  
`no normal-interval`

| Parameter                    | Description                                                 |
|------------------------------|-------------------------------------------------------------|
| <code>&lt;1-65536&gt;</code> | Time in seconds between pings when the target is reachable. |

**Default** The default is 30 seconds.

**Mode** Ping-Polling Configuration

**Examples** To specify a time period of 60 seconds between pings when the device is reachable for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# normal-interval 60
```

To reset the interval to the default of 30 seconds for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no normal-interval
```

# ping-poll

**Overview** This command enters the ping-poll configuration mode. If a ping-poll exists with the specified number, then this command enters its configuration mode. If no ping-poll exists with the specified number, then this command creates a new ping poll with this ID number.

To configure a ping-poll, create a ping poll using this command, and use the [ip \(ping-polling\)](#) command to specify the device you want the polling instance to poll. It is not necessary to specify any further commands unless you want to change a command's default.

The **no** variant of this command deletes the specified ping poll.

**Syntax** `ping-poll <1-100>`  
`no ping-poll <1-100>`

| Parameter                  | Description                   |
|----------------------------|-------------------------------|
| <code>&lt;1-100&gt;</code> | A unique ping poll ID number. |

**Mode** Global Configuration

**Examples** To create ping-poll instance 3 and enter ping-poll configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 3
awplus(config-ping-poll)#
```

To delete ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# no ping-poll 3
```

- [source-ip](#)

# sample-size

**Overview** This command sets the total number of pings that the polling instance inspects when determining whether a device is unreachable. If the number of pings specified by the **fail-count** command go unanswered within the inspected sample, then the device is declared unreachable.

If the numbers set in this command and **fail-count** command are the same, the unanswered pings must be consecutive. If the number set by this command is greater than that set with the **fail-count** command, a device that does not always reply to pings may be declared unreachable.

You cannot set this command's value lower than the **fail-count** value.

The polling instance uses the number of pings specified by the **up-count** command to determine when a device is reachable.

The **no** variant of this command resets this command to the default.

**Syntax** `sample-size <1-100>`  
`no sample size`

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| <1-100>   | Number of pings that determines critical and up counts. |

**Default** The default is 5.

**Mode** Ping-Polling Configuration

**Examples** To set the sample-size to 50 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# sample-size 50
```

To reset sample-size to the default of 5 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no sample-size
```

# show counter ping-poll

**Overview** This command displays the counters for ping polling.

**Syntax** `show counter ping-poll [<1-100>]`

| Parameter | Description                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-100>   | A unique ping poll ID number. This displays the counters for the specified ping poll only. If you do not specify a ping poll, then this command displays counters for all ping polls. |

**Mode** User Exec and Privileged Exec

**Output** Figure 67-1: Example output from the **show counter ping-poll** command

|                       |          |
|-----------------------|----------|
| Ping-polling counters |          |
| Ping-poll: 1          |          |

| PingsFailedDownState  | ..... 0  |
| ErrorSendingPing      | ..... 2  |
| CurrentUpCount        | ..... 13 |
| CurrentFailCount      | ..... 0  |
| UpStateEntered        | ..... 0  |
| DownStateEntered      | ..... 0  |
| Ping-poll: 2          |          |
| PingsSent             | ..... 15 |
| PingsFailedUpState    | ..... 0  |
| PingsFailedDownState  | ..... 0  |
| ErrorSendingPing      | ..... 2  |
| CurrentUpCount        | ..... 13 |
| CurrentFailCount      | ..... 0  |
| UpStateEntered        | ..... 0  |
| DownStateEntered      | ..... 0  |
| Ping-poll: 5          |          |
| PingsSent             | ..... 13 |
| PingsFailedUpState    | ..... 0  |
| PingsFailedDownState  | ..... 2  |
| ErrorSendingPing      | ..... 2  |
| CurrentUpCount        | ..... 9  |
| CurrentFailCount      | ..... 0  |
| UpStateEntered        | ..... 0  |
| DownStateEntered      | ..... 0  |

**Table 68:** Parameters in output of the **show counter ping-poll** command

| Parameter            | Description                                                                                                                                                  |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ping-poll            | The ID number of the polling instance.                                                                                                                       |
| PingsSent            | The total number of pings generated by the polling instance.                                                                                                 |
| PingsFailedUpState   | The number of unanswered pings while the target device is in the Up state. This is a cumulative counter for multiple occurrences of the Up state.            |
| PingsFailedDownState | Number of unanswered pings while the target device is in the Down state. This is a cumulative counter for multiple occurrences of the Down state.            |
| ErrorSendingPing     | The number of pings that were not successfully sent to the target device.<br>This error can occur when your device does not have a route to the destination. |
| CurrentUpCount       | The current number of sequential ping replies.                                                                                                               |
| CurrentFailCount     | The number of ping requests that have not received a ping reply in the current sample-size window.                                                           |
| UpStateEntered       | Number of times the target device has entered the Up state.                                                                                                  |
| DownStateEntered     | Number of times the target device has entered the Down state.                                                                                                |

**Example** To display counters for the polling instances, use the command:

```
awplus# show counter ping-poll
```

**Related commands**

- [debug ping-poll](#)
- [ping-poll](#)
- [show ping-poll](#)

# show ping-poll

**Overview** This command displays the settings and status of ping polls.

**Syntax** `show ping-poll [<1-100>|state {up|down}] [brief]`

| Parameter | Description                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------|
| <1-100>   | Displays settings and status for the specified polling instance.                                               |
| state     | Displays polling instances based on whether the device they are polling is currently reachable or unreachable. |
|           | up Displays polling instance where the device state is reachable.                                              |
|           | down Displays polling instances where the device state is unreachable.                                         |
| brief     | Displays a summary of the state of ping polls, and the devices they are polling.                               |

**Mode** User Exec and Privileged Exec

**Output** Figure 67-2: Example output from the **show ping-poll brief** command

|                         |         |       |               |
|-------------------------|---------|-------|---------------|
| Ping Poll Configuration |         |       |               |
| -----                   |         |       |               |
| Id                      | Enabled | State | Destination   |
| -----                   |         |       |               |
| 1                       | Yes     | Down  | 192.168.0.1   |
| 2                       | Yes     | Up    | 192.168.0.100 |

**Table 69:** Parameters in output of the **show ping-poll brief** command

| Parameter | Meaning                                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------------------|
| Id        | The ID number of the polling instance, set when creating the polling instance with the <a href="#">ping-poll</a> command. |
| Enabled   | Whether the polling instance is enabled or disabled.                                                                      |

**Table 69:** Parameters in output of the **show ping-poll brief** command (cont.)

| Parameter     | Meaning                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------|
| State         | The current status of the device being polled:                                                                                           |
| Up            | The device is reachable.                                                                                                                 |
| Down          | The device is unreachable.                                                                                                               |
| Critical Up   | The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.    |
| Critical Down | The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up. |
| Destination   | The IP address of the polled device, set with the <a href="#">ip (ping-polling)</a> command.                                             |

**Figure 67-3:** Example output from the **show ping-poll** command

**Table 70:** Parameters in output of the **show ping-poll** command

| Parameter              | Description                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description            | Optional description set for the polling instance with the <a href="#">description (ping-polling)</a> command.                                                                                                        |
| Destination IP address | The IP address of the polled device, set with the <a href="#">ip (ping-polling)</a> command.                                                                                                                          |
| Status                 | The current status of the device being polled:                                                                                                                                                                        |
|                        | Up      The device is reachable.                                                                                                                                                                                      |
|                        | Down    The device is unreachable.                                                                                                                                                                                    |
|                        | Critical Up    The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.                                                                  |
|                        | Critical Down    The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up.                                                             |
| Enabled                | Whether the polling instance is enabled or disabled. The <a href="#">active (ping-polling)</a> and <a href="#">active (ping-polling)</a> commands enable and disable a polling instance.                              |
| Source IP address      | The source IP address sent in the ping packets. This is set using the <a href="#">source-ip</a> command.                                                                                                              |
| Critical interval      | The time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable. This is set with the <a href="#">critical-interval</a> command. |
| Normal interval        | The time period between pings when the device is reachable. This is set with the <a href="#">normal-interval</a> command.                                                                                             |

**Table 70:** Parameters in output of the **show ping-poll** command (cont.)

| Parameter   | Description                                                                                                                                                                                                                                                |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fail count  | The number of pings that must be unanswered, within the total number of pings specified by the <a href="#">sample-size</a> command, for the polling instance to consider the device unreachable. This is set using the <a href="#">fail-count</a> command. |
| Up count    | The number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again. This is set using the <a href="#">up-count</a> command.                                                                   |
| Sample size | The total number of pings that the polling instance inspects when determining whether a device is unreachable. This is set using the <a href="#">sample-size</a> command.                                                                                  |
| Length      | The number of data bytes to include in the data portion of the ping packet. This is set using the <a href="#">length (ping-poll data)</a> command.                                                                                                         |
| Timeout     | The time in seconds that the polling instance waits for a response to a ping packet. This is set using the <a href="#">timeout (ping polling)</a> command.                                                                                                 |
| Debugging   | Indicates whether ping polling debugging is <b>Enabled</b> or <b>Disabled</b> . This is set using the <a href="#">debug ping-poll</a> command.                                                                                                             |

**Examples** To display the ping poll settings and the status of all the polls, use the command:

```
awplus# show ping-poll
```

To display a summary of the ping poll settings, use the command:

```
awplus# show ping-poll brief
```

To display the settings for ping poll 6, use the command:

```
awplus# show ping-poll 6
```

To display a summary of the state of ping poll 6, use the command:

```
awplus# show ping-poll 6 brief
```

To display the settings of ping polls that have reachable devices, use the command:

```
awplus# show ping-poll state up
```

To display a summary of ping polls that have unreachable devices, use the command:

```
awplus# show ping-poll state down brief
```

**Related commands** [debug ping-poll](#)  
[ping-poll](#)

# source-ip

**Overview** This command specifies the source IP address to use in ping packets.

By default, the polling instance uses the address of the interface through which it transmits the ping packets. It uses the device's local interface IP address when it is set. Otherwise, the IP address of the interface through which it transmits the ping packets is used.

The **no** variant of this command resets the source IP in the packets to the device's local interface IP address.

**Syntax** `source-ip {<ip-address>|<ipv6-address>}`  
`no source-ip`

| Parameter      | Description                                        |
|----------------|----------------------------------------------------|
| <ip-address>   | An IPv4 address in dotted decimal notation A.B.C.D |
| <ipv6-address> | An IPv6 address in hexadecimal notation X:X::X:X   |

**Mode** Ping-Polling Configuration

**Examples** To configure the ping-polling instance 43 to use the source IP address 192.168.0.1 in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 192.168.0.1
```

To configure the ping-polling instance 43 to use the source IPv6 address 2001:db8:: in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 2001:db8::
```

To reset the source IP address to the device's local interface IP address for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no source-ip
```

- length (ping-poll data)
- ping-poll
- show ping-poll

# timeout (ping polling)

**Overview** This command specifies the time in seconds that the polling instance waits for a response to a ping packet. You may find a higher time-out useful in networks where ping packets have a low priority.

The **no** variant of this command resets the set time out to the default of one second.

**Syntax** `timeout <1-30>`  
`no timeout`

| Parameter | Description                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------|
| <1-30>    | Length of time, in seconds, that the polling instance waits for a response from the polled device. |

**Default** The default is 1 second.

**Mode** Ping-Polling Configuration

**Examples** To specify the timeout as 5 seconds for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# timeout 5
```

To reset the timeout to its default of 1 second for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no timeout
```

[normal-interval](#)  
[ping-poll](#)  
[sample-size](#)  
[show ping-poll](#)  
[up-count](#)

# up-count

**Overview** This command sets the number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again.

The **no** variant of this command resets the up count to the default of 30.

**Syntax** `up-count <1-100>`  
`no up-count`

| Parameter                  | Description                                                                      |
|----------------------------|----------------------------------------------------------------------------------|
| <code>&lt;1-100&gt;</code> | Number of replied pings before an unreachable device is classified as reachable. |

**Default** The default is 30.

**Mode** Ping-Polling Configuration

**Examples** To set the upcount to 5 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# up-count 5
```

To reset the upcount to the default value of 30 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no up-count
```

# debug sflow

**Overview** This command enables sFlow® debug message logging, for sFlow sampling and polling activity on the specified ports. If no ports are specified, sampling and/or polling debug messages are enabled for all ports.

The **no** variant of this command disables sFlow sampling and or polling debug message logging on the ports selected. If no ports are specified, sampling and/or polling debug messages are disabled on all ports.

**Syntax** `debug sflow [interface <port-list>] [sampling][polling]`  
`no debug sflow [interface <port-list>] [sampling][polling]`

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface   | Interface information.                                                                                                                                                                                                                                                                                                                                                           |
| <port-list> | The ports for which sFlow debug is to be enabled. The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.0.12)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-1.0.24</li><li>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.1-1.0.24.</li></ul> |
| sampling    | Debug sFlow sampling for the specified port(s).                                                                                                                                                                                                                                                                                                                                  |
| polling     | Debug sFlow polling for the specified port(s).                                                                                                                                                                                                                                                                                                                                   |

**Default** The sFlow sampling and or polling debug is disabled.

**Mode** Privileged Exec

**Examples** To enable sFlow debug message logging for polling and sampling on port1.0.1 and port1.0.7, use the commands:

```
awplus# debug sflow interface port1.0.1,port1.0.7 sampling
polling
```

To enable logging and polling of sFlow debug messages for polling and sampling on all ports, use the command:

```
awplus# debug sflow sampling polling
```

**Related commands** [show debugging sflow](#)  
[no debug all](#)

# debug sflow agent

**Overview** This command enables sFlow® debug message logging that is not specific to particular ports. For example, sending an sFlow datagram to the collector.

The **no** variant of this command applies the command default.

**Syntax** debug sflow agent  
no debug sflow agent

**Default** The sFlow agent debug message logging (that is not port specific) is disabled.

**Mode** Privileged Exec

**Example** To enable logging of sFlow agent debug messages, use the following command:

```
awplus# debug sflow agent
```

**Related commands** [show debugging sflow](#)  
[debug sflow](#)

# sflow agent

**Overview** This command sets the sFlow® agent IP address on the switch. This address is inserted into every sFlow datagram sent from the sFlow agent switch to the sFlow collector device. The sFlow collector can then use this address to uniquely identify and to access the switch, such as for SNMP. We therefore recommend that you change this address as little as possible.

Although the agent address can be set to any valid IPv4 or IPv6 address; we recommended that you set the sFlow® agent IP address to be the **local address** that is configured on the switch. For information on local addresses and how to set them up, see the [interface \(to configure\)](#) command. This ensures that the sFlow collector can maintain connectivity to the switch irrespective of the addition or deletion of interfaces (each of which will have its own specific IP address). Note that sFlow is rendered inactive whenever the agent address is not set.

The **no** variant of this command applies its default setting to remove a configured address.

**Syntax** `sflow agent {ip <ip-address>|ipv6 <ipv6-address>}`  
`no sflow agent {ip|ipv6}`

| Parameter      | Description                                                                                                  |
|----------------|--------------------------------------------------------------------------------------------------------------|
| <ip-address>   | The IPv4 address of the switch that is acting as the sFlow agent.                                            |
| <ipv6-address> | The IPv6 address of the switch that is acting as the sFlow agent. The IPv6 address uses the format X:X::X:X. |

**Default** The sFlow agent address is unset.

**Mode** Global Configuration

**Examples** To set the sFlow agent (IPv4) address to 192.0.2.23, use the command:

```
awplus# configure terminal
awplus(config)# sflow agent ip 192.0.2.23
```

To remove the sFlow agent (IPv4) address, use the command:

```
awplus# configure terminal
awplus(config)# no sflow agent ip
```

To set the sFlow agent (IPv6) address to 2001:0db8::1, use the command:

```
awplus# configure terminal
awplus(config)# sflow agent ipv6 2001:0db8::1
```

To remove the sFlow agent (IPv6) address, use the command:

```
awplus# configure terminal
awplus(config)# no sflow agent ipv6
```

**Related  
commands**    `show running-config sflow`  
                  `show sflow`

# sflow collector

**Overview** This command has been deprecated. It has been replaced by the [sflow collector id](#) command.

This command sets the sFlow® agent's collector IP address and/or UDP port.

**Command changes** Version 5.5.1-1.1: command deprecated.

# sflow collector id

**Overview** Use this command to set the sFlow® agent's collector IP address and optionally the port and maximum datagram size. This is the destination IP address and UDP port, for sFlow datagrams sent from the sFlow agent. The IP address can be any valid IPv4 or IPv6 address.

Use the **no** variant of this command to remove the configuration for that collector and render it inactive.

**Syntax** sflow collector id <1-5> ip <ip-address> [port  
<1-65535>|max-datagram-size <200-1500>]  
  
sflow collector id <1-5> ipv6 <ipv6-address> [port  
<1-65535>|max-datagram-size <200-1500>]  
  
no sflow collector id <1-5>

| Parameter         | Description                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------|
| <ip-address>      | IPv4 address of the remote sFlow collector.                                                             |
| <ipv6-address>    | IPv6 address of remote sFlow collector.<br>The IPv6 address uses the format X:X::X:X.                   |
| port              | Destination UDP port for sFlow datagrams sent to the collector.                                         |
| <1-65535>         | UDP port number (default: 6343).                                                                        |
| max-datagram-size | The maximum number of bytes that can be sent in an sFlow datagram sent from the agent to the collector. |
| <200-1500>        | The value set for the max-datagram-size.                                                                |

**Default** By default the collector does not exist until configured with a valid IP address.

**Mode** Global Configuration

**Examples** To set the address of collector 1 to 192.168.1.36 with default port and max-datagram size, use the commands:

```
awplus# configure terminal
awplus(config)# sflow collector id 1 ip 192.168.1.36
```

To set the address of collector 2 to 12ae::213d::213d::333f and use UDP port 500, use the commands:

```
awplus# configure terminal
awplus(config)# sflow collector id 2 ipv6
12ae::213d::213d::333f port 500
```

To set the address of collector 5 to 10.42.2.70 and use UDP port 7777 and have a max-datagram-size of 800, use the commands:

```
awplus# configure terminal
awplus(config)# sflow collector id 5 ip 10.42.2.70 port 7777
max-datagram-size 800
```

To delete collector 5, use the commands:

```
awplus# configure terminal
awplus(config)# no sflow collector id 5
```

**Related commands**   [show running-config sflow](#)  
[show sflow](#)

**Command changes**   Version 5.5.1-1.1: command added.

# sflow collector max-datagram-size

**Overview** This command has been deprecated. It has been replaced by the [sflow collector id](#) command.

This command sets the maximum size of the sFlow® datagrams sent to the collector.

**Command changes** Version 5.5.1-1.1: command deprecated

# sflow enable

**Overview** This command enables sFlow® globally on the switch.

The **no** variant of this command disables sFlow globally on the switch.

Note that enabling sFlow does not automatically set its operational status to active. To activate sFlow the following conditions need to be met:

- sFlow is enabled.
- The sFlow agent address is set.
- The sFlow collector address is set to a valid (non zero) IPv4 or IPv6 address.
- Polling or sampling is enabled on the ports to be sampled or polled.

**Syntax** `sflow enable`  
`no sflow enable`

**Default** sFlow is disabled globally on the switch.

**Mode** Global Configuration

**Example** To enable sFlow operation, use the command:

```
awplus# configure terminal
awplus(config)# sflow enable
```

**Related commands** [show running-config sflow](#)  
[show sflow](#)

# sflow max-header-size

**Overview** This command sets the maximum header size of the Ethernet frames sampled on a specified port. The maximum header size is measured in bytes, referenced from the first byte of the Ethernet destination address and excludes the Ethernet FCS fields.

If a sampled Ethernet frame is longer than the maximum header size set by this command, then the frame will be truncated to the first N bytes before being placed in the sFlow datagram, where N is the maximum header size set by this command.

The **no** variant of this command resets the max-header-size to its default.

**Syntax** `sflow max-header-size <14-200>`  
`no sflow max-header-size`

| Parameter | Description                                       |
|-----------|---------------------------------------------------|
| <14-200>  | The maximum number of header bytes to be sampled. |

**Default** The max-header-size is 128 bytes.

**Mode** Interface Configuration

**Usage notes** The header size is measured from the first byte of the Ethernet frame MAC Destination Address.

- For an environment using standard TCP IPv4 over Ethernet frames, consider the following basic protocol structure:

Ethernet header (including the 4 byte 802.1Q header component) = 18 bytes

IPv4 header = 24 bytes

TCP header = 24 bytes

Total = 66 bytes

**CAUTION:** For IPv4, any data existing between 66 bytes and the value set by this command will be included in the sFlow packet samples. For example, with the default of 128 applied, up to 128-66=62 bytes of user data could be included in the sFlow datagram samples sent between the Agent and the Collector.

For more information, see the [sFlow Feature Overview and Configuration Guide](#).

- A similar consideration can be made for an environment using TCP IPv6 over Ethernet:

Ethernet header (including the 4 byte 802.1Q header component) = 18 bytes

IPv6 header = 40 bytes

TCP header = 24 bytes

Total = 82 bytes

**CAUTION:** For IPv6, any data existing between 82 bytes and the value set by this command will be included in the sFlow packet samples. For example, with the default of 128 applied, up to 128-82=46 bytes of user data could be included in the sFlow datagram samples sent between the Agent and the Collector.

Note that the agent-to-collector datagrams contain their own UDP headers, which are outside this calculation.

**Example** To set the maximum header size to 160 bytes for ports 1.0.1 and 1.0.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# sflow max-header-size 160
```

**Related commands**

- [show running-config sflow](#)
- [show sflow interface](#)
- [sflow max-header-size](#)

# sflow polling-interval

**Overview** This command sets the sFlow® counter polling interval (in seconds) for the specified ports. A value of 0 disables polling. A counter sample is taken every N seconds where N is the value set by this command.

The **no** variant of this command applies the default.

**Syntax** `sflow polling-interval {0|<1-16777215>}`  
`no sflow polling-interval`

| Parameter    | Description                      |
|--------------|----------------------------------|
| 0            | Disable polling (the default).   |
| <1-16777215> | The polling interval in seconds. |

**Default** The polling-interval is 0 (polling disabled).

**Mode** Interface Configuration

**Example** To set the polling interval to 60 seconds for ports 1.0.1 and 1.0.7, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# sflow polling-interval 60
```

**Related commands** [show running-config sflow](#)  
[show sflow interface](#)

# sflow sampling-rate

**Overview** This command sets the mean sFlow® sampling rate for the specified ports. Sampling occurs every N frames (on average), where N is the rate value set via this command. The sampling rate applies to ingress and egress frames independently. For example, a value of 1000 will sample one frame in every 1000 frames received, i.e. one in every 1000 frames sent from the specified port. A value of 0 disables sampling on the specified port(s).

The **no** variant of this command applies the default.

**Syntax** `sflow sampling-rate <256-16777215>`  
`no sflow sampling-rate`

| Parameter      | Description                                       |
|----------------|---------------------------------------------------|
| <256-16777215> | The sampling rate N, measured in Ethernet frames. |

**Default** The sampling-rate is 0 (sampling disabled).

**Mode** Interface Configuration

**Example** To set the sampling rate to 500 for port1.0.1 and port1.0.3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.3
awplus(config-if)# sflow sampling-rate 500
```

**Related commands** [show running-config sflow](#)  
[show sflow interface](#)

# show debugging sflow

**Overview** This command displays sFlow® debug settings for agent operation, and for sampling and polling on specific interface ports. If no interface ports are specified, sampling and polling will be applied to all ports.

**Syntax** `show debugging sflow [interface <port-list>]`

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                               |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface   | The interface information.                                                                                                                                                                                                                                                                                                                                                                |
| <port-list> | The ports for which the sFlow debug settings are to be shown. The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.0.6)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-1.0.6</li><li>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.3-1.0.6.</li></ul> |

**Mode** User Exec and Privileged Exec

**Example** To display sFlow debug settings on the agent, and for sampling and polling on ports 1.0.1 to 1.0.9, use the command:

```
awplus# show debugging sflow interface port1.0.1-1.0.9
```

**Output** Figure 68-1: Sample obtained for an sFlow agent

```
awplus# show debugging sflow interface port1.0.1-1.0.9
```

|                            |                   |                  |
|----------------------------|-------------------|------------------|
| sFlow Agent Debug: Enabled |                   |                  |
| Port                       | Sampling<br>Debug | Polling<br>Debug |
| -----                      |                   |                  |
| 1.0.1                      | Enabled           | Enabled          |
| 1.0.2                      | Enabled           | -                |
| 1.0.3                      | -                 | -                |
| 1.0.4                      | -                 | -                |
| 1.0.5                      | -                 | -                |
| 1.0.6                      | -                 | Enabled          |
| 1.0.7                      | -                 | -                |
| 1.0.8                      | -                 | Enabled          |
| 1.0.9                      | -                 | Enabled          |

To display sFlow debug settings for all ports, use the command:

```
awplus# show debugging sflow
```

**Related  
commands**    [show running-config sflow](#)  
                  [show sflow interface](#)

# show running-config sflow

**Overview** This command displays the running system information specific to the sFlow feature.

**Syntax** `show running-config sflow`

**Mode** Privileged Exec and Global Configuration

**Example** To display the sFlow running configuration information, use the command:

```
awplus# show running-config sflow
```

**Output** Figure 68-2: Example output from the **show running-config sflow** command

```
awplus#sh run sflow
!
sflow agent ip 192.0.2.33
sflow collector ip 192.0.2.65
sflow collector max-datagram-size 1200
sflow enable
!
interface port1.0.11-port1.0.22
sflow sampling-rate 512
```

**Related commands** [show running-config](#)

# show sflow

**Overview** This command displays non-port-specific sFlow agent configuration and operational status.

**Syntax** show sflow

**Mode** Privileged Exec

**Example** To display sFlow configuration and operational status, use the command:

```
awplus# show sflow
```

## Output

**Table 1:** Example output from the **show sflow** command

|                               |                     |
|-------------------------------|---------------------|
| sFlow Agent Configuration:    | Default Values      |
| sFlow Admin Status .....      | Disabled [Disabled] |
| sFlow Agent Address .....     | [not set] [not set] |
| Collector Address .....       | 0.0.0.0 [0.0.0.0]   |
| Collector UDP Port .....      | 6343 [6343]         |
| Tx Max Datagram Size .....    | 1200 [1400]         |
| sFlow Agent Status:           |                     |
| Polling/sampling/Tx .....     |                     |
| Inactive because:             |                     |
| - sFlow is disabled           |                     |
| - Agent Addr is not set       |                     |
| - Collector Addr is 0.0.0.0   |                     |
| - Polling & sampling disabled |                     |
| on all ports                  |                     |

**Table 2:** Parameters in the output of the **show sflow** command

| Output Parameter    | Description                                                                                                                                                    |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sFlow Admin Status  | Whether sFlow agent operation is administratively enabled.                                                                                                     |
| sFlow Agent Address | The sFlow agent IPv4 or IPv6 address for the device. sFlow is rendered inactive whenever the agent address is not set.                                         |
| Collector Address   | The IPv4 or IPv6 collector address to which sFlow datagrams are sent. sFlow is rendered inactive whenever the collector address is set to 0.0.0.0 or 0:0::0.0. |
| Collector UDP Port  | The UDP port on the collector to which sFlow datagrams are sent.                                                                                               |

**Table 2:** Parameters in the output of the **show sflow** command (cont.)

| Output Parameter     | Description                                                                                                                   |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Tx Max Datagram Size | The maximum size of the sFlow datagrams sent to the collector.                                                                |
| Polling/sampling/Tx  | Whether sFlow sampling and/or polling (and hence sFlow datagram transmission) are active. If inactive the reasons are listed. |

**Related commands** [show running-config sflow](#)  
[show sflow interface](#)

# show sflow interface

**Overview** This command displays sFlow agent sampling and polling configuration for all ports or a specified port.

**Syntax** `show sflow interface [<ifrange>]`

| Parameter | Description          |
|-----------|----------------------|
| <ifrange> | The interface range. |

**Mode** Privileged Exec

**Example** To display the sFlow sampling and polling configuration for port1.0.1, use the command:

```
awplus# show sflow interface port1.0.1
```

**Output** Figure 68-3: Example output from the **show sflow interface** command

```
awplus#show sflow interface
```
