awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim bsr-border
```

The following example removes the VLAN interface vlan2 from the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim bsr-border
```

# ipv6 pim bsr-candidate

**Overview** Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IPv6 address mask of the interface.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

**Syntax** `ipv6 pim bsr-candidate <interface> [<hash>] [<priority>]`  
`no ipv6 pim bsr-candidate [<interface>]`

| Parameter   | Description                                                                                                                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface> | Specify the interface.                                                                                                                                                                                      |
| <hash>      | <0-128> configure the hash mask length used for RP selection. The default hash value if you do not configure this parameter is 126.                                                                         |
| <priority>  | <0-255> configure priority for a BSR candidate. Note that you must also specify the <hash> (mask length) when specifying the <priority>. The default priority if you do not configure this parameter is 64. |

**Mode** Global Configuration

**Default** The default hash parameter value is 126 and the default priority parameter value is 64.

**Examples** To set the BSR candidate to the VLAN interface vlan2, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim bsr-candidate vlan2 20 30
```

To withdraw the address of vlan2 from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ipv6 pim bsr-candidate vlan2
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim cisco-register-checksum

**Overview** Use this command to configure the option to calculate the Register Checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this option.

**Syntax** `ipv6 pim cisco-register-checksum`  
`no ipv6 pim cisco-register-checksum`

**Default** This command is disabled by default. By default, Register Checksum is calculated only over the header.

**Mode** Global Configuration

**Example** To calculate the Register Checksum over the whole packet, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim cisco-register-checksum
```

To return to calculating the Register Checksum over the header, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim cisco-register-checksum
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim cisco-register-checksum group-list

**Overview** Use this command to configure the option to calculate the Register Checksum over the whole packet on multicast groups as specified by the software IPv6 access-list. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

**Syntax** `ipv6 pim cisco-register-checksum group-list <IPv6-access-list>`  
`no ipv6 pim cisco-register-checksum group-list`  
`<IPv6-access-list>`

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;IPv6-access-list&gt;</code> | Optional. Specify a Standard or Extended software IPv6 access list.<br>See <a href="#">IPv6 Software Access Control List (ACL) Commands</a> for supported IPv6 ACLs.<br>Use this parameter to configure the option to calculate the Register Checksum over the whole packet on multicast groups as specified by an IPv6 access list entered after this command. |

**Mode** Global Configuration

**Default** This command is disabled by default. By default, Register Checksum is calculated only over the header.

**Example** To calculate the Register Checksum over the whole packet on the multicast groups ff0x::db8:0:0/96, as specified by the ACL named G1, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G1 permit
ff0x::db8:0:0/96
awplus(config)# ipv6 pim cisco-register-checksum group-list G1
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim crp-cisco-prefix

**Overview** Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0.

Use the **no** variant of this command to revert to the default settings.

**Syntax** `ipv6 pim crp-cisco-prefix`  
`no ipv6 pim crp-cisco-prefix`

**Mode** Global Configuration

**Example** To enable this option, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim crp-cisco-prefix
```

To disable this option again, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim crp-cisco-prefix
```

**Related commands** [ipv6 pim rp-candidate](#)

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim dr-priority

**Overview** Use this command to set the Designated Router priority value.  
Use the **no** variant of this command to disable this function.

**Syntax** `ipv6 pim dr-priority <priority>`  
`no ipv6 pim dr-priority [<priority>]`

| Parameter  | Description                                                                                                                                      |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <priority> | Specify the Designated Router priority value, in the range 0 to 4294967294. Note that a higher value has a higher preference or higher priority. |

**Default** The default value is 1. The negated form of this command restores the value to the default.

**Mode** Interface Configuration for a VLAN interface.

**Examples** To set the Designated Router priority value to 11234 for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim dr-priority
```

**Related commands** [ipv6 pim ignore-rp-set-priority](#)

# ipv6 pim exclude-genid

**Overview** Use this command to exclude the GenID option from Hello packets sent out by the PIM-SMv6 module on a particular interface. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

**Syntax** `ipv6 pim exclude-genid`  
`no ipv6 pim exclude-genid`

**Default** By default, this command is disabled; the GenID option is included.

**Mode** Interface Configuration for a VLAN interface.

**Examples** To exclude the GenID option in Hello packets on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim exclude-genid
```

To include the GenID option in Hello packets, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim exclude-genid
```

# ipv6 pim ext-srcs-directly-connected

**Overview** Use this command to configure PIM-SMv6 to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM-SMv6 to treat only directly connected sources as directly connected.

**Syntax** `ipv6 pim ext-srcs-directly-connected`  
`no ipv6 pim ext-srcs-directly-connected`

**Default** The **no** variant of this command is the default behavior.

**Mode** Interface Configuration for a VLAN interface.

**Example** To configure PIM-SMv6 to treat all sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim ext-srcs-directly-connected
```

To configure PIM-SMv6 to treat only directly connected sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim ext-srcs-directly-connected
```

# ipv6 pim hello-holdtime

**Overview** This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 \* the current hello-interval.

**Syntax** `ipv6 pim hello-holdtime <holdtime>`  
`no ipv6 pim hello-holdtime`

| Parameter  | Description                                                                      |
|------------|----------------------------------------------------------------------------------|
| <holdtime> | <1-65535><br>The holdtime value in seconds (no fractional seconds are accepted). |

**Default** The default hello-holdtime value is 3.5 \* the current hello-interval. The default hello-holdtime is restored using the negated form of this command.

**Mode** Interface Configuration for a VLAN interface.

**Usage** Each time the hello-interval is updated, the hello-holdtime is also updated, according to the following rules:

If the hello-holdtime is not configured; or if the hello-holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 \* hello-interval). Otherwise, it retains the configured value.

**Examples** To configure a hello-holdtime of 123 seconds on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-holdtime 123
```

To reset the hello-holdtime to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim hello-holdtime
```

# ipv6 pim hello-interval

**Overview** This command configures a hello-interval value for PIM-SMv6.

Use the **no** variant of this command to reset the hello-interval for PIM-SMv6 to the default.

**Syntax** `ipv6 pim hello-interval <interval>`  
`no ipv6 pim hello-interval`

| Parameter  | Description                                                      |
|------------|------------------------------------------------------------------|
| <interval> | <1-65535> The value in seconds (no fractional seconds accepted). |

**Default** The default hello-interval value is 30 seconds. The default is restored using the negated form of this command.

**Mode** Interface Configuration for a VLAN interface.

**Usage** When the hello-interval is configured, and the hello-holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 \* hello-interval). Otherwise, the hello-holdtime value is the configured value.

**Example** To set the hello-interval to 123 seconds on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-interval 123
```

To set the hello-interval to the default on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim hello-interval
```

# ipv6 pim ignore-rp-set-priority

**Overview** Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

Use the **no** variant of this command to disable this setting.

**Syntax** `ipv6 pim ignore-rp-set-priority`  
`no ipv6 pim ignore-rp-set-priority`

**Mode** Global Configuration

**Usage** This command is used to inter-operate with older Cisco IOS versions.

**Example** To enable this option, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim ignore-rp-set-priority
```

To disable this option again, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim ignore-rp-set-priority
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim jp-timer

**Overview** Use this command to set the PIM-SMv6 join/prune timer. Note that the value set by the join/prune timer is the value that the device puts into the holdtime field of the join/prune packets it sends to its neighbors.

Use the **no** variant of this command to return the PIM-SMv6 join/prune timer to its default value of 210 seconds.

**Syntax** `ipv6 pim jp-timer <1-65535>`  
`no ipv6 pim jp-timer [<1-65535>]`

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| <1-65535> | Specifies the Join/Prune timer value. The default value is 210 seconds. |

**Default** The default PIM-SMv6 join/prune timer value is 210 seconds.

**Mode** Global Configuration

**Example** To change the join/prune timer to 300 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim jp-timer 300
```

To return the join/prune timer to its default value, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim jp-timer
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim neighbor-filter

**Overview** This command enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-SMv6 will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering IPv6 access list.

Use the **no** variant of this command to disable this function.

**Syntax** `ipv6 pim neighbor-filter <IPv6-accesslist>`  
`no ipv6 pim neighbor-filter <IPv6-accesslist>`

| Parameter                             | Description                                                                                                                                                                                                     |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;IPv6-access list&gt;</code> | Specify a Standard or an Extended software IPv6 access list name for the PIM-SMv6 neighbor filter.<br>See the <a href="#">IPv6 Software Access Control List (ACL) Commands</a> chapter for supported IPv6 ACLs. |

**Default** By default, there is no neighbor filtering applied to an interface.

**Mode** Interface Configuration for a VLAN interface.

**Example** To enable filtering on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 access-list standard filter1 deny
fe80:20e:cff:fe01:facc
awplus(config-if)# ipv6 access-list standard filter1 permit any
awplus(config-if)# ipv6 pim neighbor-filter filter1
```

# ipv6 pim register-rate-limit

**Overview** Use this command to configure the rate of register packets sent by this DR, in units of packets per second. The configured rate is per (S, G) state, and is not a system wide rate.

Use the **no** variant of this command to remove the limit.

**Syntax** `ipv6 pim register-rate-limit <1-65535>`  
`no ipv6 pim register-rate-limit`

| Parameter | Description                                                          |
|-----------|----------------------------------------------------------------------|
| <1-65535> | Specifies the maximum number of packets that can be sent per second. |

**Mode** Global Configuration

**Default** The default is 0, which means no rate limit.

**Examples** To set the rate limit to 3444 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rate-limit 3444
```

To remove the rate limit, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim register-rate-limit
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim register-rp-reachability

**Overview** Use this command to enable the RP reachability check for PIMv6 Register processing at the DR. The default setting is no checking for RP-reachability.

Use the **no** variant of this command to disable this processing.

**Syntax** `ipv6 pim register-rp-reachability`  
`no ipv6 pim register-rp-reachability`

**Default** This command is disabled; by default, there is no checking for RP-reachability.

**Mode** Global Configuration

**Examples** To check for RP reachability, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rp-reachability
```

To stop checking for RP reachability, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim register-rp-reachability
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim register-source

**Overview** Use this command to configure the source IPv6 address of register packets sent by this DR, overriding the default source IPv6 address, which is the IPv6 address of the RPF interface toward the source host.

Use the **no** variant of this command to remove the IPv6 source address of Register packets sent by this DR, reverting back to use the default IPv6 source address that is the address of the RPF interface toward the source host.

**Syntax** `ipv6 pim register-source [<source-IPv6-address>|<interface>]`  
`no ipv6 pim register-source`

| Parameter                                | Description                                                                                     |
|------------------------------------------|-------------------------------------------------------------------------------------------------|
| <code>&lt;source-IPv6-address&gt;</code> | The IPv6 address, entered in the form X::X:X, to be used as the source of the register packets. |
| <code>&lt;interface&gt;</code>           | The name of the interface to be used as the source of the register packets.                     |

**Mode** Global Configuration

**Usage** The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback IPv6 interface address, but can also be a physical IPv6 address. This IPv6 address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM-SMv6 enabled.

**Mode** Global Configuration

**Examples** To configure the register source as 3ffe::24:2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source 3ffe::24:2
```

To configure the register source as vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source vlan2
```

To change back to the default, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# no ipv6 pim register-source
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim register-suppression

**Overview** Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

**Syntax** `ipv6 pim register-suppression <1-65535>`  
`no ipv6 pim register-suppression`

| Parameter | Description                              |
|-----------|------------------------------------------|
| <1-65535> | Register suppression on time in seconds. |

**Mode** Global Configuration

**Default** 60 seconds

**Usage** Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the [ipv6 pim rp-register-kat](#) command is not used.

**Examples** To change the register-suppression time to 192 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-suppression 192
```

To return to the default register-suppression time of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim register-suppression
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim rp-address

**Overview** Use this command to statically configure RP (Rendezvous Point) address for IPv6 multicast groups.

Use the **no** variant of this command to remove a statically configured RP (Rendezvous Point) address for IPv6 multicast groups.

**Syntax** `ipv6 pimv6 rp-address <IPv6-address> [<IPv6-access-list>]  
[override]`  
`no ipv6 pim rp-address <IPv6-address> [<IPv6-access-list>]  
[override]`

| Parameter          | Description                                                                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <IPv6-address>     | Specify the IPv6 address of the Rendezvous Point, entered in the form X:X::X:X.                                                                                    |
| <IPv6-access-list> | Specify a Standard or an Extended software IPv6 access-list name.<br>See <a href="#">IPv6 Software Access Control List (ACL) Commands</a> for supported IPv6 ACLs. |
| override           | Specify this optional parameter keyword to enable any statically defined RPs to override dynamically learned RPs.                                                  |

**Mode** Global Configuration

**Usage notes** The AlliedWare Plus™ PIM-SMv6 implementation supports multiple static RPs. It also supports usage of static RPs and the BSR mechanism simultaneously. This command is used to statically configure the RP address for IPv6 multicast groups.

You need to understand the following information before using this command:

If the RP address that is configured by the BSR, and the RP-address that is configured statically, are both available for a group range, then the RP address configured through BSR is chosen over the statically configured RP address.

A single static RP can be configured for multiple group ranges using software IPv6 access- lists (ACLs). However, configuring multiple static RPs with the same RP address is not allowed. The static RP can either be configured for the whole multicast group range ff00::/8 (without using IPv6 ACLs) or for specific group ranges (using IPv6 ACLs). For example:

- **ipv6 pim rp-address 3ffe:10:10:5::153** will configure static RP 3ffe:10:10:5::153 for the default group range ff00::/8.
- **ipv6 pim rp-address 3fee:20:20:5::153 grp-list** will configure static RP 3fee:20:20:5::153 for all the group ranges represented by permit filters in the defined named **grp-list** ACL.

If multiple static RPs are available for a group range, then one with the highest IPv6 address is chosen.

Only **permit** filters in IPv6 ACLs are considered as valid group ranges. The default **permit** filter `::/0` is converted to the default multicast filter `ff00::/8`.

After configuration, the RP address is inserted into a static RP group tree based on the configured group ranges. For each group range, multiple static RPs are maintained in a list. This list is sorted in a descending order of IPv6 addresses. When selecting static RPs for a group range, the first element (which is the static RP with highest IPv6 address) is chosen.

RP address deletion is handled by removing the static RP from all the existing group ranges and recalculating the RPs for existing TIB states if required.

Group mode and RP address mappings learned through BSR take precedence over mappings statistically defined by this command. Commands with the **override** parameter take precedence over dynamically learned mappings.

**Examples** To configure static-RP `3ffe:30:30:5::153` for the group range `2001:db8::/128` (specified in the permit filter in the ACL named G2), use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G2 permit
2001:db8::/128
awplus(config)# ipv6 pim rp-address 3ffe:30:30:5::153 G2
```

To undo that configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp-address 3ffe:30:30:5::153 G2
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim rp-candidate

**Overview** Use this command to make the device an RP (Rendezvous Point) candidate, using the IPv6 address of the specified interface.

Use the **no** variant of this command to stop the device from being an RP candidate.

**Syntax** `ipv6 pim rp-candidate <interface> [priority <priority>|interval <interval>|grouplist <accesslist>]`  
`no ipv6 pim rp-candidate [<interface>]`

| Parameter                 | Description                                                                                                                                                         |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface>               | The interface name.                                                                                                                                                 |
| priority<br><priority>    | The RP candidate priority for this interface on this device, from 0 to 255. The lower the priority value, the more likely this candidate is to become the RP.       |
| interval<br><interval>    | The advertisement interval, from 1 to 16383 seconds.                                                                                                                |
| grouplist<br><accesslist> | A Standard or an Extended software IPv6 access list name. See the <a href="#">IPv6 Software Access Control List (ACL) Commands</a> chapter for supported IPv6 ACLs. |

**Default** The priority value for a candidate RP is 192 by default until specified using the **priority** parameter.

**Mode** Global Configuration

**Usage notes** Note that issuing the command **ipv6 pim rp-candidate <interface>** without optional **priority**, **interval**, or **grouplist** parameters will configure the candidate RP with a priority value of 192.

**Examples** To specify a priority of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-candidate vlan2 priority 3
```

To stop the device from being an RP candidate on vlan2 , use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp-candidate vlan2
```

To use the ACL named G2 to specify the group prefixes that are advertised in association with the RP address, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G2 permit
2001:db8::/128
awplus(config)# ipv6 pim rp-candidate vlan2 group-list G2
```

Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim rp embedded

**Overview** Use this command to configure and enable embedded RP (Rendezvous Point) in PIM-SMv6.

This command only applies to the embedded RP group range **ff7x::/12** and **fffx::/12**.

Use the **no** variant of this command to disable embedded RP support. Since embedded RP support is enabled by default, use the **no** variant of this command to disable the default.

**Syntax** `ipv6 pim rp embedded`  
`no ipv6 pim rp embedded`

**Mode** Global Configuration

**Default** Enabled

**Examples** The following example re-enables embedded RP support, the default state in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp embedded
```

The following example disables embedded RP support, which is enabled by default in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp embedded
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim rp-register-kat

**Overview** Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SMv6 Register packets.

Use the **no** variant of this command to return the PIM-SMv6 KAT timer to its default value of 210 seconds.

**Syntax** `ipv6 pim rp-register-kat <1-65535>`  
`no ipv6 pim rp-register-kat`

| Parameter | Description                                                         |
|-----------|---------------------------------------------------------------------|
| <1-65536> | Specify the KAT timer in seconds. The default value is 210 seconds. |

**Mode** Global Configuration

**Default** The default PIM-SMv6 KAT timer value is 210 seconds.

**Examples** To change the KAT timer to 3454 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-register-kat 3454
```

To return the KAT timer to its default setting, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp-register-kat
```

**Related commands** [ipv6 pim rp-address](#)  
[ipv6 pim rp-candidate](#)

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim sparse-mode

**Overview** Use this command to enable PIM-SMv6 on an interface.  
Use the **no** variant of this command to disable PIM-SMv6 on an interface.

**Syntax** `ipv6 pim sparse-mode`  
`no ipv6 pim sparse-mode`

**Mode** Interface Configuration for a VLAN interface.

**Examples** To enable PIM-SMv6 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode
```

To disable PIM-SMv6 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode
```

# ipv6 pim sparse-mode passive

**Overview** Use this command to enable and disable PIM-SMv6 passive mode operation for local members on an interface.

Use the **no** variant of this command to disable PIM-SMv6 passive mode operation for local members on an interface.

**Syntax** `ipv6 pim sparse-mode passive`  
`no ipv6 pim sparse-mode passive`

**Mode** Interface Configuration for a VLAN interface.

**Usage** Passive mode essentially stops PIM-SMv6 transactions on the interface, allowing only the MLD mechanism to be active.

**Examples** To enable passive mode on vlan2, use the commands

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode passive
```

To disable passive mode on vlan2, use the commands

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode passive
```

# ipv6 pim spt-threshold

**Overview** This command turns on the ability for the last-hop PIM-SMv6 router to switch to SPT (shortest-path tree).

The **no** variant of this command turns off the ability for the last-hop PIM-SMv6 router to switch to SPT.

**NOTE:** The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

**Syntax** `ipv6 pim spt-threshold`  
`no ipv6 pim spt-threshold`

**Mode** Global Configuration

**Examples** To enable the last-hop PIM-SMv6 router to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim spt-threshold
```

To stop the last-hop PIM-SMv6 router from being able to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim spt-threshold
```

**Related commands** [ipv6 pim spt-threshold group-list](#)

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim spt-threshold group-list

**Overview** Use this command to turn on/off the ability for the last-hop PIM-SMv6 router to switch to SPT (shortest-path tree) for multicast group addresses as specified by the given software IPv6 access-list.

Use the **no** variant of this command to turn off switching to the SPT.

**NOTE:** *The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.*

**Syntax** `ipv6 pim spt-threshold group-list <IPv6-access-list>`  
`no ipv6 pim spt-threshold group-list <IPv6-access-list>`

| Parameter          | Description                                                                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <IPv6-access-list> | Specify a Standard or an Extended software IPv6 access-list name.<br>See the <a href="#">IPv6 Software Access Control List (ACL) Commands</a> chapter for supported IPv6 ACLs. |

**Mode** Global Configuration

**Examples** To enable the last-hop PIM-SMv6 router to switch to SPT for groups specified by the ACL named G1, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim spt-threshold group-list G1
awplus(config)# ipv6 access-list standard G1 permit
2001:db8::/128
```

To stop the last-hop PIM-SMv6 router from being able to switch to SPT for groups specified by the ACL named G1, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim spt-threshold group-list G1
```

**Related commands** [ipv6 pim spt-threshold](#)

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim ssm

**Overview** Use this command to define the Source Specific Multicast (SSM) range of IPv6 multicast addresses. PIM-SMv6 routers will only install (S,G) entries for multicast groups (addresses) residing in the SSM range.

Use the **no** variant of this command to disable the SSM range.

**Syntax** `ipv6 pim ssm range <named-access-list>`  
`ipv6 pim ssm default`  
`no ipv6 pim ssm`

| Parameter           | Description                                        |
|---------------------|----------------------------------------------------|
| default             | Use FF3x::/32 as the range for SSM.                |
| range               | Specify an ACL for group range to be used for SSM. |
| <named-access-list> | Specify a named standard access list.              |

**Default** Disabled

**Mode** Global Configuration

**Usage** Any (\*,G) or (S,G,rpt) joins received for multicast groups (addresses) within the range are not installed in PIM-SMv6 mroute table.

**Examples** To configure the SSM service for the IPv6 address range defined by IPv6 access list 'IPv6-PIM-SSM-RANGE', use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard IPv6-PIM-SSM-RANGE
permit ff3e::/32
awplus(config)# ipv6 pim ssm range IPv6-PIM-SSM-RANGE
```

To use the default address range for PIM-SSM, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 pim ssm default
```

To disable PIM-SSM, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim ssm
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim unicast-bsm

**Overview** Use this command to enable support for the sending and receiving of unicast Bootstrap Messages (BSM) on an interface.

Use the **no** variant of this command to disable the sending and receiving of unicast BSM on an interface.

**Syntax** `ipv6 pim unicast-bsm`  
`no ipv6 pim unicast-bsm`

**Mode** Interface Configuration for a VLAN interface.

**Default** Unicast BSM is disabled by default on an interface.

**Usage** This command provides backward compatibility with older versions of the Bootstrap Router (BSR) specification, which directs unicast BSM to refresh the state of new or restarting neighbors. The current BSR specification defines a No Forward BSM to achieve the same result.

**Examples** To enable BSM messages on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim unicast-bsm
```

To disable BSM messages on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim unicast-bsm
```

# service pim6

**Overview** Use this command to enable IPv6 PIM sparse mode services.

Use the **no** version of the command to disable unused IPv6 PIM sparse mode services.

**Syntax** `service pim6`  
`no service pim6`

**Default** Enabled

**Mode** Global Configuration

**Usage notes** Sometimes it may be desirable to disable unused services, in order to reduce memory use.

Disabling the PIM services will only take effect after you save the configuration and restart the device.

**Example** To disable the IPv6 PIM sparse mode service, use the commands:

```
awplus# configure terminal
awplus(config)# no service pim6
```

**Output** Figure 34-2: Example output from **no service pim6**

```
awplus(config)#no service pim6
% Save the config and restart the device for this change to take
effect
```

**Command changes** Version 5.5.0-0.1: command added

# show debugging ipv6 pim sparse-mode

**Overview** Use this command to see what debugging is turned on for PIM-SMv6.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show debugging ipv6 pim sparse-mode`

**Mode** User Exec and Privileged Exec

**Example** To display PIM-SMv6 debugging settings, use the command:

```
awplus# show debugging ipv6 pim sparse-mode
```

Figure 34-3: Example output from the **show debugging ipv6 pim sparse-mode** command

```
awplus#show debugging ipv6 pim sparse-mode

| Parameters | Description                                   |
|------------|-----------------------------------------------|
| Address    | Primary PIM-SMv6 address.                     |
| Interface  | Name of the PIM-SMv6 interface.               |
| VIF Index  | The Virtual Interface index of the interface. |
| Ver/Mode   | PIMv6 version/Sparse mode.                    |
| Nbr Count  | Neighbor count of the PIM-SMv6 interface.     |

**Table 1:** Parameters in the output from the **show ipv6 pim sparse-mode interface** command (cont.)

| Parameters  | Description                                |
|-------------|--------------------------------------------|
| DR Priority | Designated Router priority.                |
| DR          | The IPv6 address of the Designated Router. |

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 pim sparse-mode interface detail

**Overview** Use this command to show detailed PIM-SMv6 information for all PIM-SMv6 configured interfaces.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ipv6 pim sparse-mode interface detail`

**Mode** User Exec and Privileged Exec

**Example** To show detailed PIM-SMv6 information for all PIM-SMv6 configured interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode interface detail
```

**Output** Figure 34-6: Example output from the **show ipv6 pim sparse-mode interface detail** command

```
awplus#show ipv6 pim sparse-mode interface detail
vlan2 (vif 0)
 Address fe80::207:e9ff:fe02:81d, DR fe80::20e:cff:fe01:facc

```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 pim sparse-mode local-members

**Overview** Use this command to show detailed local member information on an interface configured for PIM-SMv6. If you do not specify an interface then detailed local member information is shown for all interfaces configured for PIM-SMv6.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ipv6 pim sparse-mode local-members [<interface>]`

| Parameter   | Description                                |
|-------------|--------------------------------------------|
| <interface> | An interface to display information about. |

**Mode** User Exec and Privileged Exec

**Example** To show detailed PIM-SMv6 information for all PIM-SMv6 configured interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode local-members
```

**Output** Figure 34-7: Example output from the **show ipv6 pim sparse-mode local-members** command

```
awplus#show ipv6 pim sparse-mode local-members
PIM Local membership information

vlan1:

 (*, ff02::1:ff6b:4783) : Include

vlan203:

 (*, ff0e:1::4) : Include
```

**Output** Figure 34-8: Example output from the **show ipv6 pim sparse-mode local-members vlan1** command

```
awplus#show ipv6 pim sparse-mode local-members vlan1
PIM Local membership information

vlan1:

 (*, ff02::1:ff6b:4783) : Include
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 pim sparse-mode mroute

**Overview** Use this command to display the IPv6 multicast routing table, or the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be entered simultaneously; two source IPv6 addresses cannot be entered simultaneously.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax**

```
show ipv6 pim sparse-mode mroute
show ipv6 pim sparse-mode mroute <group-IPv6-address>
show ipv6 pim sparse-mode mroute <source-IPv6-address>
show ipv6 pim sparse-mode mroute <group-IPv6-address>
<source-IPv6-address>
show ipv6 pim sparse-mode mroute <source-IPv6-address>
<group-IPv6-address>
show ipv6 pim sparse-mode mroute brief
```

| Parameter             | Description                                                                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <group-IPv6-address>  | Group IPv6 address, entered in the form X:X::X:X. Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.  |
| <source-IPv6-address> | Source IPv6 address, entered in the form X:X::X:X. Based on the source and group IPv6 address, the output is the selected route if present in the multicast route tree. |
| brief                 | Brief display.                                                                                                                                                          |

**Mode** User Exec and Privileged Exec

**Usage notes** Note that when a feature license is enabled, the output for the [show ipv6 pim sparse-mode mroute](#) command will only show 100 interfaces because of the terminal display width limit. Use the [show ipv6 pim sparse-mode mroute detail](#) command to display detailed entries of the IPv6 multicast routing table.

**Examples**

```
awplus# show ipv6 pim sparse-mode mroute
awplus# show ipv6 pim sparse-mode mroute 2001:db8::
awplus# show ipv6 pim sparse-mode mroute 2001:db8:: 2002:db8::
awplus# show ipv6 pim sparse-mode mroute brief
```

**Output** Figure 34-9: Example output from the **show ipv6 pim sparse-mode mroute** command

```
awplus#show ipv6 pim sparse-mode mroute

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 pim sparse-mode mroute detail

**Overview** Use this command to display detailed entries of the IPv6 multicast routing table, or detailed entries of the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be used simultaneously; two IPv6 source addresses cannot be used simultaneously.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax**

```
show ipv6 pim sparse-mode mroute
[<group-IPv6-address>|<source-IPv6-address>] detail

show ipv6 pim sparse-mode mroute [<group-IPv6-address>
<source-IPv6-address>] detail

show ipv6 pim sparse-mode mroute [<source-IPv6-address>
<group-IPv6-address>] detail
```

| Parameter             | Description                                                                                                  |
|-----------------------|--------------------------------------------------------------------------------------------------------------|
| <group-IPv6-address>  | Group IPv6 address, entered in the form X:X::X:X. Output is all multicast entries belonging to that group.   |
| <source-IPv6-address> | Source IPv6 address, entered in the form X:X::X:X. Output is all multicast entries belonging to that source. |
| detail                | Show detailed information.                                                                                   |

**Mode** User Exec and Privileged Exec

**Usage notes** Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.

**Examples**

```
awplus# show ipv6 pim sparse-mode mroute detail
awplus# show ipv6 pim sparse-mode mroute 2001:db8:: detail
awplus# show ipv6 pim sparse-mode mroute 2001:db8:: 2002:db8::
detail
```

**Output** Figure 34-11: Example output from the **show ipv6 pim sparse-mode mroute detail** command

```
awplus#show ipv6 pim sparse-mode mroute detail

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 pim sparse-mode neighbor

**Overview** Use this command to show the PIM-SMv6 neighbor information.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ipv6 pim sparse-mode neighbor [<interface>]  
[<IPv6-address>] [detail]`

| Parameter      | Description                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------|
| <interface>    | Interface name. Show neighbors on an interface.                                                          |
| <IPv6-address> | Show neighbors with a particular address on an interface. The IPv6 address entered in the form X:X::X:X. |
| detail         | Show detailed information.                                                                               |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ipv6 pim sparse-mode neighbor`  
`awplus# show ipv6 pim sparse-mode neighbor vlan5 detail`

**Output** Figure 34-12: Example output from the **show ipv6 pim sparse-mode neighbor** command

| awplus#show ipv6 pim sparse-mode neighbor |           |                   |                |

| Destination                                         | Type | Nexthop<br>Num | Nexthop<br>Addr         | Nexthop<br>Ifindex | Nexthop<br>Name | Metric | Pref | Refcnt |
| 3ffe:10:10:5::153                                   | .RS. | 1              | fe80::20e:cff:fe01:facc | 2                  | 30              | 110    | 1    |        |

**Table 2:** Parameters in output of the **show ipv6 pim sparse-mode nexthop** command

| Parameter       | Description                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------|
| Destination     | The destination address for which PIM-SMv6 requires next hop information.                                    |
| Type            | The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable. |
| Nexthop Num     | The number of next hops to the destination. PIM-SMv6 always uses only 1 next hop.                            |
| Nexthop Addr    | The address of the primary next hop gateway.                                                                 |
| Nexthop IfIndex | The interface on which the next hop gateway can be reached.                                                  |
| Nexthop Name    | The name of next hop interface.                                                                              |
| Metric          | The metric of the route towards the destination.                                                             |
| Preference      | The preference of the route towards destination.                                                             |
| Refcnt          | Only used for debugging.                                                                                     |

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 pim sparse-mode rp-hash

**Overview** Use this command to display the Rendezvous Point (RP) to be chosen based on the IPv6 group address selected.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 pim sparse-mode rp-hash <IPv6-group-addr>`

| Parameter                            | Description                                                               |
|--------------------------------------|---------------------------------------------------------------------------|
| <code>&lt;IPv6-group-addr&gt;</code> | The IPv6 group address used to find the RP, entered in the form X:X::X:X. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 pim sparse-mode rp-hash ff04:10`

**Output** Figure 34-15: Output from the **show ipv6 pim sparse-mode rp-hash** command:

```
awplus#show ipv6 pim sparse-mode rp-hash ff04::10
RP: 3ffe:10:10:5::153
Info source: 3ffe:10:10:5::153, via bootstrap
```

**Related commands** [show ipv6 pim sparse-mode rp mapping](#)

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 pim sparse-mode rp mapping

**Overview** Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ipv6 pim sparse-mode rp mapping`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 pim sparse-mode rp mapping`

**Output** Figure 34-16: Output from the **show ipv6 pim sparse-mode rp mapping** command

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff00::/8
 RP: 3ffe:10:10:5::153
 Info source: 3ffe:10:10:5::153, via bootstrap, priority 192
 Uptime: 05:36:40
```

**Related commands** [show ipv6 pim sparse-mode rp-hash](#)

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 pim sparse-mode rp nexthop

**Overview** Use this command to display the RP (Rendezvous Point) next hop information used by PIM-SMv6.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ipv6 pim sparse-mode rp nexthop <RP-group-addr>`

| Parameter       | Description                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------|
| <RP-group-addr> | Specify the RP group address used to display next hop RP information, entered in the form X:X::X:X. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 pim sparse-mode rp nexthop 3ffe:10:10:5::153`

**Output** Figure 34-17: Example output from the **show ipv6 pim sparse-mode rp nexthop** command

|                                                               |      |             |                         |                 |              |        |      |        |  |
|---------------------------------------------------------------|------|-------------|-------------------------|-----------------|--------------|--------|------|--------|--|
| awplus#show ipv6 pim sparse-mode rp nexthop 3ffe:10:10:5::153 |      |             |                         |                 |              |        |      |        |  |
| Flags: N = New, R = RP, S = Source, U = Unreachable           |      |             |                         |                 |              |        |      |        |  |
| Destination                                                   | Type | Nexthop Num | Nexthop Addr            | Nexthop Ifindex | Nexthop Name | Metric | Pref | Refcnt |  |
| 3ffe:10:10:5::153                                             | .RS. | 1           | fe80::20e:cff:fe01:facc | 2               |              | 30     | 110  | 1      |  |

**Table 3:** Parameters in output of the **show ipv6 pim sparse-mode rp nexthop** command

| Parameter       | Description                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------|
| Destination     | The destination address for which PIM-SMv6 requires next hop information.                                    |
| Type            | The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable. |
| Nexthop Num     | The number of next hops to the destination. PIM-SMv6 always uses only 1 next hop.                            |
| Nexthop Addr    | The address of the primary next hop gateway.                                                                 |
| Nexthop IfIndex | The interface on which the next hop gateway can be reached.                                                  |
| Nexthop Name    | The name of next hop interface.                                                                              |

**Table 3:** Parameters in output of the **show ipv6 pim sparse-mode rp nexthop** command (cont.)

| Parameter  | Description                                      |
|------------|--------------------------------------------------|
| Metric     | The metric of the route towards the destination. |
| Preference | The preference of the route towards destination. |
| Refcnt     | Only used for debugging.                         |

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# undebug all ipv6 pim sparse-mode

**Overview** Use this command to disable all PIM-SMv6 debugging.

**Syntax** `undebug all ipv6 pim sparse-mode`

**Mode** Privileged Exec

**Example** `awplus# undebug all ipv6 pim sparse-mode`

**Related commands** [debug ipv6 pim sparse-mode](#)

# undebg ipv6 pim sparse-mode

**Overview** Use this command to deactivate PIM-SMv6 debugging. Note that this command is an alias of the no variant of the [debug ipv6 pim sparse-mode](#) command.

**Syntax** undebg ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [state] [timer]

| Parameter | Description                                                                     |
|-----------|---------------------------------------------------------------------------------|
| all       | Deactivates all PIM-SMv6 debugging.                                             |
| events    | Deactivates debug printing of PIM-SMv6 events.                                  |
| mfc       | Deactivates debug printing of MFC (Multicast Forwarding Cache).                 |
| mib       | Deactivates debug printing of PIM-SMv6 MIBs.                                    |
| nexthop   | Deactivates debug printing of PIM-SMv6 next hop communications.                 |
| nsm       | Deactivates debugging of PIM-SMv6 NSM (Network Services Module) communications. |
| state     | Deactivates debug printing of state transition on all PIM-SMv6 FSMs.            |
| timer     | Deactivates debug printing of PIM-SMv6 timers.                                  |

**Mode** Privileged Exec and Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebg ipv6 pim sparse-mode all
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebg ipv6 pim sparse-mode events
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebg ipv6 pim sparse-mode nexthop
```

**Validation  
Output**

Figure 34-18: Example output from the **show debugging ipv6 pim sparse-mode** command after issuing the **undebg ipv6 pim sparse-mode all** command

```
awplus#undebg ipv6 pim sparse-mode all
awplus#show debugging ipv6 pim sparse-mode
PIM-SMv6 debugging status:

# PIM-DM Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of PIM-DM commands. For commands common to PIM-SM and PIM-DM, see [Multicast Commands](#).

- Command List**
- “[debug pim dense-mode all](#)” on page 1587
  - “[debug pim dense-mode context](#)” on page 1588
  - “[debug pim dense-mode decode](#)” on page 1589
  - “[debug pim dense-mode encode](#)” on page 1590
  - “[debug pim dense-mode fsm](#)” on page 1591
  - “[debug pim dense-mode mrt](#)” on page 1592
  - “[debug pim dense-mode nexthop](#)” on page 1593
  - “[debug pim dense-mode nsm](#)” on page 1594
  - “[debug pim dense-mode vif](#)” on page 1595
  - “[ip pim dense-mode](#)” on page 1596
  - “[ip pim dense-mode passive](#)” on page 1597
  - “[ip pim dense-mode wrong-vif-suppression](#)” on page 1598
  - “[ip pim ext-srcs-directly-connected](#)” on page 1599
  - “[ip pim hello-holdtime \(PIM-DM\)](#)” on page 1600
  - “[ip pim hello-interval \(PIM-DM\)](#)” on page 1601
  - “[ip pim max-graft-retries](#)” on page 1602
  - “[ip pim neighbor-filter \(PIM-DM\)](#)” on page 1604
  - “[ip pim propagation-delay](#)” on page 1605
  - “[ip pim state-refresh origination-interval](#)” on page 1606
  - “[service pdm](#)” on page 1607

- [“show debugging pim dense-mode”](#) on page 1608
- [“show ip pim dense-mode interface”](#) on page 1609
- [“show ip pim dense-mode interface detail”](#) on page 1611
- [“show ip pim dense-mode mroute”](#) on page 1612
- [“show ip pim dense-mode neighbor”](#) on page 1613
- [“show ip pim dense-mode neighbor detail”](#) on page 1614
- [“show ip pim dense-mode nexthop”](#) on page 1615
- [“undebg all pim dense-mode”](#) on page 1616

# debug pim dense-mode all

**Overview** This command enables PIM-DM debugging.  
The **no** variant of this command disables PIM-DM debugging.

**Syntax** `debug pim dense-mode all`  
`no debug pim dense-mode all`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode all`

**Output** Figure 35-1: Example output from the **debug pim dense-mode all** command

```
PIM event debugging is on
PIM MFC debugging is on
PIM state debugging is on
PIM packet debugging is on
PIM incoming packet debugging is on
PIM outgoing packet debugging is on
```

**Validation Commands** `show debugging pim dense-mode`

**Related commands** `debug pim dense-mode context`  
`debug pim dense-mode decode`  
`debug pim dense-mode encode`  
`debug pim dense-mode fsm`  
`debug pim dense-mode mrt`  
`debug pim dense-mode nexthop`  
`debug pim dense-mode nsm`  
`debug pim dense-mode vif`

# debug pim dense-mode context

**Overview** This command enables debugging of general configuration context.  
The **no** variant of this command disables debugging of general configuration context.

**Syntax** `debug pim dense-mode context`  
`no debug pim dense-mode context`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode context`

**Related commands**

- `debug pim dense-mode all`
- `debug pim dense-mode decode`
- `debug pim dense-mode encode`
- `debug pim dense-mode fsm`
- `debug pim dense-mode mrt`
- `debug pim dense-mode nexthop`
- `debug pim dense-mode nsm`
- `debug pim dense-mode vif`

# debug pim dense-mode decode

**Overview** This command enables debugging of the PIM-DM message decoder.  
The **no** variant of this command disables debugging of the PIM-DM message decoder.

**Syntax** `debug pim dense-mode decode`  
`no debug pim dense-mode decode`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode decoder`

**Related commands**

- `debug pim dense-mode all`
- `debug pim dense-mode context`
- `debug pim dense-mode encode`
- `debug pim dense-mode fsm`
- `debug pim dense-mode mrt`
- `debug pim dense-mode nexthop`
- `debug pim dense-mode nsm`
- `debug pim dense-mode vif`

# debug pim dense-mode encode

**Overview** This command enables debugging of the PIM-DM message encoder. The **no** variant of this command disables debugging of the PIM-DM message encoder.

**Syntax** `debug pim dense-mode encode`  
`no debug pim dense-mode encode`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode encoder`

**Related commands** `debug pim dense-mode all`  
`debug pim dense-mode context`  
`debug pim dense-mode decode`  
`debug pim dense-mode fsm`  
`debug pim dense-mode mrt`  
`debug pim dense-mode nexthop`  
`debug pim dense-mode nsm`  
`debug pim dense-mode vif`

# debug pim dense-mode fsm

**Overview** This command enables debugging of Finite-State Machine (FSM) specific information of all Multicast Routing Table (MRT) and MRT Virtual Multicast Interface (MRT-VIF) entries.

The **no** variant of this command disables debugging of Finite-State Machine (FSM) specific information of all Multicast Routing Table (MRT) and MRT Virtual Multicast Interface (MRT-VIF) entries.

**Syntax** `debug pim dense-mode fsm`  
`no debug pim dense-mode fsm`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode fsm`

**Related commands**

- `debug pim dense-mode all`
- `debug pim dense-mode context`
- `debug pim dense-mode decode`
- `debug pim dense-mode encode`
- `debug pim dense-mode mrt`
- `debug pim dense-mode nexthop`
- `debug pim dense-mode nsm`
- `debug pim dense-mode vif`

# debug pim dense-mode mrt

**Overview** This command enables debugging of MRT and MRT-VIF entry handling (for example, creation and deletion of).

The **no** variant of this command disables debugging of MRT and MRT-VIF entry handling.

**Syntax** `debug pim dense-mode mrt`  
`no debug pim dense-mode mrt`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode mrt`

**Related commands** `debug pim dense-mode all`  
`debug pim dense-mode context`  
`debug pim dense-mode decode`  
`debug pim dense-mode encode`  
`debug pim dense-mode fsm`  
`debug pim dense-mode nexthop`  
`debug pim dense-mode nsm`  
`debug pim dense-mode vif`

# debug pim dense-mode nexthop

**Overview** This command enables debugging of Reverse Path Forwarding (RPF) neighbor next hop cache handling.

The **no** variant of this command disables debugging of Reverse Path Forwarding (RPF) neighbor next hop cache handling.

**Syntax** `debug pim dense-mode nexthop`  
`no debug pim dense-mode nexthop`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode nexthop`

**Related commands** `debug pim dense-mode all`  
`debug pim dense-mode context`  
`debug pim dense-mode decode`  
`debug pim dense-mode encode`  
`debug pim dense-mode fsm`  
`debug pim dense-mode mrt`  
`debug pim dense-mode nsm`  
`debug pim dense-mode vif`

# debug pim dense-mode nsm

**Overview** This command enables debugging of PIM-DM interface with NSM.  
The **no** variant of this command disables debugging of PIM-DM interface with NSM.

**Syntax** `debug pim dense-mode nsm`  
`no debug pim dense-mode nsm`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode nsm`

**Related commands** `debug pim dense-mode all`  
`debug pim dense-mode context`  
`debug pim dense-mode decode`  
`debug pim dense-mode encode`  
`debug pim dense-mode fsm`  
`debug pim dense-mode mrt`  
`debug pim dense-mode nexthop`  
`debug pim dense-mode vif`

# debug pim dense-mode vif

**Overview** This command enables debugging of VIF handling.  
The **no** variant of this command disables debugging of VIF handling.

**Syntax** `debug pim dense-mode vif`  
`no debug pim dense-mode vif`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode vif`

**Related commands** `debug pim dense-mode all`  
`debug pim dense-mode context`  
`debug pim dense-mode decode`  
`debug pim dense-mode encode`  
`debug pim dense-mode fsm`  
`debug pim dense-mode mrt`  
`debug pim dense-mode nexthop`  
`debug pim dense-mode nsm`

# ip pim dense-mode

**Overview** This command enables or disables PIM-DM operation from Interface mode on the current VLAN interface. This command also disables passive mode on the VLAN interface if passive mode has been enabled using an [ip pim dense-mode passive](#) command.

The **no** variant of this command disables all PIM-DM activities on the interface.

**Syntax** `ip pim dense-mode`  
`no ip pim dense-mode`

**Mode** Interface Configuration for a VLAN interface.

**Example**

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dense-mode
```

# ip pim dense-mode passive

**Overview** This command enables PIM-DM passive mode operation from Interface mode on the current VLAN interface.

The **no** variant of this command disables passive mode.

**Syntax** `ip pim dense-mode passive`  
`no ip pim dense-mode passive`

**Mode** Interface Configuration for a VLAN interface.

**Usage** Configuring a VLAN interface as a passive PIM-DM interface indicates that the VLAN interface is connected to a stub network (i.e. a network that does not contain any PIM Routers). So, multicast streams that arrive on other PIM-DM interfaces can be routed to hosts on the passive PIM-DM interface, but no PIM neighbor relationships will be formed on the passive PIM-DM interface.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip pim dense-mode passive`

# ip pim dense-mode wrong-vif-suppression

**Overview** Use this command to permit or block packets that arrive on the wrong VLAN Interface (VIF) for PIM dense-mode.

Use the **no** variant of this command to disable dense-mode wrong VIF suppression

**Syntax** `ip pim dense-mode wrong-vif-suppression`  
`no ip pim dense-mode wrong-vif-suppression`

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** This command enables wrong VIF suppression for PIM dense-mode. Wrong VIF suppression prevents multicast packets received on the wrong upstream interface from being copied to the CPU.

**Examples** To enable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim dense-mode wrong-vif-suppression
```

To disable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim dense-mode wrong-vif-suppression
```

**Command changes** Version 5.4.8-2.3: command added.

# ip pim ext-srcs-directly-connected

**Overview** Use this command to configure PIM to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM to treat only directly connected sources as directly connected.

**Syntax** `ip pim ext-srcs-directly-connected`  
`no ip pim ext-srcs-directly-connected`

**Default** The **no** variant of this command is the default behavior.

**Mode** Interface Configuration for a VLAN interface.

**Example** To configure PIM to treat all sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim ext-srcs-directly-connected
```

## ip pim hello-holdtime (PIM-DM)

**Overview** This command configures a **hello-holdtime**. The PIM **hello-holdtime** on a VLAN interface is the period which the router will wait to receive a hello from neighbors on that interface. If the router does not receive a hello from a given neighbor within that period, then it will decide that the neighbor is no longer an active PIM Router, and will terminate the neighbor relationship.

You cannot configure a **hello-holdtime** value that is less than the current **hello-interval**. Each time the **hello-interval** is updated, the **hello-holdtime** is also updated, according to the following rules:

- If the **hello-holdtime** is not configured; or if the hello holdtime is configured and less than the current **hello-interval** value, it is modified to 3.5 times the **hello-interval** value.
- Otherwise, it retains the configured value.

Use the **no** variant of this command to return the hello-holdtime value to its default of 3.5 times the current hello-interval value.

**Syntax** `ip pim hello-holdtime <holdtime>`  
`no ip pim hello-holdtime`

| Parameter                     | Description                                                                                         |
|-------------------------------|-----------------------------------------------------------------------------------------------------|
| <code>&lt;holdtime&gt;</code> | <code>&lt;1-65535&gt;</code><br>The holdtime value in seconds (no fractional seconds are accepted). |

**Mode** Interface Configuration for a VLAN interface.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip pim hello-holdtime 123`

## ip pim hello-interval (PIM-DM)

**Overview** This command configures a PIM **hello-interval** value. The PIM **hello-interval** on a VLAN interface is the period at which the router will transmit PIM hello messages on that interface.

When the **hello-interval** is configured, and the **hello-holdtime** is not configured, or when the configured **hello-holdtime** value is less than the new **hello-interval** value; the **hello-holdtime** value is modified to 3.5 times the **hello-interval** value. Otherwise, the **hello-holdtime** value is the configured value. The default is 30 seconds.

Use the **no** variant of this command to reset the **hello-interval** to the default.

**Syntax** `ip pim hello-interval <interval>`  
`no ip pim hello-interval`

| Parameter  | Description                                                      |
|------------|------------------------------------------------------------------|
| <interval> | <1-65535> The value in seconds (no fractional seconds accepted). |

**Mode** Interface Configuration for a VLAN interface.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip pim hello-interval 123`

# ip pim max-graft-retries

**Overview** This command configures PIM-DM to send a limited number of Graft message retries, after which time the device will remove all information regarding the particular (Source, Group), or until the device receives an acknowledgment, whichever occurs first.

The **no** variant of this command configures PIM-DM to send Graft message retries until the device receives an acknowledgment, which is the default behavior.

**Syntax** `ip pim max-graft-retries <1-65535>`  
`no pim max-graft-retries`

| Parameter         | Description                                                 |
|-------------------|-------------------------------------------------------------|
| no                | Negate a command or set its defaults.                       |
| ip                | Internet Protocol (IP).                                     |
| pim               | PIM Interface commands.                                     |
| max-graft-retries | PIM Graft message retries.                                  |
| <1-65535>         | Graft message retries before ceasing Graft message retries. |

**Default** By default, Graft retries are sent by PIM-DM until the device receives an acknowledgment.

**Mode** Interface Configuration for a VLAN interface.

**Usage** Graft messages are used to reduce the join latency when a previously pruned branch of the source tree must be grafted back, when a member joins the group after the PIM-DM device has sent a Prune message to prune unwanted traffic. Graft messages are the only PIM-DM messages that receive an acknowledgment.

If Graft messages were not used, then the member waiting for pruned off traffic would have to wait up to 3 minutes for the periodic re-flooding to occur to begin receiving multicast traffic again. By using Grafts, the Prune can be reversed much faster than waiting for periodic re-flooding to begin receiving multicast traffic again.

**Examples** To configure PIM-DM on the VLAN interface vlan2 to send a maximum of 10 Graft message retries, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim max-graft-retries 10
```

To configure PIM-DM on the VLAN interface vlan2 to send Graft message retries forever, which is the default behavior, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim max-graft-retries
```

**Validation  
Commands**

- show ip mroute
- show ip pim dense-mode mroute
- show running-config

## ip pim neighbor-filter (PIM-DM)

**Overview** Enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-DM will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering access list.

Use the **no** variant of this command to disable this function.

**Syntax** `ip pim neighbor-filter [<number>|<accesslist>]`  
`no ip pim neighbor-filter [<number>|<accesslist>]`

| Parameter    | Description                            |
|--------------|----------------------------------------|
| <number>     | <1-99> Standard IP access list number. |
| <accesslist> | IP access list name.                   |

**Default** By default, there is no filtering.

**Mode** Interface Configuration for a VLAN interface.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip pim neighbor-filter 14`

# ip pim propagation-delay

**Overview** This command configures the PIM **propagation-delay** value. The PIM **propagation-delay** is the expected delay in the transfer of PIM messages across the VLAN interface that it is attached to.

Use the **no** variant of this command to return the **propagation-delay** to the default (1000 milliseconds).

**Syntax** `ip pim propagation-delay <delay>`  
`no ip pim propagation-delay`

| Parameter | Description                                                                 |
|-----------|-----------------------------------------------------------------------------|
| <delay>   | <1000-5000> The value in milliseconds.<br>The default is 1000 milliseconds. |

**Default** The propagation-delay is set to 1000 milliseconds by default.

**Mode** Interface Configuration for a VLAN interface.

**Examples**

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim propagation-delay 2000
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim propagation-delay
```

# ip pim state-refresh origination-interval

**Overview** This command configures a PIM **state-refresh origination-interval** value. The origination interval is the number of seconds between PIM state refresh control messages. The default is 60 seconds.

Use the **no** variant of this command to return the origination interval to the default.

**Syntax** `ip pim state-refresh origination-interval <interval>`  
`no ip pim state-refresh origination-interval`

| Parameter  | Description                                                                                                                               |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <interval> | <1-100> The integer value in seconds (no fractional seconds accepted). The default <b>state-refresh origination-interval</b> value is 60. |

**Default** The state-refresh origination-interval is set to 60 seconds by default, and is reset using negation.

**Mode** Interface Configuration for a VLAN interface.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip pim state-refresh origination-interval 65`

# service pdm

**Overview** Use this command to enable PIM dense mode services.  
Use the **no** version of the command to disable unused PIM dense mode services.

**Syntax** service pdm  
no service pdm

**Default** Enabled

**Mode** Global Configuration

**Usage notes** Sometimes it may be desirable to disable unused services, in order to reduce memory use.  
Disabling the PIM services will only take effect after you save the configuration and restart the device.

**Example** To disable the PIM dense mode service, use the commands:

```
awplus# configure terminal
awplus(config)# no service pdm
```

**Output** Figure 35-2: Example output from **no service pdm**

```
awplus(config)#no service pdm
% Save the config and restart the device for this change to take
effect
```

**Command changes** Version 5.5.0-0.1: command added

# show debugging pim dense-mode

**Overview** This command displays the status of the debugging of the system.  
For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show debugging pim dense-mode`

**Mode** User Exec and Privileged Exec

**Output** Figure 35-3: Example output from the show debugging pim dense-mode command

```
PIM-DM Debugging status:
PIM-DM Decoder debugging is off
PIM-DM Encoder debugging is off
PIM-DM FSM debugging is off
PIM-DM MRT debugging is off
PIM-DM NHOP debugging is off
PIM-DM NSM debugging is off
PIM-DM VIF debugging is off
```

**Related commands** [debug pim dense-mode all](#)

# show ip pim dense-mode interface

**Overview** This command displays the PIM-DM interface information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim dense-mode interface`

**Mode** User Exec and Privileged Exec

**Example** To display information about the PIM-DM interfaces, use the command:

```
awplus# show ip pim dense-mode interface
```

## Output

|                                                                            |           |          |              |              |
|----------------------------------------------------------------------------|-----------|----------|--------------|--------------|
| Total configured interfaces: 24    Maximum allowed: 32                     |           |          |              |              |
| Total active interfaces:        22                                         |           |          |              |              |
| Address                                                                    | Interface | VIFIndex | Ver/<br>Mode | Nbr<br>Count |
| 192.168.1.53/24                                                            | vlan2     | 0        | v2/D         | 2            |
| 192.168.2.1                                                                | vlan3     | 2        | v2/D         | 0            |
| ...                                                                        |           |          |              |              |
| Note that this screen has been edited to remove any additional interfaces. |           |          |              |              |

**Table 1:** Parameters in the output of the **show ip pim dense-mode interface** command

| Parameter                   | Description                                                             |
|-----------------------------|-------------------------------------------------------------------------|
| Total configured interfaces | The number of configured PIM Dense Mode interfaces.                     |
| Maximum allowed             | The maximum number of PIM Dense Mode interfaces that can be configured. |
| Total active interfaces     | The number of active PIM Dense Mode interfaces.                         |
| Address                     | Primary PIM-DM address.                                                 |
| Interface                   | Name of the PIM-DM interface.                                           |
| VIF Index                   | The Virtual Interface index of the VLAN.                                |
| Ver/Mode                    | PIM version/Dense mode.                                                 |
| Nbr Count                   | Neighbor count of the PIM-DM interface.                                 |

**Related  
commands**    [ip pim dense-mode](#)  
                  [show ip pim dense-mode neighbor](#)

# show ip pim dense-mode interface detail

**Overview** This command displays detailed information on a PIM-DM interface.  
For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ip pim dense-mode interface detail`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip pim dense-mode interface detail`

**Output** Figure 35-4: Example output from the **show ip pim dense-mode interface detail** command

```
vlan2 (vif-id: 0):

Address 192.168.1.53/24
Hello period 30 seconds, Next Hello in 30 seconds

Neighbors:
 192.168.1.152/32
 192.168.1.149/32
vlan3 (vif-id: 2):
Address 192.168.10.53/24
Hello period 30 seconds, Next Hello in 8 seconds
Neighbors: none
```

# show ip pim dense-mode mroute

- Overview** Use this command to display the IP PIM-DM multicast routing table.
- For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).
- Syntax** `show ip pim dense-mode mroute`
- Mode** User Exec and Privileged Exec
- Example** `awplus# show ip pim dense-mode mroute`
- Output** Figure 35-5: Example output from the **show ip pim dense-mode mroute** command

```
PIM-DM Multicast Routing Table

(192.168.10.52, 224.1.1.1)
Source directly connected on vlan3
State-Refresh Originator State: Originator
Upstream IF: vlan3, State: Forwarding
Downstream IF List:
vlan2, in 'olist':
Downstream State: NoInfo
Assert State: NoInfo
```

# show ip pim dense-mode neighbor

**Overview** This command displays PIM-DM neighbor information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim dense-mode neighbor`

**Mode** User Exec and Privileged Exec

**Usage notes** The total number of PIM-DM neighbors is restricted to 500 PIM-DM neighbors. When the 500 PIM-DM neighbor limit is reached, as a result of receiving hello packets from new PIM-DM neighbors, a log entry will be issued to the log file in the below format:

```
<date> <time> <facility>.<severity> <program[<pid>]>: <message>

2008 Dec 10 00:58:39 user.err x908 PIM-DM[1150]: [VIF] Nbr
Create: Cannot create more than 500 neighbours - ignoring
neighbour 100.0.1.247/32 on vlan100
```

**Example** `awplus# show ip pim dense-mode neighbor`

**Output** Figure 35-6: Example output from the **show ip pim dense-mode neighbor** command

```
Total number of neighbors: 500
Neighbor-Address Interface Uptime/Expires Ver
192.168.1.152 vlan2 17:15:42/00:01:28 v2
192.168.1.149 vlan2 17:15:34/00:01:34 v2
```

# show ip pim dense-mode neighbor detail

- Overview** This command displays detailed PIM-DM neighbor information.  
For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).
- Syntax** `show ip pim dense-mode neighbor detail`
- Mode** User Exec and Privileged Exec
- Example** `awplus# show ip pim dense-mode neighbor detail`
- Output** Figure 35-7: Example output from the **show ip pim dense-mode neighbor detail** command

```
Neighbor 192.168.1.152 (vlan2)
Up since 17:16:20, Expires in 00:01:20
Neighbor 192.168.1.149 (vlan2)
Up since 17:16:12, Expires in 00:01:26
```

# show ip pim dense-mode nexthop

**Overview** This command displays the next hop information as used by PIM-DM. In the context of PIM-DM, the term '**next hop**' refers to the next hop router on the path back to the source address of a multicast stream.

For information on filtering and saving command output, see the ["Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim dense-mode nexthop`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip pim dense-mode nexthop`

**Output** Figure 35-8: Example output from the **show ip pim dense-mode neighbor nexthop** command

| Destination   | Nexthop Num | Nexthop Addr | Nexthop Interface | Metric | Pref |
|---------------|-------------|--------------|-------------------|--------|------|
| 192.168.10.52 | 1           | 0.0.0.0      | vlan2             | 3      | 1    |

**Table 2:** Parameters in the output of the **show ip pim dense-mode neighbor nexthop** command

| Parameter         | Description                                                            |
|-------------------|------------------------------------------------------------------------|
| Destination       | Destination address for which PIM-DM requires next hop information.    |
| Nexthop Num       | Number of next hops to the destination. PIM can only use one next hop. |
| Nexthop Addr      | Address of the current next hop gateway.                               |
| Nexthop Interface | Name of the next hop interface.                                        |
| Metric            | Metric of the route towards the destination.                           |
| Preference        | Preference of the route towards the destination.                       |

# undebg all pim dense-mode

**Overview** Use this command from the Global Configuration mode to disable all PIM-DM debugging.

**Syntax** `undebg all pim dense-mode`

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# undebg all pim dense-mode`

**Related commands**

- `debug pim dense-mode all`
- `debug pim dense-mode context`

# Multicast Source Discovery Protocol (MSDP) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Multicast Source Discovery Protocol (MSDP).

For more information, see the [Multicast Source Discovery Protocol \(MSDP\) Feature Overview and Configuration Guide](#).

- Command List**
- “clear ip msdp sa-cache” on page 1619
  - “debug msdp” on page 1620
  - “debug msdp timer” on page 1621
  - “ip msdp hold-time” on page 1622
  - “ip msdp keep-alive” on page 1623
  - “ip msdp mesh-group” on page 1624
  - “ip msdp mesh-group member” on page 1626
  - “ip msdp mesh-group member hold-time” on page 1628
  - “ip msdp mesh-group member keep-alive” on page 1630
  - “ip msdp peer” on page 1632
  - “ip msdp peer hold-time” on page 1634
  - “ip msdp peer keep-alive” on page 1636
  - “ip msdp peer rp-filter” on page 1638
  - “ip msdp peer sg-filter” on page 1640
  - “ip msdp sa-cache-timeout” on page 1642
  - “msdp default peer” on page 1643
  - “show debugging msdp” on page 1644
  - “show ip msdp mesh-group” on page 1646

- [“show ip msdp peer”](#) on page 1651
- [“show ip msdp sa-cache”](#) on page 1655

# clear ip msdp sa-cache

**Overview** Use this command to clear all the source-active (SA) messages in the SA-cache. The SA-cache contains multicast SA messages that are being sent to or received from MSDP peers.

**Syntax** `clear ip msdp sa-cache`

**Mode** Privileged Exec

**Example** To remove all entries in the SA-cache, use the commands:

```
awplus# clear ip msdp sa-cache
```

**Related commands** [show ip msdp sa-cache](#)

**Command changes** Version 5.5.1-0.1: command added

# debug msdp

**Overview** Use this command to enable debugging for MSDP.  
Use the **no** variant of this command to disable debugging for MSDP.

**Syntax**

```
debug msdp all
debug msdp state
debug msdp packet [in|out]
no debug msdp all
no debug msdp state
no debug msdp packet [in|out]
```

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| all       | Enable all MSDP debugging options.          |
| state     | Enable debugging for the MSDP peer state.   |
| packet    | Enable debugging for MSDP packets.          |
| in        | Enable debugging for incoming MSDP packets. |
| out       | Enable debugging for outgoing MSDP packets. |

**Default** Debugging is disabled.

**Mode** Global Configuration or Privileged Exec

**Example** To enable debugging for the MSDP peer state, use the command:

```
awplus# debug msdp state
```

To enable debugging for incoming MSDP packets, use the command:

```
awplus# debug msdp packet in
```

To disable all MSDP debugging, use the command:

```
awplus# no debug msdp all
```

**Related commands**

- [debug msdp timer](#)
- [show debugging msdp](#)

**Command changes** Version 5.5.1-0.1: command added

# debug msdp timer

**Overview** Use this command to enable debugging for the specified MSDP timers.  
Use the **no** variant of this command to disable debugging for MSDP timers.

**Syntax** `debug msdp timer [connect|hold|keep-alive|sa-advert|sa-state]`  
`no debug msdp timer`  
`[connect|hold|keep-alive|sa-advert|sa-state]`

| Parameter  | Description                               |
|------------|-------------------------------------------|
| connect    | Debugging for the connect retry timer.    |
| hold       | Debugging for the peer hold-time timer.   |
| keep-alive | Debugging for the keep-alive timer.       |
| sa-advert  | Debugging for the SA-advertisement timer. |
| sa-state   | Debugging for the SA-cache timer.         |

**Default** Debugging is disabled.

**Mode** Privileged Exec

**Example** To enable debugging for all timers, use the command:

```
awplus# debug msdp timer
```

To enable debugging for the connect retry timer, use the command:

```
awplus# debug msdp timer connect
```

To disable debugging for the peer hold-time timer, use the command:

```
awplus# no debug msdp timer hold
```

**Related commands** [debug msdp](#)  
[show debugging msdp](#)

**Command changes** Version 5.5.1-0.1: command added

# ip msdp hold-time

**Overview** Use this command to configure the global MSDP hold-time timeout.

The hold-time timeout defines how long a peer will wait between MSDP messages before dropping the connection. It is important that the hold-time timeout is greater than the keep-alive timeout configured on each peer. The global hold-time will be overridden if a specific hold-time timeout is configured for an individual peer.

Use the **no** variant of this command to reset the hold-time timeout to the default (75 seconds).

**Syntax** `ip msdp hold-time <15-75>`  
`no ip msdp hold-time`

| Parameter | Description                         |
|-----------|-------------------------------------|
| <15-75>   | The hold-time timeout (in seconds). |

**Default** 75 seconds.

**Mode** Global Configuration

**Example** To configure the hold-time timeout to 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp hold-time 60
```

To reset the hold-time timeout to the default of 75 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp hold-time
```

**Related commands**

- `ip msdp keep-alive`
- `ip msdp mesh-group`
- `ip msdp mesh-group member`
- `ip msdp mesh-group member hold-time`
- `ip msdp mesh-group member keep-alive`
- `ip msdp peer`
- `ip msdp peer hold-time`
- `ip msdp peer keep-alive`
- `ip msdp sa-cache-timeout`

**Command changes** Version 5.5.1-0.1: command added

# ip msdp keep-alive

**Overview** Use this command to configure the global MSDP keep-alive timeout.

The keep-alive timeout defines the period between keep-alive messages being sent to each peer. It is important that the keep-alive timeout is less than the hold-time timeout configured on each peer device. The global keep-alive will be overridden if a specific keep-alive timeout is configured for an individual peer.

Use the **no** variant of this command to reset the keep-alive timeout to the default (60 seconds).

**Syntax** `ip msdp keep-alive <10-60>`  
`no ip msdp keep-alive`

| Parameter | Description                          |
|-----------|--------------------------------------|
| <10-60>   | The keep-alive timeout (in seconds). |

**Default** 60 seconds.

**Mode** Global Configuration

**Example** To configure the keep-alive timeout to 45 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp keep-alive 45
```

To reset the keep-alive timeout to the default of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp keep-alive
```

**Related commands**

**Command changes** Version 5.5.1-0.1: command added

# ip msdp mesh-group

**Overview** Use this command to create an MSDP mesh-group with an associated local source address.

Use the **no** variant of this command to delete an MSDP mesh-group.

**Syntax** `ip msdp mesh-group <group-name> local-address <ip-address>`  
`no ip msdp mesh-group <group-name>`

| Parameter                       | Description                      |
|---------------------------------|----------------------------------|
| <code>&lt;group-name&gt;</code> | The name of the MSDP mesh-group. |
| <code>&lt;ip-address&gt;</code> | The IPv4 local address.          |

**Default** No mesh-groups are configured.

**Mode** Global Configuration

**Example** To create an MSDP mesh-group named 'group' with a local address of 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp mesh-group group local-address
192.168.1.5
```

To delete an MSDP mesh-group named 'group', use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp mesh-group group
```

**Related commands**

- [ip msdp hold-time](#)
- [ip msdp keep-alive](#)

- [ip msdp peer hold-time](#)
- [ip msdp peer keep-alive](#)
- [ip msdp sa-cache-timeout](#)
- [show ip msdp mesh-group](#)
- [show ip msdp peer](#)

**Command changes** Version 5.5.1-0.1: command added

# ip msdp mesh-group member

**Overview** Use this command to include an MSDP peer as a member of an MSDP mesh-group. The mesh-group needs to be configured with the [ip msdp mesh-group](#) command before members can be added.

Use the **no** variant of this command to remove an MSDP peer from an MSDP mesh-group.

**Syntax** `ip msdp mesh-group <group-name> member <ip-address>`  
`no ip msdp mesh-group <group-name> member <ip-address>`

| Parameter                       | Description                      |
|---------------------------------|----------------------------------|
| <code>&lt;group-name&gt;</code> | The name of the MSDP mesh-group. |
| <code>&lt;ip-address&gt;</code> | The IPv4 address of the peer.    |

**Default** Peers are not included in a mesh-group.

**Mode** Global Configuration

**Example** To add the peer at 192.168.1.3 to an MSDP mesh-group named 'group', use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp mesh-group group member 192.168.1.3
```

To remove the peer at 192.168.1.3 from an MSDP mesh-group named 'group', use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp mesh-group group member 192.168.1.3
```

`show ip msdp mesh-group`

**Command changes**    Version 5.5.1-0.1: command added

# ip msdp mesh-group member hold-time

**Overview** Use this command to configure the MSDP hold-time timeout for an MSDP mesh-group member.

The hold-time timeout defines how long a peer will wait between MSDP messages before dropping the connection. It is important that the hold-time timeout is greater than the keep-alive timeout configured on each peer. The global hold-time will be overridden if a specific hold-time timeout is configured for an individual peer.

Use the **no** variant of this command to delete the mesh-group member-specific hold-time timeout.

**Syntax** `ip msdp mesh-group <group-name> member <ip-address> hold-time <15-75>`

`no ip msdp mesh-group <group-name> member <ip-address> hold-time`

| Parameter    | Description                                |
|--------------|--------------------------------------------|
| <group-name> | The name of a mesh-group.                  |
| <ip-address> | The IPv4 address of the mesh-group member. |
| <15-75>      | The hold-time timeout (in seconds).        |

**Default** MSDP mesh-group members use the global hold-time timeout (75 seconds by default).

**Mode** Global Configuration

**Example** To configure the hold-time timeout for a member of mesh-group 'group' at 192.168.1.5 to 45 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp mesh-group group 192.168.1.5 hold-time 45
```

To delete the specific hold-time timeout configured for the member at 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp mesh-group group 192.168.1.5 hold-time
```

ip msdp peer hold-time

ip msdp peer keep-alive

ip msdp sa-cache-timeout

**Command changes** Version 5.5.1-0.1: command added

# ip msdp mesh-group member keep-alive

**Overview** Use this command to configure the MSDP keep-alive timeout for an MSDP mesh-group member.

The keep-alive timeout defines the period between keep-alive messages being sent to each peer. It is important that the keep-alive timeout is less than the hold-time timeout configured on each peer device. The global keep-alive will be overridden if a specific keep-alive timeout is configured for an individual peer.

Use the **no** variant of this command to delete the mesh-group member-specific keep-alive timeout.

**Syntax** `ip msdp mesh-group <group-name> member <ip-address> keep-alive <10-60>`

`no ip msdp mesh-group <group-name> member <ip-address> keep-alive`

| Parameter    | Description                                |
|--------------|--------------------------------------------|
| <group-name> | The name of a mesh-group.                  |
| <ip-address> | The IPv4 address of the mesh-group member. |
| <10-60>      | The keep-alive timeout (in seconds).       |

**Default** MSDP mesh-group members use the global keep-alive timeout (60 seconds by default).

**Mode** Global Configuration

**Example** To configure the keep-alive timeout for a member of mesh-group 'group' at 192.168.1.5 to 45 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp mesh-group group 192.168.1.5 keep-alive 45
```

To delete the specific keep-alive timeout configured for the member at 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp mesh-group group 192.168.1.5 keep-alive
```

# ip msdp peer

**Overview** Use this command to configure a new MSDP peer.  
Use the **no** variant of this command to remove an MSDP peer.

**Syntax** `ip msdp peer <ip-address> local-address <local-address>`  
`no ip msdp peer <ip-address> [local-address <local-address>]`

| Parameter       | Description                                     |
|-----------------|-------------------------------------------------|
| <ip-address>    | The IPv4 address of the peer.                   |
| <local-address> | The local IPv4 address to listen and send from. |

**Default** No MSDP peers are configured.

**Mode** Global Configuration

**Example** To configure an MSDP peer at 192.168.1.3 with a local address of 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp peer 192.168.1.3 local-address
192.168.1.5
```

**Command changes** Version 5.5.1-0.1: command added

# ip msdp peer rp-filter

**Overview** Use this command to configure filters for incoming and outgoing SA messages for a peer based on the RP address. You can configure filters for a peer to permit or deny SA messages based on the RP addresses. The filters use an access list where the source must match the SA RP address; the destination address is unused.

Use the **no** variant of this command to remove the filters.

**Syntax**

```
ip msdp peer <ip-address> rp-filter in
{<100-199>|<2000-2699>|<access-list>}

ip msdp peer <ip-address> rp-filter out
{<100-199>|<2000-2699>|<access-list>}

no ip msdp peer <ip-address> rp-filter [in|out]
```

| Parameter     | Description                               |
|---------------|-------------------------------------------|
| <ip-address>  | The IPv4 address of the peer.             |
| in            | The incoming filter.                      |
| out           | The outgoing filter.                      |
| <100-199>     | IP extended access list.                  |
| <2000-2699>   | IP extended access list (expanded range). |
| <access-list> | Access list name.                         |

**Default** No RP filters are configured.

**Mode** Global Configuration

**Example** To configure an incoming RP filter for 192.168.1.5 using IP extended access list 100, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 100 permit ip 172.16.48.133/32
1.1.1.1/32
awplus(config)# ip msdp peer 192.168.1.5 rp-filter in 100
```

To configure an outgoing RP filter for 192.168.1.5 using an access list named 'list1', use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp peer 192.168.1.5 rp-filter out list1
```

To remove an incoming RP filter for 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 rp-filter in
```

To remove all RP filters for 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 rp-filter
```

**Related  
commands**

**Command  
changes**

Version 5.5.1-0.1: command added

# ip msdp peer sg-filter

**Overview** Use this command to configure filters for a peer to permit or deny SA messages based on the source and group addresses. The filters use an access list where the source must match the SA source address, and the destination must match the SA group address.

Use the **no** variant of this command to remove the filters.

**Syntax**

```
ip msdp peer <ip-address> sg-filter in
{<100-199>|<2000-2699>|<access-list>}

ip msdp peer <ip-address> sg-filter out
{<100-199>|<2000-2699>|<access-list>}

no ip msdp peer <ip-address> sg-filter [in|out]
```

| Parameter     | Description                               |
|---------------|-------------------------------------------|
| <ip-address>  | The IPv4 address of the peer.             |
| in            | The incoming filter.                      |
| out           | The outgoing filter.                      |
| <100-199>     | IP extended access list.                  |
| <2000-2699>   | IP extended access list (expanded range). |
| <access-list> | Access list name.                         |

**Default** No SG filters are configured.

**Mode** Global Configuration

**Example** To configure an incoming SG filter for 192.168.1.5 using IP extended access list 100, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 100 permit ip 172.16.48.133/32
1.1.1.1/32
awplus(config)# ip msdp peer 192.168.1.5 sg-filter in 100
```

To configure an outgoing SG filter for 192.168.1.5 using an access list named 'list1', use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp peer 192.168.1.5 sg-filter out list1
```

To remove an incoming SG filter for 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 sg-filter in
```

To remove all SG filters for 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 sg-filter
```

# ip msdp sa-cache-timeout

**Overview** Use this command to configure the MSDP Source-Active cache expiry timeout. The MSDP Source-Active cache timeout determines how long entries can exist in the cache before they expire.

Use the **no** variant of this command to reset the timeout to the default (75 seconds).

**Syntax** `ip msdp sa-cache-timeout <75-300>`  
`no ip msdp sa-cache-timeout`

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| <75-300>  | How long cache entries exist before they expire (in seconds). |

**Default** 75 seconds

**Mode** Global Configuration

**Example** To configure the MSDP Source-Active cache timeout to 255 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp sa-cache-timeout 255
```

To reset the MSDP Source-Active cache timeout to the default of 75 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp sa-cache-timeout
```

**Command changes** Version 5.5.1-0.1: command added

# msdp default peer

**Overview** Use this command to configure an MSDP peer as a default peer. SA messages from the default peer will be accepted without Peer Reverse Path Forwarding (Peer-RPF) checks for the peer address against the advertised RP. It is possible to configure multiple default peers, however only one of the active peers that are configured as default will be recognized as the default.

Use the **no** variant of this command to remove an MSDP peer as a default peer.

**Syntax** `ip msdp peer <ip-address> default-peer`  
`no ip msdp peer <ip-address> default-peer`

| Parameter                       | Description                   |
|---------------------------------|-------------------------------|
| <code>&lt;ip-address&gt;</code> | The IPv4 address of the peer. |

**Default** No default peer is configured.

**Mode** Global Configuration

**Example** To configure existing MSDP peer 192.168.1.5 as the default peer, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp peer 192.168.1.5 default-peer
```

To remove MSDP peer 192.168.1.5 as the default peer, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 default-peer
```

**Command changes** Version 5.5.1-0.1: command added

# show debugging msdp

**Overview** Use this command to display which MSDP debugging options are currently enabled. Debugging is either on or off for each option.

**Syntax** show debugging msdp

**Mode** Privileged Exec

**Example** To display which MSDP debugging options are enabled, use the command:

```
awplus# show debugging msdp
```

**Output** Figure 36-1: Example output from **show debugging msdp**

```
awplus# show debugging msdp
MSDP debugging status:
 MSDP state debugging is on
 MSDP incoming packet debugging is on
 MSDP outgoing packet debugging is off
 MSDP peer hold timer debugging is off
 MSDP peer connect timer debugging is off
 MSDP peer keep-alive timer debugging is off
 MSDP source-active state timer debugging is on
 MSDP source-active advertisement timer debugging is off
```

Table 36-1: Parameters in the output from **show debugging msdp**

| Parameter                  | Description                                                                                                                |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------|
| MSDP state                 | If enabled, shows when a peer has a change of state.                                                                       |
| MSDP incoming packet       | If enabled, shows when MSDP packets are received by the device.                                                            |
| MSDP outgoing packet       | If enabled, shows when MSDP packets are transmitted by the device.                                                         |
| MSDP peer hold timer       | If enabled, shows activity related to the peer hold timer, for example, when the timer starts, expires, or is reset.       |
| MSDP peer connect timer    | If enabled, shows activity related to the peer hold timer, for example, when the timer starts or expires.                  |
| MSDP peer keep-alive timer | If enabled, shows activity related to the peer keep-alive timer, for example, when the timer starts, expires, or is reset. |

Table 36-1: Parameters in the output from **show debugging msdp** (cont.)

| Parameter                              | Description                                                                                                                            |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| MSDP source-active state timer         | If enabled, shows activity related to the source-active state timer, for example, when the timer starts, expires, or is reset.         |
| MSDP source-active advertisement timer | If enabled, shows activity related to the source-active advertisement timer, for example, when the timer starts, expires, or is reset. |

changes**

Version 5.5.1-0.1: command added

# show ip msdp mesh-group

**Overview** Use this command to show information about the MSDP mesh-groups and the members within them.

**Syntax**

```
show ip msdp mesh-group [detail]
show ip msdp mesh-group <group-name> [detail]
show ip msdp mesh-group <group-name> member <ip-address>
[detail]
```

| Parameter    | Description                                      |
|--------------|--------------------------------------------------|
| detail       | Show detailed information about the mesh groups. |
| <group-name> | The name of a mesh-group.                        |
| <ip-address> | The IPv4 address of a member of the mesh-group.  |

**Mode** Privileged Exec

**Example** To show brief information about every mesh-group and the members within, use the command:

```
awplus# show ip msdp mesh-group
```

To show information about mesh-group 'group2' and all of its members, use the command:

```
awplus# show ip msdp mesh-group group2
```

To show information about member 172.16.48.133 inside mesh-group 'group2', use the commands:

```
awplus# show ip msdp mesh-group group2 member 172.16.48.133
```

To show detailed information about member 172.16.48.133 inside mesh-group 'group2', use the commands:

```
awplus# show ip msdp mesh-group group2 member 172.16.48.133
detail
```

**Output** Figure 36-2: Example output from **show ip msdp mesh-group**

```
awplus# show ip msdp mesh-group

MSDP Mesh Group information:

Mesh Group : group1

Local address : 172.168.2.5
Members : 0

Table 36-2: Parameters in the output from **show ip msdp mesh-group**

| Parameter                   | Description                                                                                                                |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Default peer                | Yes, if the peer is a default peer, and No if not.                                                                         |
| Mesh-group                  | If the peer is a member of a mesh-group then the name of the mesh-group will be displayed, otherwise "--".                 |
| Keep Alive receive          | The number of keep alive messages the peer has received.                                                                   |
| Keep Alive transmit         | The number of keep alive messages the peer has transmitted.                                                                |
| Keep Alive receive error    | The number of keep alive messages that have been received that contained errors.                                           |
| Source active receive       | The number of source active messages the peer has received.                                                                |
| Source active transmit      | The number of source active messages the peer has transmitted.                                                             |
| Source active receive error | The number of source active messages that have been received that contained errors.                                        |
| Unknown TLV receive         | The number of messages received by the peer that were not keep alive or source active messages.                            |
| Peer Hold                   | The seconds remaining until the peer hold timer expires, at which point the peer connection ends.                          |
| Keep Alive                  | The seconds remaining until the keep alive timer expires, at which point the peer will send out a keep alive message.      |
| Connect Retry               | The seconds remaining till the connect retry timer expires, at which point another attempt is made to connect to the peer. |

Table 36-2: Parameters in the output from **show ip msdp mesh-group** (cont.)

| Parameter     | Description                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------|
| SG filter out | The name of the filter based on the source and group address of outgoing source active messages. |
| SG filter in  | The name of the filter based on the source and group address of incoming source active messages. |
| RP filter out | The name of the filter based on the RP address of outgoing source active messages.               |
| RP filter in  | The name of the filter based on the RP address of incoming source active messages.               |
| Out permit    | The number of SA messages that have been permitted to send.                                      |
| Out deny      | The number of SA messages that have been denied from being sent.                                 |
| In permit     | The number of SA messages that have been permitted to be received.                               |
| In deny       | The number of SA messages that have been denied to be received.                                  |

**Command changes** Version 5.5.1-0.1: command added

# show ip msdp peer

**Overview** Use this command to display MSDP peers, their addresses, and their current status. Use the **detail** parameter to display additional information on timers, filters, and counters.

**Syntax** `show ip msdp peer [<ip-address>] [detail]`

| Parameter    | Description                                                      |
|--------------|------------------------------------------------------------------|
| <ip-address> | The IPv4 address of the peer.                                    |
| detail       | Display additional information on timers, filters, and counters. |

**Mode** Privileged Exec

**Example** To show the results for all MSDP peers, use the command:

```
awplus# show ip msdp peer
```

To show the results for MSDP peer 192.168.1.3, use the command:

```
awplus# show ip msdp peer 192.168.1.3
```

To show detailed results for MSDP peer 192.168.1.3, use the command:

```
awplus# show ip msdp peer 192.168.1.3 detail
```

**Output** Figure 36-6: Example output from **show ip msdp peer**

```
awplus#show ip msdp peer

MSDP Peer Information:

Default peer : None

Peer address : 192.168.1.3
Local address : 192.168.1.2
State : Established

Peer address : 192.168.1.5
Local address : 192.168.1.4
State : Connecting

Table 36-3: Parameters in the output from **show ip msdp peer**

| Parameter                | Description                                                                                                 |
|--------------------------|-------------------------------------------------------------------------------------------------------------|
| Default peer             | Yes, if the peer is a default peer, and No if not.                                                          |
| Mesh-group               | If the peer is a member of a mesh-group, then the name of the mesh-group will be displayed, otherwise "--". |
| Keep Alive receive       | The number of keep alive messages the peer has received.                                                    |
| Keep Alive transmit      | The number of keep alive messages the peer has transmitted.                                                 |
| Keep Alive receive error | The number of keep alive messages that have been received that contained errors.                            |
| Source active receive    | The number of source active messages the peer has received.                                                 |

Table 36-3: Parameters in the output from **show ip msdp peer** (cont.)

| Parameter                   | Description                                                                                                                |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Source active transmit      | The number of source active messages the peer has transmitted.                                                             |
| Source active receive error | The number of source active messages that have been received that contained errors.                                        |
| Unknown TLV receive         | The number of messages received by the peer that were not keep alive or source active messages.                            |
| Peer Hold                   | The seconds remaining until the peer hold timer expires, at which point the peer connection ends.                          |
| Keep Alive                  | The seconds remaining until the keep alive timer expires, at which point the peer will send out a keep alive message.      |
| Connect Retry               | The seconds remaining till the connect retry timer expires, at which point another attempt is made to connect to the peer. |
| SG filter out               | The name of the filter based on the source and group address of outgoing source active messages.                           |
| SG filter in                | The name of the filter based on the source and group address of incoming source active messages.                           |
| RP filter out               | The name of the filter based on the RP address of outgoing source active messages.                                         |
| RP filter in                | The name of the filter based on the RP address of incoming source active messages.                                         |
| Out permit                  | The number of SA messages that have been permitted to send.                                                                |
| Out deny                    | The number of SA messages that have been denied from being sent.                                                           |
| In permit                   | The number of SA messages that have been permitted to be received.                                                         |
| In deny                     | The number of SA messages that have been denied to be received.                                                            |

- [ip msdp peer sg-filter](#)

msdp default peer

show ip msdp sa-cache

**Command** Version 5.5.1-0.1: command added  
**changes**

# show ip msdp sa-cache

**Overview** Use this command to display information about the MSDP Source Address Cache (SA-cache) entries.

Entries that are Local (Yes) are learned from the local multicast route table. They will expire when they are removed from the local multicast route table, and the MSDP expiry is always set to 0. Local entries will be advertised to MSDP peers.

Entries that are Local (No) have been received via an MSDP SA-message from an MSDP peer. They will expire when the expiry timer reaches 0, unless they are refreshed from the peer. SA-cache entries that are not local are advertised to PIM.

**Syntax** `show ip msdp sa-cache`

**Mode** Privileged Exec

**Example** To show information about the MSDP SA-cache entries, use the command:

```
awplus# show ip msdp sa-cache
```

**Output** Figure 36-9: Example output from **show ip msdp sa-cache**

```
awplus# show ip msdp sa-cache

MSDP Source-Active cache:

Source-Active advertisement expiry (secs): 51

RP Address Source Address Group Address Local Expiry (secs)

172.16.48.133 10.36.20.1 232.0.0.8 Yes 0
172.16.48.133 10.36.20.1 239.254.1.1 Yes 0
172.16.48.133 10.36.20.1 239.254.1.2 Yes 0

# IPv4 Hardware Access Control List (ACL) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of IPv4 Hardware Access Control List (ACL) commands. It contains detailed command information and command examples about IPv4 hardware ACLs, which you can apply directly to interfaces using the [access-group](#) command.

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself.

Most ACL command titles include information in parentheses:

- When the command title ends with words in parentheses, these words indicate usage instead of keywords to enter into the CLI. For example, the title **access-list (numbered hardware ACL for ICMP)** indicates that the command is used to create an ACL with the syntax:

```
access-list <3000-3699> <action> icmp <source-ip> <dest-ip>
[icmp-type <number>] [vlan <1-4094>]
```

- When the command title is completely surrounded by parentheses, the title indicates the type of ACL filter instead of keywords to enter into the CLI. For example, the title **(named hardware ACL: ICMP entry)** represents a command with the syntax:

```
[<sequence-number>] <action> icmp <source-ip> <dest-ip>
[icmp-type <number>] [vlan <1-4094>]
```

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**Sub-modes** Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

Table 37-1: IPv4 Hardware Access List Commands and Prompts

| Command Name                                          | Command Mode                    | Prompt                          |
|-------------------------------------------------------|---------------------------------|---------------------------------|
| show interface access-group                           | Privileged Exec                 | awplus#                         |
| show access-list (IPv4 Hardware ACLs)                 | Privileged Exec                 | awplus#                         |
| show acl-group ip address                             | Privileged Exec                 | awplus#                         |
| show acl-group ip port                                | Privileged Exec                 | awplus#                         |
| show interface access-group                           | Privileged Exec                 | awplus#                         |

# access-group

**Overview** This command adds or removes a hardware-based access-list to or from a switch port interface or interfaces. The number of hardware numbered and named access-lists that can be added to a switch port interface is determined by the available memory in hardware-based packet classification tables.

This command works in Interface Configuration mode to apply hardware access-lists to selected switch port interfaces.

The **no** variant of this command removes the selected access-list from an interface.

**Syntax**

```
access-group
[<3000-3699>|<4000-4699>|<hardware-access-list-name>]

no access-group
[<3000-3699>|<4000-4699>|<hardware-access-list-name>]
```

| Parameter                   | Description                    |
|-----------------------------|--------------------------------|
| <3000-3699>                 | Hardware IP access-list.       |
| <4000-4699>                 | Hardware MAC access-list.      |
| <hardware-access-list-name> | The hardware access-list name. |

**Mode** Interface Configuration for a switch port interface or interfaces

**Default** Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

**Usage notes** First create an IP access-list that applies the appropriate permit/deny requirements with the [access-list \(numbered hardware ACL for IP packets\)](#) command, the [access-list \(numbered hardware ACL for MAC addresses\)](#) command or the [access-list hardware \(named hardware ACL\)](#) command. Then use this command to apply this hardware access- list to a specific port or port range. Note that this command will apply the access-list only to incoming data packets.

To apply ACLs to an LACP aggregated link, apply it to all the individual switch ports in the aggregated group. To apply ACLs to a static channel group, apply it to the static channel group itself. An ACL can even be applied to a static aggregated link that spans more than one switch instance ([Link Aggregation Commands](#)).

Note that you cannot apply software numbered ACLs to switch port interfaces with the access-group command. This command will only apply hardware ACLs.

**NOTE:** Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**Examples** To add the numbered hardware access-list 3005 to switch port interface port1.0.1, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# access-group 3005
```

To add the named hardware access-list "hw-acl" to switch port interface port1.0.2, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# access-group hw-acl
```

To apply an ACL to static channel group 2 containing switch port1.0.3 and port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3-port1.0.4
awplus(config-if)# static-channel-group 2
awplus(config)# interface sa2
awplus(config-if)# access-group 3000
```

**Related  
commands**

[access-list \(numbered hardware ACL for MAC addresses\)](#)  
[show interface access-group](#)

# access-list (numbered hardware ACL for ICMP)

**Overview** This command creates an access-list for use with hardware classification. The access-list will match on ICMP packets that have the specified source and destination IP addresses and, optionally, ICMP type. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

The optional **vlan** parameter can be used to match tagged (802.1q) packets.

The **no** variant of this command removes the previously specified access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** `access-list <3000-3699> <action> icmp <source-ip> <dest-ip>  
[icmp-type <number>] [vlan <1-4094>]  
no access-list <3000-3699>`

The following actions are available for hardware ACLs:

| Values for the <action> parameter                     |                                                                                                                                                                                                                                                              |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                  | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                                | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                           | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br>port-number]          | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br>port-number]          | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                           |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                                                                                                                                            |

| Parameter                   | Description                                                                                                                                                                                                                 |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <3000–3699>                 | An ID number for this hardware IP access-list.                                                                                                                                                                              |
| <action>                    | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                             |
| icmp                        | Match against ICMP packets                                                                                                                                                                                                  |
| <source-ip>                 | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                     |
| any                         | Match any source IP address.                                                                                                                                                                                                |
| host <ip-addr>              | Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                               |
| <ip-addr>/<prefix>          | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                     |
| <ip-addr><br><reverse-mask> | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.      |
| <dest-ip>                   | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                      |
| any                         | Match any destination IP address.                                                                                                                                                                                           |
| host <ip-addr>              | Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                          |
| <ip-addr>/<prefix>          | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                |
| <ip-addr><br><reverse-mask> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| icmp-type<br><number>       | The type of ICMP message to match against, as defined in RFC792 and RFC950. Values include:                                                                                                                                 |
| 0                           | Echo replies.                                                                                                                                                                                                               |

| Parameter     | Description                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------|
| 3             | Destination unreachable messages.                                                                |
| 4             | Source quench messages.                                                                          |
| 5             | Redirect (change route) messages.                                                                |
| 8             | Echo requests.                                                                                   |
| 11            | Time exceeded messages.                                                                          |
| 12            | Parameter problem messages.                                                                      |
| 13            | Timestamp requests.                                                                              |
| 14            | Timestamp replies.                                                                               |
| 15            | Information requests.                                                                            |
| 16            | Information replies.                                                                             |
| 17            | Address mask requests.                                                                           |
| 18            | Address mask replies.                                                                            |
| vlan <1-4094> | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag. |

**Mode** Global Configuration

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

ICMP ACLs will match any ICMP packet that has the specified source and destination IP addresses and ICMP type. The ICMP type is an optional parameter.

**Examples** To create an access-list that will permit ICMP packets with a source address of 192.168.1.0/24 with any destination address and an ICMP type of 5 enter the following commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit icmp 192.168.1.0/24 any
icmp-type 5
```

To destroy the access-list with an access-list identity of 3000 enter the following commands:

```
awplus# configure terminal
awplus(config)# no access-list 3000
```

**Related commands** [access-group](#)

`match access-group`

`show running-config`

`show access-list (IPv4 Hardware ACLs)`

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# access-list (numbered hardware ACL for IP packets)

**Overview** This command creates an access-list for use with hardware classification. The access-list will match on packets that have the specified source and destination IP addresses. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

The optional **vlan** parameter can be used to match tagged (802.1q) packets.

The **no** variant of this command removes the previously specified IP hardware access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** `access-list <3000-3699> <action> ip <source-ip> <dest-ip> [vlan <1-4094>]`  
`no access-list <3000-3699>`

The following actions are available for hardware ACLs:

| Values for the <action> parameter            |                                                                                                                                                                                                                                                              |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                         | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                       | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                  | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br>port-number] | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br>port-number] | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |

| Values for the <action> parameter                     |                                                                                                                                    |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                  |

Table 37-2: IP and ICMP parameters in **access-list (hardware IP numbered)**

| Parameter                   | Description                                                                                                                                                                                                            |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <3000-3699>                 | An ID number for this hardware IP access-list.                                                                                                                                                                         |
| <action>                    | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                        |
| ip                          | Match against IP packets                                                                                                                                                                                               |
| <source-ip>                 | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                |
| any                         | Match any source IP address.                                                                                                                                                                                           |
| host <ip-addr>              | Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                          |
| <ip-addr>/<prefix>          | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                |
| <ip-addr><br><reverse-mask> | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <dest-ip>                   | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                 |
| any                         | Match any destination IP address.                                                                                                                                                                                      |
| host <ip-addr>              | Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                     |
| <ip-addr>/<prefix>          | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                           |

Table 37-2: IP and ICMP parameters in **access-list (hardware IP numbered)**

| Parameter                                                         | Description                                                                                                                                                                                                                 |
|-------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-addr&gt;</code><br><code>&lt;reverse-mask&gt;</code> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <code>vlan &lt;1-4094&gt;</code>                                  | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                            |

**Mode** Global Configuration

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

**Examples** To create an access-list that will permit IP packets with a source address of 192.168.1.1 and any destination address, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit ip 192.168.1.1/32 any
```

To destroy the access-list with an access-list identity of 3000 enter the following commands:

```
awplus# configure terminal
awplus(config)# no access-list 3000
```

**Related commands** [access-group](#)  
[match access-group](#)  
[show running-config](#)  
[show access-list \(IPv4 Hardware ACLs\)](#)

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# access-list (numbered hardware ACL for IP protocols)

**Overview** This command creates an access-list for use with hardware classification. The access-list will match on packets that have the specified source and destination IP addresses and IP protocol number. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

The optional **vlan** parameter can be used to match tagged (802.1q) packets.

The **no** variant of this command removes the previously specified IP hardware access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** `access-list <3000-3699> <action> proto <1-255> <source-ip> <dest-ip> [vlan <1-4094>]`  
`no access-list <3000-3699>`

The following actions are available for hardware ACLs:

| Values for the <action> parameter            |                                                                                                                                                                                                                                                              |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                         | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                       | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                  | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br>port-number] | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br>port-number] | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |

| Values for the <action> parameter                     |                                                                                                                                    |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                  |

Table 37-3: Parameters in **access-list (hardware IP numbered)**

| Parameter     | Description                                                                                                                                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <3000-3699>   | An ID number for this hardware IP access-list.                                                                                                                                                                                                                                     |
| <action>      | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                                    |
| proto <1-255> | The IP protocol number to match against, as defined by IANA (Internet Assigned Numbers Authority <a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a> )<br>See below for a list of IP protocol numbers and their descriptions. |
| <source-ip>   | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                                                                            |
|               | any Match any source IP address.                                                                                                                                                                                                                                                   |
|               | host <ip-addr> Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                                       |
|               | <ip-addr>/<prefix> Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                                         |
|               | <ip-addr><br><reverse-mask> Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.                                 |
| <dest-ip>     | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                                                                             |
|               | any Match any destination IP address.                                                                                                                                                                                                                                              |
|               | host <ip-addr> Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                                  |

Table 37-3: Parameters in **access-list (hardware IP numbered)** (cont.)

| Parameter                                             | Description                                                                                                                                                                                                                 |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i>                 | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                |
| <i>&lt;ip-addr&gt;</i><br><i>&lt;reverse-mask&gt;</i> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| vlan <i>&lt;1-4094&gt;</i>                            | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                            |

Table 37-4: IP protocol number and description

| Protocol Number | Protocol Description [RFC]                             |

**Mode** Global Configuration

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

**Examples** To create an access-list that will deny all IGMP packets (IP protocol 2) from the 192.168.0.0 network, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 deny proto 2 192.168.0.0/16
any
```

To destroy the access-list with an access-list identity of 3000 enter the following commands:

```
awplus# configure terminal
awplus(config)# no access-list 3000
```

**Related  
commands**

[access-group](#)  
[match access-group](#)  
[show running-config](#)  
[show access-list \(IPv4 Hardware ACLs\)](#)

**Command  
changes**

Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# access-list (numbered hardware ACL for MAC addresses)

**Overview** This command creates an access-list for use with hardware classification. The access-list will match on packets that have the specified source and destination MAC addresses. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

The **no** variant of this command removes the specified MAC hardware filter access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax**

```
access-list <4000-4699> <action> {<source-mac>|any}
{<dest-mac>|any} [vlan <1-4094>]

no access-list <4000-4699>
```

The following actions are available for hardware ACLs:

| Values for the <action> parameter                     |                                                                                                                                                                                                                                                              |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                  | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                                | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                           | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br>port-number]          | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br>port-number]          | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                           |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                                                                                                                                            |

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <4000-4699>   | An ID number for this hardware IP access-list.                                                                                                                                                                                                                                                                                                   |
| <action>      | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                                                                                                  |
| <source-mac>  | The source MAC address to match against, followed by the mask.<br>Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number.<br>Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.      |
| any           | Match against any source MAC address.                                                                                                                                                                                                                                                                                                            |
| <dest-mac>    | The destination MAC address to match against, followed by the mask.<br>Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number.<br>Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match. |
| any           | Match against any destination MAC address.                                                                                                                                                                                                                                                                                                       |
| vlan <1-4094> | Match against the specified ID in the packet's VLAN tag.                                                                                                                                                                                                                                                                                         |

**Mode** Global Configuration

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 4000-4699 match on packets that have the specified source and destination MAC addresses.

**Examples** To create an access-list that will permit packets with a source MAC address of 0000.00ab.1234 and any destination address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4000 permit 0000.00ab.1234
0000.0000.0000 any
```

To create an access-list that will permit packets if their source MAC address starts with 0000.00ab, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 permit 0000.00ab.1234
0000.0000.FFFF any
```

To create an access-list that will send a copy of packets to the mirror port if their source MAC address starts with 0000.00ab, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 copy-to-mirror 0000.00ab.1234
0000.0000.FFFF any
```

You also need to configure the mirror port with the [mirror interface](#) command.

To destroy the access-list with an access-list identity of 4000 enter the commands:

```
awplus# configure terminal
awplus(config)# no access-list 4000
```

**Command  
changes**

Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# access-list (numbered hardware ACL for TCP or UDP)

**Overview** This command creates an access-list for use with hardware classification. The access-list will match on TCP or UDP packets that have the specified source and destination IP addresses and optionally, port values. You can use the value **any** instead of source or destination IP address if an address does not matter.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

You can use the optional **vlan** parameter to match tagged (802.1q) packets.

The **no** variant of this command removes the specified IP hardware access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** `access-list <3000-3699> <action> {tcp|udp} <source-ip>  
[<source-ports>] <dest-ip> [<dest-ports>] [vlan <1-4094>]  
no access-list <3000-3699>`

The following actions are available for hardware ACLs:

| Values for the <action> parameter                     |                                                                                                                                                                                                                                                              |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                  | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                                | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                           | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br>port-number]          | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br>port-number]          | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                           |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                                                                                                                                            |

| Parameter                        | Description                                                                                                                                                                                                            |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <3000–3699>                      | An ID number for this hardware IP access-list.                                                                                                                                                                         |
| <action>                         | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                        |
| tcp                              | Match against TCP packets.                                                                                                                                                                                             |
| udp                              | Match against UDP packets.                                                                                                                                                                                             |
| <source-ip>                      | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                |
| any                              | Match any source IP address.                                                                                                                                                                                           |
| host <ip-addr>                   | Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                          |
| <ip-addr>/<prefix>               | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                |
| <ip-addr><br><reverse-mask>      | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <source-ports>                   | Match source TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:                                                                 |
| eq <0–65535>                     | Match a single port number.                                                                                                                                                                                            |
| lt <0–65535>                     | Match all port numbers that are less than the specified port number.                                                                                                                                                   |
| gt <0–65535>                     | Match all port numbers that are greater than the specified port number.                                                                                                                                                |
| ne <0–65535>                     | Match all port numbers except the specified port number.                                                                                                                                                               |
| range <start-port><br><end-port> | Match a range of port numbers.                                                                                                                                                                                         |
| <dest-ip>                        | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                 |
| any                              | Match any destination IP address.                                                                                                                                                                                      |
| host <ip-addr>                   | Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                     |

| Parameter                                                              | Description                                                                                                                                                                                                                 |
|------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-addr&gt;/&lt;prefix&gt;</code>                            | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                |
| <code>&lt;ip-addr&gt;</code><br><code>&lt;reverse-mask&gt;</code>      | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <code>&lt;dest-ports&gt;</code>                                        | Match destination TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:                                                                 |
| <code>eq &lt;0-65535&gt;</code>                                        | Match a single port number.                                                                                                                                                                                                 |
| <code>lt &lt;0-65535&gt;</code>                                        | Match all port numbers that are less than the specified port number.                                                                                                                                                        |
| <code>gt &lt;0-65535&gt;</code>                                        | Match all port numbers that are greater than the specified port number.                                                                                                                                                     |
| <code>ne &lt;0-65535&gt;</code>                                        | Match all port numbers except the specified port number.                                                                                                                                                                    |
| <code>range &lt;start-port&gt;</code><br><code>&lt;end-port&gt;</code> | Match a range of port numbers.                                                                                                                                                                                              |
| <code>vlan &lt;1-4094&gt;</code>                                       | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                            |

**Mode** Global Configuration

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

**Examples** To create an access-list that will permit TCP packets with a destination address of 192.168.1.1, a destination port of 80, and any source address and source port, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit tcp any 192.168.1.1/32
eq 80
```

To create an access-list that will copy TCP packets to the mirror port, if they have a destination address of 192.168.1.1, a destination port of 80, and any source address and source port, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 copy-to-mirror tcp any
192.168.1.1/32 eq 80
```

You also need to configure the mirror port with the [mirror interface](#) command.

**Command  
changes**

Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# access-list hardware (named hardware ACL)

**Overview** This command creates a named hardware access-list and puts you into IPv4 Hardware ACL Configuration mode, where you can add filter entries to the ACL.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

The **no** variant of this command removes the specified named hardware ACL.

**Syntax** `access-list hardware <name>`  
`no access-list hardware <name>`

| Parameter | Description                          |
|-----------|--------------------------------------|
| <name>    | Specify a name for the hardware ACL. |

**Mode** Global Configuration

**Default** Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

**Usage notes** Use this command to name a hardware ACL and enter the IPv4 Hardware ACL Configuration mode. If the named hardware ACL does not exist, it will be created after entry. If the named hardware ACL already exists, then this command puts you into IPv4 Hardware ACL Configuration mode for that existing ACL.

Entering this command moves you to the IPv4 Hardware ACL Configuration mode (config-ip-hw-acl prompt), so you can enter ACL filters with sequence numbers. From this prompt, configure the filters for the ACL. See the [ACL Feature Overview and Configuration Guide](#) for complete examples of configured sequenced numbered ACLs.

**NOTE:** Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**Examples** To create the hardware access-list named "ACL-1" and enter the IPv4 Hardware ACL Configuration mode to specify the ACL filter entry, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware ACL-1
awplus(config-ip-hw-acl)#
```

To remove the hardware access-list named "ACL-1", use the commands:

```
awplus# configure terminal
awplus(config)# no access-list hardware ACL-1
```

**Related commands**

- `access-group`
  - (named hardware ACL entry for ICMP)
  - (named hardware ACL entry for IP protocols)
  - (named hardware ACL entry for TCP or UDP)
  - (access-list standard named filter)
- `show interface access-group`
- `show access-list` (IPv4 Hardware ACLs)

# acl-group ip address

- Overview** Use this command to create a new named IPv4 ACL group that contains one or more IPv4 host or subnets.
- This command creates a named IPv4 ACL group and enters the ACL Host Group config mode. IPv4 hosts or subnets can be added to or removed from this group. This host group can be used as a source or destination match for any hardware ACL to simplify large ACL configs with lots of IPv4 hosts.
- Use the **no** variant of this command to delete an IPv4 ACL group.

**Syntax** `acl-group ip address <group>`  
`no acl-group ip address <group>`

| Parameter | Description                     |
|-----------|---------------------------------|
| <group>   | The name of the IPv4 ACL group. |

**Default** No ACL groups exist by default.

**Mode** Global Configuration

**Example** To create an IPv4 ACL group named IPV4\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip address IPV4_GROUP1
awplus(config-ip-host-group)#
```

To delete an IPv4 ACL group named IPV4\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# no acl-group ip address IPV4_GROUP1
```

**Related commands** [ip \(ip-host-group\)](#)  
[show acl-group ip address](#)

**Command changes** Version 5.5.0-1.1: command added

# acl-group ip port

**Overview** Use this command to create a new named port ACL group that contains one or more port rules for an ACL.

This command creates a named port ACL group and enters the ACL Port Group config mode. Port matching rules can be added to or removed from this group. This host group can be used to match on source or destination ports when used with an ACL.

Use the **no** variant of this command to delete a port ACL group.

**Syntax** `acl-group ip port <group>`  
`no acl-group ip port <group>`

| Parameter | Description                     |
|-----------|---------------------------------|
| <group>   | The name of the port ACL group. |

**Default** No ACL groups exist by default.

**Mode** Global Configuration

**Example** To create a port ACL group named PORT\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)#
```

To delete a port ACL group named PORT\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# no acl-group ip port PORT_GROUP1
```

**Related commands** [\(acl-group ip port range\)](#)  
[show acl-group ip port](#)

**Command changes** Version 5.5.0-1.1: command added

## (acl-group ip port range)

**Overview** Use this command to add one or more protocol port rules on a port ACL group. These port matching rules are used to simplify large ACL configs where many ACLs block or permit on the same service ports.

Use the **no** variant of this command to remove a rule match on protocol ports.

**Syntax**

```
eq <0-65535>
lt <0-65535>
gt <0-65535>
ne <0-65535>
range <0-65535> <0-65535>
no eq <0-65535>
no lt <0-65535>
no gt <0-65535>
no ne <0-65535>
no range <0-65535> <0-65535>
```

| Parameter | Description                                            |
|-----------|--------------------------------------------------------|
| eq        | The protocol port matches if equal to this number.     |
| lt        | The protocol port matches if less than this number.    |
| gt        | The protocol port matches if greater than this number. |
| ne        | The protocol port matches if not equal to this number. |
| range     | The protocol port matches if it is in this range.      |
| <0-65535> | The port number.                                       |

**Default** The port ACL group will match on all ports by default.

**Mode** IP ACL Port Group Configuration

**Example** To add the rule match on protocol ports equal to 20 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# eq 20
```

To add the rule match on protocol ports between 20 and 50 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# range 20 50
```

To add the rule match on protocol ports greater than 20 except 30 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# gt 20
awplus(config-ip-port-group)# ne 30
```

To remove the rule match on protocol ports between 20 and 50 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# no range 20 50
```

**Related  
commands**

[acl-group ip port](#)  
[show acl-group ip port](#)

**Command  
changes**

Version 5.5.0-1.1: command added

# clear access-list counters

**Overview** Use this command to reset the hardware access-list counters to zero. The access-list counters show the number of packets that match your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments.

**Syntax** `clear access-list counters [<acl>]`

| Parameter | Description                                                                          |
|-----------|--------------------------------------------------------------------------------------|
| <acl>     | Clear the counters for only the specified ACL. You can enter the ACL name or number. |

**Mode** Privileged Exec

**Usage notes** To view the counter values, use the command [show access-list counters](#).

**Example** To clear the counters for the ACL named ACL-1, use the command:

```
awplus# clear access-list counters ACL-1
```

**Related commands** [show access-list counters](#)

**Command changes** Version 5.5.2-2.1: command added

## commit (IPv4)

**Overview** Use this command to commit the IPv4 ACL filter configuration entered at the console to the hardware immediately without exiting the IPv4 Hardware ACL Configuration mode.

This command forces the associated hardware and software IPv4 ACLs to synchronize.

**Syntax** `commit`

**Mode** IPv4 Hardware ACL Configuration

**Usage notes** Normally, when an IPv4 hardware ACL is edited, the new configuration state of the IPv4 ACL is not written to hardware until you exit IPv4 Hardware ACL Configuration mode. By entering this command you can ensure that the current state of a hardware access-list that is being edited is written to hardware immediately.

Scripts typically do not include the `exit` command to exit configuration modes, potentially leading to IPv4 ACL filters in hardware not being correctly updated. Using this **commit** command in a configuration script after specifying an IPv4 hardware ACL filter ensures that it is updated in the hardware immediately.

**Example** To update the hardware with the IPv4 ACL filter configuration, use the command:

```
awplus# configure terminal
awplus(config)# access-list hardware my-hw-list
awplus(config-ip-hw-acl)# commit
```

**Related commands** [access-list hardware \(named hardware ACL\)](#)

# ip (ip-host-group)

**Overview** Use this command to add an IPv4 host or subnet to an IPv4 ACL group. Adding IPv4 hosts and subnets to an ACL group allows you to simplify ACL config when the same IP addresses are required for many ACLs.

Use the **no** variant of this command to remove an IPv4 host or subnet from an IPv4 ACL group.

**Syntax** `ip {any|<match-ip>}`  
`no ip {any|<match-ip>}`

| Parameter  | Description                                                                                                                                                                                                                                                                       |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| any        | Match any IP address.                                                                                                                                                                                                                                                             |
| <match-ip> | The addresses to match against. You can specify a single host or a subnet. The following are the valid formats for specifying the addresses:                                                                                                                                      |
|            | <code>&lt;ip-addr&gt;</code> Match a single host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                               |
|            | <code>&lt;ip-addr&gt;/&lt;prefix&gt;</code> Match any IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                      |
|            | <code>&lt;ip-addr&gt;</code><br><code>&lt;reverse-mask&gt;</code> Match any IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |

**Default** No hosts or subnets are in an IPv4 ACL group by default.

**Mode** IP ACL Host Group Configuration

**Example** To add the subnet 192.168.1.0/24 to an IPv4 ACL group IPV4\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip address IPV4_GROUP1
awplus(config-ip-host-group)# ip 192.168.1.0/24
```

To remove the subnet 192.168.1.0/24 from an IPv4 ACL group IPV4\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip address IPV4_GROUP1
awplus(config-ip-host-group)# no ip 192.168.1.0/24
```

**Related  
commands**

[acl-group ip address](#)  
[show acl-group ip address](#)

**Command  
changes**

Version 5.5.0-1.1: command added

## (named hardware ACL entry for ICMP)

**Overview** Use this command to add a new ICMP filter entry to the current hardware access-list. The filter will match on any ICMP packet that has the specified source and destination IP addresses and (optionally) ICMP type. You can specify the value **any** if source or destination address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes an ICMP filter entry from the current hardware access-list. You can specify the ICMP filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its ICMP filter profile without specifying its sequence number (e.g. **no permit icmp 192.168.1.0/24 any icmp-type 11**).

You can find the sequence number by running the [show access-list \(IPv4 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** [`<sequence-number>`] `<action>` icmp `<source-ip>` `<dest-ip>`  
[icmp-type `<number>`] [vlan `<1-4094>`]  
  
no `<sequence-number>`  
  
no `<action>` icmp `<source-ip>` `<dest-ip>` [icmp-type `<number>`]  
[vlan `<1-4094>`]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter |                                                                                                                                                                                                                                                              |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                 | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                               | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                          | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br><i>port-number</i> ] | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br><i>port-number</i> ] | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |

| Values for the <action> parameter                     |                                                                                                                                    |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                  |

| Parameter         | Description                                                                                                                                                                                                                                                          |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <sequence-number> | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number. |
| <action>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                      |
| icmp              | Match against ICMP packets                                                                                                                                                                                                                                           |
| <source-ip>       | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                                                              |
|                   | any Match any source IP address.                                                                                                                                                                                                                                     |
|                   | host <ip-addr> Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                         |
|                   | <ip-addr>/<prefix> Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                           |
|                   | <ip-addr><br><reverse-mask> Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.                   |
| <dest-ip>         | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                                                               |
|                   | any Match any destination IP address.                                                                                                                                                                                                                                |
|                   | host <ip-addr> Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                    |

| Parameter                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |   |               |   |                                   |   |                         |   |                                   |   |                |    |                         |    |                             |    |                     |    |                    |    |                       |    |                      |    |                        |    |                       |

| vlan <code>&lt;1-4094&gt;</code>         | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |   |               |   |                                   |   |                         |   |                                   |   |                |    |                         |    |                             |    |                     |    |                    |    |                       |    |                      |    |                        |    |                       |

**Mode** IPv4 Hardware ACL Configuration (accessed by running the command [access-list hardware \(named hardware ACL\)](#))

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command [access-list hardware \(named hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl) #
```

Then use this command (and the other "named hardware ACL: entry" commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a

new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add an access-list filter entry with a sequence number of 100 to the access-list named "my-list" that will permit ICMP packets with a source address of 192.168.1.0/24, any destination address and an ICMP type of 5, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# 100 permit icmp 192.168.1.0/24 any
icmp-type 5
```

To remove an access-list filter entry with a sequence number of 100 from the access-list named "my-list", use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# no 100
```

**Related commands**

- [access-group](#)
- [access-list hardware \(named hardware ACL\)](#)
- [match access-group](#)
- [show running-config](#)
- [show access-list \(IPv4 Hardware ACLs\)](#)

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

## (named hardware ACL entry for IP packets)

**Overview** Use this command to add an IP packet filter entry to the current hardware access-list. The filter will match on IP packets that have the specified IP and/or MAC addresses. You can use the value **any** instead of source or destination IP or MAC address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny ip 192.168.0.0/16 any**).

You can find the sequence number by running the [show access-list \(IPv4 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** [`<sequence-number>`] `<action>` ip `<source-ip>` `<dest-ip>`  
[`<source-mac>` `<dest-mac>`] [`vlan <1-4094>`]  
  
no `<sequence-number>`  
  
no `<action>` ip `<source-ip>` `<dest-ip>` [`<source-mac>` `<dest-mac>`]  
[`vlan <1-4094>`]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter |                                                                                                                                                                                                                                                              |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                 | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                               | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                          | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br><i>port-number</i> ] | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br><i>port-number</i> ] | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |

| Values for the <action> parameter                     |                                                                                                                                    |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                  |

| Parameter         | Description                                                                                                                                                                                                                                                          |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <sequence-number> | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number. |
| <action>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                      |
| ip                | Match against IP packets                                                                                                                                                                                                                                             |
| <source-ip>       | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                                                              |
|                   | any Match any source IP address.                                                                                                                                                                                                                                     |
|                   | dhcpsnooping Match the source address learned from the DHCP Snooping binding database.                                                                                                                                                                               |
|                   | host <ip-addr> Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                         |
|                   | <ip-addr>/<prefix> Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                           |
|                   | <ip-addr><br><reverse-mask> Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.                   |
| <dest-ip>         | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                                                               |
|                   | any Match any destination IP address.                                                                                                                                                                                                                                |
|                   | host <ip-addr> Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                    |

| Parameter                                             | Description                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i>                 | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                                                                                                               |
| <i>&lt;ip-addr&gt;</i><br><i>&lt;reverse-mask&gt;</i> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.                                                                                                                |
| <i>&lt;source-mac&gt;</i>                             | The source MAC address to match against. You can specify a single MAC address, a range (through a mask), the address learned from DHCP snooping, or any:                                                                                                                                                                                   |
| any                                                   | Match against any source MAC address.                                                                                                                                                                                                                                                                                                      |
| <i>&lt;source-mac&gt;</i>                             | The source MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.      |
| dhcpsnooping                                          | Match the source address learned from the DHCP Snooping binding database.                                                                                                                                                                                                                                                                  |
| <i>&lt;dest-mac&gt;</i>                               | The destination MAC address to match against. You can specify a single MAC address, a range (through a mask), or any:                                                                                                                                                                                                                      |
| any                                                   | Match against any destination MAC address.                                                                                                                                                                                                                                                                                                 |
| <i>&lt;dest-mac&gt;</i>                               | The destination MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match. |
| vlan <1-4094>                                         | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                                                                                                                                           |

- Mode** IPv4 Hardware ACL Configuration (accessed by running the command [access-list hardware \(named hardware ACL\)](#))
- Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.
- Usage notes** To use this command, first run the command [access-list hardware \(named hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:
- ```
awplus(config-ip-hw-acl)#
```
- Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.
- Then use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.
- Examples** To add a filter entry to the access-list named “my-list” that will permit any IP packet with a source address of 192.168.1.1, use the commands:
- ```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit ip 192.168.1.1/32 any
```
- To add a filter entry to the access-list named “my-list” that will permit any IP packet with a source address of 192.168.1.1 and a MAC source address of ffee.ddcc.bbbaa, use the commands:
- ```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit ip 192.168.1.1/32 any mac
ffee.ddcc.bbbaa 0000.0000.0000 any
```
- To add a filter entry to the access-list named “my-list” that will deny all IP packets on vlan 2, use the commands:
- ```
awplus# enable
awplus(config)# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# deny ip any any vlan 2
```
- Related commands** [access-group](#)  
[access-list hardware \(named hardware ACL\)](#)  
[match access-group](#)  
[show running-config](#)  
[show access-list \(IPv4 Hardware ACLs\)](#)

- Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches
- Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches
- Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches
- Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# (named hardware ACL entry for IP protocols)

**Overview** Use this command to add an IP protocol type filter entry to the current hardware access-list. The filter will match on IP packets that have the specified IP protocol number, and the specified IP and/or MAC addresses. You can use the value **any** instead of source or destination IP or MAC address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny proto 2 192.168.0.0/16 any**).

You can find the sequence number by running the [show access-list \(IPv4 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** [`<sequence-number>`] `<action>` proto `<1-255>` `<source-ip>`  
`<dest-ip>` [`<source-mac>` `<dest-mac>`] [`vlan <1-4094>`]  
  
no `<sequence-number>`  
  
no `<action>` proto `<1-255>` `<source-ip>` `<dest-ip>` [`<source-mac>`  
`<dest-mac>`] [`vlan <1-4094>`]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter |                                                                                                                                                                                                                                                              |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                 | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                               | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                          | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br>port-number]         | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br>port-number]         | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |

| Values for the <action> parameter                     |                                                                                                                                    |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                  |

Table 37-5: Parameters in IP protocol ACL entries

| Parameter         | Description                                                                                                                                                                                                                                                                        |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <sequence-number> | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.               |
| <action>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                                    |
| proto <1-255>     | The IP protocol number to match against, as defined by IANA (Internet Assigned Numbers Authority <a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a> )<br>See below for a list of IP protocol numbers and their descriptions. |
| <source-ip>       | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                                                                            |
|                   | any Match any source IP address.                                                                                                                                                                                                                                                   |
|                   | dhcp snooping Match the source address learned from the DHCP Snooping binding database.                                                                                                                                                                                            |
|                   | host <ip-addr> Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                                       |
|                   | <ip-addr>/<prefix> Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                                         |
|                   | <ip-addr><br><reverse-mask> Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.                                 |
| <dest-ip>         | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                                                                             |
|                   | any Match any destination IP address.                                                                                                                                                                                                                                              |

Table 37-5: Parameters in IP protocol ACL entries (cont.)

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                           |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host <ip-addr>              | Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                                                                                                    |
| <ip-addr>/<prefix>          | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                                                                                                          |
| <ip-addr><br><reverse-mask> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.                                                                                                           |
| <source-mac>                | The source MAC address to match against. You can specify a single MAC address, a range (through a mask), the address learned from DHCP snooping, or any:                                                                                                                                                                              |
| any                         | Match against any source MAC address.                                                                                                                                                                                                                                                                                                 |
| <source-mac>                | The source MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match. |
| dhcpsnooping                | Match the source address learned from the DHCP Snooping binding database.                                                                                                                                                                                                                                                             |
| <dest-mac>                  | The destination MAC address to match against. You can specify a single MAC address, a range (through a mask), or any:                                                                                                                                                                                                                 |
| any                         | Match against any destination MAC address.                                                                                                                                                                                                                                                                                            |

Table 37-5: Parameters in IP protocol ACL entries (cont.)

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;dest-mac&gt;</i> | The destination MAC address to match against, followed by the mask.<br>Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number.<br>Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match. |
| vlan <1-4094>           | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                                                                                                                                                 |

Table 37-6: IP protocol number and description

| Protocol Number | Protocol Description [RFC]                             |
|-----------------|--------------------------------------------------------|
| 1               | Internet Control Message [RFC792]                      |
| 2               | Internet Group Management [RFC1112]                    |
| 3               | Gateway-to-Gateway [RFC823]                            |
| 4               | IP in IP [RFC2003]                                     |
| 5               | Stream [RFC1190] [RFC1819]                             |

**Mode** IPv4 Hardware ACL Configuration (accessed by running the command [access-list hardware \(named hardware ACL\)](#))

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, run the command [access-list hardware \(named hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the access-list named "my-list" that will deny all IGMP packets (protocol 2) from the 192.168.0.0 subnet, and give it a sequence number of 50, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# 50 deny proto 2 192.168.0.0/16 any
```

**Related commands**

- [access-group](#)
- [access-list hardware \(named hardware ACL\)](#)
- [match access-group](#)
- [show running-config](#)
- [show access-list \(IPv4 Hardware ACLs\)](#)

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# (named hardware ACL entry for MAC addresses)

**Overview** Use this command to add a MAC address filter entry to the current hardware access-list. The access-list will match on packets that have the specified source and destination MAC addresses. You can use the value **any** instead of source or destination MAC address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no permit mac aaaa.bbbb.cccc 0000.0000.0000 any**).

You can find the sequence number by running the [show access-list \(IPv4 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** [`<sequence-number>`] `<action>` mac {`<source-mac>`|any}  
{`<dest-mac>`|any} [`vlan <1-4094>`] [`inner-vlan <1-4094>`]  
  
`no <sequence-number>`  
  
`no <action>` mac {`<source-mac>`|any} {`<dest-mac>`|any} [`vlan <1-4094>`]  
[`inner-vlan <1-4094>`]

The following actions are available for hardware ACLs:

| Values for the <action> parameter                            |                                                                                                                                                                                                                                                              |
|--------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                         | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                                       | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                                  | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[ <code>interface<br/>port-number</code> ] | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |

| Values for the <action> parameter                     |                                                                                                                                                                                                                                                         |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| send-to-mirror<br>[interface<br>port-number]          | Send matching packets to the mirror port.<br>Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                      |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                                                                                                                                       |

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                      |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <sequence-number> | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.                                                                             |
| <action>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                                                                                                  |
| mac               | Match against MAC address                                                                                                                                                                                                                                                                                                                        |
| <source-mac>      | The source MAC address to match against, followed by the mask.<br>Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number.<br>Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.      |
| any               | Match against any source MAC address.                                                                                                                                                                                                                                                                                                            |
| <dest-mac>        | The destination MAC address to match against, followed by the mask.<br>Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number.<br>Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match. |
| any               | Match against any destination MAC address.                                                                                                                                                                                                                                                                                                       |
| vlan <1-4094>     | Match against the specified ID in the packet's VLAN tag.                                                                                                                                                                                                                                                                                         |

**Mode** IPv4 Hardware ACL Configuration (accessed by running the command [access-list hardware \(named hardware ACL\)](#))

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command [access-list hardware \(named hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the access-list named “my-list” that will permit packets with a source MAC address of 0000.00ab.1234 and any destination MAC address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit mac 0000.00ab.1234
0000.0000.0000 any
```

To remove a filter entry that permit packets with a source MAC address of 0000.00ab.1234 and any destination MAC address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# no permit mac 0000.00ab.1234
0000.0000.0000 any
```

# (named hardware ACL entry for TCP or UDP)

**Overview** Use this command to add a TCP or UDP filter entry to the current hardware access-list. The access-list will match on TCP or UDP packets that have the specified source and destination IP addresses and optionally, port values. You can use the value **any** instead of source or destination IP address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no permit udp 192.168.0.0/16 any**).

You can find the sequence number by running the [show access-list \(IPv4 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** [`<sequence-number>`] `<action>` {`tcp|udp`} `<source-ip>`  
[`<source-ports>`] `<dest-ip>` [`<dest-ports>`] [`vlan <1-4094>`]  
  
`no <sequence-number>`  
  
`no <action>` {`tcp|udp`} `<source-ip>` [`<source-ports>`] `<dest-ip>`  
[`<dest-ports>`] [`vlan <1-4094>`]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter                                  |                                                                                                                                                                                                                                                              |
|---------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>deny</code>                                                                     | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| <code>permit</code>                                                                   | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| <code>copy-to-cpu</code>                                                              | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| <code>copy-to-mirror</code><br>[ <code>interface</code><br><code>port-number</code> ] | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| <code>send-to-mirror</code><br>[ <code>interface</code><br><code>port-number</code> ] | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |

| Values for the <action> parameter                     |                                                                                                                                    |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                  |

| Parameter         | Description                                                                                                                                                                                                                                                          |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <sequence-number> | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number. |
| <action>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                      |
| tcp               | Match against TCP packets.                                                                                                                                                                                                                                           |
| udp               | Match against UDP packets.                                                                                                                                                                                                                                           |
| <source-ip>       | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                                                              |
|                   | any Match any source IP address.                                                                                                                                                                                                                                     |
|                   | host <ip-addr> Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                         |
|                   | <ip-addr>/<prefix> Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                           |
|                   | <ip-addr><br><reverse-mask> Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.                   |
| <source-ports>    | Match source TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:                                                                                                               |
|                   | eq <0-65535> Match a single port number.                                                                                                                                                                                                                             |
|                   | lt <0-65535> Match all port numbers that are less than the specified port number.                                                                                                                                                                                    |
|                   | gt <0-65535> Match all port numbers that are greater than the specified port number.                                                                                                                                                                                 |

| Parameter     | Description                                                                                                                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | ne <0-65535> Match all port numbers except the specified port number.                                                                                                                                                                                |
|               | range <start-port> <end-port> Match a range of port numbers.                                                                                                                                                                                         |
| <dest-ip>     | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                                               |
|               | any Match any destination IP address.                                                                                                                                                                                                                |
|               | host <ip-addr> Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                    |
|               | <ip-addr>/<prefix> Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                      |
|               | <ip-addr> <reverse-mask> Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <dest-ports>  | Match destination TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:                                                                                          |
|               | eq <0-65535> Match a single port number.                                                                                                                                                                                                             |
|               | lt <0-65535> Match all port numbers that are less than the specified port number.                                                                                                                                                                    |
|               | gt <0-65535> Match all port numbers that are greater than the specified port number.                                                                                                                                                                 |
|               | ne <0-65535> Match all port numbers except the specified port number.                                                                                                                                                                                |
|               | range <start-port> <end-port> Match a range of port numbers.                                                                                                                                                                                         |
| vlan <1-4094> | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                                                     |

**Mode** IPv4 Hardware ACL Configuration (accessed by running the command [access-list hardware \(named hardware ACL\)](#))

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command [access-list hardware \(named hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Example** To add a filter entry to access-list named “my-list” that will permit TCP packets with a destination address of 192.168.1.1, a destination port of 80, from any source, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit tcp any 192.168.1.1/32 eq 80
```

- [access-list hardware \(named hardware ACL\)](#)
- [match access-group](#)
- [show running-config](#)
- [show access-list \(IPv4 Hardware ACLs\)](#)

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# show access-list (IPv4 Hardware ACLs)

**Overview** Use this command to display the specified access-list, or all access-lists if none have been specified. Note that only defined access-lists are displayed. An error message is displayed for an undefined access-list.

**Syntax** `show access-list`  
`[<1-99>|<100-199>|<1300-1999>|<2000-2699>|<3000-3699>|`  
`<4000-4499>|<access-list-name>]`

| Parameter          | Description                                          |
|--------------------|------------------------------------------------------|
| <1-99>             | IP standard access-list.                             |
| <100-199>          | IP extended access-list.                             |
| <1300-1999>        | IP standard access-list (standard - expanded range). |
| <2000-2699>        | IP extended access-list (extended - expanded range). |
| <3000-3699>        | Hardware IP access-list.                             |
| <4000-4499>        | Hardware MAC access-list.                            |
| <access-list-name> | IP named access-list.                                |

**Mode** User Exec and Privileged Exec

**Examples** To show all access-lists configured on the switch:

```
awplus# show access-list
```

```
Standard IP access list 1
 deny 172.16.2.0, wildcard bits 0.0.0.255
Standard IP access list 20
 deny 192.168.10.0, wildcard bits 0.0.0.255
 deny 192.168.12.0, wildcard bits 0.0.0.255
Hardware IP access list 3001
 permit ip 192.168.20.0 255.255.255.0 any
Hardware IP access list 3020
 permit tcp any 192.0.2.0/24
```

To show the access-list with an ID of 20:

```
awplus# show access-list 20
```

```
Standard IP access-list 20
 deny 192.168.10.0, wildcard bits 0.0.0.255
 deny 192.168.12.0, wildcard bits 0.0.0.255
```

ACLs that are added dynamically during port authentication will be displayed with the label 'dynamic':

```
awplus# show access-list
```

```
Hardware IP access list 3000
 4 permit ip any any
Hardware IP access list 3001
 4 deny ip 192.168.0.0/24 any
Hardware IP access list dacl-port1.0.49-eccd.6dc9.c0d2 (dynamic)
 4 permit ip 192.168.1.0/24 192.168.2.0/24
 8 deny ip 192.168.1.0/24 any
```

The following error message is displayed if you try to show an undefined access-list.

```
awplus# show access-list 2
```

```
% Can't find access-list 2
```

**Related  
commands**

[access-list extended \(named\)](#)

[access-list \(numbered hardware ACL for MAC addresses\)](#)

[access-list hardware \(named hardware ACL\)](#)

# show access-list counters

**Overview** Use this command to show the number of packets that match one or all of your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments. This lets you check your ACL configuration.

**Syntax** `show access-list counters [<acl>]`

| Parameter | Description                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------|
| <acl>     | Display the number of packets that match only the specified ACL. You can enter the ACL name or number. |

**Mode** User Exec and Privileged Exec

**Usage notes** This command displays the counter values since the last time they were cleared. To clear the counter values, enter the command [clear access-list counters](#).

To accurately measure the number of packet hits per ACL, you need to read the counters for all ACLs frequently.

**Example** To show the number of packets that match all hardware ACLs, use the following command:

```
awplus# show access-list counters
```

**Output** Figure 37-1: Example output from **show access-list counters**

```
awplus#show access-list counters
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
ACL-2
Packet Hits: 0
ACL-3
Packet Hits: 1
```

**Output** Figure 37-2: Example output from **show access-list counters ACL-1**

```
awplus#show access-list counters ACL-1
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
```

Table 37-7: Parameters in the output from **show access-list counters**

| Parameter   | Description                                                                                    |
|-------------|------------------------------------------------------------------------------------------------|
| Packet Hits | The number of packets that match the ACL. The count includes both dropped and allowed packets. |

**Related commands**    [clear access-list counters](#)  
                          [show interface access-group](#)

**Command changes**    Version 5.5.2-2.1: reading the counters no longer clears them  
                          Version 5.5.1-2.1: command added

# show acl-group ip address

**Overview** Use this command to show the hosts and subnets in a named IPv4 ACL group.

**Syntax** `show acl-group ip address <group>`

| Parameter                  | Description                     |
|----------------------------|---------------------------------|
| <code>&lt;group&gt;</code> | The name of the IPv4 ACL group. |

**Mode** Privileged Exec

**Example** To show all hosts and subnets in an IPv4 ACL group IPV4\_GROUP1, use the command:

```
awplus# show acl-group ip address IPV4_GROUP1
```

**Output** Figure 37-3: Example output from **show acl-group ip address IPV4\_GROUP1**

```
awplus#show acl-group ip address IPV4_GROUP1
Host Group: IPV4_GROUP1

192.168.1.2/32
192.168.2.5/32
10.0.0.0/8
```

**Related commands** [acl-group ip address](#)  
[ip \(ip-host-group\)](#)

**Command changes** Version 5.5.0-1.1: command added

# show acl-group ip port

**Overview** Use this command to show the port rules in a named port ACL group.

**Syntax** `show acl-group ip port <group>`

| Parameter                  | Description                     |
|----------------------------|---------------------------------|
| <code>&lt;group&gt;</code> | The name of the port ACL group. |

**Mode** Privileged Exec

**Example** To show all port rules in a port ACL group PORT\_GROUP1, use the command:

```
awplus# show acl-group ip port PORT_GROUP1
```

**Output** Figure 37-4: Example output from **show acl-group ip port PORT\_GROUP1**

```
awplus#show acl-group ip port PORT_GROUP1
Port Group: PORT_GROUP1

eq 11
gt 20
lt 503
ne 500
```

**Related commands** [\(acl-group ip port range\)](#)  
[acl-group ip port](#)

**Command changes** Version 5.5.0-1.1: command added

# show interface access-group

**Overview** Use this command to display the access groups attached to a port. If an access group is specified, then the output only includes the ports that the specified access group is attached to. If no access group is specified then this command displays all access groups that are attached to the ports that are specified with <port-list>.

Note that **access group** is the term given for an access-list when it is applied to an interface.

**NOTE:** This command will function on the switch in stand-alone mode, but is not supported when the switch forms part of a VCStack.

**Syntax** `show interface <port-list> access-group  
[<3000-3699>|<4000-4699>]`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port-list>  | Specify the ports to display information. A port-list can be either: <ul style="list-style-type: none"><li>a switch port (e.g. port1.0.6) a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po2)</li><li>a continuous range of ports separated by a hyphen, e.g. port1.0.1-1.0.6 or port1.0.1-port1.0.6 or po1-po2</li><li>a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.3-1.0.6. Do not mix switch ports, static channel groups, and LACP channel groups in the same list.</li></ul> |
| access group | Select the access group whose details you want to show.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <3000-3699>  | Specifies the Hardware IP access-list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <4000-4699>  | Specifies the Hardware MAC access-list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Mode** User Exec and Privileged Exec

**Example** To show all access-lists attached to port1.0.1, use the command:

```
awplus# show interface port1.0.1 access-group
```

**Output** Figure 37-5: Example output from the **show interface access-group** command

```
Interface port1.0.1
 access-group 3000
 access-group 3002
 access-group 3001
```

# IPv4 Software Access Control List (ACL) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for the IPv4 Software Access Control List (ACL) commands, and contains detailed command information and command examples about IPv4 software ACLs as applied to Routing and Multicasting, which are not applied to interfaces.

For information about ACLs, see the [ACL Feature Overview and Configuration Guide](#).

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see the following references:

- the [Link Aggregation Feature Overview\\_and\\_Configuration\\_Guide](#).
- [Link Aggregation Commands](#)

**NOTE:** Text in parenthesis in command names indicates usage not keyword entry. For example, **access-list hardware (named)** indicates named IPv4 hardware ACLs entered as `access-list hardware <name>` where <name> is a placeholder not a keyword.

Parenthesis surrounding ACL filters indicates the type of ACL filter not the keyword entry in the CLI, such as **(access-list standard numbered filter)** represents command entry in the format shown in the syntax:

```
[<sequence-number>] {deny|permit} {<source-address>|host
<host-address>|any}
```

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Sub-modes** Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

Table 38-1: IPv4 Software Access List Commands and Prompts

| Command Name                              | Command Mode                    | Prompt                       |
|-------------------------------------------|---------------------------------|------------------------------|
| clear ip prefix-list                      | Privileged Exec                 | awplus#                      |
| show ip access-list                       | Privileged Exec                 | awplus#                      |
| show ip prefix-list                       | Privileged Exec                 | awplus#                      |
| access-group                              | Global Configuration            | awplus (config) #            |
| access-list (extended named)              | Global Configuration            | awplus (config) #            |
| access-list (extended numbered)           | Global Configuration            | awplus (config) #            |
| access-list (standard named)              | Global Configuration            | awplus (config) #            |
| access-list (standard numbered)           | Global Configuration            | awplus (config) #            |
| ip prefix-list                            | Global Configuration            | awplus (config) #            |
| maximum-access-list                       | Global Configuration            | awplus (config) #            |
| (access-list extended ICMP filter)        | IPv4 Extended ACL Configuration | awplus (config-ip-ext-acl) # |
| (access-list extended IP filter)          | IPv4 Extended ACL Configuration | awplus (config-ip-ext-acl) # |

## access-list extended (named)

**Overview** This command configures an extended named access-list that permits or denies packets from specific source and destination IP addresses. You can:

- use this command to enter a new or existing ACL name and enter the IPv4 Extended ACL Configuration mode. Once in that mode, you can create an ACL filter entry. This approach lets you give the entry a sequence number.
- or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified extended named access-list.

**Syntax [to enter the sub-mode]**

```
access-list extended <list-name>
no access-list extended <list-name>
```

| Parameter   | Description                             |
|-------------|-----------------------------------------|
| <list-name> | A user-defined name for the access-list |

**Syntax [icmp]**

```
access-list extended <list-name> {deny|permit} icmp <source>
<destination> [icmp-type <type-number>] [log]
no access-list extended <list-name> {deny|permit} icmp <source>
<destination> [icmp-type <type-number>] [log]
```

Table 38-2: Parameters in the access-list extended (named) command - icmp

| Parameter   | Description                                                                                                         |
|-------------|---------------------------------------------------------------------------------------------------------------------|
| <list-name> | A user-defined name for the access-list.                                                                            |
| deny        | The access-list rejects packets that match the type, source, and destination filtering specified with this command. |
| permit      | The access-list permits packets that match the type, source, and destination filtering specified with this command. |
| icmp        | The access-list matches only ICMP packets.                                                                          |
| icmp-type   | Matches only a specified type of ICMP messages. This is valid only when the filtering is set to match ICMP packets. |

Table 38-2: Parameters in the access-list extended (named) command - icmp

| Parameter                                       | Description                                                                                                                                                               |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;source&gt;</i>                           | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:                |
| any                                             | Matches any source IP address.                                                                                                                                            |
| host <i>&lt;ip-addr&gt;</i>                     | Matches a single source host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.                                                              |
| <i>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</i>      | An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.                                     |
| <i>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</i> | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.10.0.0.255 is the same as entering 192.168.1.1/24.                  |
| <i>&lt;destination&gt;</i>                      | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination: |
| any                                             | Matches any destination IP address.                                                                                                                                       |
| host <i>&lt;ip-addr&gt;</i>                     | Matches a single destination host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.                                                         |
| <i>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</i>      | An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.                                |
| <i>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</i> | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.10.0.0.255 is the same as entering 192.168.1.1/24.                  |

Table 38-2: Parameters in the access-list extended (named) command - icmp

| Parameter     | Description                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <type-number> | The ICMP type, as defined in RFC792 and RFC950. Specify one of the following integers to create a filter for the ICMP message type: |
| 0             | Echo replies.                                                                                                                       |
| 3             | Destination unreachable messages.                                                                                                   |
| 4             | Source quench messages.                                                                                                             |
| 5             | Redirect (change route) messages.                                                                                                   |
| 8             | Echo requests.                                                                                                                      |
| 11            | Time exceeded messages.                                                                                                             |
| 12            | Parameter problem messages.                                                                                                         |
| 13            | Timestamp requests.                                                                                                                 |
| 14            | Timestamp replies.                                                                                                                  |
| 15            | Information requests.                                                                                                               |
| 16            | Information replies.                                                                                                                |
| 17            | Address mask requests.                                                                                                              |
| 18            | Address mask replies.                                                                                                               |
| log           | Logs the results.                                                                                                                   |

### Syntax [tcp|udp]

```
access-list extended <list-name> {deny|permit} {tcp|udp}
<source> [eq <sourceport>|lt <sourceport>|gt <sourceport>|ne
<sourceport>] <destination> [eq <destport>|lt <destport>|gt
<destport>|ne <destport>] [log]
```

```
no access-list extended <list-name> {deny|permit} {tcp|udp}
<source> [eq <sourceport>|lt <sourceport>|gt <sourceport>|ne
<sourceport>] <destination> [eq <destport> |lt <destport>|gt
<destport>|ne <destport>] [log]
```

Table 38-3: Parameters in the access-list extended (named) command - tcp|udp

| Parameter   | Description                                                                                                         |
|-------------|---------------------------------------------------------------------------------------------------------------------|
| <list-name> | A user-defined name for the access-list.                                                                            |
| deny        | The access-list rejects packets that match the type, source, and destination filtering specified with this command. |
| permit      | The access-list permits packets that match the type, source, and destination filtering specified with this command. |
| tcp         | The access-list matches only TCP packets.                                                                           |
| udp         | The access-list matches only UDP packets.                                                                           |

Table 38-3: Parameters in the access-list extended (named) command - tcp|udp

| Parameter                                             | Description                                                                                                                                                                           |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;source&gt;</code>                           | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:                            |
| <code>any</code>                                      | Matches any source IP address.                                                                                                                                                        |
| <code>host &lt;ip-addr&gt;</code>                     | Matches a single source host with the IP address given by <code>&lt;ip-addr&gt;</code> in dotted decimal notation.                                                                    |
| <code>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</code>      | An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.                                                 |
| <code>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</code> | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering <code>192.168.1.10.0.0.0.255</code> is the same as entering <code>192.168.1.1/24</code> . |
| <code>&lt;destination&gt;</code>                      | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:             |
| <code>any</code>                                      | Matches any destination IP address.                                                                                                                                                   |
| <code>host &lt;ip-addr&gt;</code>                     | Matches a single destination host with the IP address given by <code>&lt;ip-addr&gt;</code> in dotted decimal notation.                                                               |
| <code>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</code>      | An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.                                            |
| <code>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</code> | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering <code>192.168.1.10.0.0.0.255</code> is the same as entering <code>192.168.1.1/24</code> . |
| <code>&lt;sourceport&gt;</code>                       | The source port number, specified as an integer between 0 and 65535.                                                                                                                  |
| <code>&lt;destport&gt;</code>                         | The destination port number, specified as an integer between 0 and 65535.                                                                                                             |
| <code>eq</code>                                       | Matches port numbers equal to the port number specified immediately after this parameter.                                                                                             |
| <code>lt</code>                                       | Matches port numbers less than the port number specified immediately after this parameter.                                                                                            |
| <code>gt</code>                                       | Matches port numbers greater than the port number specified immediately after this parameter.                                                                                         |

Table 38-3: Parameters in the access-list extended (named) command - tcp|udp

| Parameter | Description                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------|
| ne        | Matches port numbers not equal to the port number specified immediately after this parameter. |
| log       | Log the results.                                                                              |

**Syntax**  
**[proto|any|ip]**

```
access-list extended <list-name> {deny|permit} {proto
<ip-protocol>|any|ip} {<source>} {<destination>} [log]
no access-list extended <list-name>{deny|permit} {proto
<ip-protocol>|any|ip}{<source>}{<destination>} [log]
```

Table 38-4: Parameters in the access-list extended (named) command -  
proto|ip|any

| Parameter   | Description                                                                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <list-name> | A user-defined name for the access-list.                                                                                                                                          |
| deny        | The access-list rejects packets that match the type, source, and destination filtering specified with this command.                                                               |
| permit      | The access-list permits packets that match the type, source, and destination filtering specified with this command.                                                               |
| proto       | Matches only a specified type of IP Protocol.                                                                                                                                     |
| any         | The access-list matches any type of IP packet.                                                                                                                                    |
| ip          | The access-list matches only IP packets.                                                                                                                                          |
| <source>    | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:                        |
|             | any Matches any source IP address.                                                                                                                                                |
|             | host <ip-addr> Matches a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                    |
|             | <ip-addr>/<prefix> An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.                          |
|             | <ip-addr><reverse-mask> Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24. |

Table 38-4: Parameters in the access-list extended (named) command -  
proto|ip|any (cont.)

| Parameter                                             | Description                                                                                                                                                                                                                                                         |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;destination&gt;</code>                      | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:                                                                                           |
| <code>any</code>                                      | Matches any destination IP address.                                                                                                                                                                                                                                 |
| <code>host &lt;ip-addr&gt;</code>                     | Matches a single destination host with the IP address given by <code>&lt;ip-addr&gt;</code> in dotted decimal notation.                                                                                                                                             |
| <code>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</code>      | An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.                                                                                                                          |
| <code>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</code> | Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering <code>192.168.1.1 0.0.0.255</code> is the same as entering <code>192.168.1.1/24</code> .                                                                                |
| <code>log</code>                                      | Logs the results.                                                                                                                                                                                                                                                   |
| <code>&lt;ip-protocol&gt;</code>                      | The IP protocol number, as defined by IANA (Internet Assigned Numbers Authority)<br><a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a><br>See below for a list of IP protocol numbers and their descriptions. |

Table 38-5: IP protocol number and description

| Protocol Number | Protocol Description [RFC]                             |
|-----------------|--------------------------------------------------------|
| 1               | Internet Control Message [RFC792]                      |
| 2               | Internet Group Management [RFC1112]                    |
| 3               | Gateway-to-Gateway [RFC823]                            |
| 4               | IP in IP [RFC2003]                                     |
| 5               | Stream [RFC1190] [RFC1819]                             |
| 6               | TCP (Transmission Control Protocol) [RFC793]           |

| 254             | Use for experimentation and testing / RFC3692         |
| 255             | Reserved / IANA                                       |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage** Use this command when configuring access-lists for filtering IP software packets. You can either create access-lists from within this command, or you can enter **access-list extended** followed by only the name. Entering only the name moves you to the IPv4 Extended ACL Configuration mode for the selected access-list.

From there you can configure your access-lists by using the commands ([access-list extended ICMP filter](#)), ([access-list extended IP filter](#)), and ([access-list extended IP protocol filter](#)).

Note that packets must match both the source and the destination details.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** You can enter the extended named ACL in the Global Configuration mode together with the ACL filter entry on the same line, as shown below:

```
awplus# configure terminal
awplus(config)# access-list extended TK deny tcp 2.2.2.3/24 eq
14 3.3.3.4/24 eq 12 log
```

Alternatively, you can enter the extended named ACL in Global Configuration mode before specifying the ACL filter entry in the IPv4 Extended ACL Configuration mode, as shown below:

```
awplus# configure terminal
awplus(config)# access-list extended TK
awplus(config-ip-ext-acl)# deny tcp 2.2.2.3/24 eq 14 3.3.3.4/24
eq 12 log
```

## access-list (extended numbered)

- Overview** This command configures an extended numbered access-list that permits or denies packets from specific source and destination IP addresses. You can:
- use this command to enter a new or existing ACL number and enter the IPv4 Extended ACL Configuration mode. Once in that mode, you can create an ACL filter entry. This approach lets you give the entry a sequence number.
  - or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified extended named access-list.

**Syntax [to enter the sub-mode]**

```
access-list {<100-199>|<2000-2699>}
no access-list {<100-199>|<2000-2699>}
```

**Syntax [to create an ACL entry]**

```
access-list {<100-199>|<2000-2699>} {deny|permit} ip <source>
<destination>
no access-list {<100-199>|<2000-2699>} {deny|permit} ip
<source> <destination>
```

| Parameter                   | Description                                                                                                                                                                                                               |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <100-199>                   | IP extended access-list.                                                                                                                                                                                                  |
| <2000-2699>                 | IP extended access-list (expanded range).                                                                                                                                                                                 |
| deny                        | Access-list rejects packets that match the source and destination filtering specified with this command.                                                                                                                  |
| permit                      | Access-list permits packets that match the source and destination filtering specified with this command.                                                                                                                  |
| <source>                    | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:                                                                |
| any                         | Matches any source IP address.                                                                                                                                                                                            |
| host <ip-addr>              | Matches a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                           |
| <ip-addr><br><reverse-mask> | An IPv4 address, followed by a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24. This matches any source IP address within the specified subnet. |
| <destination>               | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:                                                 |

| Parameter                   | Description                                                                                                                                                                                                                    |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| any                         | Matches any destination IP address.                                                                                                                                                                                            |
| host <ip-addr>              | Matches a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                           |
| <ip-addr><br><reverse-mask> | An IPv4 address, followed by a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24. This matches any destination IP address within the specified subnet. |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use this command when configuring access-list for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access-list** followed by only the number. Entering only the number moves you to the IPv4 Extended ACL Configuration mode for the selected access-list. From there you can configure your access-lists by using the commands ([access-list extended ICMP filter](#)), ([access-list extended IP filter](#)), and ([access-list extended IP protocol filter](#)).

Note that packets must match both the source and the destination details.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** You can enter the extended ACL in the Global Configuration mode together with the ACL filter entry on the same line, as shown below:

```
awplus# configure terminal
awplus(config)# access-list 101 deny ip 172.16.10.0 0.0.0.255
any
```

Alternatively, you can enter the extended ACL in Global Configuration mode before specifying the ACL filter entry in the IPv4 Extended ACL Configuration mode, as shown below:

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)# deny ip 172.16.10.0 0.0.0.255 any
```

**Related commands** (access-list extended ICMP filter)  
(access-list extended IP filter)  
(access-list extended TCP UDP filter)  
show interface access-group  
show ip access-list  
show running-config

## (access-list extended ICMP filter)

**Overview** Use this ACL filter to add a new ICMP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an ICMP filter entry from the current extended access-list. You can specify the ICMP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its ICMP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

**Syntax [icmp]** [*<sequence-number>*] {deny|permit} icmp *<source>* *<destination>*  
[icmp-type *<icmp-value>*] [log]

no {deny|permit} icmp *<source>* *<destination>*[icmp-type  
*<icmp-value>*] [log]

no *<sequence-number>*

| Parameter                      | Description                                                                                                                                                                           |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;sequence-number&gt;</i> | <i>&lt;1-65535&gt;</i><br>The sequence number for the filter entry of the selected access control list.                                                                               |
| deny                           | Access-list rejects packets that match the source and destination filtering specified with this command.                                                                              |
| permit                         | Access-list permits packets that match the source and destination filtering specified with this command.                                                                              |
| icmp                           | ICMP packet type.                                                                                                                                                                     |
| <i>&lt;source&gt;</i>          | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:                            |
|                                | <i>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</i> An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.      |
|                                | any      Matches any source IP address.                                                                                                                                               |
| <i>&lt;destination&gt;</i>     | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:             |
|                                | <i>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</i> An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet. |
|                                | any      Matches any destination IP address.                                                                                                                                          |

| Parameter    | Description                 |
|--------------|-----------------------------|
| icmp-type    | The ICMP type.              |
| <icmp-value> | The value of the ICMP type. |
| log          | Log the results.            |

**Mode** IPv4 Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** The access control list being configured is selected by running the [access-list \(extended numbered\)](#) command or the [access-list extended \(named\)](#) command, with the required access control list number, or name - but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To add a new entry in access-list called 'my-list' that will reject ICMP packets from 10.0.0.1 to 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny icmp 10.0.0.1/32 192.168.1.1/32
```

Use the following commands to add a new filter at sequence number 5 position of the access-list called 'my-list'. The filter will accept the ICMP type 8 packets from 10.1.1.0/24 network, to 192.168.1.0 network:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit icmp 10.1.1.0/24
192.168.1.0/24 icmp-type 8
```

**Related commands** [access-group](#)  
[show interface access-group](#)  
[show running-config](#)  
[show ip access-list](#)

## (access-list extended IP filter)

**Overview** Use this ACL filter to add a new IP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an IP filter entry from the current extended access-list. You can specify the IP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its IP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

**Syntax [ip]** [*<sequence-number>*] {deny|permit} ip *<source>* *<destination>*  
no {deny|permit} ip *<source>* *<destination>*  
no *<sequence-number>*

| Parameter                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |     |                                |                             |                                                                                                              |                                                       |                                                                                                                                     |

| permit                                                | Access-list permits packets that match the source and destination filtering specified with this command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |     |                                |                             |                                                                                                              |                                                       |                                                                                                                                     |
| <i>&lt;source&gt;</i>                                 | The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source: <table><tr><td>any</td><td>Matches any source IP address.</td></tr><tr><td>host <i>&lt;ip-addr&gt;</i></td><td>Matches a single source host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.</td></tr><tr><td><i>&lt;ip-addr&gt;</i><br/><i>&lt;reverse-mask&gt;</i></td><td>Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255.</td></tr></table> | any | Matches any source IP address. | host <i>&lt;ip-addr&gt;</i> | Matches a single source host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation. | <i>&lt;ip-addr&gt;</i><br><i>&lt;reverse-mask&gt;</i> | Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255. |
| any                                                   | Matches any source IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |     |                                |                             |                                                                                                              |                                                       |                                                                                                                                     |
| host <i>&lt;ip-addr&gt;</i>                           | Matches a single source host with the IP address given by <i>&lt;ip-addr&gt;</i> in dotted decimal notation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |     |                                |                             |                                                                                                              |                                                       |                                                                                                                                     |
| <i>&lt;ip-addr&gt;</i><br><i>&lt;reverse-mask&gt;</i> | Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |     |                                |                             |                                                                                                              |                                                       |                                                                                                                                     |

| Parameter                   | Description                                                                                                                                                               |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <destination>               | The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination: |
| any                         | Matches any destination IP address.                                                                                                                                       |
| host <ip-addr>              | Matches a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                      |
| <ip-addr><br><reverse-mask> | Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255.                                       |

**Mode** Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** The access control list being configured is selected by running the [access-list \(extended numbered\)](#) command or the [access-list extended \(named\)](#) command, with the required access control list number, or name - but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Example 1 [list-number]** First use the following commands to enter the IPv4 Extended ACL Configuration mode and define a numbered extended access-list 101:

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)#
```

Then use the following commands to add a new entry to the numbered extended access-list 101 that will reject packets from 10.0.0.1 to 192.168.1.1:

```
awplus(config-ip-ext-acl)# deny ip host 10.0.0.1 host
192.168.1.1
awplus(config-ip-ext-acl)# 20 permit ip any any
```

**Example 2 [list-name]** First use the following commands to enter the IPv4 Extended ACL Configuration mode and define a named access-list called 'my-acl':

```
awplus# configure terminal
awplus(config)# access-list extended my-acl
awplus(config-ip-ext-acl)#
```

Then use the following commands to add a new entry to the named access-list 'my-acl' that will reject packets from 10.0.0.1 to 192.168.1.1:

```
awplus(config-ip-ext-acl)# deny ip host 10.0.0.1 host
192.168.1.1
```

```
awplus(config-ip-ext-acl)# 20 permit ip any any
```

**Example 3** Use the following commands to remove the access-list filter entry with sequence  
**[list-number]** number 20 from extended numbered access-list 101.

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)# no 20
```

**Example 4** Use the following commands to remove the access-list filter entry with sequence  
**[list-name]** number 20 from extended named access-list my-acl:

```
awplus# configure terminal
awplus(config)# access-list extended my-acl
awplus(config-ip-ext-acl)# no 20
```

**Related commands**

- [access-list extended \(named\)](#)
- [access-list \(extended numbered\)](#)
- [show interface access-group](#)
- [show ip access-list](#)
- [show running-config](#)

## (access-list extended IP protocol filter)

**Overview** Use this ACL filter to add a new IP protocol type filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an IP protocol filter entry from the current extended access-list. You can specify the IP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its IP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

**Syntax [proto]** [*<sequence-number>*] {deny|permit} proto *<ip-protocol>* *<source>* *<destination>* [log]  
  
no {deny|permit} proto *<ip-protocol>* *<source>* *<destination>* [log]  
  
no *<sequence-number>*

| Parameter                           | Description                                                                                                                                                                                                                                                                                     |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Mode** IPv4 Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** The access control list being configured is selected by running the *access-list (extended numbered)* command or the *access-list extended (named)* command, with the required access control list number, or name - but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Example 1 [creating a list]** Use the following commands to add a new access-list filter entry to the access-list named 'my-list' that will reject IP packets from source address 10.10.1.1/32 to destination address 192.68.1.1/32:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny ip 10.10.1.1/32 192.168.1.1/32
```

**Example 2** Use the following commands to add a new access-list filter entry at sequence  
**[adding to a list]** position 5 in the access-list named 'my-list' that will accept packets from source  
address 10.10.1.1/24 to destination address 192.68.1.1/24:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit ip 10.10.1.1/24
192.168.1.1/24
```

**Related commands**

- [access-list \(extended numbered\)](#)
- [show interface access-group](#)
- [show ip access-list](#)
- [show running-config](#)

## (access-list extended TCP UDP filter)

**Overview** Use this ACL filter to add a new TCP or UDP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes a TCP or UDP filter entry from the current extended access-list. You can specify the TCP or UDP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its TCP or UDP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

**Syntax [tcp|udp]** [*<sequence-number>*] {deny|permit} {tcp|udp} *<source>* {eq *<sourceport>* |lt *<sourceport>*|gt *<sourceport>*|ne *<sourceport>*} *<destination>* [eq *<destport>*|lt *<destport>*|gt *<destport>*|ne *<destport>*] [log]

no [*<sequence-number>*] {deny|permit} {tcp|udp} *<source>* {eq *<sourceport>* |lt *<sourceport>*|gt *<sourceport>*|ne *<sourceport>*} *<destination>* [eq *<destport>*|lt *<destport>*|gt *<destport>*|ne *<destport>*] [log]

no *<sequence-number>*

**Mode** IPv4 Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** The access control list being configured is selected by running the [access-list \(extended numbered\)](#) command or the [access-list extended \(named\)](#) command, with the required access control list number, or name - but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Example 1 [creating a list]** To add a new entry to the access-list named 'my-list' that will reject TCP packets from 10.0.0.1 on TCP port 10 to 192.168.1.1 on TCP port 20, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny tcp 10.0.0.1/32 eq 10
192.168.1.1/32 eq 20
```

**Example 2** To insert a new entry with sequence number 5 into the access-list named 'my-list'  
**[adding to a list]** that will accept UDP packets from 10.1.1.0/24 network to 192.168.1.0/24 network on UDP port 80, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit udp 10.1.1.0/24
192.168.1.0/24 eq 80
```

# access-list standard (named)

- Overview** This command configures a standard named access-list that permits or denies packets from a specific source IP address. You can:
- use this command to enter a new or existing ACL name and enter the IPv4 Standard ACL Configuration mode. Once in that mode, you can create an ACL filter entry using the command ([access-list standard named filter](#)). This approach lets you give the entry a sequence number.
  - or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified standard named access-list.

**Syntax [to enter the sub-mode]**

```
access-list standard <standard-acl-name>
no access-list standard <standard-acl-name>
```

**Syntax [to create an ACL entry]**

```
access-list standard <standard-acl-name> {deny|permit}
{any|<ip-addr>/<prefix>}
no access-list standard <standard-acl-name> {deny|permit}
{any|<ip-addr>/<prefix>}
```

| Parameter           | Description                                                                                                                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <standard-acl-name> | Specify a name for the standard access-list.                                                                                                                                                                         |
| deny                | The access-list rejects packets that match the source filtering specified with this command.                                                                                                                         |
| permit              | The access-list permits packets that match the source filtering specified with this command.                                                                                                                         |
| any                 | Match any source IP address.                                                                                                                                                                                         |
| <ip-addr>/<prefix>  | Match the source address of the packets. Specify an IPv4 address in dotted decimal format, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet. |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use this command when configuring a standard named access-list for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access-list standard** followed by only the name. Entering only the name moves you to the IPv4 Standard ACL Configuration mode for the selected access-list. From

there you can configure your access-lists by using the command [\(access-list standard named filter\)](#).

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To define a standard access-list named 'my-list' and deny any packets from any source, use the commands:

```
awplus# configure terminal
awplus(config)# access-list standard my-list deny any
```

Alternatively, to define a standard access-list named 'my-list' and enter the IPv4 Standard ACL Configuration mode, and then create ACL entry 5 to deny any packets from any source, use the commands:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# 5 deny any
```

**Related commands** [\(access-list standard named filter\)](#)

# access-list (standard numbered)

**Overview** This command configures a standard numbered access-list that permits or denies packets from a specific source IP address. You can:

- use this command to enter a new or existing ACL number and enter the IPv4 Standard ACL Configuration mode. Once in that mode, you can create an ACL filter entry using the command ([access-list standard numbered filter](#)). This approach lets you give the entry a sequence number.
- or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified standard numbered access-list.

**Syntax [to enter the sub-mode]**

```
access-list {<1-99>|<1300-1999>}
no access-list {<1-99>|<1300-1999>}
```

**Syntax [to create an ACL entry]**

```
access-list {<1-99>|<1300-1999>} {deny|permit} <source>
no access-list {<1-99>|<1300-1999>} {deny|permit} <source>
```

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |

The source address is specified in dotted decimal format.</td></tr><tr><td>any</td><td>Any source address.</td></tr></table> | <ip-addr><br><reverse-mask> | A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24). | <ip-addr> | A single source address to match. The source address is specified in dotted decimal format. | host <ip-addr> | A single source address to match. The source address is specified in dotted decimal format. | any | Any source address. |
| <ip-addr><br><reverse-mask> | A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |
| <ip-addr>                   | A single source address to match. The source address is specified in dotted decimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |
| host <ip-addr>              | A single source address to match. The source address is specified in dotted decimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |
| any                         | Any source address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                             |                                                                                                                                                                    |           |                                                                                             |                |                                                                                             |     |                     |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use this command when configuring a standard numbered access-list for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access-list** followed by only the number. Entering only the number moves you to the IPv4 Standard ACL Configuration mode for the selected access-list. From there you can configure your access-lists by using the command ([access-list standard numbered filter](#)).

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To create ACL number 67 that will deny packets from subnet 172.16.10.0, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 67 deny 172.16.10.0 0.0.0.255
```

Alternatively, to define ACL number 67 and enter the IPv4 Standard ACL Configuration mode, and then create ACL entry 5 to deny any packets from subnet 172.16.10.0, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 67
awplus(config-ip-std-acl)# 5 deny 172.16.10.0 0.0.0.255
```

## (access-list standard named filter)

**Overview** This ACL filter adds a source IP address filter entry to a current named standard access-list. If the sequence number is specified, the new filter entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a source IP address filter entry from the current named standard access-list. You can specify the source IP address filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its source IP address filter profile without specifying its sequence number (e.g. **no deny any**).

Note that you can find the sequence number by running the [show access-list \(IPv4 Software ACLs\)](#) command.

**Syntax** [*<sequence-number>*] {deny|permit} {any|*<ip-addr>/<prefix>*  
[exact-match] }  
  
no *<sequence-number>*  
  
no {deny|permit} {any|*<ip-addr>/<prefix>* [exact-match] }

| Parameter                             | Description                                                                                                                                                                                                          |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;sequence-number&gt;</i>        | <1-65535><br>The sequence number for the filter entry of the selected access control list.                                                                                                                           |
| deny                                  | Access-list rejects packets of the source filtering specified.                                                                                                                                                       |
| permit                                | Access-list allows packets of the source filtering specified                                                                                                                                                         |
| any                                   | Match any source IP address.                                                                                                                                                                                         |
| <i>&lt;ip-addr&gt;/&lt;prefix&gt;</i> | Match the source address of the packets. Specify an IPv4 address in dotted decimal format, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet. |
| exact-match                           | Specify an exact IP prefix to match on.                                                                                                                                                                              |

**Mode** IPv4 Standard ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** The access control list being configured is selected by running the [access-list standard \(named\)](#) command with the required access control list name, but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** Use the following commands to add a new filter entry to access-list 'my-list' that will reject IP address 10.1.1.1:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# deny 10.1.1.1/32
```

Use the following commands to insert a new filter entry into access-list 'my-list' at sequence position number 15 that will accept IP network 10.1.2.0:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# 15 permit 10.1.2.0/24
```

## (access-list standard numbered filter)

**Overview** This ACL filter adds a source IP address filter entry to a current standard numbered access-list. If a sequence number is specified, the new filter entry is inserted at the specified location. Otherwise, the new filter entry is added at the end of the access-list.

The **no** variant of this command removes a source IP address filter entry from the current standard numbered access-list. You can specify the source IP address filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its source IP address filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

**Syntax** [*<sequence-number>*] {deny|permit} *<source>*  
no {deny|permit} *<source>*  
no *<sequence-number>*

| Parameter                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                       |                                                                                                                                                                    |                        |                                                                                             |                             |                                                                                             |     |                     |

The source address is specified in dotted decimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                       |                                                                                                                                                                    |                        |                                                                                             |                             |                                                                                             |     |                     |
| host <i>&lt;ip-addr&gt;</i>                           | A single source address to match. The source address is specified in dotted decimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                       |                                                                                                                                                                    |                        |                                                                                             |                             |                                                                                             |     |                     |
| any                                                   | Any source address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                       |                                                                                                                                                                    |                        |                                                                                             |                             |                                                                                             |     |                     |

**Mode** IPv4 Standard ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

**NOTE:** The access control list being configured is selected by running the [access-list \(standard numbered\)](#) command with the required access control list number but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Example** To add a new entry accepting the IP network 10.1.1.0/24 at the sequence number 15 position, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 99
awplus(config-ip-std-acl)# 15 permit 10.1.2.0 0.0.0.255
```

**Related commands**

- [access-list \(standard numbered\)](#)
- [show interface access-group](#)
- [show ip access-list](#)
- [show running-config](#)

# clear ip prefix-list

**Overview** Use this command to reset the hit count to zero in the prefix-list entries.

**Syntax** `clear ip prefix-list [<list-name>] [<ip-address>/<mask>]`

| Parameter           | Description                  |
|---------------------|------------------------------|
| <list-name>         | The name of the prefix-list. |
| <ip-address>/<mask> | The IP prefix and length.    |

**Mode** Privileged Exec

**Example** To clear a prefix-list named List1:

```
awplus# clear ip prefix-list List1
```

# dos

**Overview** Use this command to configure Denial-of-Service (DoS) protection features for a port. Six different DoS attacks can be detected: IP Options, Land, Ping-of-Death, Smurf, Synflood and Teardrop.

When the attack is detected, three different actions are available:

- Shutdown the port for one minute
- Cause an SNMP trap.
- Send traffic to the mirror port

**Syntax** `dos {ipoptions|land|ping-of-death|smurf broadcast  
<ip-address>|synflood|teardrop} action {shutdown|trap|mirror}`

| Parameter     | Description                  |
|---------------|------------------------------|
| dos           | Denial-Of-Service.           |
| ipoptions     | IP Options attack.           |
| land          | Land attack.                 |
| ping-of-death | Large ping attack.           |
| smurf         | Ping to broadcast address.   |
| broadcast     | Broadcast.                   |
| <ip-address>  | Local IP Broadcast Address.  |
| synflood      | SYN flood attack.            |
| teardrop      | IP fragmentation attack.     |
| action        | Action.                      |
| shutdown      | Shutdown port.               |
| trap          | Trap to SNMP.                |
| mirror        | Send packets to mirror port. |

**Mode** Interface Configuration for a switch port interface.

**Default** DoS attack detection is not configured by default on any switch port interface.

**Usage notes** See the below table for more information about the DoS attacks recognized by this command:

| Type of DoS attack | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipoptions          | This type of attack occurs when an attacker sends packets containing bad IP options to a victim node. There are many different types of IP options attacks and this software does not try to distinguish between them. Rather, if this defense is activated, the number of ingress IP packets containing IP options is counted. If the number exceeds 20 packets per second, the switch considers this a possible IP options attack. This defense does not require the CPU to monitor packets, so does not put extra load on the switch's CPU.                                                                                                                                                   |
| land               | This type of attack occurs when the Source IP and Destination IP address are the same. This can cause a target host to be confused. Since packets with the same source and destination addresses should never occur, these packets are dropped when this attack is enabled.<br>This defense does not require the CPU to monitor packets, so does not put extra load on the switch's CPU.                                                                                                                                                                                                                                                                                                         |
| ping-of-death      | This type of attack results from a fragmented packet which, when reassembled, would exceed the maximum size of a valid IP datagram. To detect this attack, the final fragment of ICMP packets has to be sent to the CPU for inspection. This defense can therefore load the CPU.<br>Note that the extra CPU load will not affect normal traffic switching between ports, but other protocols such as IGMP and STP may be affected. This defense is not recommended where a large number of fragmented packets are expected.                                                                                                                                                                      |
| smurf              | This type of attack is an ICMP ping packet to a broadcast address. Although routers should not forward packets to local broadcast addresses anymore (see RFC2644), the Smurf attack can still be explicitly discarded with this command. In order for the Smurf attack to work, the broadcast IP address is required. Any ICMP Ping packet with this destination address is considered an attack.<br>This defense does not require the CPU to monitor packets, so does not put extra load on the switch's CPU.                                                                                                                                                                                   |
| synflood           | In this type of attack, an attacker, seeking to overwhelm a victim with TCP connection requests, sends a large number of TCP SYN packets with bogus source addresses to the victim. The victim responds with SYN ACK packets, but since the original source addresses are bogus, the victim node does not receive any replies. If the attacker sends enough requests in a short enough period, the victim may freeze operations once the requests exceed the capacity of its connections queue.<br>To defend against this form of attack, a switch port monitors the number of ingress TCP-SYN packets it receives. An attack is recorded if a port receives more 60 TCP-SYN packets per second. |
| teardrop           | In this DoS attack, an attacker sends a packet in several fragments with a bogus offset value, used to reconstruct the packet, in one of the fragments to a victim. This results in the victim being unable to reassemble the packet, possibly causing it to freeze operations.                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Examples** To configure **smurf** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos smurf broadcast 192.168.1.0 action
shutdown
```

To configure **land** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos land action shutdown
```

To configure **ipoptions** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos ipoptions action shutdown
```

To configure **ping-of-death** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos ping-of-death action shutdown
```

To configure **synflood** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos synflood action shutdown
```

To configure **teardrop** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos teardrop action shutdown
```

**Related commands** [show dos interface](#)

# ip prefix-list

**Overview** Use this command to create an entry for an IPv4 prefix list.

Use the **no** variant of this command to delete the IPv4 prefix-list entry.

**Syntax**

```
ip prefix-list <list-name> [seq <1-429496725>] {deny|permit}
{any|<ip-prefix>} [ge <0-32>] [le <0-32>]

ip prefix-list <list-name> description <text>

ip prefix-list sequence-number

no ip prefix-list <list-name> [seq <1-429496725>]

no ip prefix-list <list-name> [description <text>]

no ip prefix-list sequence-number
```

| Parameter         | Description                                                                                          |
|-------------------|------------------------------------------------------------------------------------------------------|
| <list-name>       | Specifies the name of a prefix list.                                                                 |
| seq <1-429496725> | Sequence number of the prefix list entry.                                                            |
| deny              | Specifies that the prefixes are excluded from the list.                                              |
| permit            | Specifies that the prefixes are included in the list.                                                |
| <ip-prefix>       | Specifies the IPv4 address and length of the network mask in dotted decimal in the format A.B.C.D/M. |
| any               | Any prefix match. Same as <b>0.0.0.0/0 le 32</b> .                                                   |
| ge<0-32>          | Specifies the minimum prefix length to be matched.                                                   |
| le<0-32>          | Specifies the maximum prefix length to be matched.                                                   |
| <text>            | Text description of the prefix list.                                                                 |
| sequence-number   | Specify sequence numbers included or excluded in prefix list.                                        |

**Mode** Global Configuration

**Usage notes** When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. When setting these parameters, set the **le** value to be less than 32, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

**Example** To deny the IP addresses between 10.0.0.0/14 (10.0.0.0 255.252.0.0) and 10.0.0.0/22 (10.0.0.0 255.255.252.0) within the 10.0.0.0/8 (10.0.0.0 255.0.0.0) addressing range, enter the following commands:

```
awplus# configure terminal
awplus(config)# ip prefix-list mylist seq 12345 deny 10.0.0.0/8
ge 14 le 22
```

**Related commands**

- match ip address
- area filter-list
- clear ip prefix-list
- match route-type
- show ip prefix-list

# maximum-access-list (deleted)

**Overview** This command has been removed from version 5.5.1-01 onwards. There is no alternative command.

# show access-list (IPv4 Software ACLs)

**Overview** Use this command to display the specified access-list, or all access-lists if none have been specified. Note that only defined access-lists are displayed. An error message is displayed for an undefined access-list

**Syntax** `show access-list`  
`[<1-99>|<100-199>|<1300-1999>|<2000-2699>|<3000-3699>|`  
`<4000-4499>|<access-list-name>]`

| Parameter          | Description                                          |
|--------------------|------------------------------------------------------|
| <1-99>             | IP standard access-list.                             |
| <100-199>          | IP extended access-list.                             |
| <1300-1999>        | IP standard access-list (standard - expanded range). |
| <2000-2699>        | IP extended access-list (extended - expanded range). |
| <3000-3699>        | Hardware IP access-list.                             |
| <4000-4499>        | Hardware MAC access-list.                            |
| <access-list-name> | IP named access-list.                                |

**Mode** User Exec and Privileged Exec

**Examples** To show all access-lists configured on the switch:

```
awplus# show access-list
```

```
Standard IP access list 1
 deny 172.16.2.0, wildcard bits 0.0.0.255
Standard IP access list 20
 deny 192.168.10.0, wildcard bits 0.0.0.255
 deny 192.168.12.0, wildcard bits 0.0.0.255
Hardware IP access list 3001
 permit ip 192.168.20.0 255.255.255.0 any
Hardware IP access list 3020
 permit tcp any 192.0.2.0/24
awplus#show access-list 20
```

To show the access-list with an ID of 20:

```
awplus# show access-list 20
```

```
Standard IP access-list 20
 deny 192.168.10.0, wildcard bits 0.0.0.255
 deny 192.168.12.0, wildcard bits 0.0.0.255
```

Note the following error message is displayed if you attempt to show an undefined access-list:

```
awplus# show access-list 2
```

```
% Can't find access-list 2
```

# show dos interface

**Overview** Use this command to display the Denial-of-Service (DoS) features configured on a switch port interface from the [dos](#) command. See the [dos](#) command for descriptions of DoS attack types.

**Syntax** `show dos interface {<port-list>}`

| Parameter                      | Description                                                                                                         |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <code>&lt;port-list&gt;</code> | Specify the switch port or port list to display DoS configuration options set with the <a href="#">dos</a> command. |

**Mode** Privileged Exec

**Output** Figure 38-1: Example output from the **show dos interface** command prior to a DoS attack

```
awplus#configure terminal
Enter configuration commands, one per line. End with CTNLT/Z.
awplus(config)#interface port1.0.1
awplus(config-if)#dos synflood action shutdown
awplus(config-if)#exit
awplus(config)#exit
awplus#show dos interface port1.0.1

DoS settings for interface port1.0.1

Port status : Enabled
ipoptions : Disabled
land : Disabled
ping-of-death : Disabled
smurf : Disabled
synflood : Enabled
 Action : Shutdown port
 Attacks detected : 0
teardrop : Disabled
awplus#
```

Figure 38-2: Example output from the **show dos interface** command after a **synflood** DoS attack

```
awplus#show dos interface port1.0.1

DoS settings for interface port1.0.1

Port status : Enabled
ipoptions : Disabled
land : Disabled
ping-of-death : Disabled
smurf : Disabled
synflood : Enabled
 Action : Shutdown port
 Attacks detected : 1
teardrop : Disabled
awplus#
```

**Table 39:** Parameters in the **show dos interface** command output:

| Type of DoS attack | Description                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port status        | Displays <b>Enabled</b> when the port is configured as being administratively up after issuing the <b>no shutdown</b> command. Displays <b>Disabled</b> when the port is configured as being administratively down with the <b>shutdown</b> command.                                                                                                                                                                    |
| ipoptions          | Displays <b>Enabled</b> when the <b>ipoptions</b> parameter is configured with the <b>dos</b> command, plus the action ( <b>Shutdown port</b> , <b>Mirror port</b> , or <b>Trap port</b> ) and the number of instances of any <b>ipoptions</b> DoS attacks that have occurred on the interface. Displays <b>Disabled</b> when the <b>ipoptions</b> parameter is not configured with the <b>dos</b> command.             |
| land               | Displays <b>Enabled</b> when the <b>land</b> parameter is configured with the <b>dos</b> command, plus the action ( <b>Shutdown port</b> , <b>Mirror port</b> , or <b>Trap port</b> ) and the number of instances of any <b>land</b> DoS attacks that have occurred on the interface. Displays <b>Disabled</b> when the <b>land</b> parameter is not configured with the <b>dos</b> command.                            |
| ping-of-death      | Displays <b>Enabled</b> when the <b>ping-of-death</b> parameter is configured with the <b>dos</b> command, plus the action ( <b>Shutdown port</b> , <b>Mirror port</b> , or <b>Trap port</b> ) and the number of instances of any <b>ping-of-death</b> DoS attacks that have occurred on the interface. Displays <b>Disabled</b> when the <b>ping-of-death</b> parameter is not configured with the <b>dos</b> command. |

**Table 39:** Parameters in the **show dos interface** command output: (cont.)

| Type of DoS attack | Description                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| smurf              | Displays Enabled when the <b>smurf</b> parameter is configured with the <b>dos</b> command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any <b>smurf</b> DoS attacks that have occurred on the interface. Displays Disabled when the <b>smurf</b> parameter is not configured with the <b>dos</b> command.          |
| synflood           | Displays Enabled when the <b>synflood</b> parameter is configured with the <b>dos</b> command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any <b>synflood</b> DoS attacks that have occurred on the interface. Displays Disabled when the <b>synflood</b> parameter is not configured with the <b>dos</b> command. |
| teardrop           | Displays Enabled when the <b>teardrop</b> parameter is configured with the <b>dos</b> command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any <b>teardrop</b> DoS attacks that have occurred on the interface. Displays Disabled when the <b>teardrop</b> parameter is not configured with the <b>dos</b> command. |

# show ip access-list

**Overview** Use this command to display IP access-lists.

**Syntax** `show ip access-list`  
`[<1-99>|<100-199>|<1300-1999>|<2000-2699>|<access-list-name>]`

| Parameter          | Description                               |
|--------------------|-------------------------------------------|
| <1-99>             | IP standard access-list.                  |
| <100-199>          | IP extended access-list.                  |
| <1300-1999>        | IP standard access-list (expanded range). |
| <2000-2699>        | IP extended access-list (expanded range). |
| <access-list-name> | IP named access-list.                     |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip access-list`

**Output** Figure 38-3: Example output from the **show ip access-list** command

```
Standard IP access-list 1
 permit 172.168.6.0, wildcard bits 0.0.0.255
 permit 192.168.6.0, wildcard bits 0.0.0.255
```

# show ip prefix-list

**Overview** Use this command to display the IPv4 prefix-list entries.

Note that this command is valid for RIP only.

**Syntax** `show ip prefix-list [<name>|detail|summary]`

| Parameter | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| <name>    | Specify the name of a prefix list in this placeholder.                    |
| detail    | Specify this parameter to show detailed output for all IPv4 prefix lists. |
| summary   | Specify this parameter to show summary output for all IPv4 prefix lists.  |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip prefix-list
awplus# show ip prefix-list 10.10.0.98/8
awplus# show ip prefix-list detail
```

**Related commands** [ip prefix-list](#)

## vty access-class (numbered)

**Overview** For IPv4, use this command to set a standard numbered software access list to be the management ACL. This is then applied to all available VTY lines for controlling remote access by Telnet and SSH. This command allows or denies packets containing the IP addresses included in the ACL to create a connection to your device.

ACLs that are attached using this command have an implicit deny-all filter as the final entry in the ACL. So a typical configuration would be to permit a specific address, or range of addresses, and rely on the deny-all filter to block all other access.

Use the **no** variant of this command to remove the access list.

**Syntax** `vty access-class {<1-99>|<1300-1999>}`  
`no vty access-class [<1-99>|<1300-1999>]`

| Parameter   | Description                                       |
|-------------|---------------------------------------------------|
| <1-99>      | IPv4 standard access-list number                  |
| <1300-1999> | IPv4 standard access-list number (expanded range) |

**Mode** Global Configuration

**Examples** To set access-list 4 to be the management ACL, use the following commands:

```
awplus# configure terminal
awplus(config)# vty access-class 4
```

To remove access-list 4 from the management ACL, use the following commands:

```
awplus# configure terminal
awplus(config)# no vty access-class 4
```

**Output** Figure 38-4: Example output from the **show running-config** command

```
awplus#show running-config|grep access-class
vty access-class 4
```

**Related commands** [show running-config](#)

# IPv6 Hardware Access Control List (ACL) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for the IPv6 Hardware Access Control List (ACL) commands, and contains detailed command information and command examples about IPv6 hardware ACLs, which are applied directly to interfaces using the [ipv6 traffic-filter](#) command.

For information about ACLs, see the [ACL Feature Overview and Configuration Guide](#).

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see the following references:

- [Link Aggregation Feature Overview\\_and\\_Configuration\\_Guide](#).
- [Link Aggregation Commands](#)

Most ACL command titles include usage information in parentheses. When the command title is completely surrounded by parentheses, the title indicates the type of ACL filter instead of keywords to enter into the CLI. For example, the title **(named IPv6 hardware ACL: IP protocol entry)** represents a command with the syntax:

```
[<sequence-number>] <action> proto <1-255> <source-addr>
<dest-addr> [vlan <1-4094>]
```

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**Sub-modes** Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

Table 39-1: IPv6 Hardware Access List Commands and Prompts

| Command Name                                                 | Command Mode                      | Prompt                          |
|--------------------------------------------------------------|-----------------------------------|---------------------------------|
| <a href="#">show acl-group ipv6 address</a>                  | Privileged Exec                   | awplus#                         |
| <a href="#">show ipv6 access-list (IPv6 Hardware ACLs)</a>   | Privileged Exec                   | awplus#                         |
| <a href="#">acl-group ipv6 address</a>                       | Global Configuration              | awplus(config)#                 |
| <a href="#">ipv6 access-list (named IPv6 hardware ACL)</a>   | Global Configuration              | awplus(config)#                 |

# acl-group ipv6 address

- Overview** Use this command to create a new named IPv6 ACL group that contains one or more IPv6 host or subnets.
- This command creates a named IPv6 ACL group and enters the ACL Host Group config mode. IPv6 hosts or subnets can be added to or removed from this group. This host group can be used as a source or destination match for any hardware ACL to simplify large ACL configs with lots of IPv6 hosts.
- Use the **no** variant of this command to delete an IPv6 ACL group.

- Syntax** `acl-group ipv6 address <group>`  
`no acl-group ipv6 address <group>`

| Parameter | Description                     |
|-----------|---------------------------------|
| <group>   | The name of the IPv6 ACL group. |

- Default** No ACL groups exist by default.

- Mode** Global Configuration

- Example** To create an IPv6 ACL group named IPV6\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ipv6 address IPV6_GROUP1
awplus(config-ip-host-group)#
```

To delete an IPv6 ACL group named IPV6\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# no acl-group ipv6 address IPV6_GROUP1
```

- Related commands** [ipv6 \(ipv6-host-group\)](#)  
[show acl-group ipv6 address](#)

- Command changes** Version 5.5.0-1.1: command added

# clear access-list counters

**Overview** Use this command to reset the hardware access-list counters to zero. The access-list counters show the number of packets that match your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments.

**Syntax** `clear access-list counters [<acl>]`

| Parameter | Description                                                                          |
|-----------|--------------------------------------------------------------------------------------|
| <acl>     | Clear the counters for only the specified ACL. You can enter the ACL name or number. |

**Mode** Privileged Exec

**Usage notes** To view the counter values, use the command [show access-list counters](#).

**Example** To clear the counters for the ACL named ACL-1, use the command:

```
awplus# clear access-list counters ACL-1
```

**Related commands** [show access-list counters](#)

**Command changes** Version 5.5.2-2.1: command added

## commit (IPv6)

**Overview** Use this command to commit the IPv6 ACL filter configuration entered at the console to the hardware immediately without exiting the IPv6 Hardware ACL Configuration mode.

This command forces the associated hardware and software IPv6 ACLs to synchronize.

**Syntax** `commit`

**Mode** IPv6 Hardware ACL Configuration

**Usage notes** Normally, when an IPv6 hardware ACL is edited, the new configuration state of the IPv6 ACL is not written to hardware until you exit IPv6 Hardware ACL Configuration mode. By entering this command you can ensure that the current state of a hardware access-list that is being edited is written to hardware immediately.

Scripts typically do not include the [exit](#) command to exit configuration modes, potentially leading to IPv6 ACL filters in hardware not being correctly updated. Using this **commit** command in a configuration script after specifying an IPv6 hardware ACL filter ensures that it is updated in the hardware.

**Example** To update the hardware with the IPv6 ACL filter configuration, use the command:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-ipv6-acl
awplus(config-ipv6-hw-acl)# commit
```

**Related commands** [ipv6 access-list \(named IPv6 hardware ACL\)](#)

# ipv6 (ipv6-host-group)

**Overview** Use this command to add an IPv6 host or subnet to an IPv6 ACL group. Adding IPv6 hosts and subnets to an ACL group allows you to simplify ACL config when the same IP addresses are required for many ACLs.

Use the **no** variant of this command to remove an IPv6 host or subnet from an IPv6 ACL group.

**Syntax** `ipv6 {any|<match-ip>}`  
`no ipv6 {any|<match-ip>}`

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |             |                                                                             |                      |                                                                                                                                                                               |                               |                                                     |

The prefix-length is usually set between 0 and 64, or has the value 128. | <ipv6-addr><br><reverse-mask> | An IPv6 host and a reverse mask in format X:X::X:X. |
| <ipv6-addr>                   | Specifies a single host address. The IPv6 address uses the format X:X::X:X.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |             |                                                                             |                      |                                                                                                                                                                               |                               |                                                     |
| <ipv6-addr>/<prefix>          | Specifies an address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64, or has the value 128.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |             |                                                                             |                      |                                                                                                                                                                               |                               |                                                     |
| <ipv6-addr><br><reverse-mask> | An IPv6 host and a reverse mask in format X:X::X:X.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |             |                                                                             |                      |                                                                                                                                                                               |                               |                                                     |

**Default** No hosts or subnets are in an IPv6 ACL group by default.

**Mode** IPv6 ACL Host Group Configuration

**Example** To add the subnet 2001:DB8::/32 to an IPv6 ACL group IPV6\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ipv6 address IPV6_GROUP1
awplus(config-ipv6-host-group)# ipv6 2001:DB8::/32
```

To remove the subnet 2001:DB8::/32 from an IPv6 ACL group IPV6\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ipv6 address IPV6_GROUP1
awplus(config-ipv6-host-group)# no ipv6 2001:DB8::/32
```

**Related commands**   [acl-group ipv6 address](#)  
                              [show acl-group ipv6 address](#)

**Command changes**   Version 5.5.0-1.1: command added

# ipv6 access-list (named IPv6 hardware ACL)

**Overview** Use this command to either create a new IPv6 hardware access-list, or to select an existing IPv6 hardware access-list in order to apply a filter entry to it.

Use the **no** variant of this command to delete an existing IPv6 hardware access-list.

**NOTE:** Before you can delete an access-list, you must first remove it from any interface it is assigned to.

**Syntax** `ipv6 access-list <ipv6-access-list-name>`  
`no ipv6 access-list <ipv6-access-list-name>`

| Parameter                                  | Description                       |
|--------------------------------------------|-----------------------------------|
| <code>&lt;ipv6-access-list-name&gt;</code> | Specify an IPv6 access-list name. |

**Mode** Global Configuration

**Default** Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

**Usage notes** Use IPv6 hardware named access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 hardware named access-list when a match is encountered.

This command moves you to the (config-ipv6-hw-acl) prompt for the selected IPv6 hardware named access-list number. From there you can configure the filters for this selected IPv6 hardware named access-list.

Once you have configured the ACL, use the [ipv6 traffic-filter](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**Examples** To create an IPv6 access-list named "my-ipv6-acl", use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-ipv6-acl
awplus(config-ipv6-hw-acl)#
```

To delete the IPv6 access-list named "my-ipv6-acl", use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 access-list my-ipv6-acl
```

ipv6 traffic-filter

match access-group

show ipv6 access-list (IPv6 Hardware ACLs)

# ipv6 traffic-filter

**Overview** This command adds an IPv6 hardware-based access-list to an interface. The number of access-lists that can be added is determined by the amount of available space in the hardware-based packet classification tables.

Use the **no** variant of this command to remove an IPv6 hardware-based access-list from an interface.

**Syntax** `ipv6 traffic-filter <ipv6-access-list-name>`  
`no ipv6 traffic-filter <ipv6-access-list-name>`

| Parameter                                  | Description                     |
|--------------------------------------------|---------------------------------|
| <code>&lt;ipv6-access-list-name&gt;</code> | Hardware IPv6 access-list name. |

**Mode** Interface Configuration (to apply an IPv6 hardware ACL to a specific switch port).

**Usage notes** This command adds an IPv6 hardware-based access-list to an interface. The number of access-lists that can be added is determined by the amount of available space in the hardware-based packet classification tables.

**Examples** To add access-list "acl1" as a traffic-filter to interface port1.0.1, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ipv6 traffic-filter acl1
```

To remove access-list "acl1" as a traffic-filter from interface port1.0.1, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no ipv6 traffic-filter acl1
```

## (named IPv6 hardware ACL: ICMP entry)

**Overview** Use this command to add a new ICMP filter entry to the current IPv6 hardware access-list. The filter will match on any ICMP packet that has the specified IPv6 source and destination IP addresses and (optionally) ICMP type. You can specify the value **any** if source or destination address does not matter.

The **no** variant of this command removes a filter entry from the current IPv6 hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny icmp 2001:0db8::0/64 any**).

You can find the sequence number by running the [show ipv6 access-list \(IPv6 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** [`<sequence-number>`] `<action>` icmp `<source-addr>` `<dest-addr>`  
[icmp-type `<number>`] [vlan `<1-4094>`]  
  
`no <sequence-number>`  
  
`no <action>` icmp `<source-addr>` `<dest-addr>` [icmp-type `<number>`]  
[vlan `<1-4094>`]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter |                                                                                                                                                                                                                                                              |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                 | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                               | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                          | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br><i>port-number</i> ] | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br><i>port-number</i> ] | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |

| Values for the <action> parameter                     |                                                                                                                                    |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                  |

| Parameter         | Description                                                                                                                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <sequence-number> | The sequence number for the filter entry of the selected access control list, in the range 1-65535.                                                                                                                                          |
| <action>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                              |
| icmp              | Match against ICMP packets.                                                                                                                                                                                                                  |
| <source-addr>     | The source addresses to match against. You can specify a single host, a range, or all source addresses. The following are the valid formats for specifying the source:                                                                       |
|                   | any Match any source host.                                                                                                                                                                                                                   |
|                   | <ipv6-src-address/<br>prefix-length> Match the specified source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                                   |
|                   | <ipv6-src-address><br><ipv6-src-wildcard> Match the specified IPv6 source address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match. |
|                   | host<br><ipv6-source-host> Match a single source host address. The IPv6 address uses the format X:X::X:X.                                                                                                                                    |
| <dest-addr>       | The destination addresses to match against. You can specify a single host, a range, or all destination addresses. The following are the valid formats for specifying the destination:                                                        |
|                   | any Match any destination host.                                                                                                                                                                                                              |
|                   | <ipv6-dest-address/<br>prefix-length> Match the specified destination address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                             |

| Parameter                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |   |               |   |                                   |   |                         |   |                                   |   |                |    |                         |    |                             |    |                     |    |                    |    |                       |    |                      |    |                        |    |                       |

| <code>vlan &lt;1-4094&gt;</code>                                                  | <p>The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |   |               |   |                                   |   |                         |   |                                   |   |                |    |                         |    |                             |    |                     |    |                    |    |                       |    |                      |    |                        |    |                       |

**Mode** IPv6 Hardware ACL Configuration (accessed by running the command `ipv6 access-list (named IPv6 hardware ACL)`)

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command `ipv6 access-list (named IPv6 hardware ACL)` and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl) #
```

Then use this command (and the other "named IPv6 hardware ACL: entry" commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the [ipv6 traffic-filter](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the ACL named “my-acl”, to block ICMP packets sent from network 2001:0db8::0/64 , use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny icmp 2001:0db8::0/64 any
```

To remove a filter entry from the ACL named “my-acl” that blocks all ICMP packets sent from network 2001:0db8::0/ 64 , use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny icmp 2001:0db8::0/64 any
```

To specify an ACL named “my-acl1” and add a filter entry that blocks all ICMP6 echo requests, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl1
awplus(config-ipv6-hw-acl)# deny icmp any any icmp-type 128
```

To specify an ACL named “my-acl2” and add a filter entry that blocks all ICMP6 echo requests on the default VLAN (vlan1), enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl2
awplus(config-ipv6-hw-acl)# deny icmp any any icmp-type 128
vlan 1
```

To remove a filter entry that blocks all ICMP6 echo requests from the ACL named “my-acl1”, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl1
awplus(config-ipv6-hw-acl)# no deny icmp any any icmp-type 128
```

[show ipv6 access-list \(IPv6 Hardware ACLs\)](#)

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# (named IPv6 hardware ACL: IPv6 packet entry)

**Overview** Use this command to add an IPv6 packet filter entry to the current hardware access-list. The filter will match on IPv6 packets that have the specified source and destination IPv6 address and (optionally) prefix. You can use the value **any** instead of source or destination IPv6 address if an address does not matter.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny ipv6 2001:0db8::0/64 any**).

You can find the sequence number by running the [show ipv6 access-list \(IPv6 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** [`<sequence-number>`] `<action>` ipv6 `<source-addr>` `<dest-addr>`  
[vlan `<1-4094>`]  
  
no `<sequence-number>`  
  
no `<action>` ipv6 `<source-addr>` `<dest-addr>` [vlan `<1-4094>`]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter |                                                                                                                                                                                                                                                              |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                 | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                               | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                          | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br><i>port-number</i> ] | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br><i>port-number</i> ] | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |

| Values for the <action> parameter                     |                                                                                                                                    |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                  |

| Parameter         | Description                                                                                                                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <sequence-number> | The sequence number for the filter entry of the selected access control list, in the range 1-65535.                                                                                                                                          |
| <action>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                              |
| ipv6              | Match against IPv6 packets                                                                                                                                                                                                                   |
| <source-addr>     | The source addresses to match against. You can specify a single host, a range, or all source addresses. The following are the valid formats for specifying the source:                                                                       |
|                   | any Match any source host.                                                                                                                                                                                                                   |
|                   | <ipv6-src-address/<br>prefix-length> Match the specified source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                                   |
|                   | <ipv6-src-address><br><ipv6-src-wildcard> Match the specified IPv6 source address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match. |
|                   | host<br><ipv6-source-host> Match a single source host address. The IPv6 address uses the format X:X::X:X.                                                                                                                                    |
| <dest-addr>       | The destination addresses to match against. You can specify a single host, a range, or all destination addresses. The following are the valid formats for specifying the destination:                                                        |
|                   | any Match any destination host.                                                                                                                                                                                                              |
|                   | <ipv6-dest-address/<br>prefix-length> Match the specified destination address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                             |

| Parameter                                                                         | Description                                                                                                                                                                                                             |
|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-dest-address&gt;</code><br><code>&lt;ipv6-dest-wildcard&gt;</code> | <p>Match the specified destination address, masked using wildcard bits.</p> <p>The IPv6 address uses the format X:X::X:X.</p> <p>In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.</p> |
| <code>host</code><br><code>&lt;ipv6-dest-host&gt;</code>                          | <p>Match a single destination host address.</p> <p>The IPv6 address uses the format X:X::X:X.</p>                                                                                                                       |
| <code>vlan &lt;1-4094&gt;</code>                                                  | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                        |

**Mode** IPv6 Hardware ACL Configuration (accessed by running the command `ipv6 access-list (named IPv6 hardware ACL)`)

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command `ipv6 access-list (named IPv6 hardware ACL)` and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl)#
```

Then use this command (and the other “named IPv6 hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the `ipv6 traffic-filter` or the `match access-group` command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the ACL named “my-acl” to block IPv6 traffic sent from network 2001:0db8::0/64, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny ipv6 2001:0db8::0/64 any
```

To remove a filter entry from the ACL named “my-acl” that blocks all IPv6 traffic sent from network 2001:0db8::0/64, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny ipv6 2001:0db8::0/64 any
```

**Related  
commands**

ipv6 traffic-filter  
match access-group  
show ipv6 access-list (IPv6 Hardware ACLs)

**Command  
changes**

Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

## (named IPv6 hardware ACL: IP protocol entry)

**Overview** Use this command to add an IP protocol type filter entry to the current IPv6 hardware access-list. The filter will match on IPv6 packets that have the specified IP protocol number, and the specified IPv6 addresses. You can use the value **any** instead of source or destination IPv6 address if an address does not matter.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny proto 2 2001:0db8::0/64 any**).

You can find the sequence number by running the [show ipv6 access-list \(IPv6 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** [`<sequence-number>`] `<action>` proto `<1-255>` `<source-addr>` `<dest-addr>` [`vlan <1-4094>`]  
`no <sequence-number>`  
`no <action>` proto `<1-255>` `<source-addr>` `<dest-addr>` [`vlan <1-4094>`]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter |                                                                                                                                                                                                                                                              |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                 | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                               | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                          | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br>port-number]         | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br>port-number]         | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |

| Values for the <action> parameter                     |                                                                                                                                    |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                  |

Table 39-2: Parameters in IP protocol ACL entries

| Parameter         | Description                                                                                                                                                                                                                                                                        |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <sequence-number> | The sequence number for the filter entry of the selected access control list, in the range 1-65535.                                                                                                                                                                                |
| <action>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                                    |
| proto <1-255>     | The IP protocol number to match against, as defined by IANA (Internet Assigned Numbers Authority <a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a> )<br>See below for a list of IP protocol numbers and their descriptions. |
| <source-addr>     | The source addresses to match against. You can specify a single host, a range, or all source addresses. The following are the valid formats for specifying the source:                                                                                                             |
|                   | any Match any source host.                                                                                                                                                                                                                                                         |
|                   | <ipv6-src-address/prefix-length> Match the specified source address and prefix length.<br>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                                                                          |
|                   | <ipv6-src-address><br><ipv6-src-wildcard> Match the specified IPv6 source address, masked using wildcard bits.<br>The IPv6 address uses the format X:X::X:X.<br>In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.                                 |
|                   | host<br><ipv6-source-host> Match a single source host address.<br>The IPv6 address uses the format X:X::X:X.                                                                                                                                                                       |
| <dest-addr>       | The destination addresses to match against. You can specify a single host, a range, or all destination addresses. The following are the valid formats for specifying the destination:                                                                                              |
|                   | any Match any destination host.                                                                                                                                                                                                                                                    |

Table 39-2: Parameters in IP protocol ACL entries (cont.)

| Parameter                                                       | Description                                                                                                                                                                                        |
|-----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;ipv6-dest-address/<br/>prefix-length&gt;</i>             | Match the specified destination address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                         |
| <i>&lt;ipv6-dest-address&gt;<br/>&lt;ipv6-dest-wildcard&gt;</i> | Match the specified destination address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match. |
| <i>host<br/>&lt;ipv6-dest-host&gt;</i>                          | Match a single destination host address. The IPv6 address uses the format X:X::X:X.                                                                                                                |
| <i>vlan &lt;1-4094&gt;</i>                                      | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                   |

Table 39-3: IP protocol number and description

| Protocol Number | Protocol Description [RFC]                             |
|-----------------|--------------------------------------------------------|
| 1               | Internet Control Message [RFC792]                      |

**Mode** IPv6 Hardware ACL Configuration (accessed by running the command `ipv6 access-list` (named IPv6 hardware ACL))

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command `ipv6 access-list` (named IPv6 hardware ACL) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl)#
```

Then use this command (and the other “named IPv6 hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the [ipv6 traffic-filter](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the ACL named "my-acl" to deny IGMP packets from 2001:0db8::0/64 , use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny proto 2 2001:0db8::0/64 any
```

To remove a filter entry that blocks IGMP packets from network 2001:0db8::0/64 from the ACL named "my-acl", use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny proto 2 2001:0db8::0/64 any
```

**Related commands** [ipv6 access-list \(named IPv6 hardware ACL\)](#)  
[ipv6 traffic-filter](#)  
[match access-group](#)  
[show ipv6 access-list \(IPv6 Hardware ACLs\)](#)

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# (named IPv6 hardware ACL: TCP or UDP entry)

**Overview** Use this command to add a TCP or UDP filter entry to the current IPv6 hardware access-list. The access-list will match on TCP or UDP packets that have the specified source and destination IP addresses and optionally, port values. You can use the value **any** instead of source or destination IP address if an address does not matter.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny tcp 2001:0db8::0/64 any**).

You can find the sequence number by running the [show ipv6 access-list \(IPv6 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** [`<sequence-number>`] `<action>` {`tcp|udp`} `<source-addr>`  
[`<source-ports>`] `<dest-addr>` [`<dest-ports>`] [`vlan <1-4094>`]  
  
`no <sequence-number>`  
  
`no <action>` {`tcp|udp`} `<source-addr>` [`<source-ports>`]  
`<dest-addr>` [`<dest-ports>`] [`vlan <1-4094>`]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter                                  |                                                                                                                                                                                                                                                              |
|---------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>deny</code>                                                                     | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| <code>permit</code>                                                                   | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| <code>copy-to-cpu</code>                                                              | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| <code>copy-to-mirror</code><br>[ <code>interface</code><br><code>port-number</code> ] | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| <code>send-to-mirror</code><br>[ <code>interface</code><br><code>port-number</code> ] | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |

| Values for the <action> parameter                     |                                                                                                                                    |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN. |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                  |

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |

| <sequence-number>           | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |
| <action>                    | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |
| tcp                         | Match against TCP packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |
| udp                         | Match against UDP packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |
| <source-addr>               | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source: <table> <tr> <td>any</td><td>Match any source IP address.</td></tr> <tr> <td>host &lt;ip-addr&gt;</td><td>Match a single source host with the IP address given by &lt;ip-addr&gt; in dotted decimal notation.</td></tr> <tr> <td>&lt;ip-addr&gt;/<br/>&lt;prefix&gt;</td><td>Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.</td></tr> <tr> <td>&lt;ip-addr&gt;<br/>&lt;reverse-mask&gt;</td><td>Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.</td></tr> </table> | any          | Match any source IP address. | host <ip-addr> | Match a single source host with the IP address given by <ip-addr> in dotted decimal notation. | <ip-addr>/<br><prefix> | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length. | <ip-addr><br><reverse-mask> | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| any                         | Match any source IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |
| host <ip-addr>              | Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |
| <ip-addr>/<br><prefix>      | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |
| <ip-addr><br><reverse-mask> | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |
| <source-ports>              | Match source TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows: <table> <tr> <td>eq &lt;0-65535&gt;</td><td>Match a single port number.</td></tr> <tr> <td>lt &lt;0-65535&gt;</td><td>Match all port numbers that are less than the specified port number.</td></tr> <tr> <td>gt &lt;0-65535&gt;</td><td>Match all port numbers that are greater than the specified port number.</td></tr> </table>                                                                                                                                                                                                                                                                                                                                                                                                                                 | eq <0-65535> | Match a single port number.  | lt <0-65535>   | Match all port numbers that are less than the specified port number.                          | gt <0-65535>           | Match all port numbers that are greater than the specified port number.                                                                                 |                             |                                                                                                                                                                                                                        |
| eq <0-65535>                | Match a single port number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |
| lt <0-65535>                | Match all port numbers that are less than the specified port number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |
| gt <0-65535>                | Match all port numbers that are greater than the specified port number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |              |                              |                |                                                                                               |                        |                                                                                                                                                         |                             |                                                                                                                                                                                                                        |

| Parameter                        | Description                                                                                                                                                                                                                 |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ne <0-65535>                     | Match all port numbers except the specified port number.                                                                                                                                                                    |
| range <start-port><br><end-port> | Match a range of port numbers.                                                                                                                                                                                              |
| <dest-addr>                      | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                      |
| any                              | Match any destination IP address.                                                                                                                                                                                           |
| host <ip-addr>                   | Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                          |
| <ip-addr>/<br><prefix>           | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                |
| <ip-addr><br><reverse-mask>      | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <dest-ports>                     | Match destination TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:                                                                 |
| eq <0-65535>                     | Match a single port number.                                                                                                                                                                                                 |
| lt <0-65535>                     | Match all port numbers that are less than the specified port number.                                                                                                                                                        |
| gt <0-65535>                     | Match all port numbers that are greater than the specified port number.                                                                                                                                                     |
| ne <0-65535>                     | Match all port numbers except the specified port number.                                                                                                                                                                    |
| range <start-port><br><end-port> | Match a range of port numbers.                                                                                                                                                                                              |
| vlan <1-4094>                    | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                            |

**Mode** IPv6 Hardware ACL Configuration (accessed by running the command **ipv6 access-list (named IPv6 hardware ACL)**)

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command [ipv6 access-list \(named IPv6 hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl)#
```

Then use this command (and the other “named IPv6 hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the [ipv6 traffic-filter](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry that blocks all SSH traffic from network 2001:0db8::0/64 to the hardware IPv6 access-list named “my-acl”, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny tcp 2001:0db8::0/64 any eq 22
```

To add a filter entry that blocks all SSH traffic from network 2001:0db8::0/64 on the default VLAN (vlan1) to the hardware IPv6 access-list named “my-acl”, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny tcp 2001:0db8::0/64 any eq 22
vlan 1
```

To remove an ACL filter entry that blocks all SSH traffic from network 2001:0db8::0/64 from the hardware IPv6 access-list named “my-acl”, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny tcp 2001:0db8::0/64 any eq 22
```

**Related commands** [ipv6 access-list \(named IPv6 hardware ACL\)](#)  
[ipv6 traffic-filter](#)  
[match access-group](#)  
[show ipv6 access-list \(IPv6 Hardware ACLs\)](#)

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# platform hwfilter-size

**Overview** You can use this command to control the configuration of hardware Access Control Lists (ACLs), which determines the total available number and functionality of hardware ACLs.

For this command to take effect, you need to reboot the affected service.

You cannot attach an IPv6 ACL to a port if the ACL contains a specified source or destination IPv6 address or both and the **hw-filter size** setting is **ipv4-limited-ipv6**. If you do so, a diagnostic message will be generated.

**Syntax** `platform hwfilter-size {ipv4-limited-ipv6|ipv4-full-ipv6}`

| Parameter         | Description                                                                                                                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| hwfilter-size     | Configure hardware ACLs command.                                                                                                                                                                                                             |
| ipv4-full-ipv6    | Configure hardware ACLs to filter IPv4 traffic, MAC addresses and IPv6 traffic, including filtering on source or destination IPv6 addresses, or both; however, this will reduce the total number of filters available in the hardware table. |
| ipv4-limited-ipv6 | Configure hardware ACLs to filter IPv4 traffic, MAC addresses and IPv6 traffic. Source or destination IPv6 addresses or both are not filtered.                                                                                               |

**Default** The default mode is **ipv4-limited-ipv6**.

**Mode** Global Configuration

**Example** To configure hardware ACLs to filter IPv4 and IPv6 traffic, use the following commands:

```
awplus# configure terminal
awplus(config)# platform hwfilter-size ipv4-full-ipv6
```

**Related commands** [show platform](#)  
[ipv6 access-list \(named IPv6 hardware ACL\)](#)

# show access-list counters

**Overview** Use this command to show the number of packets that match one or all of your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments. This lets you check your ACL configuration.

**Syntax** `show access-list counters [<acl>]`

| Parameter | Description                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------|
| <acl>     | Display the number of packets that match only the specified ACL. You can enter the ACL name or number. |

**Mode** User Exec and Privileged Exec

**Usage notes** This command displays the counter values since the last time they were cleared. To clear the counter values, enter the command [clear access-list counters](#).

To accurately measure the number of packet hits per ACL, you need to read the counters for all ACLs frequently.

**Example** To show the number of packets that match all hardware ACLs, use the following command:

```
awplus# show access-list counters
```

**Output** Figure 39-1: Example output from **show access-list counters**

```
awplus#show access-list counters
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
ACL-2
Packet Hits: 0
ACL-3
Packet Hits: 1
```

**Output** Figure 39-2: Example output from **show access-list counters ACL-1**

```
awplus#show access-list counters ACL-1
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
```

Table 39-4: Parameters in the output from **show access-list counters**

| Parameter   | Description                                                                                    |
|-------------|------------------------------------------------------------------------------------------------|
| Packet Hits | The number of packets that match the ACL. The count includes both dropped and allowed packets. |

**Related commands**    [clear access-list counters](#)  
                          [show interface access-group](#)

**Command changes**    Version 5.5.2-2.1: reading the counters no longer clears them  
                          Version 5.5.1-2.1: command added

# show acl-group ipv6 address

**Overview** Use this command to show the hosts and subnets in a named IPv6 ACL group.

**Syntax** `show acl-group ipv6 address <group>`

| Parameter                  | Description                     |
|----------------------------|---------------------------------|
| <code>&lt;group&gt;</code> | The name of the IPv6 ACL group. |

**Mode** Privileged Exec

**Example** To show all hosts and subnets in an IPv6 ACL group IPV6\_GROUP1, use the command:

```
awplus# show acl-group ipv6 address IPV6_GROUP1
```

**Output** Figure 39-3: Example output from **show acl-group ipv6 address IPV6\_GROUP1**

```
awplus#show acl-group ipv6 address IPV6_GROUP1
Host Group: IPV6_GROUP1

2001:DB8::/32
2001:DB9::1/128
```

**Related commands** [acl-group ipv6 address](#)  
[ipv6 \(ipv6-host-group\)](#)

**Command changes** Version 5.5.0-1.1: command added

# show ipv6 access-list (IPv6 Hardware ACLs)

**Overview** Use this command to display all configured hardware IPv6 access-lists or the IPv6 access-list specified by name. Omitting the optional name parameter will display all IPv6 ACLs.

**Syntax** `show ipv6 access-list [<name>]`

| Parameter | Description                     |
|-----------|---------------------------------|
| <name>    | Hardware IPv6 access-list name. |

**Mode** User Exec and Privileged Exec

**Example** To show all configured IPv6 access-lists use the command:

```
awplus# show ipv6 access-list
```

**Output** Figure 39-4: Example output from the **show ipv6 access-list** command

```
IPv6 access-list deny_ssh
deny tcp abcd::0/64 any eq 22
```

ACLs that are added dynamically during port authentication will be displayed with the label 'dynamic':

```
awplus# show ipv6 access-list
```

```
Named Standard IPv6 access list red
 10 deny any

Named Extended IPv6 access list blue
 10 deny ip any any

Hardware IPv6 access list dacl-port1.0.45-2477.03fe.ded4-ipv6 (dynamic)
 4 deny ipv6 any any
```

# 40

# IPv6 Software Access Control List (ACL) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for the IPv6 Software Access Control List (ACL) commands, and contains detailed command information and command examples about IPv6 software ACLs as applied to Routing and Multicasting, which are not applied to interfaces.

For information about ACLs, see the [ACL Feature Overview and Configuration Guide](#).

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see the following references:

- the [Link Aggregation Feature Overview\\_and\\_Configuration\\_Guide](#).
- [Link Aggregation Commands](#)

Note that text in parenthesis in command names indicates usage not keyword entry. For example, **ipv6-access-list (named)** indicates named IPv6 ACLs entered as:

```
ipv6-access-list<name>
```

where <name> is a placeholder not a keyword.

Note also that parenthesis surrounding ACL filters indicates the type of ACL filter not the keyword entry in the CLI. For example, **(ipv6 access-list standard IPv6 filter)** represents command entry in the format shown in the syntax:

```
[<sequence-number>] {deny|permit}
{<source-ipv6-address/prefix-length>|any}
```

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Sub-modes** Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

Table 40-1: IPv6 Software Access List Commands and Prompts

| Command Name                                   | Command Mode                    | Prompt                         |
|------------------------------------------------|---------------------------------|--------------------------------|
| show ipv6 access-list (IPv6 Software ACLs)     | Privileged Exec                 | awplus#                        |
| ipv6 access-list extended (named)              | Global Configuration            | awplus (config) #              |
| ipv6 access-list standard (named)              | Global Configuration            | awplus (config) #              |
| (ipv6 access-list extended IP protocol filter) | IPv6 Extended ACL Configuration | awplus (config-ipv6-ext-acl) # |
| (ipv6 access-list extended TCP UDP filter)     | IPv6 Extended ACL Configuration | awplus (config-ipv6-ext-acl) # |
| (ipv6 access-list standard filter)             | IPv6 Standard ACL Configuration | awplus (config-ipv6-std-acl) # |

# ipv6 access-list extended (named)

**Overview** Use this command when configuring an IPv6 extended access-list for filtering frames that permit or deny IP, ICMP, TCP, UDP packets or ICMP packets with a specific value based on the source or destination.

The **no** variant of this command removes a specified IPv6 extended access-list.

**Syntax**  
**[list-name]** ipv6 access-list extended <list-name>  
no ipv6 access-list extended <list-name>

| Parameter   | Description                                                     |
|-------------|-----------------------------------------------------------------|
| <list-name> | A user-defined name for the IPv6 software extended access-list. |

**Syntax**  
**[any|icmp|ip]** ipv6 access-list extended <list-name> {deny|permit}  
{any|icmp|ip} {<ipv6-source-address/prefix-length>|any}  
{<ipv6-destination-address/prefix-length>|any} [<icmp-type  
<icmp-type>] [log]

no ipv6 access-list extended <list-name> {deny|permit}  
{any|icmp|ip} {<ipv6-source-address/prefix-length>|any}  
{<ipv6-destination-address/prefix-length>|any} [<icmp-type  
<icmp-type>] [log]

**Syntax [tcp|udp]** ipv6 access-list extended <list-name> {deny|permit} {tcp|udp}  
{<ipv6-source-address/prefix-length>|any} {eq <sourceport>|lt  
<sourceport>|gt <sourceport>|ne  
<sourceport>}{<ipv6-destination-address/prefix-length>|any}  
{eq <destport>|lt <destport>|gt <destport>|ne <destport>} [log]  
no ipv6 access-list extended <list-name> {deny|permit}  
{tcp|udp} {<ipv6-source-address/prefix-length>|any} {eq  
<sourceport>|lt <sourceport>|gt <sourceport>|ne  
<sourceport>}{<ipv6-destination-addr/prefix-length>|any} {eq  
<destport>|lt<destport>|gt <destport>|ne <destport>} [log]

| Parameter   | Description                                                                                                                                |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <list-name> | A user-defined name for the IPv6 software extended access-list.                                                                            |
| deny        | The IPv6 software extended access-list rejects packets that match the type, source, and destination filtering specified with this command. |
| permit      | The IPv6 software extended access-list permits packets that match the type, source, and destination filtering specified with this command. |

| Parameter                                             | Description                                                                                                                                                    |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| any                                                   | For ICMP IP<br>The IPv6 software extended access-list matches any type of packet.                                                                              |
| ip                                                    | For ICMP IP<br>The IPv6 software extended access-list matches only IP packets.                                                                                 |
| icmp                                                  | For ICMP IP<br>The IPv6 software extended access-list matches only ICMP packets.                                                                               |
| tcp                                                   | For TCP/UDP<br>The IPv6 software extended access-list matches only TCP packets.                                                                                |
| udp                                                   | For TCP/UDP<br>The IPv6 software extended access-list matches only UDP packets.                                                                                |
| <i>&lt;ipv6-source-address/prefix-length&gt;</i>      | Specifies a source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.  |
| <i>&lt;ipv6-destination-address/prefix-length&gt;</i> | Specifies a destination address and prefix length. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |
| any                                                   | Matches any IPv6 address.                                                                                                                                      |
| <i>&lt;sourceport&gt;</i>                             | For TCP/UDP<br>The source port number, specified as an integer between 0 and 65535.                                                                            |
| <i>&lt;destport&gt;</i>                               | For TCP/UDP<br>The destination port number, specified as an integer between 0 and 65535.                                                                       |
| icmp-type                                             | For ICMP IP<br>Matches only a specified type of ICMP messages. This is valid only when the filtering is set to match ICMP packets.                             |
| eq                                                    | For TCP/UDP<br>Matches port numbers equal to the port number specified immediately after this parameter.                                                       |
| lt                                                    | For TCP/UDP<br>Matches port numbers less than the port number specified immediately after this parameter.                                                      |
| gt                                                    | For TCP/UDP<br>Matches port numbers greater than the port number specified immediately after this parameter.                                                   |
| ne                                                    | For TCP/UDP<br>Matches port numbers not equal to the port number specified immediately after this parameter.                                                   |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use IPv6 extended access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 extended access-list when a match is encountered.

For backwards compatibility you can either create IPv6 extended access-lists from within this command, or you can enter `ipv6 access-list extended` followed by only the IPv6 extended access-list name. This latter (and preferred) method moves you to the `(config-ipv6-ext-acl)` prompt for the selected IPv6 extended access-list number, and from here you can configure the filters for this selected access-list.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Example 1 [creating a list]** To add a new filter to the access-list named `my-list` that will reject incoming ICMP packets from 2001:0db8::0/64 to 2001:0db8::f/64, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# icmp 2001:0db8::0/64
2001:0db8::f/64
```

**Example 2 [adding to a list]** To insert a new filter at sequence number 5 of the access-list named `my-list` that will accept ICMP type 8 packets from the 2001:0db8::0/64 network to the 2001:0db8::f/64 network, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 icmp 2001:0db8::0/64
2001:0db8::f/64
```

**Example 3 [list with filter]** To create the access-list named TK to deny TCP protocols, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended TK deny tcp any eq 14
any lt 12 log
```

**Command changes**

Version 5.5.1-0.1: Support for the **no** variant added

## ipv6 access-list extended proto

**Overview** Use this command when configuring an IPv6 extended access-list for filtering frames that permit or deny packets with a specific value based on the IP protocol number specified.

The **no** variant of this command removes a specified IPv6 extended access-list with an IP protocol number.

**Syntax**

```
ipv6 access-list extended <list-name> {deny|permit} proto
<ip-protocol> {<ipv6-source-address/prefix>|any}
{<ipv6-destination-address/prefix>|any} [log]

no ipv6 access-list extended <list-name> {deny|permit} proto
<ip-protocol>{<ipv6-source-address/prefix>|any}
{<ipv6-destination-address/prefix>|any} [log]
```

| Parameter                         | Description                                                                                                                                                                                                                                                          |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <list-name>                       | A user-defined name for the IPv6 software extended access- list.                                                                                                                                                                                                     |
| deny                              | Specifies the packets to reject.                                                                                                                                                                                                                                     |
| permit                            | Specifies the packets to accept.                                                                                                                                                                                                                                     |
| proto                             | The IP Protocol type specified by its protocol number in the range 1 to 255.                                                                                                                                                                                         |
| <ip-protocol>                     | The IP protocol number, as defined by IANA (Internet Assigned Numbers Authority<br><a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a> )<br>See below for a list of IP protocol numbers and their descriptions. |
| <ipv6-source-address/prefix>      | IPv6 source address, or local address.<br>The IPv6 address uses the format X:X::X/X/Prefix-Length. The prefix-length is usually set between 0 and 64.                                                                                                                |
| any                               | Any source address or local address.                                                                                                                                                                                                                                 |
| <ipv6-destination-address/prefix> | IPv6 destination address, or local address.<br>The IPv6 address uses the format X:X::X/X/Prefix-Length. The prefix-length is usually set between 0 and 64.                                                                                                           |
| any                               | Any destination address or remote address.                                                                                                                                                                                                                           |
| log                               | Log the results.                                                                                                                                                                                                                                                     |

Table 40-2: IP protocol number and description (cont.)

| Protocol Number | Protocol Description [RFC]                    |
|-----------------|-----------------------------------------------|
| 139-252         | Unassigned / IANA                             |
| 253             | Use for experimentation and testing / RFC3692 |
| 254             | Use for experimentation and testing / RFC3692 |
| 255             | Reserved / IANA                               |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use IPv6 extended access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 extended access-list when a match is encountered.

The filter entry will match on any IP protocol type packet that has the specified source and destination IPv6 addresses and the specified IP protocol type. The parameter *any* may be specified if an address does not matter.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To create the IPv6 access-list named ACL-1 to deny IP protocol 9 packets from 2001:0db8:1::1/128 to 2001:0db8:f::1/128, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended ACL-1 deny proto 9
2001:0db8:1::1/128 2001:0db8:f::1/128
```

To remove the IPv6 access-list named ACL-1 to deny IP protocol 9 packets from 2001:0db8:1::1/128 to 2001:0db8:f::1/128, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 access-list extended ACL-1 deny proto
10 2001:0db8:1::1/128 2001:0db8:f::1/128
```

- ipv6 access-list extended (named)
- (ipv6 access-list extended IP protocol filter)
- show ipv6 access-list (IPv6 Software ACLs)
- show running-config

## (ipv6 access-list extended IP protocol filter)

**Overview** Use this ACL filter to add a filter entry for an IPv6 source and destination address and prefix, with or without an IP protocol specified, to the current extended IPv6 access-list. If a sequence is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source and destination address and prefix, with or without an IP protocol filter entry, from the current extended IPv6 access-list. You can specify the ACL filter entry by entering either its sequence number, or its filter entry profile.

**Syntax [ip|proto]** [*<sequence-number>*] {deny|permit} {ip|any|proto *<ip-protocol>*} {*<ipv6-source-address/prefix>*|any} {*<ipv6-destination-address/prefix>*|any} [log]

no {deny|permit} {ip|any|proto *<ip-protocol>*} {*<ipv6-source-address/prefix>*|any} {*<ipv6-destination-address/prefix>*|any} [log]

no [*<sequence-number>*]

**Mode** IPv6 Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** The filter entry will match on any IP protocol type packet that has the specified source and destination IPv6 addresses and the specified IP protocol type. The parameter *any* may be specified if an address does not matter.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To add a new ACL filter entry to the extended IPv6 access-list named *my-list* with sequence number 5 rejecting the IPv6 packet from *2001:db8:1:1:1* to *2001:db8:f:1:1*, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny ip 2001:db8:1::1/128
2001:db8:f::1/128
```

To remove the ACL filter entry to the extended IPv6 access-list named *my-list* with sequence number 5, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# no 5
```

**Related commands** [ipv6 access-list extended \(named\)](#)  
[show ipv6 access-list \(IPv6 Software ACLs\)](#)  
[show running-config](#)

## (ipv6 access-list extended TCP UDP filter)

**Overview** Use this ACL filter to add a filter entry for an IPv6 source and destination address and prefix, with a TCP (Transmission Control Protocol) or UDP (User Datagram Protocol) source and destination port specified, to the current extended IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source and destination address and prefix, with a TCP or UDP source and destination port specified, from the current extended IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

**Syntax [tcp|udp]** [*<sequence-number>*] {deny|permit} {tcp|udp} {<ipv6-source-address/prefix>|any} {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>} {<IPv6-destination-address/prefix>|any} {eq <destport>|lt <destport>|gt <destport>|ne <destport>} [log]

no {deny|permit} {tcp|udp} {<ipv6-source-address/prefix>|any} {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>}} {<IPv6-destination-address/prefix>|any} {eq <destport>|lt <destport>|gt <destport>|ne <destport>} [log]

no <sequence-number>

|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <sequence-number>            | <1-65535><br>The sequence number for the filter entry of the selected access control list.                                                            |
| deny                         | Specifies the packets to reject.                                                                                                                      |
| permit                       | Specifies the packets to accept.                                                                                                                      |
| tcp                          | TCP packet.                                                                                                                                           |
| udp                          | UDP packet.                                                                                                                                           |
| <ipv6-source-address/prefix> | IPv6 source address, or local address.<br>The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |
| any                          | Any source address or local address.                                                                                                                  |
| eq                           | Equal to.                                                                                                                                             |
| lt                           | Less than.                                                                                                                                            |
| gt                           | Greater than.                                                                                                                                         |
| ne                           | Not equal to.                                                                                                                                         |
| <sourceport>                 | The source port number, specified as an integer between 0 and 65535.                                                                                  |

| Parameter                         | Description                                                                                                                                           |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipv6-destination-address/prefix> | IPv6 destination address, or local address. The IPv6 address uses the format X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |
| <destport>                        | The destination port number, specified as an integer between 0 and 65535.                                                                             |
| log                               | Log the results.                                                                                                                                      |

**Mode** IPv6 Extended ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** The filter entry will match on any packet that has the specified source and destination IPv6 addresses and the specified TCP or UDP source and destination port. The parameter *any* may be specified if an address does not matter.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To add a new filter entry with sequence number 5 to the access-list named *my-list* to reject TCP packets from 2001:0db8::0/64 port 10 to 2001:0db8::f/64 port 20, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny tcp 2001:0db8::0/64 eq 10
2001:0db8::f/64 eq 20
```

To add a new filter entry with sequence number 5 to the extended IPv6 access-list named *my-list* to reject UDP packets from 2001:0db8::0/64 port 10 to 2001:0db8::f/64 port 20, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny udp 2001:0db8::0/64 eq 10
2001:0db8::f/64 eq 20
```

To remove the filter entry with sequence number 5 to the extended IPv6 access-list named *my-list*, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# no 5
```

**Related commands** [ipv6 access-list extended \(named\)](#)  
[show ipv6 access-list \(IPv6 Software ACLs\)](#)  
[show running-config](#)

## ipv6 access-list standard (named)

**Overview** This command configures an IPv6 standard access-list for filtering frames that permit or deny IPv6 packets from a specific source IPv6 address.

The **no** variant of this command removes a specified IPv6 standard access-list.

**Syntax**  
**[list-name]** `ipv6 access-list standard <ipv6-acl-list-name>`  
`no ipv6 access-list standard <ipv6-acl-list-name>`

| Parameter                               | Description                                                     |
|-----------------------------------------|-----------------------------------------------------------------|
| <code>&lt;ipv6-acl-list-name&gt;</code> | A user-defined name for the IPv6 software standard access-list. |

**Syntax [deny|permit]** `ipv6 access-list standard <ipv6-acl-list-name> [{deny|permit} {<ipv6-source-address/prefix-length>|any} [exact-match]]`  
`no ipv6 access-list standard <ipv6-acl-list-name> [{deny|permit} {<ipv6-source-address/prefix-length>|any} [exact-match]]`

| Parameter                                              | Description                                                                                                                                                   |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-acl-list-name&gt;</code>                | A user-defined name for the IPv6 software standard access-list.                                                                                               |
| <code>deny</code>                                      | The IPv6 software standard access-list rejects packets that match the type, source, and destination filtering specified with this command.                    |
| <code>permit</code>                                    | The IPv6 software standard access-list permits packets that match the type, source, and destination filtering specified with this command.                    |
| <code>&lt;ipv6-source-address/prefix-length&gt;</code> | Specifies a source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64. |
| <code>any</code>                                       | Matches any source IPv6 address.                                                                                                                              |
| <code>exact-match</code>                               | Exact match of the prefixes.                                                                                                                                  |

**Mode** Global Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage notes** Use IPv6 standard access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 standard access-list when a match is encountered.

For backwards compatibility you can either create IPv6 standard access-lists from within this command, or you can enter `ipv6 access-list standard` followed by only the IPv6 standard access-list name. This latter (and preferred) method moves you to the `(config-ipv6-std-acl)` prompt for the selected IPv6 standard access-list, and from here you can configure the filters for this selected IPv6 standard access-list.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Example** To enter the IPv6 Standard ACL Configuration mode for the access-list named `my-list`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)#
```

**Related commands** [\(ipv6 access-list standard filter\)](#)  
[show ipv6 access-list \(IPv6 Software ACLs\)](#)  
[show running-config](#)

## (ipv6 access-list standard filter)

**Overview** Use this ACL filter to add a filter entry for an IPv6 source address and prefix length to the current standard IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source address and prefix from the current standard IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

**Syntax [icmp]** [`<sequence-number>`] {deny|permit}  
{`<ipv6-source-address/prefix-length>`|any}  
no {deny|permit} {`<ipv6-source-address/prefix-length>`|any}  
no `<sequence-number>`

| Parameter                                              | Description                                                                                                   |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>&lt;sequence-number&gt;</code>                   | <code>&lt;1-65535&gt;</code><br>The sequence number for the filter entry of the selected access control list. |
| deny                                                   | Specifies the packets to reject.                                                                              |
| permit                                                 | Specifies the packets to accept.                                                                              |
| <code>&lt;ipv6-source-address/prefix-length&gt;</code> | IPv6 source address and prefix-length in the form X:X::X:X/P.                                                 |
| any                                                    | Any IPv6 source host address.                                                                                 |

**Mode** IPv6 Standard ACL Configuration

**Default** Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

**Usage** The filter entry will match on any IPv6 packet that has the specified IPv6 source address and prefix length. The parameter `any` may be specified if an address does not matter.

**NOTE:** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

**Examples** To add an ACL filter entry with sequence number 5 that will deny any IPv6 packets to the standard IPv6 access-list named `my-list`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# 5 deny any
```

To remove the ACL filter entry that will deny any IPv6 packets from the standard IPv6 access-list named `my-list`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# no deny any
```

Alternately, to remove the ACL filter entry with sequence number 5 to the standard IPv6 access-list named `my-list`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# no 5
```

# ipv6 prefix-list

**Overview** Use this command to create an IPv6 prefix list or an entry in an existing prefix list.

Use the **no** variant of this command to delete a whole prefix list, a prefix list entry, or a description.

**Syntax**

```
ipv6 prefix-list <list-name> [seq <1-429496725>] {deny|permit}
{any|<ipv6-prefix>} [ge <0-128>] [le <0-128>]

ipv6 prefix-list <list-name> description <text>

no ipv6 prefix-list <list-name> [seq <1-429496725>]

no ipv6 prefix-list <list-name> [description <text>]
```

| Parameter         | Description                                                                          |
|-------------------|--------------------------------------------------------------------------------------|
| <list-name>       | Specifies the name of a prefix list.                                                 |
| seq <1-429496725> | Sequence number of the prefix list entry.                                            |
| deny              | Specifies that the prefixes are excluded from the list.                              |
| permit            | Specifies that the prefixes are included in the list.                                |
| <ipv6-prefix>     | Specifies the IPv6 prefix and prefix length in hexadecimal in the format X:X::X:X/M. |
| any               | Any prefix match. Same as ::0/0 le 128.                                              |
| ge <0-128>        | Specifies the minimum prefix length to be matched.                                   |
| le <0-128>        | Specifies the maximum prefix length to be matched.                                   |
| description       | Prefix list specific description.                                                    |
| <text>            | Up to 80 characters of text description of the prefix list.                          |

**Mode** Global Configuration

**Usage notes** When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. The parameters **ge** and **le** are only used if an ip-prefix is stated. When setting these parameters, set the **le** value to be less than 128, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

**Example** To check the first 32 bits of the prefix 2001:db8:: and that the subnet mask must be greater than or equal to 34 and less than or equal to 40, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 prefix-list mylist seq 12345 permit
2001:db8::/32 ge 34 le 40
```

# show ipv6 access-list (IPv6 Software ACLs)

**Overview** Use this command to display all configured IPv6 access-lists or the IPv6 access-list specified by name.

**Syntax** show ipv6 access-list [<access-list-name>]  
show ipv6 access-list standard [<access-list-name>]  
show ipv6 access-list extended [<access-list-name>]

| Parameter          | Description                                                                 |
|--------------------|-----------------------------------------------------------------------------|
| <access-list-name> | Only display information about an IPv6 access-list with the specified name. |
| standard           | Only display information about standard access-lists.                       |
| extended           | Only display information about extended access-lists.                       |

**Mode** User Exec and Privileged Exec

**Example** To show all configured IPv6 access-lists, use the following command:

```
awplus# show ipv6 access-list
```

**Output** Figure 40-1: Example output from **show ipv6 access-list**

```
IPv6 access-list deny_icmp
deny icmp any any vlan 1

IPv6 access-list deny_ssh
deny tcp abcd::0/64 any eq 22
```

**Example** To show the IPv6 access-list named **deny\_icmp**, use the following command:

```
awplus# show ipv6 access-list deny_icmp
```

**Output** Figure 40-2: Example output from **show ipv6 access-list** for a named ACL

```
IPv6 access-list deny_icmp
deny icmp any any vlan 1
```

# show ipv6 prefix-list

**Overview** Use this command to display the prefix-list entries.

Note that this command is valid for RIPng only.

**Syntax** `show ipv6 prefix-list [<name>|detail|summary]`

| Parameter | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| <name>    | Specify the name of an individual IPv6 prefix list.                       |
| detail    | Specify this parameter to show detailed output for all IPv6 prefix lists. |
| summary   | Specify this parameter to show summary output for all IPv6 prefix lists.  |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ipv6 prefix-list
awplus# show ipv6 prefix-list 10.10.0.98/8
awplus# show ipv6 prefix-list detail
```

**Related commands** [ipv6 prefix-list](#)

## vtv ipv6 access-class (named)

**Overview** For IPv6, use this command to set a standard named software access list to be the management ACL. This is then applied to all available VTY lines for controlling remote access by Telnet and SSH. This command allows or denies packets containing the IPv6 addresses included in the ACL to create a connection to your device.

ACLs that are attached using this command have an implicit 'deny-all' filter as the final entry in the ACL. A typical configuration is to permit a specific address, or range of addresses, and rely on the 'deny-all' filter to block all other access.

Use the **no** variant of this command to remove the access list.

**Syntax** `vtv ipv6 access-class <access-name>`  
`no vtv ipv6 access-class [<access-name>]`

| Parameter                        | Description                                        |
|----------------------------------|----------------------------------------------------|
| <code>&lt;access-name&gt;</code> | Specify an IPv6 standard software access-list name |

**Mode** Global Configuration

**Examples** To set the named standard access-list named **access-ctrl** to be the IPv6 management ACL, use the following commands:

```
awplus# configure terminal
awplus(config)# vtv ipv6 access-class access-ctrl
```

To remove **access-ctrl** from the management ACL, use the following commands:

```
awplus# configure terminal
awplus(config)# no vtv ipv6 access-class access-ctrl
```

**Output** Figure 40-3: Example output from the **show running-config** command

```
awplus#show running-config|grep access-class
vtv ipv6 access-class access-ctrl
```

# QoS Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for Quality of Service commands.

QoS uses ACLs. For more information about ACLs, see the [ACL Feature Overview and Configuration Guide](#).

For more information about PBR, see the [Policy-Based Routing Feature Overview and Configuration Guide](#).

# class

**Overview** Use this command to associate an existing class-map to a policy or policy-map (traffic classification), and to enter Policy Map Class Configuration mode to configure the class-map.

Use the **no** variant of this command to delete an existing class-map.

If your class-map does not exist, you can create it by using the [class-map](#) command.

**Syntax** `class {<name>|default}`  
`no class <name>`

| Parameter | Description                               |
|-----------|-------------------------------------------|
| <name>    | Name of the (already existing) class-map. |
| default   | Specify the default class-map.            |

**Mode** Policy Map Configuration

**Example** The following example creates the policy-map `pmap1` (using the `policy-map` command), then associates this to an already existing class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)#
```

**Related commands** [class-map](#)  
[policy-map](#)

# class-map

**Overview** Use this command to create a class-map.  
Use the **no** variant of this command to delete the named class-map.

**Syntax** `class-map <name>`  
`no class-map <name>`

| Parameter | Description                          |
|-----------|--------------------------------------|
| <name>    | Name of the class-map to be created. |

**Mode** Global Configuration

**Example** This example creates a class-map called `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)#
```

# clear mls qos interface policer-counters

**Overview** Resets an interface's policer counters to zero. You can either clear a specific class-map, or you can clear all class-maps by not specifying a class map.

**Syntax** `clear mls qos interface <port> policer-counters [class-map <class-map>]`

| Parameter   | Description                                                                                                                      |
|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| <port>      | The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4). |
| class-map   | Select a class-map.                                                                                                              |
| <class-map> | Class-map name.                                                                                                                  |

**Mode** Privileged Exec

**Example** To reset the policy counters to zero for all class-maps for port1.0.4, use the command:

```
awplus# clear mls qos interface port1.0.4 policer-counters
```

**Related commands** [show mls qos interface policer-counters](#)

# clear mls qos interface queue-counters

**Overview** Use this command to clear the QoS queue counters for an interface.

**Syntax** `clear mls qos interface <interface> queue-counters`

| Parameter   | Description                                                                                                                   |
|-------------|-------------------------------------------------------------------------------------------------------------------------------|
| <interface> | The interface to clear the counters for. This can be a switchport, a static channel group, or a dynamic (LACP) channel group. |

**Mode** Privileged Exec

**Example** To clear the egress queue counters on interface port1.0.1, use the command:

```
awplus# clear mls qos interface port1.0.1 queue-counters
```

To clear the egress queue counters on the static aggregator sa1, use the command:

```
awplus# clear mls qos interface sa1 queue-counters
```

**Related commands** [show mls qos interface queue-counters](#)

**Command changes** Version 5.5.2-2.1: command added

# default-action

**Overview** Use this command to set the action for the default class-map belonging to a particular policy-map. The action for a non-default class-map depends on the action of any ACL that is applied to the policy-map.

You can think of the default action as the action that the switch will apply to any data that does not meet the criteria specified by the applied matching commands.

Use the **no** variant of this command to reset to the default action of 'permit'.

**Syntax** `default-action <action>`  
`no default-action`

| Parameter                                    | Description                                                                                                                                                                                                                                                               |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <action> permit                              | Permit packets                                                                                                                                                                                                                                                            |
| deny                                         | Deny packets.                                                                                                                                                                                                                                                             |
| send-to-cpu                                  | Send packets to the CPU.                                                                                                                                                                                                                                                  |
| copy-to-cpu                                  | Copy packets to the CPU as well as forwarding them.                                                                                                                                                                                                                       |
| copy-to-mirror<br>[interface<br>port-number] | Copy packets to the mirror port as well as forwarding them.<br>Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br>port-number] | Send packets to the mirror port instead of forwarding them.<br>Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |

**Default** The default is **permit**.

**Mode** Policy Map Configuration

**Examples** To set the action for the default class-map to 'deny' for the policy map named 'map1', use the commands:

```
awplus# configure terminal
awplus(config)# mls qos enable
awplus(config)# policy-map map1
awplus(config-pmap)# default-action deny
```

To set the action for the default class-map to 'copy-to-mirror' for use with the [mirror interface](#) command, for the policy map named 'map1', use the commands:

```
awplus# configure terminal
awplus(config)# mls qos enable
awplus(config)# policy-map map1
awplus(config-pmap)# default-action copy-to-mirror
```

**Related  
commands** [mirror interface](#)

## description (QoS policy-map)

**Overview** Adds a textual description of the policy-map. This can be up to 80 characters long. Use the **no** variant of this command to remove the current description from the policy-map.

**Syntax** `description <line>`  
`no description`

| Parameter                 | Description                               |
|---------------------------|-------------------------------------------|
| <code>&lt;line&gt;</code> | Up to 80 character long line description. |

**Mode** Policy Map Configuration

**Example** To add the description, VOIP traffic, use the command:  
`awplus(config-pmap)# description VOIP traffic`

# egress-rate-limit

**Overview** Use this command to limit the amount of traffic that can be transmitted per second from this port.

Use the **no** variant of this command to disable the limiting of traffic egressing on the interface.

**Syntax** `egress-rate-limit <rate-limit> max-burst-size <size>`  
`no egress-rate-limit`

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;rate-limit&gt;</code> | Bandwidth <1-10000000 units per second> (usable units: k, m, g). The egress rate limit can be configured in multiples of 64kbps. If you configure a value that is not an exact multiple of 64kbps, then the value will be rounded up to the nearest higher exact multiple of 64kbps. The minimum is 64 Kb. The default unit is Kb ( <b>k</b> ), but Mb ( <b>m</b> ) or Gb ( <b>g</b> ) can also be specified. The command syntax is not case sensitive, so a value such as 20m or 20M will be interpreted as 20 megabits.                                                                                                               |
| <code>&lt;size&gt;</code>       | The maximum burst size in kilobytes (k), megabytes (m) or gigabytes (g). The minimum value for the max-burst-size is 64 kilobytes. Only certain values are valid; if you enter an invalid value, the max-burst size will be rounded to the nearest valid value. The default value is the number of bytes that would be transmitted in one full second of transmission at the rate limit. We recommend setting the maximum burst size to approximately the number of bytes that would be transmitted in one-third of a second of transmission at the rate limit. This means entering a value of approximately $\text{<rate-limit>/24}$ . |

**Mode** Interface Configuration

**Usage notes** Egress rate limiting uses a token bucket system. The rate limit represents how fast the bucket fills and the maximum burst size represents its maximum depth. The maximum burst size enables the switch to groom upstream traffic so that it meets the requirements of upstream devices. See the examples for more detail about the resulting behavior.

**Examples** To set a rate limit on port 1.0.1 of 5Mbps and burst size of 200KB, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# egress-rate-limit 5m max-burst-size 200k
```

When maximum burst size is 200KB, a burst of up to approximately 200KB can be sent at line rate (100 or 1000Mbps) if there are packets in the queues to send. If

traffic is still sitting in the queues once the 200KB burst has been sent, then that traffic will be only transmitted at 5Mbps, not at line rate. If the average egress traffic rate is over 5Mbps, then the queues will fill up over time. When the queues become full, the switch will drop packets and/or send pause frames to the traffic source. You can enable the switch to send pause frames by entering the command **flowcontrol**.

To disable egress rate limiting on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no egress-rate-limit
```

**Related  
commands**

[egress-rate-limit overhead](#)

**Command  
changes**

Version 5.4.6-2.1: **max-burst-size** parameter added

# egress-rate-limit overhead

**Overview** Use this command to allow for the size of packet preamble and inter-packet gap (the “overhead”) in egress queue rate limiting on switch ports.

Doing this keeps the rate limit at the same percentage of line rate for all packet sizes. Otherwise, the percentage of line rate changes with packet size, because of the size of the overhead relative to smaller packets. This means smaller packets take up a larger percentage of the line rate.

Use the **no** variant of this command to turn off the overhead allowance.

**Syntax** egress-rate-limit overhead <bytes>  
no egress-rate-limit overhead

| Parameter | Description                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <bytes>   | The number of bytes to allow for overhead. For standard ethernet packets, use a value of 20 bytes (8 bytes of preamble and a inter-packet gap of 12 bytes). |

**Default** No overhead allowance

**Mode** Interface Configuration

**Example** To configure an overhead allowance of 20 bytes (8 bytes of preamble and a inter-packet gap of 12 bytes) on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# egress-rate-limit overhead 20
```

To return port1.0.1 to the default of no overhead allowance, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no egress-rate-limit overhead
```

**Related commands** [egress-rate-limit](#)

**Command changes** Version 5.4.9-2.1: command added

# match access-group

**Overview** Use this command to apply an ACL to a class-map or VLAN.

Use the **no** variant of this command to remove the match.

**Syntax** `match access-group {<hw-IP-ACL>|<hw-MAC-ACL>|<hw-named-ACL>}`  
`no match access-group`  
`{<hw-IP-ACL>|<hw-MAC-ACL>|<hw-named-ACL>}`

| Parameter      | Description                                                     |
|----------------|-----------------------------------------------------------------|
| <hw-IP-ACL>    | Specify a hardware IP ACL number in the range <3000-3699>.      |
| <hw-MAC-ACL>   | Specify a hardware MAC ACL number in the range <4000-4699>.     |
| <hw-named-ACL> | Specify a hardware named ACL (IP, IPv6 or MAC address entries). |

**Mode** Class Map or VLAN Access-Map

**Usage notes** First create an access-list that applies the appropriate action to matching packets. Then use the **match access-group** command to apply this access-list as desired. Note that this command will apply the access-list matching only to *incoming* data packets.

**Examples** To configure a class-map named "cmap1", which matches traffic against access-list 3001, which allows IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 3001 permit ip any any
awplus(config)# class-map cmap1
awplus(config-cmap)# match access-group 3001
```

To configure a class-map named "cmap2", which matches traffic against access-list 4001, which allows MAC traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 permit any any
awplus(config)# class-map cmap2
awplus(config-cmap)# match access-group 4001
```

To configure a class-map named “cmap3”, which matches traffic against access-list “hw\_acl”, which allows IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware hw_acl
awplus(config-ip-hw-acl)# permit ip any any
awplus(config)# class-map cmap3
awplus(config-cmap)# match access-group hw_acl
```

To apply ACL 3001 to VLAN 48, where the ACL drops IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 3001 deny ip any any
awplus(config)# vlan access-map deny_all
awplus(config-vlan-access-map)# match access-group 3001
awplus(config-vlan-access-map)# exit
awplus(config)# vlan filter deny_all vlan-list 48 input
```

**Command  
changes**

Version 5.4.6-2.1: support for VLAN access-maps added

# match cos

**Overview** Use this command to define a COS to match against incoming packets.  
Use the **no** variant of this command to remove CoS.

**Syntax** `match cos <0-7>`  
`no match cos`

| Parameter | Description            |
|-----------|------------------------|
| <0-7>     | Specify the CoS value. |

**Mode** Class Map Configuration

**Examples** To set the class-map's CoS to 4, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match cos 4
```

To remove CoS from a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match cos
```

# match dscp

**Overview** Use this command to define the DSCP to match against incoming packets.  
Use the **no** variant of this command to remove a previously defined DSCP.

**Syntax** `match dscp <0-63>`  
`no match dscp`

| Parameter | Description                                           |
|-----------|-------------------------------------------------------|
| <0-63>    | Specify DSCP value (only one value can be specified). |

**Mode** Class Map Configuration

**Usage** Use the **match dscp** command to define the match criterion after creating a class-map.

**Examples** To configure a class-map named `cmap1` with criterion that matches DSCP 56, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match dscp 56
```

To remove a previously defined DSCP from a class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match dscp
```

**Related commands** [class-map](#)

# match eth-format protocol

**Overview** This command sets the Ethernet format and the protocol for a class-map to match on.

Select one Layer 2 format and one Layer 3 protocol when you issue this command.

Use the **no** variant of this command to remove the configured Ethernet format and protocol from a class-map.

**Syntax** `match eth-format <layer-two-format> protocol  
<layer-three-protocol>  
no match eth-format protocol`

The following eth-formats and protocols are available (note that not all options are available on all AlliedWare Plus switch models):

| Parameter                            | Description                                                                                                              |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;layer-two-formats&gt;</i>     |                                                                                                                          |
| 802dot2-tagged                       | 802.2 Tagged Packets (enter the parameter name).                                                                         |
| 802dot2-untagged                     | 802.2 Untagged Packets (enter the parameter name).                                                                       |
| ethii-tagged                         | EthII Tagged Packets (enter the parameter name).                                                                         |
| ethii-untagged                       | EthII Untagged Packets (enter the parameter name).                                                                       |
| ethii-any                            | EthII Tagged or Untagged Packets (enter the parameter name).                                                             |
| netwareraw-tagged                    | Netware Raw Tagged Packets (enter the parameter name).                                                                   |
| netwareraw-untagged                  | Netware Raw Untagged Packets (enter the parameter name).                                                                 |
| snap-tagged                          | SNAP Tagged Packets (enter the parameter name).                                                                          |
| snap-untagged                        | SNAP Untagged Packets (enter the parameter name).                                                                        |
| <i>&lt;layer-three-protocols&gt;</i> |                                                                                                                          |
| <word>                               | A Valid Protocol Number in hexadecimal.                                                                                  |
| any                                  | Note that the parameter "any" is only valid when used with the netwarerawtagged and netwarerawuntagged protocol options. |
| sna-path-control                     | Protocol Number 04 (enter the parameter name or its number).                                                             |
| proway-lan                           | Protocol Number 0E (enter the parameter name or its number).                                                             |
| eia-rs Protocol                      | Number 4E (enter the parameter name or its number).                                                                      |
| proway Protocol                      | Number 8E (enter the parameter name or its number).                                                                      |

| Parameter         | Description                                                    |
|-------------------|----------------------------------------------------------------|
| ipx-802dot2       | Protocol Number E0 (enter the parameter name or its number).   |
| netbeui           | Protocol Number F0 (enter the parameter name or its number).   |

| ipx              | Protocol Number 8137 (enter the parameter name or its number). |
| ipv6             | Protocol Number 86DD (enter the parameter name or its number). |

### Mode Class Map Configuration

**Examples** To set the eth-format to ethii-tagged and the protocol to 0800 (IP) for class-map cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match eth-format ethii-tagged protocol
0800
awplus(config-cmap)# match eth-format ethii-tagged protocol ip
```

To remove the eth-format and the protocol from the class-map cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match eth-format protocol
```

# match ip-precedence

**Overview** Use this command to identify IP precedence values as match criteria.

Use the **no** variant of this command to remove IP precedence values from a class-map.

**Syntax** `match ip-precedence <0-7>`  
`no match ip-precedence`

| Parameter                | Description                         |
|--------------------------|-------------------------------------|
| <code>&lt;0-7&gt;</code> | The precedence value to be matched. |

**Mode** Class Map Configuration

**Example** To configure a class-map named `cmap1` to match all IPv4 packets with a precedence value of 5, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match ip-precedence 5
```

# match mac-type

**Overview** Use this command to set the MAC type for a class-map to match on.  
Use **no** variant of this command to remove the MAC type match entry.

**Syntax** `match mac-type {l2broadcast|l2multicast|l2unicast}`  
`no match mac-type`

| Parameter   | Description                |
|-------------|----------------------------|
| l2broadcast | Layer 2 Broadcast traffic. |
| l2multicast | Layer 2 Multicast traffic. |
| l2unicast   | Layer 2 Unicast traffic.   |

**Mode** Class Map Configuration

**Examples** To set the class-map's MAC type to Layer 2 multicast, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match mac-type l2multicast
```

To remove the class-map's MAC type entry, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match mac-type
```

# match tcp-flags

**Overview** Sets one or more TCP flags (control bits) for a class-map to match on.

Use the **no** variant of this command to remove one or more TCP flags for a class-map to match on.

**Syntax** `match tcp-flags [ack] [fin] [psh] [rst] [syn] [urg]`  
`no match tcp-flags [ack] [fin] [psh] [rst] [syn] [urg]`

| Parameter | Description  |
|-----------|--------------|
| ack       | Acknowledge. |
| fin       | Finish.      |
| psh       | Push.        |
| rst       | Reset.       |
| syn       | Synchronize. |
| urg       | Urgent.      |

**Mode** Class Map Configuration

**Examples** To set the class-map's TCP flags to **ack** and **syn**, use the commands:

```
awplus# configure terminal
awplus(config)# class-map
awplus(config-cmap)# match tcp-flags ack syn
```

To remove the TCP flags **ack** and **rst**, use the commands:

```
awplus# configure terminal
awplus(config)# class-map
awplus(config-cmap)# no match tcp-flags ack rst
```

# match vlan

**Overview** Use this command to define the VLAN ID as match criteria.  
Use the **no** variant of this command to disable the VLAN ID used as match criteria.

**Syntax** `match vlan <1-4094>`  
`no match vlan`

| Parameter                   | Description      |
|-----------------------------|------------------|
| <code>&lt;1-4094&gt;</code> | The VLAN number. |

**Mode** Class Map Configuration

**Examples** To configure a class-map named `cmap1` to include traffic from VLAN 3, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match vlan 3
```

To disable the configured VLAN ID as a match criteria for the class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match vlan
```

# mls qos cos

**Overview** This command assigns a CoS (Class of Service) user-priority value to untagged frames entering a specified interface. By default, all untagged frames are assigned a CoS value of 0.

Use the **no** variant of this command to return the interface to the default CoS setting for untagged frames entering the interface.

**Syntax** `mls qos cos <0-7>`  
`no mls qos cos`

| Parameter | Description                                |
|-----------|--------------------------------------------|
| <0-7>     | The Class of Service, user-priority value. |

**Default** By default, all untagged frames are assigned a CoS value of 0. Note that for tagged frames, the default behavior is not to alter the CoS value.

**Mode** Interface Configuration

**Example** To assign a CoS user priority value of 2 to all untagged packets entering port1.0.1 to port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# mls qos cos 2
```

# mls qos enable

**Overview** Use this command to enable QoS.

Use the **no** variant of this command to globally disable QoS and remove all QoS configuration. The **no** variant of this command removes all class-maps, policy-maps, and policers that have been created. Running the **no mls qos** command will therefore remove all pre-existing QoS configurations on the switch.

**Mode** Global Configuration

**Syntax** mls qos enable  
no mls qos

**Example** To enable QoS on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos enable
```

# mls qos map cos-queue

**Overview** Use this command to set the default CoS to egress queue mapping. This is the default queue mapping for packets that do not get assigned an egress queue via any other QoS functionality.

Use the **no** variant of this command to reset the cos-queue map back to its default setting. The default mappings for this command are:

|                |   |   |   |   |   |   |   |   |
|----------------|---|---|---|---|---|---|---|---|
| CoS Priority : | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| -----          |   |   |   |   |   |   |   |   |
| CoS QUEUE:     | 2 | 0 | 1 | 3 | 4 | 5 | 6 | 7 |

**Syntax** `mls qos map cos-queue <cos-priority> to <queue-number>`  
`no mls qos map cos-queue`

| Parameter      | Description                                           |
|----------------|-------------------------------------------------------|
| <cos-priority> | CoS priority value. Can take a value between 0 and 7. |
| <queue-number> | Queue number. Can take a value between 0 and 7.       |

**Mode** Global Configuration

**Examples** To map CoS 2 to queue 0, use the command:

```
awplus# configure terminal
awplus(config)# mls qos map cos-queue 2 to 0
```

To set the cos-queue map back to its defaults, use the command:

```
awplus# configure terminal
awplus(config)# no mls qos map cos-queue
```

**Related commands** [show mls qos interface](#)

# mls qos map premark-dscp

**Overview** This command configures the premark-dscp map. It is used when traffic is classified by a class-map that has [trust dscp](#) configured. Based on a lookup DSCP, the map determines new QoS settings for the traffic.

The **no** variant of this command resets the premark-dscp map to its defaults. If no DSCP is specified then all DSCP entries will be reset to their defaults.

**Syntax** `mls qos map premark-dscp <0-63> to  
{[new-dscp <0-63>] [new-cos <0-7>]  
[new-bandwidth-class {green|yellow|red}]}`  
`no mls qos map premark-dscp [<0-63>]`

| Parameter           | Description                                                                                                           |
|---------------------|-----------------------------------------------------------------------------------------------------------------------|
| premark-dscp <0-63> | The DSCP value on ingress.                                                                                            |
| new-dscp <0-63>     | The DSCP value that the packet will have on egress.<br>If unspecified, this value will remain the DSCP ingress value. |
| new-cos <0-7>       | The CoS value that the packet will have on egress.<br>If unspecified, this value will retain its value on ingress.    |
| new-bandwidth-class | Modify Egress Bandwidth-class.<br>If unspecified, this value will be set to green.                                    |
| green               | Egress Bandwidth-class green (marked down Bandwidth-class).                                                           |
| yellow              | Egress Bandwidth-class yellow (marked down Bandwidth-class).                                                          |
| red                 | Egress Bandwidth-class red (marked down Bandwidth-class).                                                             |

**Mode** Global Configuration

**Usage notes** With the [trust dscp](#) command set, this command (**mls qos map premark-dscp**) enables you to remap the DSCP, CoS, output queue, or bandwidth class values.

However, note that you cannot simultaneously change the DSCP and CoS, because they use the same byte in the IP header.

**Example** To set the entry for DSCP 1 to use a new DSCP of 2, use the command:

```
awplus# configure terminal
awplus(config)# mls qos map premark-dscp 1 to new-dscp 2
```

**Example** To set the entry for DSCP 1 to use a new CoS of 3, and a new bandwidth class of yellow, use the command:

```
awplus# configure terminal
awplus(config)# mls qos map premark-dscp 1 to new-cos 3
new-bandwidth-class yellow
```

**Example** To reset the entry for DSCP 1 use the command:

```
awplus# configure terminal
awplus(config)# no mls qos map premark-dscp 1
```

**Related commands** [show mls qos maps premark-dscp](#)  
[trust dscp](#)

# mls qos queue name

**Overview** Use this command to give a name and optional description to a specific egress queue.

Use the **no** variant of this command to remove the name and description from an egress queue.

**Syntax** `mls qos queue <0-7> name <name> [description <description>]`  
`no mls qos queue <0-7> name`

| Parameter     | Description                                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-7>         | The number of the egress queue to name.                                                                                                        |
| <name>        | The name you want to give the egress queue. The name can contain any printable ASCII character (ASCII 33-126), except for spaces.              |
| <description> | The description you want to give the egress queue. The description can contain any printable ASCII character (ASCII 32-126), including spaces. |

**Default** Queues have no name or description

**Mode** Global Configuration

**Example** To give queue 6 the name 'Video' and the description 'Real-time interactive, broadcast video', use the commands:

```
awplus# configure terminal
awplus(config)# mls qos queue 6 name Video description Real-time
interactive, broadcast video
```

To remove the name and description from queue 6, use the commands:

```
awplus# configure terminal
awplus(config)# no mls qos queue 6 name
```

**Command changes** Version 5.5.2-2.1: command added

# no police

**Overview** Use this command to disable any policer previously configured on the class-map.

**Syntax** no police

**Mode** Policy Map Class Configuration

**Usage notes** This command disables any policer previously configured on the class-map.

**Example** To disable policing on a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# no police
```

**Related commands** [police single-rate action](#)  
[police twin-rate action](#)

# police single-rate action

**Overview** Configures a single-rate policer for a class-map.

**Syntax** `police single-rate <cir> <cbs> <ebs> action  
{drop-red|remark-transmit}`

| Parameter       | Description                                                                                                                            |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <cir>           | Specify the Committed Information Rate (CIR) (1-100000000 kbps).                                                                       |
| <cbs>           | Specify the Committed Burst Size (CBS) (0-16777216 bytes).                                                                             |
| <ebs>           | Specify a Excess Burst Size (EBS) (0-16777216 bytes).                                                                                  |
| action          | Specify the action if the rate is exceeded.                                                                                            |
| drop-red        | Drop the red packets.                                                                                                                  |
| remark-transmit | Modify the packets using the remark map, then transmit. You can configure the remark map using the <a href="#">remark-map</a> command. |

**Mode** Policy Map Class Configuration

**Usage notes** You can use a policer to meter the traffic classified by the class-map and assign it to one of three bandwidth classes.

The bandwidth classes are green (conforming), yellow (partially-conforming), and red (non-conforming). A single-rate policer is based on three values. These are the average rate, minimum burst and maximum burst.

| Color  | Definition                                                           |
|--------|----------------------------------------------------------------------|
| green  | The traffic rate is less than the average rate and minimum burst.    |
| yellow | The traffic rate is between the minimum burst and the maximum burst. |
| red    | The traffic rate exceeds the average rate and the maximum burst.     |

Using an action of drop-red means that any packets classed as red are discarded.

**NOTE:** This command will not take effect when applied to a class-map that attaches to a channel group whose ports span processor instances.

Note that the [remark-map](#) does not only apply to red traffic. If a remark-map is configured on the same class-map as the policer, then the remark-map will apply to green- colored and yellow-colored traffic irrespective of the value configured on the **action** parameter of the policer. So, even if **action** is configured to **drop-red**, the remark-map will be applied to green and yellow traffic. So, the **action** parameter only applies to red- colored traffic. If **action** is set to **drop-red**, then red

traffic is dropped; if **action** is set to **remark-transmit**, then the red traffic has the action of the remark map applied to it, and is then transmitted.

**Example** To configure a single rate meter measuring traffic of 100 Mbps that drops a sustained burst of traffic over this rate, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police single-rate 100000 1875000
1875000 action drop-red
```

**Related commands**

- [no police](#)
- [police twin-rate action](#)
- [remark-map](#)

# police twin-rate action

**Overview** Configures a twin-rate policer for a class-map.

**Syntax** `police twin-rate <cir> <pir> <cbs> <pbs> action  
{drop-red|remark-transmit}`

| Parameter       | Description                                                                                                                            |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <cir>           | Specify the Committed Information Rate (CIR) (1-100000000 kbps).                                                                       |
| <pir>           | Specify the Peak Information Rate (PIR) (1-100000000 kbps).                                                                            |
| <cbs>           | Specify the Committed Burst Size (CBS) (0-16777216 bytes).                                                                             |
| <pbs>           | Specify the Peak Burst Size (PBS) (0-16777216 bytes).                                                                                  |
| action          | Specify the action if rate is exceeded.                                                                                                |
| drop-red        | Drop the red packets.                                                                                                                  |
| remark-transmit | Modify the packets using the remark map, then transmit. You can configure the remark map using the <a href="#">remark-map</a> command. |

**Mode** Policy Map Class Configuration

**Usage notes** A policer can be used to meter the traffic classified by the class-map and as a result will be given one of three bandwidth classes. These are green (conforming), yellow (partially-conforming), and red (non-conforming).

A twin-rate policer is based on four values. These are the minimum rate (CIR), minimum burst size (CBS), maximum rate (PIR), and maximum burst size (PBS). The following table shows how these values define the bandwidth classes.

| Bandwidth Class | Definition                                                                                                                                                             |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| green           | The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that is less than that set for the CBS.            |
| yellow          | The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that is between those set for the CBS and the PBS. |
| red             | The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that exceeds that set for the PBS.                 |

Using an action of drop-red means that any packets classed as red will be discarded.

Using an action of remark-transmit means that the packet will be remarked with the values configured in the policed-dscp map. The index into this map is determined by the DSCP in the packet.

Note that the [remark-map](#) does not only apply to red traffic. If a remark-map is configured on the same class-map as the policer, then the remark-map will apply to green-colored and yellow-colored traffic irrespective of the value configured on the **action** parameter of the policer. So, even if **action** is configured to **drop-red**, the remark-map will be applied to green and yellow traffic. So, the **action** parameter only applies to red-colored traffic. If **action** is set to **drop-red**, then red traffic is dropped; if **action** is set to **remark-transmit**, then the red traffic has the action of the remark map applied to it, and is then transmitted.

**Example** To configure a twin rate meter measuring a minimum rate of 10 Mbps and a maximum rate of 20 Mbps, and drop red packets, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police twin-rate 10000 20000 1875000
3750000 action drop-red
```

To configure a twin rate meter measuring a minimum rate of 10 Mbps and a maximum rate of 20 Mbps that uses the remark map to remark any non-conforming traffic, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police twin-rate 10000 20000 1875000
3750000 action remark-transmit
```

**Related commands** [no police](#)  
[police single-rate action](#)

# policy-map

**Overview** Use this command to create a policy-map and to enter Policy Map Configuration mode to configure the specified policy-map.

Use the **no** variant of this command to delete an existing policy-map.

**Syntax** `policy-map <name>`  
`no policy-map <name>`

| Parameter | Description             |
|-----------|-------------------------|
| <name>    | Name of the policy-map. |

**Mode** Global Configuration

**Example** To create a policy-map called pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)#
```

**Related commands** [class-map](#)

# priority-queue

**Overview** This command configures strict priority-based scheduling on the specified egress queues. You must specify at least one queue.

**Syntax** `priority-queue [0] [1] [2] [3] [4] [5] [6] [7]`

| Parameter                      | Description                                                                                                                                                                                                            |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>[0] [1] . . . [7]</code> | Specify the queues that will use strict priority scheduling. With strict priority scheduling, the switch will completely empty the highest numbered queue first, then start processing the next lowest numbered queue. |

**Mode** Interface Configuration.

**Usage notes** By default, the queues on all ports are set for priority queuing. You can change the queue emptying sequence to weighted round robin, by using the [wrr-queue weight queues](#) command. You can then use the [priority-queue](#) command to reset the selected queues to priority queuing.

Note that the emptying sequence for priority queuing is always highest queue number to lowest queue number.

**Example** To apply priority-based scheduling to egress queues 1 and 2, use the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1
awplus(config-if)#priority-queue 1 2
```

**Related commands** [show mls qos interface](#)  
[show mls qos interface queue-counters](#)  
[wrr-queue weight queues](#)

# remark-map

**Overview** Use this command to configure the remark map. If a re-mark map is applied to a class, and a policer is also applied to the same class, then:

- green and yellow traffic will all be acted upon by the remark-map, and
- red traffic will be either dropped or acted upon by the remark-map, depending on whether the policer **action** is set to **drop-red** or **remark-transmit**.

The **no** variant of this command resets the remark map to its defaults. Specifying the bandwidth class is optional. If no bandwidth class is specified, then all bandwidth classes are reset to their defaults.

**Syntax** `remark-map [bandwidth-class {green|yellow|red}] to {[new-dscp <0-63>] [new-bandwidth-class {green|yellow|red}]}`

`no remark-map [bandwidth-class {green|yellow|red}] to {[new-dscp <0-63>] [new-bandwidth-class {green|yellow|red}]}`

| Parameter           | Description                                       |
|---------------------|---------------------------------------------------|
| bandwidth-class     | Specify the bandwidth class of packets to remark. |
| green               | Remark green packets.                             |
| yellow              | Remark yellow packets.                            |
| red                 | Remark red packets.                               |
| new-dscp            | Specify the new DSCP value.                       |
| <0-63>              | The DSCP value.                                   |
| new-bandwidth-class | Specify the new bandwidth class.                  |
| green               | Remark the packet green.                          |
| yellow              | Remark the packet yellow.                         |
| red                 | Remark the packet red.                            |

**Mode** Policy Map Class Configuration

**Examples** To remark the policed green traffic to a new DSCP of 2 and a new bandwidth class of yellow, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# remark-map bandwidth-class green to
new-dscp 2 new-bandwidth-class yellow
```

To remark the policed green traffic to a new DSCP of 2, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# remark-map bandwidth-class green to
new-dscp 2
```

To reset the DSCP for all bandwidth classes, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# no remark-map to new-dscp
```

**Related  
commands**   [police single-rate action](#)  
[police twin-rate action](#)

# remark new-cos

- Overview** This command enables you to configure and remark either or both of:
- the CoS flag in the data packet
  - the input into the CoS to queue map, thus changing the destination egress queue.

**Syntax** `remark new-cos <0-7> [internal|external|both]`  
`no remark new-cos [internal|external|both]`

| Parameter | Description                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------|
| <0-7>     | The new value for the CoS flag and/or the input into the CoS to queue map.                           |
| external  | Remarks the CoS flag in the packet.                                                                  |
| internal  | Remarks the new-CoS input into the CoS to queue map.                                                 |
| both      | Remarks (with the same value) both the CoS flag in the packet and the input to the CoS to queue map. |

**Mode** Policy Map Class Configuration

**Usage notes** The default CoS to Queue mappings are shown in the following table:

|                 |   |   |   |   |   |   |   |   |
|-----------------|---|---|---|---|---|---|---|---|
| CoS Value       | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| Egress Queue No | 2 | 0 | 1 | 3 | 4 | 5 | 6 | 7 |

The relationship between this command and the CoS to queue map is shown in the following figure.

Figure 41-1: Remarking and the CoS to Q map

Table 41-1: CoS to egress queue remarking function

| Input                                                                            | Command                         | Output                                         |
|----------------------------------------------------------------------------------|---------------------------------|------------------------------------------------|
| CoS field = 1                                                                    | Remark new-cos (not configured) | CoS value = 1<br>Packet sent to egress queue 0 |
| CoS field = 1                                                                    | Remark new-cos 2 external       | CoS value = 2<br>Packet sent to egress queue 0 |
| CoS set to 1                                                                     | Remark new-cos 2 internal       | CoS value = 1<br>Packet sent to egress queue 1 |
| CoS set to 1                                                                     | Remark new-cos 2 both           | CoS value = 2<br>Packet sent to egress queue 1 |
| Note: This table assumes that the CoS to Queue map is set to its default values. |                                 |                                                |

**Example** For policy-map “pmap3” and class-map “cmap1”, set the CoS value to 2 and also set the input to the CoS to queue map so that the traffic is assigned to egress queue 1:

```
awplus# configure terminal
awplus(config)# policy-map pmap3
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# remark new-cos 2 both
```

**Related commands** [mls qos map cos-queue](#)  
[show mls qos maps cos-queue](#)

# service-policy input

**Overview** Use this command to apply a policy-map to the input of an interface.

Use the **no** variant of this command to remove a policy-map and interface association.

**Syntax** `service-policy input <policy-map>`  
`no service-policy input <policy-map>`

| Parameter                       | Description                                        |
|---------------------------------|----------------------------------------------------|
| <code>&lt;policy-map&gt;</code> | Policy map name that will be applied to the input. |

**Mode** Interface Configuration

**Usage notes** This command can be applied to switch ports or static channel groups, but not to dynamic (LACP) channel groups.

**Example** To apply a policy-map named `pmap1` to interface `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
wplus(config-if)# service-policy input pmap1
```

# set ip next-hop (PBR)

**Overview** Use this command to configure policy-based routing. When this command is set, all packets that match a selected class-map will be forwarded to the specified next hop.

The **no** variant of this command removes the next-hop address (in the context of its policy-map and class-map) from the configuration.

**Syntax** `set ip next-hop <ip-addr>`  
`no set ip next-hop`

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| <ip-addr> | The IP address of the next hop destination. |

**Mode** Policy Map Class Configuration

**Usage notes** **Combining conventional and policy-based routing**

In typical deployments of policy-based routing, some traffic types require conventional routing (i.e. via the routes in the IP routing table) while other traffic types require policy-based routing.

Where the traffic to be policy-routed is a subset of the traffic that is to be conventionally routed, then the configuration is reasonably simple. To configure this, make a policy-map that contains one or more class-maps that match the traffic to be policy routed. Then configure their next-hop with this command (**set ip next-hop**). The remaining traffic will be conventionally routed according to the rules set for the default class-map, providing that this is not subject to the **set ip next-hop**.

The situation becomes more complex if the traffic requiring conventional routing is a subset of the traffic to be policy-routed. To configure this, make a policy-map that contains one, or more, class-maps that match the requirement for conventional routing. Do not configure these class-maps with a **set ip next-hop** command. Then identify the remaining class-maps that require policy-based routing and apply the **set ip next-hop** command to them. Note that this remaining traffic could be just the default class-map, if all other traffic types were to be policy-routed.

Also note that the order in which the class-maps are configured in the policy-map is important, because traffic is matched against the class-maps in the order that they were assigned to the policy-map.

For more information about PBR, see the [Policy-Based Routing Feature Overview and Configuration Guide](#).

**Example** To forward packets to 192.168.1.1 if they match the class-map called cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# set ip next-hop 192.168.1.1
```

**Related commands** [class-map](#)

# show class-map

**Overview** Use this command to display the QoS class-maps' criteria for classifying traffic.

**Syntax** `show class-map [<class-map-name>]`

| Parameter                           | Description            |
|-------------------------------------|------------------------|
| <code>&lt;class-map-name&gt;</code> | Name of the class-map. |

**Mode** User Exec and Privileged Exec

**Example** To display a QoS class-map's match criteria for classifying traffic, use the command:

```
awplus# show class-map cmap1
```

**Output** Figure 41-2: Example output from the **show class-map** command

```
awplus#show class-map

CLASS-MAP-NAME: myClass
Match Mac Type: 2 12mcast

CLASS-MAP-NAME: default
```

Table 41-2: Parameters in the output of the show mls qos interface command

| Parameter               | Description                                                                            |
|-------------------------|----------------------------------------------------------------------------------------|
| Number of egress queues | The total number of egress queues available on this interface.                         |
| Egress Queue            | Number of this egress queue.                                                           |
| Status                  | Queue can either be enabled or disabled.                                               |
| Scheduler               | The scheduling mode being used for servicing the transmission of packets on this port. |

Table 41-2: Parameters in the output of the show mls qos interface command

| Parameter                       | Description                                                                                                                                                                                                            |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Queue Limit                     | The percentage of the port's buffers that have been allocated to this queue.                                                                                                                                           |
| Egress Rate Limit               | The amount of traffic that can be transmitted via this queue per second. 0 Kb means there is currently no rate-limiting enabled.                                                                                       |
| Egress Traffic Shaping Overhead | The number of bytes specified to allow for the size of packet preamble and inter-packet gap (the "overhead") in egress queue rate limiting. Use the <a href="#">egress-rate-limit overhead</a> command to change this. |

**Command  
changes**

Version 5.5.1-0.1: DSCP queue mapping removed from output

# show mls qos interface policer-counters

**Overview** This command displays an interface's policer counters. This can either be for a specific class-map or for all class-maps attached to the interface. If no class-map is specified then all class-map policer counters attached to the interface are displayed.

**Syntax** `show mls qos interface <port> policer-counters [class-map <class-map>]`

| Parameter   | Description         |
|-------------|---------------------|
| <port>      | Switch port.        |
| class-map   | Select a class-map. |
| <class-map> | Class-map name.     |

**Mode** User Exec and Privileged Exec

**Usage** Note that:

- The hardware does not record distinct counters for the number of Green or Yellow bytes, so the field marked Green/Yellow is the summation of bytes that have been marked Green or Yellow by the meter.
- The counters are based on metering performed on the specified class-map. Therefore, the 'Dropped Bytes' counter is the number of bytes dropped due to metering. This is different from packets dropped via a 'deny' action in the ACL. If a policer is configured to perform re-marking, bytes can be marked Red but are not dropped, and is shown with a value of 0 for the Dropped field and a non-0 value for the 'Red Bytes' field.

**Example** To show the counters for all class-maps attached to port1.0.1, use the command:

```
awplus# show mls qos interface port1.0.1 policer-counters
```

**Output** Figure 41-5: Example output from **show mls qos interface policer-counters** on a port

```
awplus#show mls qos interface port1.0.1 policer-counters
Interface: port1.0.1
 Class-map: default
 Green/Yellow Bytes: 0
 Red Bytes: 0
 Dropped Bytes: 0
 Non-dropped Bytes: 0
 Class-map: cmap1
 Green/Yellow Bytes: 1290
 Red Bytes: 0
 Dropped Bytes: 0
 Non-dropped Bytes: 1290
```

# show mls qos interface queue-counters

**Overview** This command displays an interface's egress queue counters. This can either be for a specific queue or for all queues on the interface. If no queue is specified all queue counters on the interface will be displayed.

The counters show the number of frames currently in the queue and the maximum number of frames allowed in the queue, for individual egress queues and the port's queue (which will be a sum of all egress queues).

**Syntax** `show mls qos interface <port> queue-counters [queue <0-7>]`

| Parameter   | Description                                      |
|-------------|--------------------------------------------------|
| <port>      | The switch port to display counters for.         |
| queue <0-7> | The number of the queue to display counters for. |

**Mode** User Exec and Privileged Exec

**Example** To show the counters for all queues on port1.0.1, use the command:

```
awplus# show mls qos interface port1.0.1 queue-counters
```

**Output** Figure 41-6: Example output from **show mls qos interface queue-counters**

|                                      |               |              |          |         |
|--------------------------------------|---------------|--------------|----------|---------|
| Interface port1.0.1 Queue Counters:  |               |              |          |         |
| Port queue length                    |               | 1169         |          |         |
| Egress Queue length:                 |               |              |          |         |
| Queue 0                              | 0             |              |          |         |
| Queue 1                              | 0             |              |          |         |
| Queue 2                              | 1169          |              |          |         |
| Queue 3                              | 0             |              |          |         |
| Queue 4                              | 0             |              |          |         |
| Queue 5                              | 0             |              |          |         |
| Queue 6                              | 0             |              |          |         |
| Queue 7                              | 0             |              |          |         |
| Egress queue drop/transmit counters: |               |              |          |         |
|                                      | Dropped Bytes | Dropped Pkts | Tx Bytes | Tx Pkts |
| Queue 0                              | 0             | 0            | 0        | 0       |
| Queue 1                              | 0             | 0            | 0        | 0       |
| Queue 2                              | 0             | 0            | 0        | 0       |
| Queue 3                              | 0             | 0            | 0        | 0       |
| Queue 4                              | 0             | 0            | 576      | 9       |
| Queue 5                              | 0             | 0            | 0        | 0       |
| Queue 6                              | 0             | 0            | 10489664 | 63901   |
| Queue 7                              | 0             | 0            | 0        | 0       |

Table 41-3: Parameters in the output from **show mls qos interface queue-counters**

| Parameter                           | Description                                                                                  |
|-------------------------------------|----------------------------------------------------------------------------------------------|
| Interface                           | Port we are showing the counters for.                                                        |
| Port queue length                   | Number of frames in the port's queue. This will be the sum of all egress queues on the port. |
| Egress Queue length                 | Number of frames in a specific egress queue.                                                 |
| Egress queue drop/transmit counters | The number of bytes and packets dropped and transmitted on each egress queue.                |

```

**Output parameters** Depending on your switch, you will see some of the following parameters in the output from **show platform classifier statistics utilization brief**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                   |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPv6 Multicast | Reserved hardware space for use by IPv6 multicast, when the <a href="#">ipv6 multicast-routing</a> command is used.                                                                                                                                                                                                           |
| System         | Fixed system entries. For example, resiliency links make use of system ACLs.                                                                                                                                                                                                                                                  |
| MLD Snooping   | Entries to send various packets that MLD Snooping is interested in to the CPU.                                                                                                                                                                                                                                                |
| DHCP Snooping  | Entries used to send DHCP and ARP packets to the CPU. User-added DHCP Snooping filters under ACLs are counted under the ACL or QoS categories.                                                                                                                                                                                |
| Loop Detection | Entries uses to send the special loop detection frame to the CPU.                                                                                                                                                                                                                                                             |
| EPSR           | Entries used to send EPSR control traffic to the CPU.                                                                                                                                                                                                                                                                         |
| CFM            | Entries used by Connectivity Fault Management.                                                                                                                                                                                                                                                                                |
| G8032          | Entries used to send G.8032 control traffic to the CPU.                                                                                                                                                                                                                                                                       |
| Global ACLs    | Entries for ACLs appear here if the ACLs are applied globally instead of per switchport.                                                                                                                                                                                                                                      |
| ACL            | Entries for ACL filters that have been applied directly to ports using the <a href="#">access-group</a> command.                                                                                                                                                                                                              |
| VACL           | Entries for VLAN-based ACLs (ACLs that are applied to VLANs instead of ports).                                                                                                                                                                                                                                                |
| DOS            | Entries used for Denial of Service protection.                                                                                                                                                                                                                                                                                |
| UFO            | Entries used by Upward Forwarding Only (UFO).                                                                                                                                                                                                                                                                                 |
| QoS            | Entries for ACL filters and other class-map configurations, such as policers, applied through policy maps using the <b>service input</b> command.                                                                                                                                                                             |
| RA Guard       | Entries used to block IPv6 router advertisements, configured with the <b>ipv6 nd raguard</b> command.                                                                                                                                                                                                                         |
| AMFAPPS        | Entries used by AMF Application Proxy. These entries enable the SES Controller to block infected ports.                                                                                                                                                                                                                       |
| Pre-Ingress    | Entries used for VLAN ID Translation (and also for subnet-based and MAC-based VLAN entries on SBx81XLEM cards).                                                                                                                                                                                                               |
| Egress         | Entries used for VLAN ID Translation.                                                                                                                                                                                                                                                                                         |
| UDB            | User Defined Bytes (UDB), which are a limited resource of bytes that can be used to implement additional arbitrary matching on packet bytes on some switches. The software manages the use and allocation of these bytes automatically. The output of this table is intended for use by Allied Telesis Customer Support only. |

[ipv6 access-list \(named IPv6 hardware ACL\)](#)

# show policy-map

**Overview** Displays the policy-maps configured on the switch. The output also shows whether or not they are connected to a port (attached / detached) and shows their associated class-maps.

**Syntax** `show policy-map [<name>]`

| Parameter | Description                        |
|-----------|------------------------------------|
| <name>    | The name of a specific policy-map. |

**Mode** User Exec and Privileged Exec

**Example** To display a listing of the policy-maps configured on the switch, use the command:

```
awplus# show policy-map
```

**Output** Figure 41-11: Example output from the **show policy-map** command

```
POLICY-MAP-NAME: example
 Interfaces:
 Default class-map action: permit

 CLASS-MAP-NAME: default
 Policer counters enabled
```

**Related commands** [no police](#)  
[service-policy input](#)

# storm-action

**Overview** Sets the action to be taken when triggered by QoS Storm Protection (QSP). There are three available options:

- **portdisable** will disable the port in software.
- **vlandisable** will disable the port from the VLAN matched by the class-map in class-map. This option requires the match vlan class-map to be present in the class-map
- **linkdown** will physically bring the port down. .

The **no** variant of this command will negate the action set by the **storm-action** command.

**Syntax** `storm-action {portdisable|vlandisable|linkdown}`  
`no storm-action`

| Parameter   | Description                   |
|-------------|-------------------------------|
| portdisable | Disable the port in software. |
| vlandisable | Disable the VLAN.             |
| linkdown    | Shutdown the port physically. |

**Mode** Policy Map Class Configuration

**Examples** To apply the storm protection of **vlandisable** to the policy-map named "pmap2" and the class-map named "cmap1", use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c# storm-action vlandisable
```

To negate the storm protection set on the policy-map named "pmap2" and the class-map named "cmap1", use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c# no storm-action
```

**Related commands** [storm-downtime](#)  
[storm-protection](#)  
[storm-rate](#)  
[storm-window](#)

# storm-downtime

**Overview** Sets the time to re-enable a port that has been disabled by QoS Storm Protection (QSP). The time is given in seconds, from a minimum of one second to maximum of 86400 seconds (i.e. one day).

The **no** variant of this command resets the time to the default value of 10 seconds.

**Syntax** `storm-downtime <1-86400>`  
`no storm-downtime`

| Parameter | Description |
|-----------|-------------|
| <1-86400> | Seconds.    |

**Default** 10 seconds

**Mode** Policy Map Class Configuration

**Examples** To re-enable the port in 1 minute, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# storm-downtime 60
```

To re-set the port to the default (10 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# no storm-downtime
```

**Related commands** [storm-action](#)  
[storm-protection](#)  
[storm-rate](#)  
[storm-window](#)

# storm-protection

**Overview** Use this command to enable policy-based Storm Protection (such as QSP - QoS Storm Protection). Storm protection is activated as soon as a port is enabled. However, it will only be functional after [storm-rate](#) and [storm-window](#) have been set.

The **no** variant of this command disables policy-based Storm Protection.

**Syntax** `storm-protection`  
`no storm-protection`

**Default** By default, storm protection is disabled.

**Mode** Policy Map Class Configuration

**Examples** To enable QSP on cmap2 in pmap2, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-protection
```

To disable QSP on cmap2 in pmap2, use the following commands:

```
awplus# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# no storm-protection
```

**Related commands** [show mls qos interface storm-status](#)  
[storm-action](#)  
[storm-downtime](#)  
[storm-rate](#)  
[storm-window](#)

# storm-rate

**Overview** Sets the data rate that triggers the storm-action. The rate is in kbps and the range is from 1kbps to 40Gbps.

Note that this setting is made in conjunction with the [storm-window](#) command.

Use the **no** variant of this command to negate the **storm-rate** command.

**Syntax** `storm-rate <1-40000000>`  
`no storm-rate`

| Parameter                       | Description                  |
|---------------------------------|------------------------------|
| <code>&lt;1-40000000&gt;</code> | The range of the storm-rate. |

**Default** No default

**Mode** Policy Map Class Configuration

**Usage** This setting is made in conjunction with the [storm-window](#) command.

**Examples** To limit the data rate to 100Mbps, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-rate 100000
```

To negate the limit set previously, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# no storm-rate
```

**Related commands** [storm-action](#)  
[storm-downtime](#)  
[storm-protection](#)  
[storm-window](#)

# storm-window

**Overview** Sets the window size of QoS Storm Protection (QSP). This sets the time to poll the data-rate every given milliseconds. Minimum window size is 100 ms and the maximum size is 60 sec.

Use the **no** variant of this command to negate the **storm-window** command.

**Syntax** `storm-window <100-60000>`  
`no storm-window`

| Parameter                      | Description                                |
|--------------------------------|--------------------------------------------|
| <code>&lt;100-60000&gt;</code> | The window size, measured in milliseconds. |

**Default** No default

**Mode** Policy Map Class Configuration

**Usage** This command should be set in conjunction with the [storm-rate](#) command.

**Examples** To set the QSP window size to 5000 ms, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-window 5000
```

To negate the QSP window size set previously, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# no storm-window
```

**Related commands** [storm-action](#)  
[storm-downtime](#)  
[storm-protection](#)  
[storm-rate](#)

# strict-priority-queue egress-rate-limit queues

**Overview** Sets a limit on the amount of traffic that can be transmitted per second from these queues. The default unit is in Kb, but Mb or Gb can also be specified. The minimum is 651 Kb.

This limit applies to WRR queues too. Setting the limit with this command is the same as setting it with [wrr-queue egress-rate-limit queues](#).

**Syntax** `strict-priority-queue egress-rate-limit <bandwidth> queues  
[0] [1] [2] [3] [4] [5] [6] [7]`  
`no strict-priority-queue egress-rate-limit <bandwidth> queues  
[0] [1] [2] [3] [4] [5] [6] [7]`

| Parameter         | Description                                            |
|-------------------|--------------------------------------------------------|
| <bandwidth>       | Bandwidth <1-100000000 kbits> (usable units: k, m, g). |
| [0] [2] . . . [7] | Selects one or more queues numbered 0 to 7.            |

**Mode** Interface Configuration

**Example** To limit the egress rate of queues 0, 1 and 2 on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# strict-priority-queue egress-rate-limit
500M queues 0 1 2
```

**Related commands** [show mls qos interface](#)  
[wrr-queue egress-rate-limit queues](#)

# trust dscp

**Overview** This command enables the premark-dscp map to replace the DSCP, bandwidth-class and/or CoS of classified traffic based on a lookup DSCP value.

With the **no** variant of this command, no premark-dscp mapping function will be applied for the selected class-map. QoS components of the packet existing either at ingress, or applied by the class-map, will pass unchanged.

**Syntax** `trust dscp`  
`no trust`

**Mode** Policy-Map Configuration

**Examples** To enable the premark-dscp map lookup for policy-map pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# trust dscp
```

To disable the premark-dscp map lookup for policy-map pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# no trust
```

**Related commands** [mls qos map premark-dscp](#)

# wrr-queue disable queues

**Overview** Use this command to disable an egress queue from transmitting traffic.  
The **no** variant of this command enables an egress queue to transmit traffic.

**Syntax** `wrr-queue disable queues [0] [1] [2] [3] [4] [5] [6] [7]`  
`no wrr-queue disable queues [0] [1] [2] [3] [4] [5] [6] [7]`

| Parameter       | Description                                 |
|-----------------|---------------------------------------------|
| [0] [2] ... [7] | Selects one or more queues numbered 0 to 7. |

**Mode** Interface Configuration

**Examples** To disable queue 1 on port1.0.1 from transmitting traffic, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# wrr-queue disable queues 1
```

To enable queue 1 on port1.0.1 to transmit traffic, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no wrr-queue disable queues 1
```

**Related commands** [show mls qos interface](#)

# wrr-queue egress-rate-limit queues

**Overview** Sets a limit on the amount of traffic that can be transmitted per second from these queues. The default unit is in Kb, but Mb or Gb can also be specified. The minimum is 651 Kb.

This limit applies to strict priority queues too. Setting the limit with this command is the same as setting it with [strict-priority-queue egress-rate-limit queues](#).

**Syntax** `wrr-queue egress-rate-limit <bandwidth> queues  
[0] [1] [2] [3] [4] [5] [6] [7]`  
`no wrr-queue egress-rate-limit <bandwidth> queues  
[0] [1] [2] [3] [4] [5] [6] [7]`

| Parameter         | Description                                            |
|-------------------|--------------------------------------------------------|
| <bandwidth>       | Bandwidth <1-100000000 kbits> (usable units: k, m, g). |
| [0] [2] . . . [7] | Selects one or more queues numbered 0 to 7.            |

**Mode** Interface Configuration

**Example** To limit the egress rate of queues 0, 1 and 2 on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# wrr-queue egress-rate-limit 500M queues 0 1
2
```

**Related commands** [show mls qos interface](#)  
[strict-priority-queue egress-rate-limit queues](#)

# wrr-queue weight queues

**Overview** This command configures weighted round-robin based scheduling on the specified egress queues on switch port interfaces only. The weights are specified as ratios relative to each other.

Use the **no wrr-queue** command to remove weighted round-robin based scheduling from the specified egress queue. The queue then reverts to its normal priority-based scheduling.

**Syntax** `wrr-queue weight <1-15> queues [0][1][2][3][4][5][6][7]`  
`no wrr-queue <queue-number>`

| Parameter      | Description                                                             |
|----------------|-------------------------------------------------------------------------|
| <1-15>         | Weight (the higher the number the greater will be the queue servicing). |
| [0][2]...[7]   | Selects one or more queues numbered 0 to 7.                             |
| <queue-number> | Egress queue to revert to priority-based scheduling.                    |

**Mode** Interface Configuration for switch port interfaces only (not for static aggregated interfaces).

**Usage notes** You cannot apply weighted round-robin based scheduling to static aggregated interfaces (for example, sa2).

**Example** To apply a WRR weight of 6 to queues 0 and 1 on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# wrr-queue weight 6 queues 0 1
```

To remove weighted round-robin scheduling from egress queue 2 on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no wrr-queue 2
```

**Related commands** [priority-queue](#)

# 42

# 802.1X Commands

## Introduction

**Overview** 802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device. Devices wishing to access services behind a port must authenticate themselves before any Ethernet packets are allowed to pass through. The protocol is referred to as 802.1X because it was initially defined in the IEEE standard 802.1X, published in 2001 and revised in 2004 and again as the current 802.1X 2010 standard.

This chapter provides an alphabetical reference of commands used to configure 802.1X port access control. For more information, see the [AAA and Port Authentication\\_Feature Overview and Configuration Guide](#).

# dot1x accounting

**Overview** This command overrides the **default** RADIUS accounting method for IEEE 802.1X-based authentication on an interface by allowing you to apply a user-defined named method list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method list.

**Syntax** `dot1x accounting {default|<list-name>}`  
`no dot1x accounting`

| Parameter   | Description                              |
|-------------|------------------------------------------|
| default     | Apply the default accounting method list |
| <list-name> | Apply the user-defined named list        |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# dot1x accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no dot1x accounting
```

**Related commands** [aaa accounting dot1x](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x authentication

**Overview** This command overrides the **default** 802.1X-based authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

**Syntax** `dot1x authentication {default|<list-name>}`  
`no dot1x authentication`

| Parameter                | Description                                  |
|--------------------------|----------------------------------------------|
| <i>default</i>           | Apply the default authentication method list |
| <i>&lt;list-name&gt;</i> | Apply the user-defined named list            |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# dot1x authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no dot1x authentication
```

**Related commands** [aaa authentication dot1x](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# debug dot1x

**Overview** Use this command to enable 802.1X IEEE Port-Based Network Access Control troubleshooting functions.

Use the **no** variant of this command to disable this function.

**Syntax** `debug dot1x [all|auth-web|event|nsm|packet|timer]`  
`no debug all dot1x`  
`no debug dot1x [all|auth-web|event|nsm|packet|timer]`

| Parameter | Description                                                                                      |
|-----------|--------------------------------------------------------------------------------------------------|
| all       | Used with the <b>no</b> variant of this command exclusively; turns off all debugging for 802.1X. |
| auth-web  | Specifies debugging for 802.1X auth-web information.                                             |
| events    | Specifies debugging for 802.1X events.                                                           |
| nsm       | Specifies debugging for NSM messages.                                                            |
| packet    | Specifies debugging for 802.1X packets.                                                          |
| timer     | Specifies debugging for 802.1X timers.                                                           |

**Mode** Privileged Exec and Global Configuration

**Usage notes** This command turns on a mode where trace-level information is output during authentication conversations. Be aware that this is a very verbose output. It is mostly useful to capture this as part of escalating an issue to ATI support.

**Examples** Use this command without any parameters to turn on normal 802.1X debug information.

```
awplus# debug dot1x
awplus# show debugging dot1x
```

```
802.1X debugging status:
 802.1X events debugging is
 802.1X timer debugging is on
 802.1X packets debugging is on
 802.1X NSM debugging is on
```

**Related commands** [show debugging dot1x](#)  
[undebug dot1x](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x control-direction

- Overview** This command sets the direction of the filter for the unauthorized interface.
- If the optional **in** parameter is specified with this command then packets entering the specified port are discarded. The **in** parameter discards the ingress packets received from the supplicant.
- If the optional **both** parameter is specified with this command then packets entering (ingress) and leaving (egress) the specified port are discarded. The **both** parameter discards the packets received from the supplicant and sent to the supplicant.
- The **no** variant of this command sets the direction of the filter to **both**. The port will then discard both ingress and egress traffic.

**Syntax** dot1x control-direction {in|both}  
no dot1x control-direction

| Parameter | Description                                                                                                                |
|-----------|----------------------------------------------------------------------------------------------------------------------------|
| in        | Discard received packets from the supplicant (ingress packets).                                                            |
| both      | Discard received packets from the supplicant (ingress packets) and transmitted packets to the supplicant (egress packets). |

- Default** The authentication port direction is set to **both** by default.
- Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the port direction to the default (**both**) for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x control-direction
```

To set the port direction to **in** for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x control-direction in
```

To set the port direction to **in** for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x control-direction in
```

**Related commands**

- auth profile (global)
- show dot1x
- show dot1x interface
- show auth interface

**Command changes**    Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x eap

**Overview** This command selects the transmit mode for the EAP packet. If the authentication feature is not enabled then EAP transmit mode is not enabled. The default setting discards EAP packets.

**Syntax** `dot1x eap {discard|forward|forward-untagged-vlan|forward-vlan}`

| Parameter             | Description                                   |
|-----------------------|-----------------------------------------------|
| discard               | Discard.                                      |
| forward               | Forward to all ports on the switch.           |
| forward-untagged-vlan | Forward to ports with the same untagged VLAN. |
| forward-vlan          | Forward to ports with the same VLAN.          |

**Default** The transmit mode is set to `discard` EAP packets by default.

**Mode** Global Configuration

**Examples** To set the transmit mode of EAP packet to **forward**, to forward EAP packets to all ports on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward
```

To set the transmit mode of EAP packet to **discard**, to discard EAP packets, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap discard
```

To set the transmit mode of EAP packet to **forward-untagged-vlan**, to forward EAP packets to ports with the same untagged VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward-untagged-vlan
```

To set the transmit mode of EAP packet to **forward-vlan**, to forward EAP packets to ports with the same VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward-vlan
```

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x eapol-version

**Overview** This command sets the EAPOL protocol version for EAP packets when 802.1X port authentication is applied.

Use the **no** variant of this command to set the EAPOL protocol version to 1.

The default EAPOL protocol version is version 1.

**Syntax** dot1x eapol-version {1|2}  
no dot1x eapol-version

| Parameter | Description                    |
|-----------|--------------------------------|
| 1   2     | EAPOL protocol version 1 or 2. |

**Default** The EAP version for 802.1X authentication is set to 1 by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the EAPOL protocol version to 2 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x eapol-version 2
```

To set the EAPOL protocol version to the default version (1) for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x eapol-version
```

To set the EAPOL protocol version to 2 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x eapol-version 2
```

**Validation Commands** auth profile (global)  
show dot1x  
show dot1x interface

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x initialize interface

**Overview** This command removes authorization for a specified connected interface. The connection will attempt to re-authorize when the specified port attempts to make use of the network connection.

**NOTE:** *Reauthentication could be a long time after the use of this command because the reauthorization attempt is not triggered by this command. The attempt is triggered by the first packet from the interface trying to access the network resources.*

**Syntax** `dot1x initialize interface <interface-list>`

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;interface-list&gt;</code> | The interfaces or ports to configure. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul> The specified interfaces must exist. |

**Mode** Privileged Exec

**Examples** To initialize 802.1X port authentication on the interface port1.0.2, use the command:

```
awplus# dot1x initialize interface port1.0.2
```

To unauthorize switch port1.0.2 and attempt reauthentication on switch port1.0.2, use the command:

```
awplus# dot1x initialize interface port1.0.2
```

To unauthorize all switch ports for a 18-port device and attempt reauthentication, use the command:

```
awplus# dot1x initialize interface port1.0.1-port1.0.18
```

**Related commands** [dot1x initialize supplicant](#)  
[show dot1x](#)  
[show dot1x interface](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x initialize supplicant

**Overview** This command removes authorization for a connected supplicant with the specified MAC address or username. The connection will attempt to re-authorize when the specified supplicant attempts to make use of the network connection.

**NOTE:** *Reauthentication could be a long time after the use of this command because the reauthorization attempt is not triggered by this command. The attempt is triggered by the first packet from the supplicant trying to access the network resources.*

**Syntax** dot1x initialize supplicant {<macadd>|username}

| Parameter  | Description                                      |
|------------|--------------------------------------------------|
| dot1x      | IEEE 802.1X Port-Based Access Control.           |
| initialize | Initialize the port to attempt reauthentication. |
| supplicant | Specify the supplicant to initialize.            |
| <macadd>   | MAC (hardware address of the supplicant.         |
| username   | The name of the supplicant entry.                |

**Mode** Privileged Exec

**Example** To initialize the supplicant authentication, use the commands

```
awplus# configure terminal
awplus(config)# dot1x initialize supplicant 0090.99ab.a020
awplus(config)# dot1x initialize supplicant guest
```

**Related commands** [dot1x initialize interface](#)  
[show dot1x](#)  
[show dot1x supplicant](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x keytransmit

**Overview** Use this command to enable key transmission on the interface specified previously in Interface mode.

This command enables key transmission over an Extensible Authentication Protocol (EAP) packet between the authenticator and supplicant.

The **no** variant of this command disables key transmission on the interface specified.

**Syntax** dot1x keytransmit  
no dot1x keytransmit

**Default** Key transmission for port authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To enable the key transmit feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x keytransmit
```

To disable the key transmit feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x keytransmit
```

**Related commands** [show dot1x](#)  
[show dot1x interface](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x max-auth-fail

**Overview** Use this command to configure the maximum number of login attempts for a supplicant (client device) using the **auth-fail vlan** feature, when using 802.1X port authentication on an interface.

The **no** variant of this command resets the maximum login attempts for a supplicant (client device) using the auth-fail vlan feature, to the default configuration of 3 login attempts.

**Syntax** `dot1x max-auth-fail <0-10>`  
`no dot1x max-auth-fail`

| Parameter                 | Description                                                                                                    |
|---------------------------|----------------------------------------------------------------------------------------------------------------|
| <code>&lt;0-10&gt;</code> | Specify the maximum number of login attempts for supplicants on an interface using 802.1X port authentication. |

**Default** The default maximum number of login attempts for a supplicant on an interface using 802.1X port authentication is 3 login attempts.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** This command sets the maximum number of login attempts for supplicants on an interface. The supplicant is moved to the auth-fail VLAN from the Guest VLAN after the number of failed login attempts using 802.1X authentication is equal to the number set with this command.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- the auth-fail VLAN feature, and
- restrictions regarding combinations of authentication enhancements working together

**Examples** To configure the maximum number of login attempts for a supplicant on interface port1.0.2 to a single login attempt, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x max-auth-fail 1
```

To configure the maximum number of login attempts for a supplicant on interface port1.0.2 to the default number of 3 login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x max-auth-fail
```

To configure the maximum number of login attempts for a supplicant on authentication profile 'student' to a single login attempt, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-auth-fail 1
```

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x max-reauth-req

**Overview** Use this command to set the number of reauthentication attempts before an interface is unauthorized.

The **no** variant of this command resets the reauthentication delay to the default.

**Syntax** `dot1x max-reauth-req <1-10>`  
`no dot1x max-reauth-req`

| Parameter | Description                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------|
| <1-10>    | Specify the maximum number of reauthentication attempts for supplicants on an interface using 802.1X port authentication. |

**Default** The default maximum reauthentication attempts for interfaces using 802.1X port authentication is two (2) reauthentication attempts, before an interface is unauthorized.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Use this command to set the maximum reauthentication attempts after failure.

**Examples** To configure the maximum number of reauthentication attempts for interface port1.0.2 to a single (1) reauthentication request, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x max-reauth-req 1
```

To configure the maximum number of reauthentication attempts for interface port1.0.2 to the default maximum number of two (2) reauthentication attempts, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x max-reauth-req
```

To configure the maximum number of reauthentication attempts for authentication profile 'student' to a single (1) reauthentication request, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-reauth-req 1
```

**Related commands** [auth profile \(global\)](#)

dot1x max-req  
show dot1x interface

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

## dot1x max-req

**Overview** Use this command to change the number of times the device resends an EAP Request packet if that packet is lost between the authenticating device and the supplicant. If the supplicant does not respond to an EAP Request after this number of retries, the supplicant fails the authentication process.

Use the **no** variant of this command to return to the default number of retries.

**Syntax** `dot1x max-req <1-10>`  
`no dot1x max-req`

| Parameter | Description                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-10>    | The number of retries. Note that this does not include the initial attempt, so the total number of attempts is one higher than the number you specify here. |

**Default** The default value is 2.

Note: This means the authenticator sends the original attempt and 2 more attempts, which is 3 attempts in total.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** You can set this on a per-supplicant basis by using the **max-req** parameter in the commands:

- `auth supplicant-ip`
- `auth supplicant-mac`

**Example** To change the number of retries to 5 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x max-req 5
```

To return the number of retries to the default setting of 2 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x max-req
```

To set the number of retries to 1 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-req 1
```

**Command  
changes**

Version 5.5.3-1.1: command added

# dot1x port-control

**Overview** This command enables 802.1X port authentication on the interface specified, and sets the control of the authentication port.

The **no** variant of this command disables the port authentication on the interface specified.

**Syntax** `dot1x port-control {force-unauthorized|force-authorized|auto}`  
`no dot1x port-control`

| Parameter          | Description                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------|
| force-unauthorized | Force the port state to unauthorized. Specify this to force a port to always be in an unauthorized state. |
| force-authorized   | Force the port state to authorized. Specify this to force a port to always be in an authorized state.     |
| auto               | Allow the port client to negotiate authentication. Specify this to enable authentication on the port.     |

**Default** 802.1X port control is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Use this command to force a port state.

When **port-control** is set to **auto**, the 802.1X authentication feature is executed on the interface, but only if the **aaa authentication dot1x** command has been issued.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

**Examples** To enable port authentication on the interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
```

To enable port authentication force authorized on the interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control force-authorized
```

To disable port authentication on the interface port1.0.2 use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x port-control
```

To enable port authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x port-control auto
```

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# dot1x timeout tx-period

**Overview** This command sets the transmit timeout for the authentication request on the specified interface.

The **no** variant of this command resets the transmit timeout period to the default (30 seconds).

**Syntax** `dot1x timeout tx-period <1-65535>`  
`no dot1x timeout tx-period`

| Parameter | Description |
|-----------|-------------|
| <1-65535> | Seconds.    |

**Default** The default transmit period for port authentication is 30 seconds.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Use this command to set the interval between successive attempts to request an ID.

**Examples** To set the transmit timeout period to 5 seconds on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x timeout tx-period 5
```

To reset transmit timeout period to the default (30 seconds) on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x timeout tx-period
```

To set the transmit timeout period to 5 seconds on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x timeout tx-period 5
```

# show debugging dot1x

**Overview** Use this command to see what debugging is turned on for 802.1X.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show debugging dot1x`

**Mode** User Exec and Privileged Exec

**Example** To enable 802.1X debugging and display the debugging option set, use the following commands:

```
awplus# debug dot1x
awplus# show debugging dot1x
```

```
802.1X debugging status:
 802.1X events debugging is on
 802.1X timer debugging is on
 802.1X packets debugging is on
 802.1X NSM debugging is on
```

**Related commands** [debug dot1x](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x

**Overview** Use this command to show authentication information for 802.1X port authentication.

If you specify the optional **all** parameter then this command also displays all authentication information for each port available on the switch.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

**Syntax** show dot1x [all]

| Parameter | Description                                                                    |
|-----------|--------------------------------------------------------------------------------|
| all       | Displays all authentication information for each port available on the switch. |

**Mode** Privileged Exec

**Example** awplus# show dot1x all

**Table 1:** Example output from the **show dot1x all** command

# show dot1x statistics interface

**Overview** Use this command to show the authentication statistics for the specified interface. For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

The output from this command is the same as the output from the [show auth statistics interface](#) command.

**Syntax** `show dot1x statistics interface <interface-list>`

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;interface-list&gt;</code> | The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul> |

**Mode** Privileged Exec

**Example** To display 802.1X authentication statistics for port1.0.2, use the command:

```
awplus# show dot1x statistics interface port1.0.2
```

**Output** Figure 42-2: Example output from **show dot1x statistics interface** for a port

```
awplus# show dot1x statistics interface port1.0.2
802.1X statistics for interface port1.0.2
 EAPOL Frames Rx: 5 - EAPOL Frames Tx: 16
 EAPOL Start Frames Rx: 0 - EAPOL Logoff Frames Rx: 0
 EAP Rsp/Id Frames Rx: 3 - EAP Response Frames Rx: 2
 EAP Req/Id Frames Tx: 8 - EAP Request Frames Tx: 2
 Invalid EAPOL Frames Rx: 0 - EAP Length Error Frames Rx: 0
 EAPOL Last Frame Version Rx: 1 - EAPOL Last Frame
Src:00d0.59ab.7037
```

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x supplicant

**Overview** This command shows the supplicant state of the authentication mode set for the switch.

This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

**Syntax** show dot1x supplicant [<macadd>] [brief]

| Parameter | Description                               |
|-----------|-------------------------------------------|
| <macadd>  | MAC (hardware) address of the Supplicant. |
| brief     | Brief summary of the Supplicant state.    |

**Mode** Privileged Exec

**Example** See sample output below showing the 802.1X authenticated supplicant on the switch:

```
awplus# show dot1x supplicant
```

```
authenticationMethod: dot1x
totalSupplicantNum: 1
authorizedSupplicantNum: 1
macBasedAuthenticationSupplicantNum: 0
dot1xAuthenticationSupplicantNum: 1
webBasedAuthenticationSupplicantNum: 0
Supplicant name: manager
Supplicant address: 00d0.59ab.7037
 authenticationMethod: dot1x
 Two-Step Authentication:
 firstAuthentication: Pass - Method: mac
 secondAuthentication: Pass - Method: dot1x
portStatus: Authorized - currentId: 4
abort:F fail:F start:F timeout:F success:T
PAE: state: Authenticated - portMode: Auto
PAE: reAuthCount: 0 - rxRespId: 0
PAE: quietPeriod: 60 - maxReauthReq: 2 - txPeriod: 30
BE: state: Idle - reqCount: 0 - idFromServer: 3
BE: suppTimeout: 30 - serverTimeout: 30
CD: adminControlledDirections: in - operControlledDirections: in
CD: bridgeDetected: false
KR: rxKey: false
KT: keyAvailable: false - keyTxEnabled: false
RADIUS server group (auth): radius
RADIUS server (auth): 192.168.1.40
```

See sample output below showing the supplicant on the switch using the **brief** parameter:

```
awplus# show dot1x supplicant 00d0.59ab.7037 brief
```

```
Interface port1.0.2
 authenticationMethod: dot1x
 totalSupplicantNum: 1
 authorizedSupplicantNum: 1
 macBasedAuthenticationSupplicantNum: 0
 dot1xAuthenticationSupplicantNum: 1
 webBasedAuthenticationSupplicantNum: 0
```

| Interface | VID | Mode | MAC Address    | Status        | IP Address    | Username |
|-----------|-----|------|----------------|---------------|---------------|----------|
| port1.0.2 | 2   | D    | 00d0.59ab.7037 | Authenticated | 192.168.2.201 | manager  |

See sample output below showing the supplicant on the switch using the **brief** parameter:

```
awplus# show dot1x supplicant brief
```

For example, if two-step authentication is configured with 802.1X authentication as the first method and web authentication as the second method then the output is as follows:

```
Interface port1.0.2 authenticationMethod: dot1x/web
 Two-Step Authentication
 firstMethod: dot1x
 secondMethod: web
 totalSupplicantNum: 1
 authorizedSupplicantNum: 1
 macBasedAuthenticationSupplicantNum: 0
 dot1xAuthenticationSupplicantNum: 0
 webBasedAuthenticationSupplicantNum: 1
 otherAuthenticationSupplicantNum: 0
```

| Interface | VID | Mode | MAC Address    | Status        | IP Address    | Username |
|-----------|-----|------|----------------|---------------|---------------|----------|
| port1.0.2 | 5   | W    | 0008.0d5e.c216 | Authenticated | 192.168.1.200 | web      |

**Related commands** [show dot1x supplicant interface](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# show dot1x supplicant interface

**Overview** Use this command to show the supplicant state of the authentication mode set for the interface.

This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show dot1x supplicant interface <interface-list> [brief]`

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

# 43

# Authentication Commands

## Introduction

**Overview** Port authentication commands enable you to specify three different types of device authentication: 802.1X authentication, web authentication, and MAC authentication.

- 802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device.
- Web authentication is applicable to devices that have a human user who opens the web browser and types in a user name and password when requested.
- MAC authentication is used to authenticate devices that have neither a human user nor implement 802.1X supplicant when making a network connection request.

This chapter provides an alphabetical reference for MAC and web authentication commands. For a list of 802.1X commands see the [802.1X Commands](#) chapter.

For more information on configuring and using port authentication, see the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

## auth auth-fail vlan

**Overview** Use this command to enable the **auth-fail vlan** feature on the specified vlan interface. This feature assigns supplicants (client devices) to the specified VLAN if they fail port authentication.

Use the **no** variant of this command to disable the auth-fail vlan feature for a specified VLAN interface.

**Syntax** `auth auth-fail vlan <1-4094>`  
`no auth auth-fail vlan`

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| <1-4094>  | Assigns the VLAN ID to any supplicants that have failed port authentication. |

**Default** The auth-fail vlan feature is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Use the auth-fail vlan feature when using web authentication instead of the Guest VLAN feature, when you need to separate networks where one supplicant (client device) requires authentication and another supplicant does not require authentication from the same interface.

This is because the DHCP lease time using the Web-Authentication feature is shorter, and the auth-fail vlan feature enables assignment to a different VLAN if a supplicant fails authentication.

To enable the auth-fail vlan feature with web authentication, you need to set the web authentication server virtual IP address by using the [auth-web-server ipaddress](#) command or the [auth-web-server dhcp ipaddress](#) command.

When using 802.1X port authentication, use a [dot1x max-auth-fail](#) command to set the maximum number of login attempts. Three login attempts are allowed by default for 802.1X port authentication before supplicants trying to authenticate are moved from the Guest VLAN to the auth-fail VLAN. See the [dot1x max-auth-fail](#) on page 1907 for command information.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- the auth-fail VLAN feature, which allows the Network Administrator to separate the supplicants who attempted authentication, but failed, from the supplicants who did not attempt authentication, and
- restrictions regarding combinations of authentication enhancements working together

Use appropriate ACLs (Access Control Lists) on interfaces for extra security if a supplicant allocated to the designated auth-fail vlan can access the same network

as a supplicant on the Guest VLAN. For more information about ACL concepts, and configuring ACLs see the [ACL Feature Overview and Configuration Guide](#). For more information about ACL commands see:

- [IPv4 Hardware Access Control List \(ACL\) Commands](#)
- [IPv4 Software Access Control List \(ACL\) Commands](#)
- [IPv6 Hardware Access Control List \(ACL\) Commands](#)
- [IPv6 Software Access Control List \(ACL\) Commands](#)

**Examples** To enable the auth-fail vlan feature for port1.0.2 and assign VLAN 100, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth auth-fail vlan 100
```

To disable the auth-fail vlan feature for port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth auth-fail vlan
```

**Related commands** [auth profile \(global\)](#)  
[dot1x max-auth-fail](#)  
[show dot1x](#)  
[show dot1x interface](#)  
[show running-config](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth critical

**Overview** Use this command to enable the critical port feature on the interface. When the critical port feature is enabled on an interface, and all the RADIUS servers are unavailable, then the interface becomes authorized.

The **no** variant of this command disables the critical port feature on the interface.

**Syntax** `auth critical`  
`no auth critical`

**Default** The critical port of port authentication is disabled.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To enable the critical port feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth critical
```

To disable the critical port feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth critical
```

To enable the critical port feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth critical
```

**Related commands** [auth profile \(global\)](#)  
[show auth-web-server](#)  
[show dot1x](#)  
[show dot1x interface](#)  
[show running-config](#)

# auth dhcp-framed-ip-lease

**Overview** Use this command to enable DHCP Framed IP Lease on an interface.

When the DHCP Framed IP Lease feature is enabled on an interface, supplicants authenticated using 802.1x or MAC authentication will be assigned a specific IP address, and other network settings, gathered from the RADIUS server during the authentication process.

Use the **no** variant of this command to disable DHCP Framed IP Lease.

**Syntax** `auth dhcp-framed-ip-lease`  
`no auth dhcp-framed-ip-lease`

**Default** DHCP Framed IP Lease is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** You need to complete the following steps to configure the DHCP Framed IP Lease feature on your network.

**On the RADIUS server:**

- Configure the RADIUS server with the username and password for 802.1x or MAC authentication
- Configure the following 'framed' RADIUS attributes on the RADIUS server for the that user:
  - Framed-IP-Address (8): the IPv4 address for the supplicant
  - Framed-IP-Netmask (9): the netmask for the supplicant
  - Framed-Route (22): the default gateway IPv4 address for the supplicant
  - Session-Timeout (27): IP address lease time for the supplicant

**NOTE:** *The Frame-IP-Address (8) attribute must be configured for this feature to work. All other attributes are optional.*

**On the DHCP server:**

- Configure the RADIUS client
- Enable 802.1x or MAC authentication on the required interface/s
- Enable DHCP Framed IP Lease feature on the required interface/s
- Setup a DHCP pool with the network range for the IP address/es registered on the RADIUS server
- Enable DHCP server

For more information, see the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Example** To enable DHCP Framed IP Lease on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# auth dhcp-framed-ip-lease
```

To disable DHCP Framed IP Lease on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no auth dhcp-framed-ip-lease
```

**Related commands** [show dot1x supplicant](#)  
[show ip dhcp pool](#)

**Command changes** Version 5.4.8-2.1: command added

# auth dynamic-acl enable

**Overview** Use this command to enable Dynamic Access Control Lists (ACLs). This lets you configure port authentication to dynamically apply ACLs when a supplicant is authorized. These ACLs are automatically removed when the supplicant disconnects.

Use the **no** variant of this command to disable Dynamic ACLs.

**Syntax** `auth dynamic-acl enable`  
`no auth dynamic-acl enable`

**Default** Disabled.

**Mode** Interface configuration for switch port or static aggregator.

**Usage notes** Dynamic ACLs are created and attached to a switchport in the following way:

- A RADIUS server holds the ACL rules for a supplicant, along with that supplicants user name and password.
- These ACL rules can be either:
  - a complete IPv4 or IPv6 hardware rule (stored as a RADIUS NAS-Filter-Rule attribute), or
  - name or number reference to an existing ACL rule (stored as a RADIUS Filter-Id attribute)
- When the first packet from a supplicant arrives on a switchport the authenticator starts the authentication process with the RADIUS server.
- The RADIUS server returns Access-Accept packet to the authenticator with the configured ACL rules.
- The authenticator creates and installs these ACLs dynamically on the switchport and authorizes the supplicant.
- These Dynamic ACLs are named IPv4 and IPv6 hardware access-lists. They are internally maintained and cannot be removed or modified from the CLI.
- All traffic on the switchport is filtered using these ACLs.
- When the supplicant is unauthorized, dynamically installed ACLs are removed and detached from the switchport.

For more information, see the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Examples** This example uses the local RADIUS server to define two ACL rules that are applied to MAC authenticated supplicants on port1.0.2.

Define the local RADIUS server as the RADIUS server to use:

```
awplus# configure terminal
awplus(config)# radius-server host 127.0.0.1 key
awplus-local-radius-server
```

Define the authentication method list:

```
awplus(config)# aaa authentication auth-mac default group
radius
```

Enable MAC authentication and dynamic ACLs on port1.0.2:

```
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac enable
awplus(config-if)# auth dynamic-acl enable
awplus(config-if)# exit
```

Configure the local RADIUS server with the required ACL rules:

```
awplus(config)# radius-server local
awplus(config-radsrv)# group dacl-rule
awplus(config-radsrv-group)# attribute repeated
NAS-Filter-Rule "ip:permit ip 192.168.1.0/24 192.168.2.0/24"
awplus(config-radsrv-group)# attribute repeated
NAS-Filter-Rule "ip:deny ip 192.168.1.0/24 any"
awplus(config-radsrv-group)# exit
```

Add a user with the Dynamic ACL rules and enable the local RADIUS server:

```
awplus(config-radsrv)# user xx-xx-xx-xx-xx-xx password
xx-xx-xx-xx-xx-x group dacl-rule
awplus(config-radsrv)# server enable
awplus(config-radsrv)# exit
```

These ACL rules will reject IP traffic from 192.168.1.x to any destination except 192.168.2.x for supplicants on port1.0.2.

**Command  
changes**

Version 5.5.0-1.1: command added

# auth dynamic-vlan-creation

**Overview** Use this command to enable and disable the Dynamic VLAN assignment feature.

The Dynamic VLAN assignment feature allows a supplicant (client device) to be placed into a specific VLAN based on information returned from the RADIUS server during authentication, on a given interface.

Use the **no** variant of this command to disable the Dynamic VLAN assignment feature.

**Syntax** `auth dynamic-vlan-creation [rule {deny|permit}] [type {multi|single}]`  
`no auth dynamic-vlan-creation`

| Parameter | Description                                                                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule      | VLAN assignment rule.                                                                                                                                                                      |
| deny      | Deny a differently assigned VLAN ID. This is the default rule.                                                                                                                             |
| permit    | Permit a differently assigned VLAN ID.                                                                                                                                                     |
| type      | Specifies whether multiple different VLANs can be assigned to supplicants (client devices) attached to the port, or whether only a single VLAN can be assigned to supplicants on the port. |
| multi     | Multiple Dynamic VLAN.                                                                                                                                                                     |
| single    | Single Dynamic VLAN.                                                                                                                                                                       |

**Default** By default, the Dynamic VLAN assignment feature is disabled.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** If the Dynamic VLAN assignment feature is enabled, VLAN assignment is dynamic. If the Dynamic VLAN assignment feature is disabled then RADIUS attributes are ignored and configured VLANs are assigned to ports. Dynamic VLANs may be associated with authenticated MAC addresses if the **type** parameter is applied with the **rule** parameter.

The **rule** parameter deals with the case where there are multiple supplicants attached to a port, and the type parameter has been set to **single-vlan**. The parameter specifies how the switch should act if different VLAN IDs end up being assigned to different supplicants. The keyword value **deny** means that once a given VID has been assigned to the first supplicant, then if any subsequent supplicant is assigned a different VID, that supplicant is rejected. The keyword value **permit** means that once a given VID has been assigned to the first supplicant, then if any subsequent supplicant is assigned a different VID, that supplicant is accepted, but it is actually assigned the same VID as the first supplicant.

If you issue an **auth dynamic-vlan-creation** command without a **rule** parameter then a second supplicant with a different VLAN ID is rejected. It is not assigned to the first supplicant's VLAN. Issuing an **auth dynamic-vlan-creation** command without a **rule** parameter has the same effect as issuing an **auth dynamic-vlan-creation rule deny** command rejecting supplicants with differing VLAN IDs.

The **type** parameter specifies whether multiple different VLANs can be assigned to supplicants attached to the port, or whether only a single VLAN can be assigned to supplicants on the port. The **type** parameter can select the port base VLAN or the MAC base VLAN from the RADIUS VLAN ID. This can be used when the host-mode is set to multi-supplicant. For **single**-host ports, the VLAN ID will be assigned to the port. It is not supported with the Guest VLAN feature. Display the ID assigned using a **show vlan** command. For **multi**-host ports, the VLAN ID will be assigned to the MAC address of the authenticated supplicant. The VLAN ID assigned for the MAC Base VLAN is displayed using the **show platform table vlan** command.

To configure Dynamic VLAN with Web Authentication, you need to set the Web Authentication Server virtual IP address by using the [auth-web-server ipaddress](#) command or the [auth-web-server dhcp ipaddress](#) command. You also need to create a hardware access-list that can be applied to the switch port interface.

You need to configure an IPv4 address for the VLAN interface on which Web Authentication is running.

**Examples** To enable the Dynamic VLAN assignment feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport access vlan 10
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# interface vlan10
awplus(config-if)# ip address 10.1.1.1/24
```

To enable the Dynamic VLAN assignment feature with Web Authentication on interface port1.0.2 when Web Authentication is needed, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ipaddress 1.2.3.4
awplus(config)# access-list hardware acl-web send-to-cpu ip any 1.2.3.4
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# access-group acl-web
awplus(config-if)# interface vlan1
awplus(config-if)# ip address 10.1.1.1/24
```

To disable the Dynamic VLAN assignment feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth dynamic-vlan-creation
```

To enable the Dynamic VLAN assignment feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth dynamic-vlan-creation
```

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth guest-vlan

**Overview** Use this command to enable and configure the Guest VLAN feature on the interface specified by associating a Guest VLAN with an interface. This command does not start authentication. The supplicant's (client device's) traffic is associated with the native VLAN of the interface unless it is already associated with another VLAN. The **routing** option enables routing from the Guest VLAN to another VLAN, so the switch can lease DHCP addresses and accept access to a limited network.

The **no** variant of this command disables the guest VLAN feature on the interface specified.

**Syntax** `auth guest-vlan <1-4094> [routing]`  
`no auth guest-vlan [routing]`

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| <1-4094>  | VLAN ID (VID).                                      |
| routing   | Enables routing from the Guest VLAN to other VLANs. |

**Default** The Guest VLAN authentication feature is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** The Guest VLAN feature may be used by supplicants (client devices) that have not attempted authentication, or have failed the authentication process. Note that if a port is in multi-supplicant mode with per-port dynamic VLAN configuration, after the first successful authentication, subsequent hosts cannot use the guest VLAN due to the change in VLAN ID. This may be avoided by using per-user dynamic VLAN assignment.

When using the Guest VLAN feature with the multi-host mode, a number of supplicants can communicate via a guest VLAN before authentication. A supplicant's traffic is associated with the native VLAN of the specified switch port. The supplicant must belong to a VLAN before traffic from the supplicant can be associated.

Note that you must enable 802.1X on the port and define a VLAN using the [vlan](#) command before you can configure it as a guest VLAN.

Roaming Authentication cannot be enabled if DHCP snooping is enabled ([service dhcp-snooping](#) command), and vice versa.

Note that Guest VLAN can use only untagged ports.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- Guest VLAN, and

- restrictions regarding combinations of authentication enhancements working together

**Examples** To define vlan100 and assign the guest VLAN feature to vlan100 on interface port1.0.2, and enable routing from the guest VLAN to other VLANs, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100
awplus(config-vlan)# exit
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth guest-vlan 100 routing
```

To disable the guest VLAN feature on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth guest-vlan
```

To define vlan100 and assign the guest VLAN feature to vlan100 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100
awplus(config-vlan)# exit
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan 100
```

- [show dot1x interface](#)

**Command changes** Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth guest-vlan forward

**Overview** Use this command to enable packet forwarding from the guest VLAN to a destination IP address or subnet. If this command is configured, the device can lease DHCP addresses and accept access to a limited part of your network. Also, when using NAP authentication, the supplicant can log on to a domain controller to gain certification.

Use the **no** variant of this command to disable packet forwarding from the Guest VLAN to a destination IP address or subnet.

**Syntax**

```
auth guest-vlan forward {<ip-address>|<ip-address/mask>}
[dns|tcp <1-65535>|udp <1-65535>]

no auth guest-vlan forward {<ip-address>|<ip-address/mask>}
[dns|tcp <1-65535>|udp <1-65535>]
```

| Parameter                             | Description                                                                                      |
|---------------------------------------|--------------------------------------------------------------------------------------------------|
| <ip-address><br><ip-address/<br>mask> | The IP address or subnet to which the guest VLAN can forward packets, in dotted decimal notation |
| dns                                   | Enable forwarding of DNS packets                                                                 |
| tcp <1-65535>                         | Enable forwarding of packets for the specified TCP port number                                   |
| udp <1-65535>                         | Enable forwarding of packets for the specified UDP port number                                   |

**Default** Forwarding is disabled by default.

**Mode** Interface Configuration mode for a specified switch port, or Authentication Profile mode

**Usage** Before using this command, you must configure the guest VLAN with the [auth guest-vlan](#) command.

**Example** To enable packet forwarding from the guest VLAN to the destination IP address on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth guest-vlan forward 10.0.0.1
```

To enable forwarding of DNS packets from the guest VLAN to the destination IP address on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface
awplus(config-if)# auth guest-vlan forward 10.0.0.1 dns
```

To disable forwarding of DNS packets from the guest VLAN to the destination IP address on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth guest-vlan forward 10.0.0.1 dns
```

To enable the TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan forward 10.0.0.1
tcp 137
```

**Related commands**

# auth guest-vlan hw-forwarding

**Overview** Use this command to enable hardware forwarding on the guest VLAN. By default, hardware forwarding is disabled and all traffic on the VLAN is forwarded by the CPU.

Use the **no** variant of this command to disable hardware forwarding on the guest VLAN.

**Syntax** `auth guest-vlan hw-forwarding`  
`no auth guest-vlan hw-forwarding`

**Default** Disabled.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To enable guest VLAN hardware forwarding on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth guest-vlan hw-forwarding
```

To disable guest VLAN hardware forwarding on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth guest-vlan hw-forwarding
```

To enable guest VLAN hardware forwarding authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan hw-forwarding
```

**Related commands** [auth profile \(global\)](#)  
[auth guest-vlan](#)

**Command changes** Version 5.5.0-1.1: command added to x230, GS970M, IE210 series switches.  
Version 5.5.1-0.1: command added to all other AlliedWare Plus switches.

# auth host-mode

**Overview** Use this command to select the host mode on the specified interface.

Use the **no** variant of this command to set host mode to the default setting (single host).

**Syntax**

```
auth host-mode
{host-plus-voice|single-host|multi-host|multi-supPLICANT}

no auth host-mode
```

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host-plus-voice  | In this mode, only one voice device (IP phone) and one host device can join the network. You use the RADIUS attribute 'Cisco-AVPair device-traffic-class=voice' to identify the IP phone. For more information and a step-by-step configuration example, see the "Limit the number of supplicants when connecting via an IP phone" section of the <a href="#">AAA and Port Authentication Feature Overview and Configuration Guide</a> . |
| single-host      | In this mode, only one supplicant is allowed per port. This is the default mode.                                                                                                                                                                                                                                                                                                                                                         |
| multi-host       | In this mode, once the first host on a port is authenticated, all other downstream hosts are allowed without being authenticated (piggy-back mode).                                                                                                                                                                                                                                                                                      |
| multi-supPLICANT | In this mode, multiple separate supplicants are individually authenticated on one port.                                                                                                                                                                                                                                                                                                                                                  |

**Default** The default host mode for port authentication is for a single host.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** **Single-host mode**

With this mode, only one supplicant may be authenticated on the port. Once that host has been authenticated, no other supplicants may be authenticated until the first supplicant's session has closed. This means, of course, that none of the other hosts downstream of the port will be able to send or receive traffic on that port.

This option is recommended when you know that there should only be one host connected to a port. By limiting the port to a single authenticated host, you guard against the consequences of someone accidentally or maliciously connecting a downstream switch to the port.

**Multi-host mode**

With this mode, once the first host has been authenticated on the port, all other downstream hosts are allowed without being authenticated. This is sometimes known as piggy-back mode. It is useful when the downstream switch attached to

the authenticating port is an intelligent switch that can act as an authentication supplicant.

If you trust that malicious users cannot be connected to that switch but you do not know the identity of those users, then you can simply authenticate the switch and then allow its attached users to have network access. If the valid switch is disconnected and an invalid one is connected which is not configured with the correct authentication credentials, then the devices connected to the invalid switch will be blocked from accessing the network.

**Examples** To set the host mode to multi-supplicant on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth host-mode multi-supplicant
```

To set the host mode to the default (single host) on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth host-mode
```

To set the host mode to multi-supplicant on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth host-mode multi-supplicant
```

To set the host mode to the default (single host) on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth host-mode
```

# auth log

**Overview** Use this command to configure the types of authentication feature log messages that are output to the log file.

Use the **no** variant of this command to remove either specified types or all types of authentication feature log messages that are output to the log file.

**Syntax**

```
auth log {dot1x|auth-mac|auth-web}
{success|failure|logoff|all}

no auth log {dot1x|auth-mac|auth-web}
{success|failure|logoff|all}
```

| Parameter | Description                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dot1x     | Specify only 802.1X-Authentication log messages are output to the log file.                                                                                 |
| auth-mac  | Specify only MAC-Authentication log messages are output to the log file.                                                                                    |
| auth-web  | Specify only Web-Authentication log messages are output to the log file.                                                                                    |
| success   | Specify only successful authentication log messages are output to the log file.                                                                             |
| failure   | Specify only authentication failure log messages are output to the log file.                                                                                |
| logoff    | Specify only authentication log-off messages are output to the log file. Note that link down, age out and expired ping polling messages will be included.   |
| all       | Specify all types of authentication log messages are output to the log file. Note that this is the default behavior for the authentication logging feature. |

**Default** All types of authentication log messages are output to the log file by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To configure the logging of MAC authentication failures to the log file for supplicants (client devices) connected to interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth log auth-mac failure
```

To disable the logging of all types of authentication log messages to the log file for auth-mac supplicants (client devices) connected to interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth log auth-mac all
```

To configure the logging of web authentication failures to the log file for supplicants (client devices) connected to authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth log auth-web failure
```

To disable the logging of all types of authentication log messages to the log file for auth-mac supplicants (client devices) connected to authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth log auth-mac all
```

**Related commands**   [auth profile \(global\)](#)  
[show running-config](#)

# auth max-suppliant

**Overview** Use this command to set the maximum number of supplicants (client devices) that can be authenticated on the selected port. Once this value is exceeded, further supplicants will not be authenticated.

The **no** variant of this command resets the maximum supplicant number to the default.

**Syntax** `auth max-suppliant <2-1024>`  
`no auth max-suppliant`

| Parameter | Description   |
|-----------|---------------|
| <2-1024>  | Limit number. |

**Default** 1024

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the maximum number of supplicants to 10 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth max-suppliant 10
```

To reset the maximum number of supplicants to the default value on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth max-suppliant
```

To set the maximum number of supplicants to 10 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth max-suppliant 10
```

To reset the maximum number of supplicants to the default value on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth max-suppliant
```

**Related commands**

- `auth max-supPLICANT untagged-vlan`
- `auth profile (global)`
- `show dot1x`
- `show dot1x interface`
- `show running-config`

# auth max-suppliant tagged-vlan

**Overview** Use this command to set the maximum number of supplicants (client devices) that can be authenticated on the selected port on tagged VLANs. Once this value is exceeded, further supplicants will not be authenticated on tagged VLANs on that port.

This command is useful for preventing unwanted supplicants from connecting to the network when a host (e.g. a PC) connects to an AlliedWare Plus NAS via an IP phone. For more information and a step-by-step configuration example, see the [“Limit the number of supplicants when connecting via an IP phone”](#) section of the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

Use the **no** variant of this command to reset the maximum number of supplicants on tagged VLANs to the default.

**Syntax** `auth max-suppliant tagged-vlan <0-1024>`  
`no auth max-suppliant tagged-vlan <0-1024>`

**Default** 1024

**Mode** Interface Configuration for a switch port; or Authentication Profile mode.

**Examples** To set the maximum number of supplicants on tagged VLANs on interface port1.0.2 to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth max-suppliant tagged-vlan 1
```

To reset the maximum number of supplicants on tagged VLANs on interface port1.0.2 to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth max-suppliant tagged-vlan
```

To set the maximum number of supplicants on tagged VLANs on authentication profile 'accounts' to 1, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# auth max-suppliant tagged-vlan 1
```

To reset the maximum number of supplicants on tagged VLANs on authentication profile 'accounts' to the default value, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# no auth max-suppliant tagged-vlan
```

**Related commands**    [auth max-supPLICant](#)  
                              [auth max-supPLICant untagged-vlan](#)

**Command changes**    Version 5.5.2-1.1: command added

# auth max-suppliant untagged-vlan

**Overview** Use this command to set the maximum number of supplicants (client devices) that can be authenticated on the selected port on untagged VLANs. Once this value is exceeded, further supplicants will not be authenticated on untagged VLANs on that port.

This command is useful for preventing unwanted supplicants from connecting to the network when a host (e.g. a PC) connects to an AlliedWare Plus NAS via an IP phone. For more information and a step-by-step configuration example, see the [“Limit the number of supplicants when connecting via an IP phone”](#) section of the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

Use the **no** variant of this command to reset the maximum number of supplicants on untagged VLANs to the default.

**Syntax** `auth max-suppliant untagged-vlan <0-1024>`  
`no auth max-suppliant untagged-vlan <0-1024>`

**Default** 1024

**Mode** Interface Configuration for a switch port; or Authentication Profile mode.

**Examples** To set the maximum number of supplicants on untagged VLANs on interface port1.0.2 to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth max-suppliant untagged-vlan 1
```

To reset the maximum number of supplicants on untagged VLANs on interface port1.0.2 to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth max-suppliant untagged-vlan
```

To set the maximum number of supplicants on untagged VLANs on authentication profile 'accounts' to 1, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# auth max-suppliant untagged-vlan 1
```

To reset the maximum number of supplicants on untagged VLANs on authentication profile 'accounts' to the default value, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# no auth max-suppliant untagged-vlan
```

- Command changes** Version 5.5.2-1.1: command added

# auth multi-vlan-session

**Overview** Use this command to enable packet forwarding on multiple VLANs for an authenticated supplicant attached to a trunked (tagged VLAN) port.

By default, AlliedWare Plus only allows packet forwarding on the VLAN that a device was authenticated on. This command enables packet forwarding to the attached device on any VLAN configured on the switchport. After the device authenticates it will have access to all VLANs configured on the switchport.

Use the **no** variant of this command to disable packet forwarding on multiple VLANs for an authenticated supplicant.

**Syntax** `auth multi-vlan-session`  
`no auth multi-vlan-session`

**Default** By default, **multi-vlan-session** is disabled.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To allow a client attached to port1.0.2 to access all VLANs configured on the AlliedWare Plus device, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan all
awplus(config-if)# auth host-mode multi-supplicant
awplus(config-if)# auth multi-vlan-session
```

To disable **multi-vlan-session** on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth multi-vlan-session
```

**Related commands** [auth-mac enable](#)

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth priority

**Overview** Use this command to enable authentication priority on an interface. This sets the tri-authentication order of priority for MAC, 802.1X, and web-based authentication. If tri-authentication is not configured on the interface then this command has no effect.

You specify the authentication methods in order of priority. The first method in the list has the highest priority, the second method has the second highest priority, and the third method has the lowest priority. Any methods not specified will have the lowest priority.

Use the **no** variant of this command to disable authentication priority.

**Syntax** `auth priority {[auth-mac] [dot1x] [auth-web]}`  
`no auth priority`

| Parameter | Description                            |
|-----------|----------------------------------------|
| auth-mac  | Set MAC authentication priority.       |
| dot1x     | Set 802.1X authentication priority.    |
| auth-web  | Set web-based authentication priority. |

**Default** Authentication priority is not set.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Before using this command you must correctly configure tri-authentication on the interface. Tri-authentication is when multiple authentication methods (MAC, 802.1X, and/or web-based) are configured on the same interface. With tri-authentication, a supplicant is authorized to use the network as soon as they are successfully authenticated by any of the configured authentication methods.

When authentication priority is not set, once a supplicant is authenticated any future attempts to authenticate are ignored. When, however, authentication priority is set, and a higher priority authentication attempt is made by the supplicant, a new authentication process starts. The supplicant will then be authorized, or unauthorized, based on the result of this new authentication attempt.

**Example** To configure 802.1X authentication to have a higher priority than MAC authentication on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth priority dot1x auth-mac
```

To disable authentication priority on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth priority
```

To configure 802.1X authentication to have a higher priority than MAC authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth priority dot1x auth-mac
```

**Related commands**

**Command changes** Version 5.5.0-2.1: command added

# auth profile (global)

**Overview** Use this command to enter port authentication profile mode and configure a port authentication profile.

If the specified profile does not exist a new authentication profile is created with the name provided.

Use the **no** variant of this command to delete the specified port authentication profile.

**Syntax** `auth profile <profile-name>`  
`no auth profile <profile-name>`

| Parameter                         | Description                                 |
|-----------------------------------|---------------------------------------------|
| <code>&lt;profile-name&gt;</code> | Name of the profile to create or configure. |

**Default** No port authentication profiles are created by default.

**Mode** Global Configuration

**Usage** A port authentication profile is a configuration object that aggregates multiple port authentication commands. These profiles are attached or detached from an interface using the [auth profile \(interface\)](#) command.

**Example** To create a new authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)#
```

To delete an authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# no auth profile student
```

**Related commands** [auth profile \(interface\)](#)  
[description \(auth-profile\)](#)

# auth profile (interface)

**Overview** Use this command to attach a port authentication profile to the current interface.

Use the **no** variant of this command to detach a port authentication profile from the current interface.

**Syntax** `auth profile <profile-name>`  
`no auth profile <profile-name>`

| Parameter                         | Description                                                 |
|-----------------------------------|-------------------------------------------------------------|
| <code>&lt;profile-name&gt;</code> | The name of the profile to attach to the current interface. |

**Default** No profile is attached by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage** This command attaches an authentication profile, that was created using the [auth profile \(global\)](#) command, to a static channel, a dynamic (LACP) channel group, or a switch port.

You can only attach one profile to an interface at a time. Use the **no** variant of the command to detach a profile before attempting to attach another one.

**Example** To attach the authentication profile 'student' to port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth profile student
```

To detach the authentication profile 'student' from port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth profile student
```

**Related commands** [auth profile \(global\)](#)

# auth reauthentication

**Overview** Use this command to enable re-authentication on the interface specified in the Interface mode, which may be a static channel group (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Use the **no** variant of this command to disable reauthentication on the interface.

**Syntax** `auth reauthentication`  
`no auth reauthentication`

**Default** Reauthentication of port authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To enable reauthentication on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth reauthentication
```

To disable reauthentication on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth reauthentication
```

To enable reauthentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth reauthentication
```

**Related commands** [auth profile \(global\)](#)  
[show dot1x](#)  
[show dot1x interface](#)  
[show running-config](#)

# auth roaming disconnected

**Overview** This command allows a supplicant to move to another authenticating interface without reauthentication, even if the link is down for the interface that the supplicant is currently connected to.

You must enter the [auth roaming enable](#) command on both interfaces before using this command.

The **no** variant of this command disables roaming authentication on interfaces that are link-down, and forces a supplicant to be reauthenticated when moving between interfaces.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for further information about this feature.

**Syntax** `auth roaming disconnected`  
`no auth roaming disconnected`

**Default** By default, the authentication status for a roaming supplicant is deleted when an interface goes down, so supplicants must reauthenticate.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Note that 802.1X port authentication, MAC-authentication, or Web-authentication must be configured before using this feature. The port that the supplicant is moving to must have the same authentication configuration as the port the supplicant is moving from.

Roaming Authentication cannot be enabled if DHCP snooping is enabled ([service dhcp-snooping](#) command), and vice versa.

**Examples** To allow supplicants to move from port1.0.2 without reauthentication even when the link is down, when using 802.1X authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth roaming enable
awplus(config-if)# auth roaming disconnected
```

To require supplicants to reauthenticate when moving from port1.0.2 if the link is down, when using 802.1X authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth roaming disconnected
```

To allow supplicants using authentication profile 'student' to move between ports without reauthentication even when the link is down, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth roaming disconnected
```

To require supplicants using authentication profile 'student' to reauthenticate when moving between ports if the link is down, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth roaming disconnected
```

**Related  
commands**

[auth profile \(global\)](#)  
[auth-mac enable](#)  
[auth roaming enable](#)  
[auth-web enable](#)  
[dot1x port-control](#)  
[show auth interface](#)  
[show dot1x interface](#)  
[show running-config](#)

# auth roaming enable

**Overview** Use this command to allow a supplicant to move to another authenticating interface without reauthentication, providing the link is up for the interface that the supplicant is currently connected to.

The **no** variant of this command disables roaming authentication on an interface, and forces a supplicant to be reauthenticated when moving between interfaces.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for further information about this feature.

**Syntax** `auth roaming enable`  
`no auth roaming enable`

**Default** Roaming authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Note that 802.1X port authentication, MAC authentication, or web-based authentication must be configured before using this feature. The port that the supplicant is moving to must have the same authentication configuration as the port the supplicant is moving from.

This command only enables roaming authentication for links that are up. If you want roaming authentication on links that are down, you must also use the command [auth roaming disconnected](#).

Roaming Authentication cannot be enabled if DHCP snooping is enabled ([service dhcp-snooping](#) command), and vice versa.

**Examples** To enable roaming authentication for port1.0.4, when using auth-mac authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# auth-mac enable
awplus(config-if)# auth roaming enable
```

To disable roaming authentication for port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no auth roaming enable
```

To enable roaming authentication for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth roaming enable
```

# auth supplicant-ip

**Overview** Use this command to add a supplicant (client device) IP address on a given interface.

Use the **no** variant of this command to delete the supplicant IP address and reset other parameters to their default values. The IP address can be determined before authentication for auth-web clients only.

**Syntax** `auth supplicant-ip <ip-addr> [max-reauth-req <1-10>] [max-req <1-10>] [port-control {auto|force-authorized|force-unauthorized|skip-second-auth}] [quiet-period <1-65535>] [reauthentication] [reauth-period <1-4294967295>] [supp-timeout <1-65535>] [server-timeout <1-65535>]`  
`no auth supplicant-ip <ip-addr> [reauthentication]`

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-addr>                    | IP address of the supplicant entry in A.B.C.D/P format.                                                                                                                                                                                                                                                                                    |
| max-reauth-req <1-10>        | Number of reauthentication attempts before becoming unauthorized (default 2).                                                                                                                                                                                                                                                              |
| max-req <1-10>               | Number of times the device resends an EAP Request packet if that packet is lost between the authenticating device and the specified supplicant (default 2, which is 3 transmission attempts in total). If the supplicant does not respond to an EAP Request after this number of retries, the supplicant fails the authentication process. |
| port-control                 | Port control options:<br><b>auto</b> : Allow port client to negotiate authentication<br><b>force-authorized</b> : Force port state to authorized<br><b>force-unauthorized</b> : Force port state to unauthorized<br><b>skip-second-auth</b> : Skip second authentication step.                                                             |
| quiet-period <1-65535>       | Quiet period in the HELD state in seconds (default 60 seconds).                                                                                                                                                                                                                                                                            |
| reauthentication             | Enable reauthentication on a port.                                                                                                                                                                                                                                                                                                         |
| reauth-period <1-4294967295> | Seconds between reauthorization attempts (default 3600 seconds).                                                                                                                                                                                                                                                                           |
| supp-timeout <1-65535>       | Supplicant response timeout in seconds (default 30 seconds).                                                                                                                                                                                                                                                                               |
| server-timeout <1-65535>     | Authentication server response timeout in seconds (default 30 seconds).                                                                                                                                                                                                                                                                    |

**Default** No supplicant IP address for port authentication exists by default until first created with the **auth supplicant-ip** command. The parameter defaults are shown in the table above.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To add the supplicant IP address 192.168.10.0/24 to force authorized port control for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth supplicant-ip 192.168.10.0/24
port-control force-authorized
```

To delete the supplicant IP address 192.168.10.0/24 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth supplicant-ip 192.168.10.0/24
```

To disable reauthentication for the supplicant(s) IP address 192.168.10.0/24 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth supplicant-ip 192.168.10.0/24
reauthentication
```

To add the supplicant IP address 192.168.10.0/24 to force authorized port control for auth profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth supplicant-ip
192.168.10.0/24 port-control force-authorized
```

**Command changes** Version 5.5.3-1.1: **max-req** parameter added

# auth supplicant-mac

**Overview** This command adds a supplicant (client device) MAC address or MAC mask on a given interface with the parameters as specified in the table below.

Use the **no** variant of this command to delete the supplicant MAC address and reset other parameters to their default values.

**Syntax**

```
auth supplicant-mac <mac-addr> [mask <mac-addr-mask>]
[max-reauth-req <1-10>] [max-req <1-10>] [port-control
{auto|force-authorized|force-unauthorized|skip-second-auth}]
[quiet-period <1-65535>] [reauthentication] [reauth-period
<1-4294967295>] [supp-timeout <1-65535>] [server-timeout
<1-65535>]

no auth supplicant-mac <mac-addr> [reauthentication]
```

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <mac-addr>                | MAC (hardware) address of the supplicant entry in HHHH.HHHH.HHHH MAC address hexadecimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| mask<br><mac-addr-mask>   | A mask applied to MAC addresses in order to select only those addresses containing a specific string. The mask comprises a string of three (period separated) bytes, where each byte comprises four hexadecimal characters that will generally be either 1 or 0. When the mask is applied to a specific MAC address, a match is only required for characters that correspond to a 1 in the mask. Characters that correspond to a 0 in the mask are effectively ignored. In the examples section below, the mask ffff.ff00.0000 is applied for the MAC address 0000.5E00.0000. The applied mask will then match only those MAC addresses that begin with 0000.5E (in this case the OUI component). The remaining portion of the addresses (in this case the NIC component) will be ignored. |
| max-reauth-req<br><1-10>  | Number of reauthentication attempts before becoming unauthorized (default 2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| max-req <1-10>            | Number of times the device resends an EAP Request packet if that packet is lost between the authenticating device and the specified supplicant (default 2, which is 3 transmission attempts in total). If the supplicant does not respond to an EAP Request after this number of retries, the supplicant fails the authentication process.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| port-control              | Port control options:<br><b>auto</b> : Allow port client to negotiate authentication<br><b>force-authorized</b> : Force port state to authorized<br><b>force-unauthorized</b> : Force port state to unauthorized<br><b>skip-second-auth</b> : Skip second authentication step.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| quiet-period<br><1-65535> | Quiet period in the HELD state in seconds (default 60 seconds).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Parameter                       | Description                                                             |
|---------------------------------|-------------------------------------------------------------------------|
| reauthentication                | Enable reauthentication on a port.                                      |
| reauth-period<br><1-4294967295> | Seconds between reauthorization attempts (default 3600 seconds).        |
| supp-timeout<br><1-65535>       | Supplicant response timeout in seconds (default 30 seconds).            |
| server-timeout<br><1-65535>     | Authentication server response timeout in seconds (default 30 seconds). |

**Default** No supplicant MAC address for port authentication exists by default until first created with the **auth supplicant-mac** command. The defaults for parameters are shown in the table above.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To add the supplicant MAC address 0000.5E00.5343 to force authorized port control for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth supplicant-mac 0000.5E00.5343
port-control force-authorized
```

To apply the mask ffff.ff00.0000 in order to add any supplicant MAC addresses whose MAC address begins with 0000.5E, and then to force authorized port control for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth supplicant-mac 0000.5E00.0000 mask
ffff.ff00.0000 port-control force-authorized
```

To delete the supplicant MAC address 0000.5E00.5343 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth supplicant-mac 0000.5E00.5343
```

To disable reauthentication for the supplicant MAC address 0000.5E00.5343 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth supplicant-mac 0000.5E00.5343
reauthentication
```

To add the supplicant MAC address 0000.5E00.5343 to force authorized port control for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth supplicant-mac
0000.5E00.5343 port-control force-authorized
```

To delete the supplicant MAC address 0000.5E00.5343 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth supplicant-mac
0000.5E00.5343
```

**Command  
changes**

Version 5.5.3-1.1: **max-req** parameter added

# auth timeout connect-timeout

**Overview** Use this command to set the connect-timeout period for the interface.

Use the **no** variant of this command to reset the connect-timeout period to the default.

**Syntax** `auth timeout connect-timeout <1-65535>`  
`no auth timeout connect-timeout`

| Parameter                    | Description                                        |
|------------------------------|----------------------------------------------------|
| <code>&lt;1-65535&gt;</code> | Specifies the connect-timeout period (in seconds). |

**Default** The connect-timeout default is 30 seconds.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** This command is used for MAC and web authentication. If the connect-timeout has lapsed and the supplicant has the state **connecting**, then the supplicant is deleted. When [auth-web-server session-keep](#) or [auth two-step enable](#) is enabled, we recommend you configure a longer connect-timeout period.

**Examples** To set the connect-timeout period to 3600 seconds for port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout connect-timeout 3600
```

To reset the connect-timeout period to the default (30 seconds) for port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout connect-timeout
```

To set the connect-timeout period to 3600 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout connect-timeout 3600
```

**Related commands** [auth profile \(global\)](#)

[show dot1x interface](#)

# auth timeout quiet-period

**Overview** Use this command to set a time period for which another authentication request is not accepted on a given interface, after an authentication request has failed.

Use the **no** variant of this command to reset the quiet period to the default.

**Syntax** `auth timeout quiet-period <1-65535>`  
`no auth timeout quiet-period`

| Parameter | Description                              |
|-----------|------------------------------------------|
| <1-65535> | Specifies the quiet period (in seconds). |

**Default** The quiet period for port authentication is 60 seconds.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the quiet period to 10 seconds for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout quiet-period 10
```

To reset the quiet period to the default (60 seconds) for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout quiet-period
```

To set the quiet period to 10 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout quiet-period 10
```

**Related commands** [auth profile \(global\)](#)

# auth timeout reauth-period

**Overview** Use this command to set the timer for reauthentication on a given interface. The re-authentication for the supplicant (client device) is executed at this timeout. The timeout is only applied if the **auth reauthentication** command is applied.

Use the **no** variant of this command to reset the **reauth-period** parameter to the default (3600 seconds).

**Syntax** `auth timeout reauth-period <1-4294967295>`  
`no auth timeout reauth-period`

| Parameter                         | Description                                       |
|-----------------------------------|---------------------------------------------------|
| <code>&lt;1-4294967295&gt;</code> | The reauthentication timeout period (in seconds). |

**Default** The default reauthentication period for port authentication is 3600 seconds, when reauthentication is enabled on the port.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the reauthentication period to 1 day for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout reauth-period 86400
```

To reset the reauthentication period to the default (3600 seconds) for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout reauth-period
```

To set the reauthentication period to 1 day for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout reauth-period 86400
```

To reset the reauthentication period to the default (3600 seconds) for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth timeout reauth-period
```

# auth timeout server-timeout

**Overview** Use this command to set the timeout for the waiting response from the RADIUS server on a given interface.

Use the **no** variant of this command to reset the server-timeout to the default (30 seconds).

**Syntax** `auth timeout server-timeout <1-65535>`  
`no auth timeout server-timeout`

| Parameter | Description                         |
|-----------|-------------------------------------|
| <1-65535> | Server timeout period (in seconds). |

**Default** The server timeout for port authentication is 30 seconds.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the server timeout to 120 seconds for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout server-timeout 120
```

To set the server timeout to the default (30 seconds) for interface port1.0.2 use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout server-timeout
```

To set the server timeout to 120 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout server-timeout 120
```

To set the server timeout to the default (30 seconds) for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth timeout server-timeout
```

**Related commands** [auth profile \(global\)](#)

`show dot1x`

# auth timeout supp-timeout

**Overview** This command sets the timeout of the waiting response from the supplicant (client device) on a given interface.

The **no** variant of this command resets the supplicant timeout to the default (30 seconds).

**Syntax** `auth timeout supp-timeout <1-65535>`  
`no auth timeout supp-timeout`

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| <1-65535> | The supplicant timeout period (in seconds). |

**Default** The supplicant timeout for port authentication is 30 seconds.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the supplicant timeout to 2 seconds for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout supp-timeout 2
```

To reset the supplicant timeout to the default (30 seconds) for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout supp-timeout
```

To set the supplicant timeout to 2 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout supp-timeout 2
```

# auth vlan-restriction

**Overview** Use this command to restrict port authenticated supplicants on an interface to one per VLAN. This is useful, for example, if you have configured multiple supplicants on an interface but you want to restrict network access to a single IP phone and a single authorized workstation.

Use the **no** variant of this command to remove the single supplicant per VLAN restriction.

**Syntax** `auth vlan-restriction`  
`no auth vlan-restriction`

**Default** Not configured

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** This is a port authentication command, so you should first configure 802.1X, MAC, or web authentication. In addition, configure multi-supplicants on the interface using the **auth host-mode multi-supplicant** command.

This command works with both dynamic VLANs and static voice VLAN configurations.

**Examples** To restrict supplicants to a one per VLAN on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth vlan-restriction
```

To remove the one per VLAN supplicant restriction on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth vlan-restriction
```

**Command changes** Version 5.5.1-2.1: command added

# auth two-step enable

**Overview** Use this command to enable a two-step authentication feature on an interface. When this feature is enabled, the supplicant is authorized in a two-step process. If authentication succeeds, the supplicant becomes authenticated.

Use this command to apply the two-step authentication method based on 802.1X, MAC or web authentication.

Use the **no** variant of this command to disable the two-step authentication feature.

**Syntax** `auth two-step enable`  
`no auth two-step enable`

**Default** Two step authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage** The single step authentication methods (either user or device authentication) have a potential security risk:

- an unauthorized user can access the network with an authorized device, or
- an authorized user can access the network with an unauthorized device.

Two-step authentication solves this problem by authenticating both the user and the device. The supplicant will only become authenticated if both these steps are successful. If the first authentication step fails, then the second step is not started.

**Examples** To enable the two step authentication feature, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth two-step enable
```

To disable the two step authentication feature, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth two-step enable
```

To enable MAC authentication followed by 802.1X authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable MAC authentication followed by web authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable 802.1X authentication followed by web authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable the two step authentication feature for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth two-step enable
```

show dot1x supplicant

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# auth two-step order

**Overview** Use this command to configure the order for two-step authentication. Two-step authentication and the relevant authentication methods must be enabled on the interface.

Use the **no** variant of this command to reset the authentication order to the default.

**Syntax**

```
auth two-step order auth-mac {dot1x|auth-web}
auth two-step order dot1x {auth-mac|auth-web}
no auth two-step order
```

| Parameter | Description           |
|-----------|-----------------------|
| auth-mac  | MAC authentication    |
| dot1x     | 802.1X authentication |
| auth-web  | Web authentication    |

**Default** Order is determined by the authentication methods configured on the interface (see **Usage notes**).

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** The default authentication order depends on the combination of the authentication methods configured on the interface:

- If auth-mac is configured then auth-mac will be the first method.
- If auth-mac is **not** configured then dot1x will become the first method.
- If only two methods are configured then the remaining method becomes the second method.
- If all three methods are configured then the second method is chosen based on the packet type received (dot1x for an EAPOL packet and auth-web for an HTTP packet).

**Examples** To set the two-step authentication order on port1.0.1 for 802.1X authentication and then MAC authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth two-step enable
awplus(config-if)# auth two-step order dot1x auth-mac
```

To reset the two-step authentication order back to the default, which would be MAC authentication then 802.1X authentication if configured as above, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no auth two-step order
```

**Command changes** Version 5.5.0-0.3: command added

# auth-mac accounting

**Overview** Use this command to override the **default** RADIUS accounting method for MAC-based authentication on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

**Syntax** `auth-mac accounting {default|<list-name>}`  
`no auth-mac accounting`

| Parameter   | Description                              |
|-------------|------------------------------------------|
| default     | Apply the default accounting method list |
| <list-name> | Apply the user-defined named list        |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-mac accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the accounting method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-mac accounting
```

**Related commands** [aaa accounting auth-mac](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac authentication

**Overview** This command overrides the **default** MAC authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

**Syntax** `auth-mac authentication {default|<list-name>}`  
`no auth-mac authentication`

| Parameter   | Description                                  |
|-------------|----------------------------------------------|
| default     | Apply the default authentication method list |
| <list-name> | Apply a user-defined named list              |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-mac authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-mac authentication
```

**Related commands** [aaa authentication auth-mac](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac enable

**Overview** This command enables MAC authentication on the interface specified in the Interface command mode.

Use the **no** variant of this command to disable MAC authentication on an interface.

**Syntax** `auth-mac enable`  
`no auth-mac enable`

**Default** MAC-Authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** Enabling **spanning-tree edgeport** on ports after enabling MAC authentication avoids unnecessary re-authentication when the port state changes, which does not happen when spanning tree edgeport is enabled. Note that re-authentication is correct behavior without **spanning-tree edgeport** enabled.

Applying **switchport mode access** on ports is also good practice to set the ports to access mode with ingress filtering turned on, whenever ports for MAC authentication are in a VLAN.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

**Examples** To enable MAC authentication on interface port1.0.2 and enable spanning tree edgeport to avoid unnecessary re-authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac enable
awplus(config-if)# spanning-tree edgeport
awplus(config-if)# switchport mode access
```

To disable MAC authentication on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac enable
```

To enable MAC authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac enable
```

changes**

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac method

**Overview** This command sets the type of authentication method for MAC authentication that is used with RADIUS on the interface specified in the interface command mode.

The **no** variant of this command resets the authentication method used to the default method (PAP) as the RADIUS authentication method used by the MAC authentication.

**Syntax** `auth-mac method [eap-md5|pap]`  
`no auth-mac method`

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| eap-md5   | Enable EAP-MD5 as the authentication method. |
| pap       | Enable PAP as the authentication method.     |

**Default** The MAC authentication method is PAP.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the MAC authentication method to PAP on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac method pap
```

To set the MAC authentication method to the default on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac method
```

To set the MAC authentication method to EAP-MD5 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac method eap-md5
```

# auth-mac password

**Overview** This command changes the password for MAC-based authentication.  
Use the **no** variant of this command to return the password to its default.

**Syntax** `auth-mac [encrypted] password <password>`  
`no auth-mac password`

| Parameter                     | Description                                                                                                                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>auth-mac</code>         | MAC-based authentication                                                                                                                                                                                          |
| <code>encrypted</code>        | Specify an encrypted password                                                                                                                                                                                     |
| <code>password</code>         | Configure the password                                                                                                                                                                                            |
| <code>&lt;password&gt;</code> | The new password. Passwords can be up to 64 characters in length and can contain any printable characters except: <ul style="list-style-type: none"><li>• ?</li><li>• " (double quotes)</li><li>• space</li></ul> |

**Default** By default, the password is the MAC address of the supplicant.

**Mode** Global Configuration

**Usage notes** Changing the password increases the security of MAC-based authentication, because the default password is easy for an attacker to discover. This is particularly important if:

- some MAC-based supplicants on the network are intelligent devices, such as computers, and/or
- you are using two-step authentication (see the “Ensuring Authentication Methods Require Different Usernames and Passwords” section of the [AAA and Port Authentication Feature\\_Overview\\_and\\_Configuration\\_Guide](#)).

**Examples** To change the password to verySecurePassword, use the commands:

```
awplus# configure terminal
awplus(config)# auth-mac password verySecurePassword
```

**Related commands** [auth two-step enable](#)  
[show auth](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac reauth-relearning

**Overview** This command sets the MAC address learning of the supplicant (client device) to re-learning for re-authentication on the interface specified in the interface command mode.

Use the **no** variant of this command to disable the auth-mac re-learning option.

**Syntax** `auth-mac reauth-relearning`  
`no auth-mac reauth-relearning`

**Default** Re-learning for port authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To enable the re-authentication re-learning feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac reauth-relearning
```

To disable the re-authentication re-learning feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac reauth-relearning
```

To enable the re-authentication re-learning feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac reauth-relearning
```

**Related commands** [auth profile \(global\)](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac static

**Overview** This command configures MAC authentication to use static entries in the FDB. Static entries persist in the FDB, even if there is no traffic flow from the supplicant.

When static FDB entries are configured, the [auth roaming disconnected](#) command is supported for MAC authentication. This command allows a supplicant to move to another authenticating interface without re-authentication.

Use the **no** variant of this command to revert to dynamic FDB entries.

**Syntax** `auth-mac static`  
`no auth-mac static`

**Default** By default MAC authentication supplicants are added to the FDB dynamically.

**Mode** Global Configuration

**Example** To configure MAC authentication to use static FDB entries, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-mac static
```

To configure MAC authentication to use dynamic FDB entries, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-mac static
```

**Related commands** [auth roaming disconnected](#)  
[show auth](#)  
[show dot1x](#)

**Command changes** Version 5.4.7-2.4: Command added  
Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-mac username

**Overview** Use this command to specify the format of the MAC address in the username and password field when a request for MAC-based authorization is sent to a RADIUS server.

**Syntax** `auth-mac username {ietf|unformatted} {lower-case|upper-case}`

| Parameter   | Description                                                                          |
|-------------|--------------------------------------------------------------------------------------|
| ietf        | The MAC address includes a hyphen between each 2 bytes. (Example: xx-xx-xx-xx-xx-xx) |
| unformatted | The MAC address does not include hyphens. (Example: xxxxxxxxxxxx)                    |
| lower-case  | The MAC address uses lower-case characters (a-f)                                     |
| upper-case  | The MAC address uses upper-case characters (A-F)                                     |

**Default** `auth-mac username ietf lower-case`

**Mode** Global Configuration

**Usage** This command is provided to allow other vendors', AlliedWare, and AlliedWare Plus switches to share the same format on the RADIUS server.

**Example** To configure the format of the MAC address in the username and password field to be changed to IETF and upper-case, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-mac username ietf upper-case
```

**Related commands** [auth-mac username](#)  
[show running-config](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# auth-web accounting

**Overview** This command overrides the default RADIUS accounting method for web-based authentication on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the default method.

**Syntax** `auth-web accounting {default|<list-name>}`  
`no auth-web accounting`

| Parameter   | Description                              |
|-------------|------------------------------------------|
| default     | Apply the default accounting method list |
| <list-name> | Apply a named accounting method list     |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-web accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the accounting method back to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-web accounting
```

**Related commands** [aaa accounting auth-web](#)

# auth-web authentication

**Overview** Use this command to override the default web-based authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the default method.

**Syntax** `auth-web authentication {default|<list-name>}`  
`no auth-web authentication`

| Parameter   | Description                                  |
|-------------|----------------------------------------------|
| default     | Apply the default authentication method list |
| <list-name> | Apply the user-defined named list            |

**Default** The **default** method list is applied to an interface by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To apply the named list 'vlan10\_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-web authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-web authentication
```

**Related commands** [aaa authentication auth-web](#)

# auth-web enable

**Overview** Use this command to enable web-based authentication in Interface mode on the interface specified.

Use the **no** variant of this command to apply its default.

**Syntax** `auth-web enable`  
`no auth-web enable`

**Default** Web authentication is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

**Examples** To enable web authentication on static-channel-group 2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# static-channel-group 2
awplus(config-if)# exit
awplus(config)# interface sa2
awplus(config-if)# auth-web enable
```

To disable web authentication on static-channel-group 2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface sa2
awplus(config-if)# no auth-web enable
```

To enable web authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web enable
```

To disable web authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web enable
```

**Related  
commands**

[auth profile \(global\)](#)  
[show auth](#)  
[show auth interface](#)  
[show running-config](#)

# auth-web forward

**Overview** Use this command to enable the web authentication packet forwarding feature on the interface specified. This command also enables ARP forwarding, and adds forwarded packets to the **tcp** or **udp** port number specified.

Use the **no** variant of this command to disable the specified packet forwarding feature on the interface.

**Syntax** `auth-web forward [<ip-address>|<ip-address/prefix-length>]  
{dns|tcp <1-65535>|udp <1-65535>}`

or

`auth-web forward {arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}`

The **no** variants of this command are:

`no auth-web forward [<ip-address>|<ip-address/prefix-length>]  
{dns|tcp <1-65535>|udp <1-65535>}`

or

`no auth-web forward {arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}`

| Parameter                                      | Description                                                                |
|------------------------------------------------|----------------------------------------------------------------------------|
| <ip-address><br><ip-address/<br>prefix-length> | The IP address or subnet on which the web authentication is to be enabled. |
| arp                                            | Enable forwarding of ARP.                                                  |
| dhcp                                           | Enable forwarding of DHCP (67/udp).                                        |
| dns                                            | Enable forwarding of DNS (53/udp).                                         |
| tcp                                            | Enable forwarding of TCP specified port number.                            |
| <1-65535>                                      | TCP Port number.                                                           |
| udp                                            | Enable forwarding of UDP specified port number.                            |
| <1-65535>                                      | UDP Port number.                                                           |

**Default** Packet forwarding for port authentication is enabled by default for "arp", "dhcp" and "dns".

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Usage notes** For more information about the <ip-address> parameter, and an example, see the "auth-web forward" section in the [AlliedWare Plus Technical Tips and Tricks](#).

**Examples** To enable the ARP forwarding feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web forward arp
```

To add TCP forwarding port 137 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web forward tcp 137
```

To add the DNS Server IP address 192.168.1.10 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth-web forward 192.168.1.10 dns
```

To disable the ARP forwarding feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web forward arp
```

To delete TCP forwarding port 137 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web forward tcp 137
```

To delete all TCP forwarding on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web forward tcp
```

To enable the ARP forwarding feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web forward arp
```

To add TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web forward tcp 137
```

To disable the ARP forwarding feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward arp
```

To delete TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward tcp 137
```

To delete all TCP forwarding on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward tcp
```

**Related  
commands**

[auth profile \(global\)](#)  
[show auth](#)  
[show auth interface](#)

# auth-web idle-timeout enable

**Overview** Use this command to enable the idle-timeout for client of web authentication on the interface.

The **no** variant of this command to disable the idle-timeout for client of web authentication on the interface.

**Syntax** `auth-web idle-timeout enable`  
`no auth-web idle-timeout enable`

**Default** The idle-timeout is disabled by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To enable the idle-timeout on an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config)# auth-web enable
awplus(config-if)# auth-web idle-timeout enable
```

To disable the idle-timeout on an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web idle-timeout enable
```

**Related commands** [auth-web enable](#)  
[auth-web idle-timeout timeout](#)

# auth-web idle-timeout timeout

**Overview** Use this command to set the timeout value for web authentication client in seconds. The client will be unauthorized when it does not have any activity for a period that exceeds the timeout value.

The **no** variant of this command sets the timeout value to the default setting, 3600 seconds.

**Syntax** `auth-web idle-timeout timeout <420-86400>`  
`no auth-web idle-timeout timeout`

| Parameter   | Description      |
|-------------|------------------|
| <420-86400> | Time in seconds. |

**Default** The timeout is 3600 seconds by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To set 30 minutes as the idle-timeout, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web idle-timeout timeout 1800
```

To return the idle-timeout to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web idle-timeout timeout
```

**Related commands** [auth-web enable](#)  
[auth-web idle-timeout enable](#)

# auth-web max-auth-fail

**Overview** Use this command to set the number of authentication failures allowed before rejecting further authentication requests. When the supplicant (client device) fails more than the specified number of times, then login requests are refused during the quiet period.

Use the **no** variant of this command to reset the maximum number of authentication failures to the default.

**Syntax** `auth-web max-auth-fail <0-10>`  
`no auth-web max-auth-fail`

| Parameter                 | Description                                                                              |
|---------------------------|------------------------------------------------------------------------------------------|
| <code>&lt;0-10&gt;</code> | The maximum number of authentication failures allowed before login requests are refused. |

**Default** The maximum number of authentication failures is set to 3.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Examples** To set the lock count to 5 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web max-auth-fail 5
```

To set the lock count to the default on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web max-auth-fail
```

To set the lock count to 5 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web max-auth-fail 5
```

To set the lock count to the default on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web max-auth-fail
```

**Related commands**

- auth profile (global)
- auth timeout quiet-period
- show auth
- show auth interface
- show running-config

# auth-web method

**Overview** Use this command to set the web authentication access method that is used with RADIUS on the interface specified.

Use the **no** variant of this command to set the authentication method to PAP for the interface specified when web authentication is also used with the RADIUS authentication method.

**Syntax** `auth-web method {eap-md5|pap}`  
`no auth-web method`

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| eap-md5   | Enable EAP-MD5 as the authentication method. |
| pap       | Enable PAP as the authentication method.     |

**Default** The web authentication method is set to PAP by default.

**Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

**Example** To set the web authentication method to EAP-MD5 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web method eap-md5
```

To set the web authentication method to EAP-MD5 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web method eap-md5
```

**Related commands**

- [auth profile \(global\)](#)
- [show auth](#)
- [show auth interface](#)
- [show running-config](#)

# auth-web-server blocking-mode

**Overview** Use this command to enable blocking mode for the Web-Authentication server. The blocking mode displays an authentication success or failure screen immediately from the response result from a RADIUS server.

Use the **no** variant of this command to disable blocking mode for the Web-Authentication server.

**Syntax** `auth-web-server blocking-mode`  
`no auth-web-server blocking-mode`

**Default** By default, blocking mode is disabled for the Web-Authentication server.

**Mode** Global Configuration

**Example** To enable blocking mode for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server blocking-mode
```

To disable blocking mode for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server blocking-mode
```

**Related commands** [auth-web-server redirect-delay-time](#)  
[show auth-web-server](#)  
[show running-config](#)

# auth-web-server dhcp ipaddress

**Overview** Use this command to assign an IP address and enable the DHCP service on the Web-Authentication server for supplicants (client devices).

Use the **no** variant of this command to remove an IP address and disable the DHCP service on the Web-Authentication server for supplicants.

**Syntax** `auth-web-server dhcp ipaddress <ip-address/prefix-length>`  
`no auth-web-server dhcp ipaddress`

| Parameter                                     | Description                                                                                                        |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-address/prefix-length&gt;</code> | The IPv4 address and prefix length assigned for the DHCP service on the Web-Authentication server for supplicants. |

**Default** No IP address for the Web-Authentication server is set by default.

**Mode** Global Configuration

**Usage notes** See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- using DHCP with web authentication, and
- restrictions regarding combinations of authentication enhancements working together

You cannot use the IPv4 address assigned to the device's interface as the Web-Authentication server address.

Note that this Web Authentication virtual DHCP server is a limited implementation of the DHCP protocol. Separation of IP addresses depends on allocating addresses incrementally and a short lease time. In a situation where a supplicant remains permanently connected but does not authenticate, there is a risk of re-allocation of the same IP address once the server has rolled through the entire address range.

**Examples** To assign the IP address 10.0.0.1 to the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp ipaddress 10.0.0.1/8
```

To remove an IP address on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp ipaddress
```

**Related  
commands**    `auth-web-server dhcp lease`  
                  `show auth-web-server`  
                  `show running-config`

# auth-web-server dhcp lease

**Overview** Use this command to set the DHCP lease time for supplicants (client devices) using the DHCP service on the Web-Authentication server.

Use the **no** variant of this command to reset to the default DHCP lease time for supplicants using the DHCP service on the Web-Authentication server.

**Syntax** `auth-web-server dhcp lease <20-60>`  
`no auth-web-server dhcp lease`

| Parameter | Description                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------|
| <20-60>   | DHCP lease time for supplicants using the DHCP service on the Web-Authentication server in seconds. |

**Default** The default DHCP lease time for supplicants using the DHCP service on the Web-Authentication server is set to 30 seconds.

**Mode** Global Configuration

**Usage notes** See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- using DHCP with web authentication, and
- restrictions regarding combinations of authentication enhancements working together

**Examples** To set the DHCP lease time to 1 minute for supplicants using the DHCP service on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp lease 60
```

To reset the DHCP lease time to the default setting (30 seconds) for supplicants using the DHCP service on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp lease
```

**Validation Commands** `show running-config`

**Related commands** `show auth-web-server`  
`auth-web-server dhcp ipaddress`

# auth-web-server dhcp-wpad-option

**Overview** This command sets the DHCP WPAD (Web Proxy Auto-Discovery) option for the Web-Authentication temporary DHCP service.

For more information and examples, see the “Web Auth Proxy” section in the [Alliedware Plus Technical Tips and Tricks](#).

Use the **no** variant of this command to disable the DHCP WPAD function.

**Syntax** `auth-web-server dhcp wpad-option <url>`  
`no auth-web-server dhcp wpad-option`

| Parameter | Description                               |
|-----------|-------------------------------------------|
| <url>     | URL to the server which gets a .pac file. |

**Default** The Web-Authentication server DHCP WPAD option is not set.

**Mode** Global Configuration

**Usage notes** If the supplicant is configured to use WPAD, the supplicant’s web browser will use TCP port 80 as usual. Therefore, the packet can be intercepted by Web-Authentication as normal, and the Web-Authentication Login page can be sent. However, after authentication, the browser does not know where to get the WPAD file and so cannot access external web pages. The WPAD file is usually named proxy.pac file and tells the browser what web proxy to use.

Use this command to tell the supplicant where it can get this file from. The switch itself can be specified as the source for this file, and it can deliver it to the supplicant on request.

**Example** To specify that the proxy.pac file is found on the server at 192.168.1.100, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp wpad-option
http://192.168.1.100/proxy/proxy.pac
```

**Related commands** [show auth-web-server](#)

# auth-web-server host-name

**Overview** This command assigns a hostname to the web authentication server.

Use the **no** variant of this command to remove the hostname from the web authentication server.

**Syntax** `auth-web-server host-name <hostname>`  
`no auth-web-server host-name`

| Parameter                     | Description                |
|-------------------------------|----------------------------|
| <code>&lt;hostname&gt;</code> | URL string of the hostname |

**Default** The web authentication server has no hostname.

**Mode** Global Configuration

**Usage notes** When the web authentication server uses HTTPS protocol, the web browser will validate the certificate. If the certificate is invalid, the web page gives a warning message before displaying server content. However, the web page will not give warning message if the server has a hostname same as the one stored in the installed certificate.

**Examples** To set the auth.example.com as the hostname of the web authentication server, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server host-name auth.example.com
```

To remove hostname auth.example.com from the web authentication server, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server host-name
```

**Related commands** [aaa authentication auth-web](#)  
[auth-web enable](#)

# auth-web-server intercept-port

**Overview** This command specifies any additional TCP port numbers that the Web-Authentication server is to intercept.

Use the **no** variant of this command to stop intercepting the TCP port numbers.

**Syntax** `auth-web-server intercept-port {<1-65535>|any}`  
`no auth-web-server intercept-port {<1-65535>|any}`

| Parameter | Description               |
|-----------|---------------------------|
| <1-65535> | TCP port number.          |
| any       | Intercept all TCP packets |

**Default** No additional TCP port numbers are intercepted by default.

**Mode** Global Configuration

**Usage notes** If this command is not specified, AlliedWare Plus Web-Authentication intercepts the supplicant's initial TCP port 80 connection to a web page and sends it the Web-Authentication Login page. However, if the supplicant is configured to use a web proxy, then it will usually be using TCP port 8080 (or another user configured port number). In this case Web-Authentication cannot intercept the connection.

To overcome this limitation you can use this command to tell the switch which additional port it should intercept, and then send the Web-Authentication Login page to the supplicant.

When the web authentication switch is in a guest network, the switch does not know the proxy server's port number in the supplicant's proxy setting. To overcome this limitation, you can use the **any** option in this command to intercept all TCP packets.

When you use this command in conjunction with a proxy server configured in the web browser, you must add the proxy server's network as a 'No Proxy' network. You can specify 'No Proxy' networks in the proxy settings in your web browser. For more information, see the "Web Auth Proxy" section in the [Alliedware Plus Technical Tips and Tricks](#).

**Example** To additionally intercept port number 3128, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server intercept-port 3128
```

**Related commands** [show auth-web-server](#)

# auth-web-server ip-conflict-prefer-newer-supPLICANT

**Overview** Use this command to alter the behavior of a Network Access Server (NAS) when it detects a supplicant with a duplicate IP address.

The default behavior is for the NAS to not authorize the newer supplicant. This command allows it to authorize the newer supplicant and unauthorize the original supplicant.

This command applies to Web-based authentication supplicants only.

Use the **no** variant of this command to set the behavior back to default.

**Syntax** `auth-web-server ip-conflict-prefer-newer-supPLICANT`  
`no auth-web-server ip-conflict-prefer-newer-supPLICANT`

**Default** The default behavior is to not authorize the newer supplicant if the NAS detects a duplicate IP address.

**Mode** Global Configuration

**Usage notes** Allied Telesis recommends you investigate and resolve the root cause of the conflicting IP addresses.

**Example** To configure a NAS to authorize the newer supplicant, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server
ip-conflict-prefer-newer-supPLICANT
```

**Related commands** [auth-web enable](#)  
[show auth](#)

**Command changes** Version 5.5.2-0.1: command added

# auth-web-server ipaddress

**Overview** This command sets the IP address for the Web-Authentication server.

Use the **no** variant of this command to delete the IP address for the Web-Authentication server.

You cannot use the IPv4 address assigned to the device's interface as the Web-Authentication server address.

**Syntax** `auth-web-server ipaddress <ip-address>`  
`no auth-web-server ipaddress`

| Parameter                       | Description                                                            |
|---------------------------------|------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | Web-Authentication server dotted decimal IP address in A.B.C.D format. |

**Default** The Web-Authentication server address on the system is not set by default.

**Mode** Global Configuration

**Examples** To set the IP address 10.0.0.1 to the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ipaddress 10.0.0.1
```

To delete the IP address from the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ipaddress
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server page language

**Overview** Use this command to set the presentation language of Web authentication pages. Titles and subtitles of Web authentication pages will be set accordingly. Note that presently only English or Japanese are offered.

Use the **no** variant of this command to set the presentation language of Web authentication pages to its default (English).

**Syntax** `auth-web-server page language {english|japanese}`  
`no auth-web-server page language`

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| english   | Web authentication pages are presented in English.  |
| japanese  | Web authentication pages are presented in Japanese. |

**Default** Web authentication pages are presented in English by default.

**Mode** Global Configuration

**Examples** To set Japanese as the presentation language of Web authentication pages, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page language japanese
```

To set English as the presentation language of Web authentication pages, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page language english
```

To unset the presentation language of Web authentication pages and use English as the default presentation language, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page language
```

**Related commands** [auth-web-server page title](#)  
[auth-web-server page sub-title](#)  
[show auth-web-server page](#)

# auth-web-server login-url

**Overview** This command sets the web-authentication login page URL. This lets you replace the login page with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for details.

Use the **no** variant of this command to delete the URL.

**Syntax** `auth-web-server login-url <URL>`  
`no auth-web-server login-url`

| Parameter | Description        |
|-----------|--------------------|
| <URL>     | Set login page URL |

**Default** The built-in login page is set by default.

**Mode** Global Configuration

**Examples** To set `http://example.com/login.html` as the login page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server login-url
http://example.com/login.html
```

To unset the login page URL, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server login-url
```

**Related commands** [show running-config](#)

# auth-web-server page logo

**Overview** This command sets the type of logo that will be displayed on the web authentication page.

Use the **no** variant of this command to set the logo type to **auto**.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page logo {auto|default|hidden}`  
`no auth-web-server page logo`

| Parameter | Description                                                              |
|-----------|--------------------------------------------------------------------------|
| auto      | Display the custom logo if installed; otherwise display the default logo |
| default   | Display the default logo                                                 |
| hidden    | Hide the logo                                                            |

**Default** Logo type is **auto** by default.

**Mode** Global Configuration

**Examples** To display the default logo with ignoring installed custom logo, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page logo default
```

To set back to the default logo type **auto**, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page logo
```

**Validation Commands** `show auth-web-server page`

# auth-web-server page sub-title

**Overview** This command sets the custom sub-title on the web authentication page.

Use the **no** variant of this command to reset the sub-title to its default.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page sub-title {hidden|text <sub-title>}`  
`no auth-web-server page sub-title`

| Parameter   | Description                  |
|-------------|------------------------------|
| hidden      | Hide the sub-title           |
| <sub-title> | Text string of the sub-title |

**Default** “Allied-Telesis” is displayed by default.

**Mode** Global Configuration

**Examples** To set the custom sub-title, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page sub-title text Web
Authentication
```

To hide the sub-title, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page sub-title hidden
```

To change back to the default title, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page sub-title
```

**Validation  
Commands** `show auth-web-server page`

# auth-web-server page success-message

**Overview** This command sets the success message on the web-authentication page.

Use the **no** variant of this command to remove the success message.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page success-message text <success-message>`  
`no auth-web-server page success-message`

| Parameter                            | Description                        |
|--------------------------------------|------------------------------------|
| <code>&lt;success-message&gt;</code> | Text string of the success message |

**Default** No success message is set by default.

**Mode** Global Configuration

**Examples** To set the success message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page success-message text Your
success message
```

To unset the success message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page success-message
```

**Validation Commands** [show auth-web-server page](#)

# auth-web-server page title

**Overview** This command sets the custom title on the web authentication page.

Use the **no** variant of this command to remove the custom title.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page title {hidden|text <title>}`  
`no auth-web-server page title`

| Parameter | Description              |
|-----------|--------------------------|
| hidden    | Hide the title           |
| <title>   | Text string of the title |

**Default** “Web Access Authentication Gateway” is displayed by default.

**Mode** Global Configuration

**Examples** To set the custom title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page title text Login
```

To hide the title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page title hidden
```

To unset the custom title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page title
```

**Validation Commands** [show auth-web-server page](#)

# auth-web-server page welcome-message

**Overview** This command sets the welcome message on the web-authentication login page.

Use the **no** variant of this command to remove the welcome message.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

**Syntax** `auth-web-server page welcome-message text <welcome-message>`  
`no auth-web-server page welcome-message`

| Parameter                            | Description                        |
|--------------------------------------|------------------------------------|
| <code>&lt;welcome-message&gt;</code> | Text string of the welcome message |

**Default** No welcome message is set by default.

**Mode** Global Configuration

**Examples** To set the welcome message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page welcome-message text Your
welcome message
```

To remove the welcome message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page welcome-message
```

**Validation Commands** [show auth-web-server page](#)

# auth-web-server ping-poll enable

**Overview** This command enables the ping polling to the supplicant (client device) that is authenticated by Web-Authentication.

The **no** variant of this command disables the ping polling to the supplicant that is authenticated by Web-Authentication.

**Syntax** `auth-web-server ping-poll enable`  
`no auth-web-server ping-poll enable`

**Default** The ping polling feature for Web-Authentication is disabled by default.

**Mode** Global Configuration

**Examples** To enable the ping polling feature for Web-Authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
```

To disable the ping polling feature for Web-Authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll enable
```

**Validation  
Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll failcount

**Overview** This command sets a fail count for the ping polling feature when used with Web-Authentication. The **failcount** parameter specifies the number of unanswered pings. A supplicant (client device) is logged off when the number of unanswered pings are greater than the failcount set with this command.

Use the **no** variant of this command to resets the fail count for the ping polling feature to the default (5 pings).

**Syntax** `auth-web-server ping-poll failcount <1-100>`  
`no auth-web-server ping-poll failcount`

| Parameter | Description |
|-----------|-------------|
| <1-100>   | Count.      |

**Default** The default failcount for ping polling is 5 pings.

**Mode** Global Configuration

**Examples** To set the failcount of ping polling to 10 pings, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll failcount 10
```

To set the failcount of ping polling to default, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll failcount
```

**Validation  
Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll interval

**Overview** This command is used to change the ping poll interval. The interval specifies the time period between pings when the supplicant (client device) is reachable.

Use the **no** variant of this command to reset to the default period for ping polling (30 seconds).

**Syntax** `auth-web-server ping-poll interval <1-65535>`  
`no auth-web-server ping-poll interval`

| Parameter | Description |
|-----------|-------------|
| <1-65535> | Seconds.    |

**Default** The interval for ping polling is 30 seconds by default.

**Mode** Global Configuration

**Examples** To set the interval of ping polling to 60 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll interval 60
```

To set the interval of ping polling to the default (30 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll interval
```

**Validation  
Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll reauth-timer-refresh

**Overview** This command modifies the **reauth-timer-refresh** parameter for the Web-Authentication feature. The **reauth-timer-refresh** parameter specifies whether a re-authentication timer is reset and when the response from a supplicant (a client device) is received.

Use the **no** variant of this command to reset the **reauth-timer-refresh** parameter to the default setting (disabled).

**Syntax** `auth-web-server ping-poll reauth-timer-refresh`  
`no auth-web-server ping-poll reauth-timer-refresh`

**Default** The `reauth-timer-refresh` parameter is disabled by default.

**Mode** Global Configuration

**Examples** To enable the `reauth-timer-refresh` timer, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll reauth-timer-refresh
```

To disable the `reauth-timer-refresh` timer, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll
reauth-timer-refresh
```

**Validation  
Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll timeout

**Overview** This command modifies the ping poll **timeout** parameter for the Web-Authentication feature. The **timeout** parameter specifies the time in seconds to wait for a response to a ping packet.

Use the **no** variant of this command to reset the timeout of ping polling to the default (1 second).

**Syntax** `auth-web-server ping-poll timeout <1-30>`  
`no auth-web-server ping-poll timeout`

| Parameter | Description |
|-----------|-------------|
| <1-30>    | Seconds.    |

**Default** The default timeout for ping polling is 1 second.

**Mode** Global Configuration

**Examples** To set the timeout of ping polling to 2 seconds, use the command:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll timeout 2
```

To set the timeout of ping polling to the default (1 second), use the command:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll timeout
```

**Validation  
Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ping-poll type

**Overview** Use this command to set the type of polling used to check that a web authenticated supplicant is still connected. The polling can be done using either ICMP (ping), or ARP messages.

If there is a firewall between an authenticating server and a supplicant, it may block ICMP traffic. If this occurs try changing to ARP polling.

Polling only starts when ping-polling is enabled and the supplicant has been authorized.

Use the **no** variant of this command to set the default polling type of ICMP (ping).

**Syntax** `auth-web-server ping-poll type {arp|ping}`  
`no auth-web-server ping-poll type`

| Parameter       | Description                                      |
|-----------------|--------------------------------------------------|
| auth-web-server | Web authentication server configuration commands |
| arp             | Enable polling via ARP                           |
| ping            | Enable polling via ICMP (ping)                   |

**Default** ICMP

**Mode** Global Configuration

**Examples** To set the polling type to ARP, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
awplus(config)# auth-web-server ping-poll type arp
```

To set the polling type to ICMP, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
awplus(config)# auth-web-server ping-poll type ping
```

To set the polling type to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll type
```

**Related commands** [auth-web-server ping-poll enable](#)

auth-web-server ping-poll timeout  
show auth-web-server

**Command changes** Version 5.5.1-1.1: command added

# auth-web-server port

**Overview** This command sets the HTTP port number for the Web-Authentication server.  
Use the **no** variant of this command to reset the HTTP port number to the default (80).

**Syntax** `auth-web-server port <port-number>`  
`no auth-web-server port`

| Parameter                        | Description                                                                               |
|----------------------------------|-------------------------------------------------------------------------------------------|
| <code>&lt;port-number&gt;</code> | Set the local Web-Authentication server port within the TCP port number range 1 to 65535. |

**Default** The Web-Authentication server HTTP port number is set to 80 by default.

**Mode** Global Configuration

**Examples** To set the HTTP port number 8080 for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server port 8080
```

To reset to the default HTTP port number 80 for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server port
```

**Validation Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server redirect-delay-time

**Overview** Use this command to set the delay time in seconds before redirecting the supplicant to a specified URL when the supplicant is authorized.

Use the variant **no** to reset the delay time set previously.

**Syntax** `auth-web-server redirect-delay-time <5-60>`  
`no auth-web-server redirect-delay-time`

| Parameter                        | Description                                                                              |
|----------------------------------|------------------------------------------------------------------------------------------|
| <code>redirect-delay-time</code> | Set the delay time before jumping to a specified URL after the supplicant is authorized. |
| <code>&lt;5-60&gt;</code>        | The time in seconds.                                                                     |

**Default** The default redirect delay time is 5 seconds.

**Mode** Global Configuration

**Examples** To set the delay time to 60 seconds for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-delay-time 60
```

To reset the delay time, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-delay-time
```

**Related commands** [auth-web-server blocking-mode](#)  
[auth-web-server redirect-url](#)  
[show auth-web-server](#)  
[show running-config](#)

# auth-web-server redirect-url

**Overview** This command sets a URL for supplicant (client device) authentication. When a supplicant is authorized it will be automatically redirected to the specified URL. Note that if the http redirect feature is used then this command is ignored.

Use the **no** variant of this command to delete the URL string set previously.

**Syntax** `auth-web-server redirect-url <url>`  
`no auth-web-server redirect-url`

| Parameter                | Description                           |
|--------------------------|---------------------------------------|
| <code>&lt;url&gt;</code> | URL (hostname or dotted IP notation). |

**Default** The redirect URL for the Web-Authentication server feature is not set by default (null).

**Mode** Global Configuration

**Examples** To enable and set redirect a URL string `www.alliedtelesis.com` for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-url
http://www.alliedtelesis.com
```

To delete a redirect URL string, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-url
```

**Related commands** [auth-web-server redirect-delay-time](#)  
[show auth](#)

[show running-config](#)

# auth-web-server session-keep

**Overview** This command enables the session-keep feature to jump to the original URL after being authorized by Web-Authentication.

Use the **no** variant of this command to disable the session keep feature.

**Syntax** `auth-web-server session-keep`  
`no auth-web-server session-keep`

**Default** The session-keep feature is disabled by default.

**Mode** Global Configuration

**Usage notes** This function doesn't ensure to keep session information in all cases. Authenticated supplicant may be redirected to unexpected page when session-keep is enabled. This issue occurred by supplicant sending HTTP packets automatically after authentication page is displayed and the URL is written.

**Examples** To enable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server session-keep
```

To disable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server session-keep
```

**Validation  
Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ssl

**Overview** This command enables HTTPS functionality for the Web-Authentication server feature.

Use the **no** variant of this command to disable HTTPS functionality for the Web-Authentication server.

**Syntax** `auth-web-server ssl`  
`no auth-web-server ssl`

**Default** HTTPS functionality for the Web-Authentication server feature is disabled by default.

**Mode** Global Configuration

**Examples** To enable HTTPS functionality for the Web-Authentication server feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ssl
```

To disable HTTPS functionality for the Web-Authentication server feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ssl
```

**Validation  
Commands** `show auth`  
`show auth-web-server`  
`show running-config`

# auth-web-server ssl intercept-port

**Overview** Use this command to register HTTPS intercept port numbers when the HTTPS server uses custom port number (not TCP port number 443).

Note that you need to use the **auth-web-server intercept-port** command to register HTTP intercept port numbers.

Use the **no** variant of this command to delete registered port number.

**Syntax** `auth-web-server ssl intercept-port <1-65535>`  
`no auth-web-server ssl intercept-port <1-65535>`

| Parameter | Description                                       |
|-----------|---------------------------------------------------|
| <1-65535> | TCP port number in the range from 1 through 65535 |

**Default** 443/TCP is registered by default.

**Mode** Global Configuration

**Examples** To register HTTPS port number 3128, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ssl intercept-port 3128
```

To delete HTTPS port number 3128, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ssl intercept-port 3128
```

**Validation Commands** [show auth-web-server](#)

**Related commands** [auth-web-server intercept-port](#)

# auth-web-server trustpoint

**Overview** Use this command to set the PKI trustpoint to use for secure web authentication communication to an AlliedWare Plus device.

Use the **no** variant of this command to revert to using the default trustpoint 'default-selfsigned'.

**Syntax** `auth-web-server trustpoint <trustpoint-name>`  
`no auth-web-server trustpoint`

| Parameter                            | Description        |
|--------------------------------------|--------------------|
| <code>&lt;trustpoint-name&gt;</code> | Name of trustpoint |

**Default** By default, web authentication uses the 'default-selfsigned' trustpoint.

**Mode** Global Configuration

**Usage notes** Before using the **auth-web-server trustpoint** command you will need to establish a trustpoint. For example, you can create a local self-signed trustpoint using the procedure outlined below.

Create a self-signed trustpoint called 'web-trust' with keypair 'web\_key':

```
awplus# configure terminal
awplus(config)# crypto pki trustpoint web-trust
awplus(ca-trustpoint)# enrollment selfsigned
awplus(ca-trustpoint)# rsakeypair web_key
awplus(ca-trustpoint)# exit
awplus(config)# exit
```

Create the root and server certificates for this trustpoint:

```
awplus# crypto pki authenticate web-trust
awplus# crypto pki enroll web-trust
```

For more information about the AlliedWare Plus implementation of Public Key Infrastructure (PKI), see the [Public Key Infrastructure \(PKI\) Feature Overview and Configuration Guide](#)

**Example** To configure web authentication to use the trustpoint 'web-trust', use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server trustpoint web-trust
```

To configure web authentication to use the default trustpoint 'default-selfsigned', use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server trustpoint
```

**Related

changes**

Version 5.5.1-2.1: command added

# copy proxy-autoconfig-file

**Overview** Use this command to download the proxy auto configuration (PAC) file to your switch. The Web-Authentication supplicant can get the downloaded file from the system web server.

**Syntax** `copy <filename> proxy-autoconfig-file`

| Parameter                     | Description              |
|-------------------------------|--------------------------|
| <code>&lt;filename&gt;</code> | The URL of the PAC file. |

**Mode** Privileged Exec

**Example** To download the PAC file to this device, use the command:

```
awplus# copy tftp://server/proxy.pac proxy-autoconfig-file
```

**Related commands** [show proxy-autoconfig-file](#)  
[erase proxy-autoconfig-file](#)

# copy web-auth-https-file

**Overview** Use this command to download the SSL server certificate for web-based authentication. The file must be in PEM (Privacy Enhanced Mail) format, and contain the private key and the server certificate.

**Syntax** `copy <filename> web-auth-https-file`

| Parameter  | Description                             |
|------------|-----------------------------------------|
| <filename> | The URL of the server certificate file. |

**Mode** Privileged Exec

**Example** To download the server certificate file `verisign_cert.pem` from the TFTP server directory `server`, use the command:

```
awplus# copy tftp://server/verisign_cert.pem
web-auth-https-file
```

**Related commands**

- [auth-web-server ssl](#)
- [erase web-auth-https-file](#)
- [show auth-web-server](#)

# description (auth-profile)

**Overview** Use this command to add a description to an authentication profile in Authentication Profile mode.

Use the **no** variant of this command to remove the current description.

**Syntax** `description <description>`

| Parameter                        | Description                                          |
|----------------------------------|------------------------------------------------------|
| <code>&lt;description&gt;</code> | Text describing the selected authentication profile. |

**Default** No description configured by default.

**Mode** Authentication Profile

**Example** To add a description to the authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# description student room setting
```

To remove a description from the authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no description
```

**Related commands** [auth profile \(global\)](#)

# erase proxy-autoconfig-file

**Overview** Use this command to remove the proxy auto configuration file.

**Syntax** `erase proxy-autoconfig-file`

**Mode** Privileged Exec

**Example** To remove the proxy auto configuration file, use the command:

```
awplus# erase proxy-autoconfig-file
```

**Related commands** [show proxy-autoconfig-file](#)  
[copy proxy-autoconfig-file](#)

# erase web-auth-https-file

**Overview** Use this command to remove the SSL server certificate for web-based authentication.

**Syntax** `erase web-auth-https-file`

**Mode** Privileged Exec

**Example** To remove the SSL server certificate file for web-based authentication use the command:

```
awplus# erase web-auth-https-file
```

**Related commands**

- [auth-web-server ssl](#)
- [copy web-auth-https-file](#)
- [show auth-web-server](#)

# platform l3-hashing-algorithm

**Overview** This command enables you to change the L3 VLAN hash-key-generating algorithm.

The **no** variant of this command returns the hash-key algorithm to the default of `crc32l`.

**Syntax** `platform l3-hashing-algorithm {crc16l|crc16u|crc32l|crc32u}`  
`no platform l3-hashing-algorithm`

| Parameter           | Description                                               |
|---------------------|-----------------------------------------------------------|
| <code>crc16l</code> | The algorithm that will apply to the lower bits of CRC-16 |
| <code>crc16u</code> | The algorithm that will apply to the upper bits of CRC-16 |
| <code>crc32l</code> | The algorithm that will apply to the lower bits of CRC-32 |
| <code>crc32u</code> | The algorithm that will apply to the upper bits of CRC-32 |

**Default** The hash-key algorithm is `crc32l` by default.

**Mode** Global configuration

**Usage notes** Occasionally, when using the Multiple Dynamic VLAN feature, a supplicant cannot be authenticated because a collision occurs within the VLAN L3 table. This can happen when more than four different IP addresses produce the same hash-key.

When this situation occurs, collisions can sometimes be avoided by changing the hashing algorithm from its default of `crc32l`. Several different algorithms may need to be tried to rectify the problem.

You must restart the switch for this command to take effect.

Note that this command is intended for technical support staff, or advanced end users.

**Example** To change the hash-key generating algorithm applying to the lower bits of CRC-16, use the command:

```
awplus# configure terminal
awplus(config)# platform l3-hashing-algorithm crc16l
```

**Related commands** [platform mac-vlan-hashing-algorithm](#)  
[show platform](#)

# platform mac-vlan-hashing-algorithm

**Overview** This command enables you to change the MAC VLAN hash-key-generating algorithm.

The **no** variant of this command returns the hash-key algorithm to the default of `crc32l`

**Syntax** `platform mac-vlan-hashing-algorithm`  
`{crc16l|crc16u|crc32l|crc32u}`  
`no platform mac-vlan-hashing-algorithm`

| Parameter           | Description                                               |
|---------------------|-----------------------------------------------------------|
| <code>crc16l</code> | The algorithm that will apply to the lower bits of CRC-16 |
| <code>crc16u</code> | The algorithm that will apply to the upper bits of CRC-16 |
| <code>crc32l</code> | The algorithm that will apply to the lower bits of CRC-32 |
| <code>crc32u</code> | The algorithm that will apply to the upper bits of CRC-32 |

**Default** The hash-key algorithm is `crc32l` by default.

**Mode** Global configuration

**Usage notes** Occasionally, when using the Multiple Dynamic VLAN feature, a supplicant cannot be authenticated because a collision occurs within the VLAN MAC table. This can happen when more than four different MAC addresses produce the same hash-key.

When this situation occurs, collisions can sometimes be avoided by changing the hashing algorithm from its default of `crc32l`. Several different algorithms may need to be tried to rectify the problem.

You must restart the switch for this command to take effect.

Note that this command is intended for technical support staff, or advanced end users.

**Example** To change the hash-key generating algorithm applying to the lower bits of CRC-16, use the command:

```
awplus# configure terminal
awplus(config)# platform mac-vlan-hashing-algorithm crc16l
```

**Related commands** [platform l3-hashing-algorithm](#)  
[show platform](#)

# show auth

**Overview** This command shows the configuration state of authentication.

**Syntax** show auth [all]

| Parameter | Description                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| all       | Display all authentication information for each authenticated interface. This can be a static channel (or static aggregator), or a dynamic (or LACP) channel group, or a switch port. |

**Mode** Privileged Exec

**Example** To display all authentication information, enter the command:

```
awplus# show auth all
```

**Output** Figure 43-1: Example output from the **show auth** command

```
awplus# show auth all

# show auth diagnostics

**Overview** This command shows authentication diagnostics, optionally for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

If no interface is specified then authentication diagnostics are shown for all interfaces.

**Syntax** `show auth diagnostics [interface <interface-list>]`

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <code>&lt;interface-list&gt;</code> | The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul> |

**Mode** Privileged Exec

**Example** To display the web-based authentication status for port1.0.4, enter the command:

```
awplus# show auth interface port1.0.4
```

If port-based authentication is not configured, the output will be

```
% Port-Control not configured on port1.0.4
```

To display the port-based authentication status for port1.0.4, enter the command:

```
awplus# show auth interface port1.0.4
```

```
awplus# show auth interface port1.0.4

# show auth sessionstatistics

**Overview** This command shows authentication session statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

**Syntax** `show auth sessionstatistics [interface <interface-list>]`

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

```
awplus# show auth supplicant interface port1.0.2 brief
```

# show auth two-step supplicant brief

**Overview** This command displays the supplicant state of the two-step authentication feature on the interface.

**Syntax** show auth two-step supplicant [interface <interface-list>]  
brief

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface        | The interface selected for display.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <interface-list> | The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3)</li><li>• a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.</li></ul> |

**Mode** Privileged Exec

**Usage notes** Do not mix interface types in a list. The specified interfaces must exist.

**Example** To display the supplicant state of the two-step authentication feature, enter the command:

```
awplus# show two-step supplicant interface port1.0.2 brief
```

**Output** Figure 43-8: Example output from **show auth two-step supplicant brief**

|                                        |     |      |                 |               |           |            |

# show auth-web-server

**Overview** This command shows the Web-Authentication server configuration and status on the switch.

**Syntax** `show auth-web-server`

**Mode** Privileged Exec

**Example** To display Web-Authentication server configuration and status, enter the command:

```
awplus# show auth-web-server
```

**Output** Figure 43-9: Example output from the **show auth-web-server** command

```
Web authentication server
 Server status: enabled
 Server mode: none
 Server address: 192...
 DHCP server enabled
 DHCP lease time: 20
 DHCP WPAD Option URL: http://...
 HTTP Port No: 80
 Security: disabled
 Certification: default
 SSL Port No: 443
 Redirect URL: --
 Redirect Delay Time: 5
 HTTP Redirect: enabled
 Session keep: disabled
 PingPolling: disabled
 PingPollingType: Ping
 PingInterval: 30
 Timeout: 1
 FailCount: 5
 ReauthTimerReFresh: disabled
```

# AAA Commands

## Introduction

**Overview** AAA is the collective title for the three related functions of Authentication, Authorization and Accounting. These functions can be applied in a variety of methods with a variety of servers.

The purpose of the AAA commands is to map instances of the AAA functions to sets of servers. The Authentication function can be performed in multiple contexts, such as authentication of users logging in at a console, or 802.1X-Authentication of devices connecting to Ethernet ports.

For each of these contexts, you may want to use different sets of servers for examining the proffered authentication credentials and deciding if they are valid. AAA Authentication commands enable you to specify which servers will be used for different types of authentication.

This chapter provides an alphabetical reference for AAA commands for Authentication, Authorization and Accounting. For more information, see the [AAA and Port\\_Authentication Feature Overview and Configuration Guide](#).

# aaa accounting auth-mac

**Overview** This command configures an accounting method list for MAC-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with MAC-based authentication enabled, or a named method list, which can be applied to an interface with the [auth-mac accounting](#) command.

Use the **no** variant of this command to disable either the default or a named accounting method list for MAC-based authentication. Once all method lists are disabled, AAA accounting for MAC-based authentication is disabled globally.

**Syntax** `aaa accounting auth-mac {default|<list-name>}  
{start-stop|stop-only|none} group {<group-name>|radius}  
no aaa accounting auth-mac {default|<list-name>}`

| Parameter    | Description                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------|
| default      | Configure the default accounting method list                                                                              |
| <list-name>  | Configure a named accounting method list                                                                                  |
| start-stop   | Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session. |
| stop-only    | Only sends a stop accounting message at the end of the session.                                                           |
| none         | No accounting record sent.                                                                                                |
| group        | Use a server group                                                                                                        |
| <group-name> | Server group name.                                                                                                        |
| radius       | Use all RADIUS servers.                                                                                                   |

**Default** RADIUS accounting for MAC-based Authentication is disabled by default

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default accounting method list or a named accounting method list:

- **default:** the default accounting method list which is automatically applied to all interfaces with MAC-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [auth-mac accounting](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command

- **group** <group-name>: use the specified RADIUS server group configured with the [aaa group server](#) command

The accounting event to send to the RADIUS server is configured with the following options:

- **start-stop**: sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only**: sends a **stop** accounting message at the end of a session.
- **none**: disables accounting.

**Examples** To enable the default RADIUS accounting for MAC-based authentication, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-mac default start-stop
group radius
```

To disable RADIUS accounting for MAC-based Authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-mac default
```

To enable a named RADIUS accounting method list 'vlan10\_acct' for MAC-based authentication, with the RADIUS server group 'rad\_group\_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-mac vlan10_acct start-stop
group rad_group_vlan10
```

To disable a named RADIUS accounting method list 'vlan10\_acct' for MAC-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-mac vlan10_acct
```

**Related commands**

- [aaa authentication auth-mac](#)
- [aaa group server](#)
- [auth-mac accounting](#)
- [auth-mac enable](#)
- [radius-server host](#)
- [show aaa server group](#)

# aaa accounting auth-web

**Overview** This command configures an accounting method list for Web-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with Web-based authentication enabled, or a named method list, which can be applied to an interface with the [auth-web accounting](#) command.

Use the **no** variant of this command to disable either the default or a named accounting method list for Web-based authentication. Once all method lists are disabled, AAA accounting for Web-based authentication is disabled globally.

**Syntax** `aaa accounting auth-web {default|<list-name>}  
{start-stop|stop-only|none} group {<group-name>|radius}  
no aaa accounting auth-web {default|<list-name>}`

| Parameter    | Description                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------|
| default      | Configure the default accounting method list                                                                              |
| <list-name>  | Configure a named accounting method list                                                                                  |
| start-stop   | Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session. |
| stop-only    | Only sends a stop accounting message at the end of the session.                                                           |
| none         | No accounting record sent.                                                                                                |
| group        | Use a server group                                                                                                        |
| <group-name> | Server group name.                                                                                                        |
| radius       | Use all RADIUS servers.                                                                                                   |

**Default** RADIUS accounting for Web-based authentication is disabled by default.

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default accounting method list or a named accounting method list:

- **default:** the default accounting method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [auth-web accounting](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command

- **group** <group-name>: use the specified RADIUS server group configured with the [aaa group server](#) command

Configure the accounting event to be sent to the RADIUS server with the following options:

- **start-stop**: sends a start accounting message at the beginning of a session and a stop accounting message at the end of the session.
- **stop-only**: sends a stop accounting message at the end of a session.
- **none**: disables accounting.

**Examples** To enable the default RADIUS accounting method for Web-based authentication, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-web default start-stop
group radius
```

To disable the default RADIUS accounting method for Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-web default
```

To enable a named RADIUS accounting method list 'vlan10\_acct' for Web-based authentication, with the RADIUS server group 'rad\_group\_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-web vlan10_acct start-stop
group rad_group_vlan10
```

To disable a named RADIUS accounting method list 'vlan10\_acct' for Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-web vlan10_acct
```

**Related commands**

# aaa accounting commands

**Overview** This command configures and enables TACACS+ accounting on commands entered at a specified privilege level. Once enabled for a privilege level, accounting messages for commands entered at that privilege level will be sent to a TACACS+ server.

In order to account for all commands entered on a device, configure command accounting for each privilege level separately.

The command accounting message includes, the command as entered, the date and time the command finished executing, and the user-name of the user who executed the command.

Use the **no** variant of this command to disable command accounting for a specified privilege level.

TACACS+ is not available in Secure Mode (see the [crypto secure-mode](#) command).

**Syntax** `aaa accounting commands <1-15> default stop-only group tacacs+`  
`no aaa accounting commands <1-15> default`

| Parameter | Description                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------|
| <1-15>    | The privilege level being configured, in the range 1 to 15.                                                        |
| default   | Use the default method list, this means the command is applied globally to all user exec sessions.                 |
| stop-only | Send accounting message when the commands have stopped executing.                                                  |
| group     | Specify the server group where accounting messages are sent. Only the tacacs+ group is available for this command. |
| tacacs+   | Use all TACACS+ servers configured by the <a href="#">tacacs-server host</a> command.                              |

**Default** TACACS+ command accounting is disabled by default.

**Mode** Global Configuration

**Usage notes** This command only supports a **default** method list, this means that it is applied to every console and VTY line.

The **stop-only** parameter indicates that the command accounting messages are sent to the TACACS+ server when the commands have stopped executing.

The **group tacacs+** parameters signifies that the command accounting messages are sent to the TACACS+ servers configured by the [tacacs-server host](#) command.

Note that up to four TACACS+ servers can be configured for accounting. The servers are checked for reachability in the order they are configured with only the

first reachable server being used. If no server is found, the accounting message is dropped.

Command accounting cannot coexist with triggers. An error message is displayed if you attempt to enable command accounting while a trigger is configured. Likewise, an error message is displayed if you attempt to configure a trigger while command accounting is configured.

**Examples** To configure command accounting for privilege levels 1, 7, and 15, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting commands 1 default stop-only
group tacacs+
awplus(config)# aaa accounting commands 7 default stop-only
group tacacs+
awplus(config)# aaa accounting commands 15 default stop-only
group tacacs+
```

To disable command accounting for privilege levels 1, 7, and 15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting commands 1 default
awplus(config)# no aaa accounting commands 7 default
awplus(config)# no aaa accounting commands 15 default
```

- [aaa accounting login](#)
- [accounting login](#)
- [tacacs-server host](#)

# aaa accounting dot1x

**Overview** Use this command to configure an accounting method list for IEEE 802.1X-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with IEEE 802.1X-based authentication enabled, or a named method list, which can be applied to an interface with the [dot1x accounting](#) command.

Use the **no** variant of this command to disable either the default or a named accounting method list for 802.1X-based authentication. Once all method lists are disabled, AAA accounting for 802.1x-based authentication is disabled globally.

**Syntax** `aaa accounting dot1x {default|<list-name>}  
{start-stop|stop-only|none} group {<group-name>|radius}  
no aaa accounting dot1x {default|<list-name>}`

| Parameter    | Description                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------|
| default      | Configure the default accounting method list                                                                              |
| <list-name>  | Configure a named accounting method list                                                                                  |
| start-stop   | Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session. |
| stop-only    | Only sends a stop accounting message at the end of the session.                                                           |
| none         | No accounting record sent.                                                                                                |
| group        | Use a server group                                                                                                        |
| <group-name> | Server group name.                                                                                                        |
| radius       | Use all RADIUS servers.                                                                                                   |

**Default** RADIUS accounting for 802.1X-based authentication is disabled by default (there is no default server set by default).

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default accounting method list or a named accounting method list:

- **default:** the default accounting method list which is automatically applied to all interfaces with 802.1X-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [dot1x accounting](#) command.

There are two ways to define servers where RADIUS accounting messages will be sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command.
- **group <group-name>:** use the specified RADIUS server group configured with the [aaa group server](#) command.

The accounting event to send to the RADIUS server is configured by the following options:

- **start-stop:** sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only:** sends a **stop** accounting message at the end of a session.
- **none:** disables accounting.

**Examples** To enable RADIUS accounting for 802.1X-based authentication, and use all available RADIUS Servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting dot1x default start-stop group
radius
```

To disable RADIUS accounting for 802.1X-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting dot1x default
```

To enable a named RADIUS accounting method list 'vlan10\_acct' for 802.1X-based authentication, with the RADIUS server group 'rad\_group\_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting dot1x vlan10_acct start-stop
group rad_group_vlan10
```

To disable a named RADIUS accounting method list 'vlan10\_acct' for 802.1X-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting dot1x vlan10_acct
```

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# aaa accounting login

**Overview** This command configures RADIUS and TACACS+ accounting for login shell sessions. The specified method list name can be used by the **accounting login** command in the Line Configuration mode. If the **default** parameter is specified, then this creates a default method list that is applied to every console and VTY line, unless another accounting method list is applied on that line.

Note that unlimited RADIUS servers and up to four TACACS+ servers can be configured and consulted for accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, i.e. is unreachable.

TACACS+ is not available in Secure Mode (see the [crypto secure-mode](#) command).

Use the **no** variant of this command to remove an accounting method list for login shell sessions configured by an **aaa accounting login** command. If the method list being deleted is already applied to a console or VTY line, accounting on that line will be disabled. If the default method list name is removed by this command, it will disable accounting on every line that has the default accounting configuration.

**Syntax**

```
aaa accounting login
{default|<list-name>} {start-stop|stop-only|none} {group
{radius|tacacs+|<group-name>}}
no aaa accounting login {default|<list-name>}
```

| Parameter    | Description                                                                                           |
|--------------|-------------------------------------------------------------------------------------------------------|
| default      | Default accounting method list.                                                                       |
| <list-name>  | Named accounting method list.                                                                         |
| start-stop   | Start and stop records to be sent.                                                                    |
| stop-only    | Stop records to be sent.                                                                              |
| none         | No accounting record to be sent.                                                                      |
| group        | Specify the servers or server group where accounting packets are sent.                                |
| radius       | Use all RADIUS servers configured by the <a href="#">radius-server host</a> command.                  |
| tacacs+      | Use all TACACS+ servers configured by the <a href="#">tacacs-server host</a> command.                 |
| <group-name> | Use the specified RADIUS server group, as configured by the <a href="#">aaa group server</a> command. |

**Default** Accounting for login shell sessions is disabled by default.

**Mode** Global Configuration

**Usage notes** This command enables you to define a named accounting method list. The items that you define in the accounting options are:

- the types of accounting packets that will be sent
- the set of servers to which the accounting packets will be sent

You can define a default method list with the name **default** and any number of other named method lists. The name of any method list that you define can then be used as the *<list-name>* parameter in the [accounting login](#) command.

If the method list name already exists, the command will replace the existing configuration with the new one.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>** : use the specified RADIUS server group configured with the [aaa group server](#) command

There is one way to define servers where TACACS+ accounting messages are sent:

- **group tacacs+** : use all TACACS+ servers configured by [tacacs-server host](#) command

The accounting event to send to the RADIUS or TACACS+ server is configured with the following options:

- **start-stop** : sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only** : sends a **stop** accounting message at the end of a session.
- **none** : disables accounting.

**Examples** To configure RADIUS accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group
radius
```

To configure TACACS+ accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group
tacacs+
```

To reset the configuration of the default accounting list, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting login default
```

**Related commands**

- [radius-server host](#)
- [tacacs-server host](#)

# aaa accounting update

**Overview** This command enables periodic accounting reporting to either the RADIUS or TACACS+ accounting server(s) wherever login accounting has been configured.

Note that unlimited RADIUS servers and up to four TACACS+ servers can be configured and consulted for accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, i.e. is unreachable.

Use the **no** variant of this command to disable periodic accounting reporting to the accounting server(s).

**Syntax** `aaa accounting update [periodic <1-65535>]`  
`no aaa accounting update`

| Parameter                    | Description                                                                      |
|------------------------------|----------------------------------------------------------------------------------|
| <code>periodic</code>        | Send accounting records periodically.                                            |
| <code>&lt;1-65535&gt;</code> | The interval to send accounting updates (in minutes). The default is 30 minutes. |

**Default** Disabled

**Mode** Global Configuration

**Usage notes** Use this command to enable the device to send periodic AAA login accounting reports to the accounting server. When periodic accounting reporting is enabled, interim accounting records are sent at the interval specified by the **periodic** parameter. The accounting updates are start messages.

If the **no** variant of this command is used to disable periodic accounting reporting, any interval specified by the **periodic** parameter is reset to the default of 30 minutes when accounting reporting is re-enabled, unless this interval is specified.

**Examples** To configure the switch to send period accounting updates every 30 minutes, the default period, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting update
```

To configure the switch to send period accounting updates every 10 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting update periodic 10
```

To disable periodic accounting updates wherever accounting has been configured, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no aaa accounting update
```

**Related  
commands**

[aaa accounting auth-mac](#)

[aaa accounting auth-web](#)

[aaa accounting dot1x](#)

[aaa accounting login](#)

[radius-server host](#)

# aaa authentication auth-mac

**Overview** This command enables MAC-based authentication globally and allows you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running MAC-based authentication, or a user named authentication method list, which is applied to an interface with the [auth-mac authentication](#) command.

Use the **no** variant of this command to disable either the default or a named method list for MAC-based authentication. Once all method lists are disabled MAC-based authentication is disabled globally.

**Syntax** `aaa authentication auth-mac {default|<list-name>} group {<group-name>|radius}`  
`no aaa authentication auth-mac {default|<list-name>}`

| Parameter    | Description                                      |
|--------------|--------------------------------------------------|
| default      | Configure the default authentication method list |
| <list-name>  | Configure a named authentication method list     |
| group        | Use a server group                               |
| <group-name> | Server group name.                               |
| radius       | Use all RADIUS servers.                          |

**Default** MAC-based Port Authentication is disabled by default.

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default authentication method list or a named authentication method list:

- **default:** the default authentication method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [auth-web authentication](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>:** use the specified RADIUS server group configured with the [aaa group server](#) command

All configured RADIUS Servers are automatically members of the server group **radius**. If a server is added to a named group **<group-name>**, it also remains a member of the group **radius**.

**Examples** To enable MAC-based authentication globally for all RADIUS servers, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-mac default group
radius
```

To disable MAC-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-mac default
```

To enable MAC-based authentication for named list 'vlan10\_auth', with RADIUS server group 'rad\_group\_vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-mac vlan10_auth group
rad_group_vlan10
```

To disable MAC-based authentication for named list 'vlan10\_auth', use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-mac vlan10_acct
```

**Related  
commands**

# aaa authentication auth-web

**Overview** This command enables Web-based authentication globally and allows you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running Web-based authentication, or a user named authentication method list, which is applied to an interface with the [auth-web authentication](#) command.

Use the **no** variant of this command to disable either the default or a named method list for Web-based authentication. Once all method lists are disabled Web-based authentication is disabled globally.

**Syntax** `aaa authentication auth-web {default|<list-name>} group {<group-name>|radius}`  
`no aaa authentication auth-web {default|<list-name>}`

| Parameter    | Description                                      |
|--------------|--------------------------------------------------|
| default      | Configure the default authentication method list |
| <list-name>  | Configure a named authentication method list     |
| group        | Use a server group                               |
| <group-name> | Server group name.                               |
| radius       | Use all RADIUS servers.                          |

**Default** Web-based authentication is disabled by default.

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default authentication method list or a named authentication method list:

- **default:** the default authentication method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [auth-web authentication](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>:** use the specified RADIUS server group configured with the [aaa group server](#) command

Note that you need to configure an IPv4 address for the VLAN interface on which Web authentication is running.

**Examples** To enable Web-based authentication globally for all RADIUS servers, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-web default group
radius
```

To disable Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-web default
```

To enable Web-based authentication for named list 'vlan10\_auth', with RADIUS server group 'rad\_group\_vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-web vlan10_auth group
rad_group_vlan10
```

To disable Web-based authentication for named list 'vlan10\_auth', use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication vlan10_auth
```

# aaa authentication dot1x

**Overview** Use this command to enable IEEE 802.1X-based authentication globally and to allow you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running IEEE 802.1X-based authentication, or a user named authentication method list, which is applied to an interface with the [dot1x authentication](#) command.

Use the **no** variant of this command to disable either the default or a named method list for 802.1X-based authentication. Once all method lists are disabled 802.1x-based authentication is disabled globally.

**Syntax** `aaa authentication dot1x {default|<list-name>} group  
{<group-name>|radius}`  
`no aaa authentication dot1x {default|<list-name>}`

| Parameter    | Description                                      |
|--------------|--------------------------------------------------|
| default      | Configure the default authentication method list |
| <list-name>  | Configure a named authentication method list     |
| group        | Use a server group                               |
| <group-name> | Server group name.                               |
| radius       | Use all RADIUS servers.                          |

**Default** 802.1X-based Port Authentication is disabled by default.

**Mode** Global Configuration

**Usage notes** This command can be used to configure either the default authentication method list or a named authentication method list:

- **default:** the default authentication method list which is automatically applied to all interfaces with 802.1X-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [aaa authentication dot1x](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>:** use the specified RADIUS server group configured with the [aaa group server](#) command

**Examples** To enable 802.1X-based authentication globally with all RADIUS servers, and use all available RADIUS servers, use the command:

```
awplus# configure terminal
awplus(config)# aaa authentication dot1x default group radius
```

To disable 802.1X-based authentication, use the command:

```
awplus# configure terminal
awplus(config)# no aaa authentication dot1x default
```

To enable 802.1X-based authentication for named list 'vlan10\_auth', with RADIUS server group 'rad\_group\_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication dot1x vlan10_auth group
rad_group_vlan10
```

To disable 802.1X-based authentication for named list 'vlan10\_auth' use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication dot1x vlan10_acct
```

**Related  
commands**

[aaa accounting dot1x](#)

**Command  
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

# aaa authentication enable default group tacacs+

**Overview** This command enables privilege level authentication against a TACACS+ server. Use the **no** variant of this command to disable privilege level authentication. TACACS+ is not available in Secure Mode (see the [crypto secure-mode](#) command).

**Syntax** `aaa authentication enable default group tacacs+ [local] [none]`  
`no aaa authentication enable default`

| Parameter | Description                                                                                      |
|-----------|--------------------------------------------------------------------------------------------------|
| local     | Use the locally configured enable password ( <b>enable password</b> command) for authentication. |
| none      | No authentication.                                                                               |

**Default** Local privilege level authentication is enabled by default ([aaa authentication enable default local](#) command).

**Mode** Global Configuration

**Usage notes** A user is configured on a TACACS+ server with a maximum privilege level. When they enter the [enable \(Privileged Exec mode\)](#) command they are prompted for an enable password which is authenticated against the TACACS+ server. If the password is correct and the specified privilege level is equal to or less than the users maximum privilege level, then they are granted access to that level. If the user attempts to access a privilege level that is higher than their maximum configured privilege level, then the authentication session will fail and they will remain at their current privilege level.

**NOTE:** If both **local** and **none** are specified, you must always specify **local** first.

If the TACACS+ server goes offline, or is not reachable during enable password authentication, and command level authentication is configured as:

- **aaa authentication enable default group tacacs+**  
then the user is never granted access to Privileged Exec mode.
- **aaa authentication enable default group tacacs+ local**  
then the user is authenticated using the locally configured enable password, which if entered correctly grants the user access to Privileged Exec mode. If no enable password is locally configured (**enable password** command), then the enable authentication will fail until the TACACS+ server becomes available again.

- **aaa authentication enable default group tacacs+ none**

then the user is granted access to Privileged Exec mode with no authentication. This is true even if a locally configured enable password is configured.

- **aaa authentication enable default group tacacs+ local none**

then the user is authenticated using the locally configured enable password. If no enable password is locally configured, then the enable authentication will grant access to Privileged Exec mode with no authentication.

If the password for the user is not successfully authenticated by the server, then the user is again prompted for an enable password when they enter **enable** via the CLI.

**Examples** To enable a privilege level authentication method that will not allow the user to access Privileged Exec mode if the TACACS+ server goes offline, or is not reachable during enable password authentication, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# aaa authentication enable default group tacacs+
```

To enable a privilege level authentication method that will allow the user to access Privileged Exec mode if the TACACS+ server goes offline, or is not reachable during enable password authentication, and a locally configured enable password is configured, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# aaa authentication enable default group tacacs+
local
```

To disable privilege level authentication, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no aaa authentication enable default
```

**Related  
commands**

[aaa authentication login](#)

[aaa authentication enable default local](#)

[enable \(Privileged Exec mode\)](#)

[enable password](#)

[enable secret \(deprecated\)](#)

[tacacs-server host](#)

# aaa authentication enable default local

**Overview** This command enables local privilege level authentication.  
Use the **no** variant of this command to disable local privilege level authentication.

**Syntax** `aaa authentication enable default local`  
`no aaa authentication enable default`

**Default** Local privilege level authentication is enabled by default.

**Mode** Global Configuration

**Usage notes** The privilege level configured for a particular user in the local user database is the privilege threshold above which the user is prompted for an [enable \(Privileged Exec mode\)](#) command.

**Examples** To enable local privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default local
```

To disable local privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication enable default
```

**Related commands** [aaa authentication login](#)  
[enable \(Privileged Exec mode\)](#)  
[enable password](#)  
[enable secret \(deprecated\)](#)

# aaa authentication login

**Overview** Use this command to create an ordered list of methods for authenticating user logins. It can also be used to replace an existing method list with a list of the same name. Specify one or more of the options **local** or **group**, in the order you want them to be applied. If the **default** method list name is specified, it is applied to every console and VTY line immediately unless another method list is applied to that line by the [login authentication](#) command. To apply a non-default method list, you must also use the [login authentication](#) command.

TACACS+ is not available in Secure Mode (see the [crypto secure-mode](#) command).

Use the **no** variant of this command to remove a method list from user login authentication. The specified method list name is deleted from the configuration. If the method list name has been applied to any console or VTY line, user login authentication on that line will fail.

Note that the **no aaa authentication login default** command does not remove the default method list. This will return the default method list to its default state (**local** is the default).

**Syntax** `aaa authentication login {default|<list-name>} {[local] [group  
{radius|ldap|tacacs+|<group-name>}]}`  
`no aaa authentication login {default|<list-name>}`

| Parameter    | Description                                                                           |
|--------------|---------------------------------------------------------------------------------------|
| default      | Set the default authentication server for user login.                                 |
| <list-name>  | Name of authentication server.                                                        |
| local        | Use the local username database.                                                      |
| group        | Use server group.                                                                     |
| radius       | Use all RADIUS servers configured by the <a href="#">radius-server host</a> command.  |
| ldap         | Use all LDAP servers configured by the <a href="#">ldap-server</a> command.           |
| tacacs+      | Use all TACACS+ servers configured by the <a href="#">tacacs-server host</a> command. |
| <group-name> | Use the specified RADIUS or LDAP server group.                                        |

**Default** If the default server is not configured using this command, user login authentication uses the local user database only.

If the **default** method list name is specified, it is applied to every console and VTY line immediately unless a named method list server is applied to that line by the **login authentication** command.

**local** is the default state for the default method list unless a named method list is applied to that line by the **login authentication** command. You can reset it to the default method list using the **no aaa authentication login default** command.

**Mode** Global Configuration

**Usage notes** When a user attempts to log in, the switch sends an authentication request to the first authentication server in the method list. If the first server in the list is reachable and it contains a username and password matching the authentication request, the user is authenticated and the login succeeds. If the authentication server denies the authentication request because of an incorrect username or password, the user login fails. If the first server in the method list is unreachable, the switch sends the request to the next server in the list, and so on.

For example, if the method list specifies **group tacacs+ local**, and a user attempts to log in with a password that does not match a user entry in the first TACACS+ server, if this TACACS+ server denies the authentication request, then the switch does not try any other TACACS+ servers nor the local user database; the user login fails.

**Examples** To configure the default authentication method list for user login to first use all available RADIUS servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login default group radius
local
```

To configure the default authentication method list for user login to first use all available LDAP servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login default group ldap
local
```

To configure a user login authentication method list called 'USERS' to first use the RADIUS server group 'RAD\_GROUP1' for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group RAD_GROUP1
local
```

To configure a user login authentication method list called 'USERS' to first use the TACACS+ servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group tacacs+
local
```

To return to the default method list (**local** is the default server), use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication login default
```

To delete an existing authentication method list 'USERS' created for user login authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication login USERS
```

**Command  
changes**

Version 5.5.2-1.1: **ldap** parameter added

# aaa authorization commands

**Overview** This command configures a method list for commands authorization that can be applied to console or VTY lines. When command authorization is enabled for a privilege level, only authorized users can executed commands in that privilege level.

Use the **no** variant of this command to remove a named method list or disable the default method list for a privilege level.

**Syntax**

```
aaa authorization commands <privilege-level>
{default|<list-name>} group tacacs+ [none]

no aaa authorization commands <privilege-level>
{default|<list-name>}
```

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| group             | Specify the server group where authorization messages are sent. Only the <code>tacacs+</code> group is available for this command.                                                                                                                                                                                                                                                                                                                                                              |
| tacacs+           | Use all TACACS+ servers configured by the <code>tacacs-server host</code> command.                                                                                                                                                                                                                                                                                                                                                                                                              |
| default           | Configure the default authorization commands method list.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <list-name>       | Configure a named authorization commands method list                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| none              | If specified, this provides a local fallback to command authorization so that if authorization servers become unavailable then the device will accept all commands normally allowed for the privilege level of the user.                                                                                                                                                                                                                                                                        |

**Mode** Global Configuration

**Usage notes** TACACS+ command authorization provides centralized control of the commands available to a user of an AlliedWare Plus device. Once enabled:

- The command string and username are encrypted and sent to the first available configured TACACS+ server (the first server configured) for authorization.

- The TACACS+ server decides if the user is authorized to execute the command and returns the decision to the AlliedWare Plus device.
- Depending on this decision the device will then either execute the command or notify the user that authorization has failed.

If multiple TACACS+ servers are configured, and the first server is unreachable or does not respond, the other servers will be queried, in turn, for an authorization decision. If all servers are unreachable and a local fallback has been configured, with the **none** parameter, then commands are authorized based on the user's privilege level; the same behavior as if command authorization had not been configured. If, however, the local fallback is not configured and all servers become unreachable then all commands except **logout**, **exit**, and **quit** will be denied.

The **default** method list is defined with a local fallback unless configured differently using this command.

**Example** To configure a commands authorization method list, named TAC15, using all TACACS+ servers to authorize commands for privilege level 15, with a local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 15 TAC15 group
tacacs+ none
```

To configure the default method list to authorize commands for privilege level 7, with no local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 7 default group
tacacs+
```

To remove the authorization method list TAC15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization commands 15 TAC15
```

**Related commands** [aaa authorization config-commands](#)

[tacacs-server host](#)

**Command changes** Version 5.4.6-2.1: command added

# aaa authorization config-commands

**Overview** Use this command to enable command authorization on configuration mode commands. By default, command authorization applies to commands in exec mode only.

Use the **no** variant of this command to disable command authorization on configuration mode commands.

**Syntax** `aaa authorization config-commands`  
`no aaa authorization config-commands`

**Default** By default, command authorization is disabled on configuration mode commands.

**Mode** Global Configuration

**Usage notes** If authorization of configuration mode commands is not enabled then all configuration commands are accepted by default, including command authorization commands.

**NOTE:** *Authorization of configuration commands is required for a secure TACACS+ command authorization configuration as it prevents the feature from being disabled to gain access to unauthorized exec mode commands.*

**Example** To enable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authorization config-commands
```

To disable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization config-commands
```

**Related commands** [aaa authorization commands](#)  
[authorization commands](#)  
[tacacs-server host](#)

**Command changes** Version 5.4.6-2.1: command added

# aaa group server

**Overview** Use this command to create an AAA group of RADIUS or LDAP servers, and to enter Server Group Configuration mode.

A server group is used to specify a subset of RADIUS or LDAP servers in AAA commands. Once in Server Group Configuration mode you can add servers to the group.

Use the **no** variant of this command to remove an existing server group.

**Syntax** `aaa group server {radius|ldap} <group-name>`  
`no aaa group server {radius|ldap} <group-name>`

| Parameter    | Description                                |
|--------------|--------------------------------------------|
| radius       | Create or configure a RADIUS server group. |
| ldap         | Create or configure an LDAP server group.  |
| <group-name> | Server group name.                         |

**Mode** Global Configuration

**Usage notes** To add servers to a RADIUS or LDAP server group, use the **server** command. Each RADIUS server in a server group must be configured using the [radius-server host](#) command. Similarly, each LDAP server in a server group must be configured using the [ldap-server](#) command.

Server groups named 'radius' and 'ldap' are predefined and include all RADIUS and LDAP servers configured using the [radius-server host](#) or [ldap-server](#) commands.

**Examples** To create a RADIUS server group named 'GROUP1' with hosts 192.168.1.1, 192.168.2.1 and 192.168.3.1, use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1 auth-port 1812 acct-port 1813
awplus(config-sg)# server 192.168.2.1 auth-port 1812 acct-port 1813
awplus(config-sg)# server 192.168.3.1 auth-port 1812 acct-port 1813
```

To remove a RADIUS server group named 'GROUP1' from the configuration, use the command:

```
awplus(config)# no aaa group server radius GROUP1
```

To create an LDAP server group named 'GROUP2' with servers named 'SERVER1', 'SERVER2' and 'SERVER3', use the commands:

```
awplus(config)# aaa group server ldap GROUP2
awplus(config-ldap-group)# server SERVER1
awplus(config-ldap-group)# server SERVER2
awplus(config-ldap-group)# server SERVER3
```

To remove an LDAP server group named 'GROUP2' from the configuration, use the command:

```
awplus(config)# no aaa group server ldap GROUP2
```

changes**

Version 5.5.2-1.1: **ldap** parameter added

# aaa local authentication attempts lockout-time

**Overview** This command configures the duration of the user lockout period.

Use the **no** variant of this command to restore the duration of the user lockout period to its default of 300 seconds (5 minutes).

**Syntax** `aaa local authentication attempts lockout-time <lockout-time>`  
`no aaa local authentication attempts lockout-time`

| Parameter                         | Description                                                         |
|-----------------------------------|---------------------------------------------------------------------|
| <code>&lt;lockout-time&gt;</code> | <code>&lt;0-10000&gt;</code> . Time in seconds to lockout the user. |

**Mode** Global Configuration

**Default** The default for the lockout-time is 300 seconds (5 minutes).

**Usage notes** While locked out all attempts to login with the locked account will fail. The lockout can be manually cleared by another privileged account using the [clear aaa local user lockout](#) command.

**Examples** To configure the lockout period to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts lockout-time
600
```

To restore the default lockout period of 5 minutes (300 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts
lockout-time
```

**Related commands** [aaa local authentication attempts max-fail](#)  
[aaa local authentication attempts max-fail remote-login-only](#)  
[clear aaa local user lockout](#)

# aaa local authentication attempts max-fail

**Overview** This command configures the maximum number of failed login attempts before a user account is locked out. Every time a login attempt fails the failed login counter is incremented.

Use the **no** variant of this command to restore the maximum number of failed login attempts to the default setting (five failed login attempts).

**Syntax** `aaa local authentication attempts max-fail <failed-logins>`  
`no aaa local authentication attempts max-fail`

| Parameter                          | Description                                                                             |
|------------------------------------|-----------------------------------------------------------------------------------------|
| <code>&lt;failed-logins&gt;</code> | <code>&lt;1-32&gt;</code> . Number of login failures allowed before locking out a user. |

**Mode** Global Configuration

**Default** The default for the maximum number of failed login attempts is five failed login attempts.

**Usage** When the failed login counter reaches the limit configured by this command that user account is locked out for a specified duration configured by the [aaa local authentication attempts lockout-time](#) command.

When a successful login occurs the failed login counter is reset to 0. When a user account is locked out all attempts to login using that user account will fail.

**Examples** To configure the number of login failures that will lock out a user account to two login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts max-fail 2
```

To restore the number of login failures that will lock out a user account to the default number of login attempts (five login attempts), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts max-fail
```

**Related commands** [aaa local authentication attempts lockout-time](#)  
[aaa local authentication attempts max-fail remote-login-only](#)  
[clear aaa local user lockout](#)

# aaa local authentication attempts max-fail remote-login-only

**Overview** Use this command to configure account lockout to remote logins only. This means that console logins are not subject to lock out when this feature is configured.

This command allow users to login via the physical console port even when the account is locked due to reaching the maximum number of failed login attempts.

Use the **no** variant of this command to prevent users from logging in via the console port when the maximum number of failed login attempts is reached.

**Syntax** `aaa local authentication attempts max-fail remote-login-only`  
`no aaa local authentication attempts max-fail remote-login-only`

**Default** Not set. Max-fail lockout applies to all logins.

**Mode** Global Configuration

**Example** To configure account lock-out to remote login only, use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts max-fail
remote-login-only
```

To configure account lock-out to apply to all logins, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts max-fail
remote-login-only
```

**Related commands** [aaa local authentication attempts max-fail](#)

**Command changes** Version 5.5.4-1.2: command added

# aaa login fail-delay

**Overview** Use this command to configure the minimum time period between failed login attempts. This setting applies to login attempts via the console, SSH and Telnet. Use the **no** variant of this command to reset the minimum time period to its default value.

**Syntax** `aaa login fail-delay <1-10>`  
`no aaa login fail-delay`

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| <1-10>    | The minimum number of seconds required between login attempts |

**Default** 1 second

**Mode** Global configuration

**Example** To apply a delay of at least 5 seconds between login attempts, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa login fail-delay 5
```

**Related commands** [aaa authentication login](#)  
[aaa local authentication attempts logout-time](#)  
[clear aaa local user logout](#)

# accounting login

**Overview** This command applies a login accounting method list to console or VTY lines for user login. When login accounting is enabled using this command, logging events generate an accounting record to the accounting server.

The accounting method list must be configured first using this command. If an accounting method list is specified that has not been created by this command then accounting will be disabled on the specified lines.

The **no** variant of this command resets AAA Accounting applied to console or VTY lines for local or remote login. **default** login accounting is applied after issuing the **no accounting login** command. Accounting is disabled with **default**.

**Syntax** `accounting login {default|<list-name>}`  
`no accounting login`

| Parameter   | Description                     |
|-------------|---------------------------------|
| default     | Default accounting method list. |
| <list-name> | Named accounting method list.   |

**Default** By default login accounting is disabled in the **default** accounting server. No accounting will be performed until accounting is enabled using this command.

**Mode** Line Configuration

**Examples** To apply the accounting server `USERS` to all VTY lines, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# accounting login USERS
```

**Related commands** [aaa accounting commands](#)  
[aaa accounting login](#)

# authorization commands

**Overview** This command applies a command authorization method list, defined using the [aaa authorization commands](#) command, to console and VTY lines.

Use the **no** variant of this command to reset the command authorization configuration on the console and VTY lines.

**Syntax** `authorization commands <privilege-level> {default|<list-name>}`  
`no authorization commands <privilege-level>`

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <privilege-level> | The privilege level of the set of commands the method list will be applied to.<br>AlliedWare Plus defines three sets of commands, that are indexed by a level value:<br><b>Level = 1:</b> All commands that can be accessed by a user with privilege level between 1 and 6 inclusive<br><b>Level = 7:</b> All commands that can be accessed by a user with privilege level between 7 and 14 inclusive<br><b>Level = 15:</b> All commands that can be accessed by a user with privilege level 15 |
| default           | Configure the default authorization commands method list.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <list-name>       | Configure a named authorization commands method list                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Default** The **default** method list is applied to each console and VTY line by default.

**Mode** Line Configuration

**Usage notes** If the specified method list does not exist users will not be enable to execute any commands in the specified method list on the specified VTY lines.

**Example** To apply the TAC15 command authorization method list with privilege level 15 to VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# authorization commands 15 TAC15
```

To reset the command authorization configuration with privilege level 15 on VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# no authorization commands 15
```

**Related commands** [aaa authorization commands](#)

tacacs-server host

**Command changes** Version 5.4.6-2.1: command added

# clear aaa local user lockout

**Overview** Use this command to clear the lockout on a specific user account or all user accounts.

**Syntax** `clear aaa local user lockout {username <username>|all}`

| Parameter  | Description                           |
|------------|---------------------------------------|
| username   | Clear lockout for the specified user. |
| <username> | Specifies the user account.           |
| all        | Clear lockout for all user accounts.  |

**Mode** Privileged Exec

**Examples** To unlock the user account 'bob' use the following command:

```
awplus# clear aaa local user lockout username bob
```

To unlock all user accounts use the following command:

```
awplus# clear aaa local user lockout all
```

**Related commands** [aaa local authentication attempts lockout-time](#)

# debug aaa

**Overview** This command enables AAA debugging.  
Use the **no** variant of this command to disable AAA debugging.

**Syntax** `debug aaa [accounting|all|authentication|authorization]`  
`no debug aaa [accounting|all|authentication|authorization]`

| Parameter      | Description                        |
|----------------|------------------------------------|
| accounting     | Accounting debugging.              |
| all            | All debugging options are enabled. |
| authentication | Authentication debugging.          |
| authorization  | Authorization debugging.           |

**Default** AAA debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable authentication debugging for AAA, use the command:

```
awplus# debug aaa authentication
```

To disable authentication debugging for AAA, use the command:

```
awplus# no debug aaa authentication
```

**Related commands** [show debugging aaa](#)  
[undebug aaa](#)

# login authentication

**Overview** Use this command to apply an AAA server for authenticating user login attempts from a console or remote logins on these console or VTY lines. The authentication method list must be specified by the **aaa authentication login** command. If the method list has not been configured by the **aaa authentication login** command, login authentication will fail on these lines.

Use the **no** variant of this command to reset AAA Authentication configuration to use the default method list for login authentication on these console or VTY lines.

**Command Syntax** login authentication {default|<list-name>}  
no login authentication

| Parameter   | Description                                                                                                                                                                                                        |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| default     | The default authentication method list. If the default method list has not been configured by the <a href="#">aaa authentication login</a> command, the local user database is used for user login authentication. |
| <list-name> | Named authentication server.                                                                                                                                                                                       |

**Default** The default login authentication method list, as specified by the [aaa authentication login](#) command, is used to authenticate user login. If this has not been specified, the default is to use the local user database.

**Mode** Line Configuration

**Examples** To reset user authentication configuration on all VTY lines, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# no login authentication
```

**Related commands** [aaa authentication login](#)  
[line](#)

# proxy-port

**Overview** Use this command to change the local UDP port used for communication between local RADIUS client applications and the RadSecProxy AAA application. Any unused UDP port may be selected. The default port is 1645.

Use the **no** variant of this command to change the UDP port back to the default of 1645.

**Syntax** `proxy-port <port>`  
`no proxy-port`

| Parameter                 | Description               |
|---------------------------|---------------------------|
| <code>&lt;port&gt;</code> | UDP Port Number, 1-65536. |

**Default** The default port is 1645.

**Mode** RadSecProxy AAA Configuration Mode

**Usage notes** It is not necessary to change the value from the default unless UDP port 1645 is required for another purpose. RADIUS requests received on this port from external devices will be ignored. The port is only used for local (intra-device) communication.

**Example** To configure change the UDP port to 7001, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# proxy-port 7001
```

**Related commands** [radius-secure-proxy aaa](#)  
[server \(radsecproxy-aaa\)](#)  
[server name-check](#)  
[server trustpoint](#)

# radius-secure-proxy aaa

**Overview** Use this command to enter the RadSecProxy AAA (authentication, authorization, and accounting) application configuration mode. This application allows local RADIUS-based clients on system to communicate with remote RadSec servers via a secure (TLS) proxy.

**Syntax** `radius-secure-proxy aaa`

**Mode** Global Configuration Mode

**Example** To change mode from User Exec mode to the RadSecProxy AAA configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)#
```

**Related commands**

- [proxy-port](#)
- [server \(radsecproxy-aaa\)](#)
- [server name-check](#)
- [server trustpoint](#)

## server (radsecproxy-aaa)

**Overview** Use this command to add a server to the RadSecProxy AAA application. Local RADIUS client applications will attempt, via the proxy, to communicate with any RadSec servers that are operational (in addition to any non-TLS RADIUS servers that are configured).

Use the **no** variant of this command to delete a previously-configured server from the RadSecProxy AAA application.

**Syntax** `server {<hostname>|<ip-addr>} [timeout <1-1000>] [name-check {on|off}]`  
`no server {<hostname>|<ip-addr>}`

| Parameter  | Description                                                                                                                                                                     |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <hostname> | Hostname of RadSec server                                                                                                                                                       |
| <ip-addr>  | Specify the client IPv4 address, in dotted decimal notation (A.B.C.D).                                                                                                          |
| timeout    | Specify the amount of time that the RadSecProxy AAA application should wait for replies from this server. RADIUS server timeout (which defaults to 5 seconds).                  |
| <1-1000>   | Time in seconds to wait for a server reply.                                                                                                                                     |
| name-check | Specify whether or not to enforce certificate name checking for this client. If the parameter is not specified then the global behavior, which defaults to <b>on</b> , is used. |
| on         | Enable name checking for this client.                                                                                                                                           |
| off        | Disable name checking for this client.                                                                                                                                          |

**Mode** RadSecProxy AAA Configuration Mode

**Usage notes** The server may be specified by its domain name or by its IPv4 address. If a domain name is used, it must be resolvable using a configured DNS name server.

Each server may be configured with a timeout; if not specified, the global timeout value for RADIUS servers will be used. The global timeout may be changed using the **radius-server timeout** command. The default global timeout is 5 seconds.

Each server may be configured to use certificate name-checking; if not specified, the global behavior defined by **server name-check** or **no server name-check** will be used. If name checking is enabled, the Common Name portion of the subject field of the server's X.509 certificate must match the domain name or IP address specified in this command.

**Example** To add a server 'mynas.local' with a timeout of 3 seconds, and name checking off, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# server mynas.local name-check
off
```

**Related commands**

- [proxy-port](#)
- [radius-secure-proxy aaa](#)
- [server name-check](#)
- [server trustpoint](#)

# server mutual-authentication

**Overview** This command enables or disables mutual certificate authentication for all RadSecProxy servers. When enabled, the RadSecProxy AAA application will send a local X.509 certificate to the server when establishing a TLS connection.

Use the **no** variant of this command to disable mutual certificate validation causing the RadSecProxy AAA application to not transmit a certificate to the server.

**NOTE:** *If mutual authentication is disabled on the client (AAA) application but enabled on the server, a connection will not be established.*

**Syntax** `server mutual-authentication`  
`no server mutual-authentication`

**Default** Mutual authentication is enabled by default.

**Mode** RadSecProxy AAA Configuration Mode

**Example** Disable mutual certificate validation with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# no server
mutual-authentication
```

**Related commands** [radius-secure-proxy aaa](#)  
[server name-check](#)  
[server \(radsecproxy-aaa\)](#)

**Command changes** Version 5.4.6-2.1: command added

# server name-check

**Overview** This command sets the global behavior for certificate name-checking for the RadSecProxy AAA application to **on**. This behavior will be used for all servers associated with the application that do not specify a behavior on a per-server basis. If name-checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in the **server (radsecproxy-aaa)** command.

Use the **no** variant of this command to set the global behavior for certificate name checking to **off**

**Syntax** `server name-check`  
`no server name-check`

**Default** Certificate name checking is on by default.

**Mode** RadSecProxy AAA Configuration Mode

**Example** Disable certificate name checking globally with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# no server name-check
```

**Related commands** [proxy-port](#)  
[radius-secure-proxy aaa](#)  
[server \(radsecproxy-aaa\)](#)  
[server trustpoint](#)

# server trustpoint

**Overview** This command adds one or more trustpoints to be used with the RadSecProxy AAA application. Multiple trustpoints may be specified, or the command may be executed more than once, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

**Syntax** `server trustpoint [<trustpoint-list>]`  
`no server trustpoint [<trustpoint-list>]`

| Parameter         | Description                                             |
|-------------------|---------------------------------------------------------|
| <trustpoint-list> | Specify one or more trustpoints to be added or deleted. |

**Default** By default, no trustpoints are associated with the application.

**Mode** RadSecProxy AAA Configuration Mode

**Usage notes** The device certificate associated with first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If no trustpoints are specified in the command, the trustpoint list will be unchanged.

If **no server trustpoint** is issued without specifying any trustpoints, then all trustpoints will be disassociated from the application.

**Example** You can add multiple trustpoints to the RadSecProxy AAA application by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# server trustpoint example_1
awplus(config-radsecproxy-aaa)# server trustpoint example_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config-radsecproxy-aaa)# server trustpoint example_3
example_4
```

Disassociate all trustpoints from the RadSecProxy AAA application using the command:

```
awplus(config-radsecproxy-aaa)# no server trustpoint
```

**Related commands** [proxy-port](#)  
[radius-secure-proxy aaa](#)

server (radsecproxy-aaa)  
server name-check

# show aaa local user locked

**Overview** This command displays the failed attempts against each user account attempting to login into the device, along with the failure times and locations.

Use this command's output to see if a user is currently locked out or not. You can check:

- the number of login attempts that have a 'V' in the 'Valid' column, and
- if the last attempt happened within the lockout time. If the number of 'V' attempts exceeds the maximum allowed number of attempts, and the last attempt is within the lockout time, then the user is locked out.

The maximum number of attempts is 5 by default. You can change it using the command **aaa local authentication attempts max-fail**. The lockout time is 5 minutes by default. You can change it using the command **aaa local authentication attempts lockout-time**.

Once a user's lockout status is cleared, this command will no longer display any failed attempts for that user. The status gets cleared by:

- being manually cleared by another privileged user, using the [clear aaa local user lockout](#) command, or
- the locked out user successfully logs into the system after waiting for the lockout time to pass.

In the Valid column:

- 'V' means this login attempt counts towards the maximum allowed number of attempts
- 'I' means this login attempt does not count towards the maximum allowed number of attempts, because it was more than 15 minutes ago.

**Syntax** `show aaa local user locked`

**Mode** User Exec and Privileged Exec

**Example** To display the current failed attempts for local users, use the command:

```
awplus# show aaa local user locked
```

**Output** Figure 44-1: Example output from the **show aaa local user locked** command

```
awplus#show aaa local user locked

```

This output example was run at 11:49. The lockout-time and max-fail settings are set to their defaults:

- manager: is not locked out because they only have 2 valid attempts.
- user1: is locked out because they have 7 valid attempts and the most recent was within the lockout time.
- user2: is not locked out because only 4 attempts are valid.
- user3: is not locked out. Even though they have 5 valid attempts, the most recent attempt is older than the lockout time of 5 minutes.

# show aaa server group

**Overview** Use this command to list AAA users and any method lists applied to them.

**Syntax** show aaa server group

**Mode** Privileged Exec

**Example** To show the AAA configuration on a device, use the command:

```
awplus# show aaa server group
```

**Output** Figure 44-2: Example output from **show aaa server group**

```
awplus#show aaa server group
```

| User     | List Name        | Method           | Acct-Event       |
|----------|------------------|------------------|------------------|
| login    | auth default     | -                | local -          |

# show debugging aaa

**Overview** Use this command to see what debugging is turned on for AAA (Authentication, Authorization, Accounting).

**Syntax** `show debugging aaa`

**Mode** User Exec and Privileged Exec

**Example** To display the current debugging status of AAA, use the command:

```
awplus# show debug aaa
```

**Output** Figure 44-3: Example output from the **show debug aaa** command

```
AAA debugging status:
Authentication debugging is on
Accounting debugging is off
```

# show radius server group

**Overview** Use this command to show the RADIUS server group configuration.

**Syntax** `show radius server group [<group-name>]`

| Parameter                       | Description               |
|---------------------------------|---------------------------|
| <code>&lt;group-name&gt;</code> | RADIUS server group name. |

**Default** Command name is set to something by default.

**Mode** Privileged Exec

**Usage** Use this command with the `<group-name>` parameter to display information for a specific RADIUS server group, or without the parameter to display information for all RADIUS server groups.

**Example** To display information for all RADIUS server groups, use the command:

```
awplus# show radius server group
```

To display a information for a RADIUS server group named 'rad\_group\_list1', use the command:

```
awplus# show radius server group rad_group_list1
```

**Output** Figure 44-4: Example output from **show radius server group**

```
awplus#show radius server group
RADIUS Group Configuration
 Group Name : radius?
 Server Host/ Auth Acct Auth Acct
 IP Address Port Port Status Status

 192.168.1.101 1812 1813 Active Active
 192.168.1.102 1812 1813 Active Active

 Group Name : rad_group_list1
 Server Host/ Auth Acct Auth Acct
 IP Address Port Port Status Status

 192.168.1.101 1812 1813 Active Active

 Group Name : rad_group_list2
 Server Host/ Auth Acct Auth Acct
 IP Address Port Port Status Status

 192.168.1.102 1812 1813 Active Active
```

Figure 44-5: Example output from **show radius server group rad\_group\_list1**

```
awplus#show radius server group rad_group_list1
RADIUS Group Configuration
 Group Name : rad_group_list1
 Server Host/ Auth Acct Auth Acct
 IP Address Port Port Status Status

 192.168.1.101 1812 1813 Active Active
```

# Lightweight Directory Access Protocol (LDAP) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Lightweight Directory Access Protocol (LDAP).

LDAP is an authentication protocol that facilitates user access to various IT resources e.g. applications, servers, networking equipment, and file servers.

It can be used to connect to internal networks over OpenVPN. Although both LDAP and RADIUS are interchangeable on AlliedWare Plus devices as an authentication protocol, LDAP is added because of its ability to interact with directory services such as Microsoft's Active Directory (AD).

For more information, see the [LDAP Feature Overview and Configuration Guide](#).

# authentication (ldap-server)

**Overview** Use this command to set the authentication method used to authenticate users against the Lightweight Directory Access Protocol (LDAP) server.

Use the **no** variant of this command to reset the authentication method to **search**.

**Syntax** `authentication {search|bind-only}`  
`no authentication`

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                             |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>search</code>    | The <b>search</b> method initially binds to the LDAP server, then searches for the user, then binds to the user using the DN found with the search. The initial bind is either anonymous, or using the user specified with the <a href="#">bind authenticate root-dn</a> command.                                                                                       |
| <code>bind-only</code> | The <b>bind-only</b> method attempts to bind to the LDAP server using a predicted DN based on the username, the user attribute (set with the <code>login-attribute</code> command) and the base DN (set with the <a href="#">base-dn</a> command). The format of this user DN is as follows: ' <code>&lt;username&gt;=&lt;login-attribute&gt;,&lt;base-dn&gt;</code> '. |

**Default** Search

**Mode** LDAP Server Configuration

**Example** To set the authentication method to bind-only for the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# authentication bind-only
```

To reset the authentication method to the default (search) for 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no authentication
```

**Related commands**

- [base-dn](#)
- [bind authenticate root-dn](#)
- [ldap-server](#)
- [login-attribute](#)
- [search-filter](#)

**Command changes** Version 5.5.2-1.1: command added

# base-dn

- Overview** Use this command to set the base DN (Distinguished Name) of the LDAP server.
- When using 'search' authentication, the base DN is the LDAP server's starting point to search for the user within the directory.
- If 'bind-only' authentication is enabled, then the base DN is the suffix of the DN that is used to bind to the user.
- Use the **no** variant of this command to remove the configured base DN.

**Syntax** base-dn <base-dn>  
no base-dn

| Parameter | Description                     |
|-----------|---------------------------------|
| <base-dn> | The base DN of the LDAP server. |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To set the base DN for the LDAP server called 'Server1' to 'dc=example, dc=com', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# base-dn dc=example,dc=com
```

To clear the base DN for Server1, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no base-dn
```

**Related commands**

- [bind authenticate root-dn](#)
- [group-attribute](#)
- [group-dn](#)
- [ldap-server](#)
- [login-attribute](#)
- [search-filter](#)

**Command changes** Version 5.5.2-1.1: command added

# bind authenticate root-dn

**Overview** Use this command to set the authenticated user to bind to when searching for a user on an LDAP server. Do not set this option if you wish to use anonymous binding with the 'search' method.

This option is ignored with the 'bind-only' authentication method.

Use the **no** variant of this command to unset the authenticated user.

**Syntax** `bind authenticate root-dn <user-dn> password <password>`  
`no bind authenticate root-dn`

| Parameter                     | Description                                  |
|-------------------------------|----------------------------------------------|
| <code>&lt;user-dn&gt;</code>  | The DN of the authenticated user to bind to. |
| <code>&lt;password&gt;</code> | The password of the authenticated user.      |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To set the authenticated user to 'cn=admin,dc=example,dc=com' with the password '12345678' for the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# bind authenticate root-dn
cn=admin,dc=example,dc=com password 12345678
```

**Related commands** [authentication \(ldap-server\)](#)

[group-attribute](#)

[ldap-server](#)

[login-attribute](#)

[search-filter](#)

**Command changes** Version 5.5.2-1.1: command added

# deadtime (ldap-server)

**Overview** Use this command to configure the deadtime for an LDAP server. The configured deadtime is how long in seconds before an unresponsive LDAP server is considered dead.

Use the **no** variant of this command to remove the deadtime configured on an LDAP server. When you remove the deadtime, the server will never be considered dead.

**Syntax** `deadtime <0-1440>`  
`no deadtime`

| Parameter                   | Description                                                                                 |
|-----------------------------|---------------------------------------------------------------------------------------------|
| <code>&lt;0-1440&gt;</code> | The number of seconds that the server can be unresponsive for before it is considered dead. |

**Default** 0 seconds (the LDAP server is never considered dead)

**Mode** LDAP Server Configuration

**Example** To set the deadtime to 20 seconds for the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# deadtime 20
```

To reset the deadtime to the default for 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no deadtime
```

**Related commands** [host \(ldap-server\)](#)  
[ldap-server](#)  
[port \(ldap-server\)](#)  
[retransmit \(ldap-server\)](#)  
[show ldap server group](#)  
[timeout \(ldap-server\)](#)

**Command changes** Version 5.5.2-1.1: command added

# debug ldap client

**Overview** Use this command to enable LDAP debugging.

Use the **no** variant of this command to disable all LDAP debugging.

**Syntax** debug ldap client all

debug ldap client {[acl] [args] [ber] [config] [conns] [filter]  
[packets] [parse] [shell] [stats] [stats2] [sync] [trace]}

no debug ldap client

| Parameter | Enable or disable debugging for ...                       |
|-----------|-----------------------------------------------------------|
| all       | All LDAP debugging options                                |
| acl       | Access Control List processing                            |
| args      | Heavy trace debugging (args, arguments)                   |
| ber       | Print out packets sent and received (ber, Bit Error Rate) |
| config    | Configuration processing                                  |
| conns     | Connection management                                     |
| filter    | Search filter processing                                  |
| packets   | Debug packet handling                                     |
| parse     | Parsing processing                                        |
| shell     | Print communication with shell backends                   |
| stats     | Stats from connections, operations and results            |
| stats2    | Stats from log entries sent                               |
| sync      | Syncrepl consumer processing (LDAP Sync replication)      |
| trace     | Trace function calls                                      |

**Default** By default, all LDAP debugging is disabled.

**Mode** Global Configuration

**Example** To turn on all LDAP debugging, use the command:

```
awplus# debug ldap client all
```

To turn on filter and packet LDAP debugging, use the command:

```
awplus# debug ldap client filter packets
```

To disable all LDAP debugging, use the command:

```
awplus# no debug ldap client
```

**Related commands**    [aaa authentication login](#)  
                          [aaa group server](#)  
                          [ldap-server](#)

**Command changes**    Version 5.5.2-1.1: command added

# group-attribute

**Overview** Use this command to configure the name of the attribute that group members are stored in.

It is only necessary to set this option if [group-dn](#) is used and you don't want to use the default attribute, which is 'uniquemember'.

Use the **no** variant of this command to revert to the default group attribute.

**Syntax** `group-attribute <attribute>`  
`no group-attribute`

| Parameter                      | Description                                     |
|--------------------------------|-------------------------------------------------|
| <code>&lt;attribute&gt;</code> | The attribute that group members are stored in. |

**Default** The default group attribute is 'uniquemember'.

**Mode** LDAP Server Configuration

**Example** To set the group attribute for the LDAP server called 'Server1' to 'member', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# group-attribute member
```

To reset the group attribute to default for 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no group-attribute
```

**Related commands** [base-dn](#)  
[bind authenticate root-dn](#)  
[group-dn](#)  
[ldap-server](#)  
[login-attribute](#)  
[search-filter](#)

**Command changes** Version 5.5.2-1.1: command added

# group-dn

**Overview** Use this command to configure the group DN (Distinguished Name) of the group that users should be a member of.

By default the device will determine this by checking the 'uniquemember' attribute of the group to see if it contains the user's DN string. This can be changed with the [group-attribute](#) command.

Use the **no** variant of this command to remove the configured group DN.

**Syntax** `group-dn <group-dn>`  
`no group-dn`

| Parameter                     | Description                                           |
|-------------------------------|-------------------------------------------------------|
| <code>&lt;group-dn&gt;</code> | The DN of the group that users should be a member of. |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To set the group DN for the LDAP server called 'Server1' to 'cn=Users,dc=example,dc=com', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# group-dn cn=Users,dc=example,dc=com
```

To clear the group DN for 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no group-dn
```

**Related commands** [base-dn](#)  
[bind authenticate root-dn](#)  
[group-attribute](#)  
[ldap-server](#)  
[login-attribute](#)  
[search-filter](#)

**Command changes** Version 5.5.2-1.1: command added

# host (ldap-server)

**Overview** Use this command to configure the address of the remote LDAP server you want to connect to.

Use the **no** variant of this command to remove the remote LDAP server.

**Syntax** `host {<host-name>|<ip-address>|<ipv6-address>}`  
`no host`

| Parameter                         | Description                                                    |
|-----------------------------------|----------------------------------------------------------------|
| <code>&lt;hostname&gt;</code>     | The hostname of the LDAP server.                               |
| <code>&lt;ip-address&gt;</code>   | The IPv4 address of the LDAP server. Uses the format A.B.C.D.  |
| <code>&lt;ipv6-address&gt;</code> | The IPv6 address of the LDAP server. Uses the format x:x::x:x. |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To set the host for the LDAP server called 'Server1' to the IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# host 10.0.0.1
```

To set the host for Server1 to the IPv6 address 2001:0db8::a2, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# host 2001:db8::a2
```

To set the host for Server1 to the hostname www.ldapserver.com, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# host www.ldapserver.com
```

To unset the host for Server1, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no host
```

**Related commands** [ldap-server](#)  
[port \(ldap-server\)](#)

retransmit (ldap-server)  
secure mode (ldap-server)  
secure cipher (ldap-server)  
show ldap server group  
secure trustpoint (ldap-server)  
timeout (ldap-server)

**Command changes** Version 5.5.2-1.1: command added

# ldap-server

**Overview** Use this command to configure an LDAP server and enter LDAP server configuration mode.

Use the **no** variant of this command to remove the specified server.

**Syntax** `ldap-server <server-name>`  
`no ldap-server <server-name>`

| Parameter                        | Description                  |
|----------------------------------|------------------------------|
| <code>&lt;server-name&gt;</code> | The name of the LDAP server. |

**Default** Not set

**Mode** Global Configuration

**Example** To create and configure an LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)#
```

To configure the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)#
```

To remove an LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# no ldap-server Server1
```

**Related commands**

- [authentication \(ldap-server\)](#)
- [host \(ldap-server\)](#)
- [port \(ldap-server\)](#)
- [retransmit \(ldap-server\)](#)
- [secure cipher \(ldap-server\)](#)
- [secure mode \(ldap-server\)](#)
- [secure trustpoint \(ldap-server\)](#)
- [show ldap server group](#)
- [timeout \(ldap-server\)](#)

**Command changes** Version 5.5.2-1.1: command added

# login-attribute

**Overview** Use this command to set the name of the attribute user names are stored in. The device will search this attribute for the user's DN (Distinguished Name).

It is only necessary to set this option if you don't want to use the default attribute, which is 'uid'.

If the authentication method is 'bind-only', then this attribute is used as the first component of the user DN, with the base DN added to complete the user DN.

Use the **no** variant of this command to reset the login attribute to the default of 'uid'.

**Syntax** login-attribute <attribute>  
no login-attribute

| Parameter   | Description                                                     |
|-------------|-----------------------------------------------------------------|
| <attribute> | The LDAP attribute to use for the username of connecting users. |

**Default** uid

**Mode** LDAP Server Configuration

**Example** To set the login attribute for the LDAP server called 'Server1' to 'sAMAccountName', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# login-attribute sAMAccountName
```

To reset the login attribute for 'Server1' to the default, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no login-attribute
```

[search-filter](#)

**Command changes** Version 5.5.2-1.1: command added

# port (ldap-server)

**Overview** Use this command to configure the port you are using to connect to the remote LDAP server.

Note that if secure ciphers are enabled, then the secure port is used instead. Secure ciphers are configured with the [secure mode \(ldap-server\)](#) command.

Use the **no** variant of this command to reset the port number to the default (389).

**Syntax** port <1-65535>  
no port

| Parameter | Description                       |
|-----------|-----------------------------------|
| <1-65535> | Port number from 1 through 65535. |

**Default** 389

**Mode** LDAP Server Configuration

**Example** To set the port for the LDAP server called 'Server1' to 1579, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# port 1579
```

To reset the port for 'Server1' to the default of 389, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no port
```

**Related commands**

- [secure mode \(ldap-server\)](#)
- [secure trustpoint \(ldap-server\)](#)
- [show ldap server group](#)
- [timeout \(ldap-server\)](#)

**Command changes** Version 5.5.2-1.1: command added

# retransmit (ldap-server)

**Overview** Use this command to configure the number of times a device will attempt to reconnect to the LDAP server before aborting.

Use the **no** variant of this command to reset the reconnect attempts to the default value of 3.

**Syntax** `retransmit <0-100>`  
`no retransmit`

| Parameter                  | Description                                                                  |
|----------------------------|------------------------------------------------------------------------------|
| <code>&lt;0-100&gt;</code> | The number of times the device will attempt to reconnect to the LDAP server. |

**Default** 3 times

**Mode** LDAP Server Configuration

**Example** To set the number of reconnect attempts for the LDAP server called 'Server1' to 5 attempts, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# retransmit 5
```

To reset the number of reconnect attempts for 'Server1' to 3 attempts, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no retransmit
```

**Related commands** [deadtime \(ldap-server\)](#)  
[host \(ldap-server\)](#)  
[ldap-server](#)  
[port \(ldap-server\)](#)  
[timeout \(ldap-server\)](#)

**Command changes** Version 5.5.2-1.1: command added

# search-filter

**Overview** Use this command to add a filter to use when searching for a user on the LDAP server.

The filter should be a form similar to 'attribute=value' or '&(attribute1=value1)(attribute2=value2)

Use the **no** variant of this command to remove the search filter.

**Syntax** search-filter <filter>  
no search-filter

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| <filter>  | The filter to use when searching for a user. |

**Default** Not set

**Mode** LDAP Server Configuration

**Usage notes** If the 'bind-only' authentication method is used, then this value is unused.  
For the search authentication method, a search operation is used to search the LDAP server. The client specifies the starting point (base DN) of the search, the search scope (either the object, its children, or the subtree rooted at the object), and a search filter.

**Example** To set a search filter on the LDAP server called 'Server1' to 'building=block1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# search-filter building=block1
```

To unset the search filter of 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no search-filter
```

**Related commands** [authentication \(ldap-server\)](#)

[bind authenticate root-dn](#)  
[group-attribute](#)  
[group-dn](#)  
[ldap-server](#)

## login-attribute

**Command changes** Version 5.5.2-1.1: command added

# secure cipher (ldap-server)

**Overview** Use this command to configure the OpenSSL ciphers used in LDAP secure mode. You can choose groups of ciphers from a number of Mozilla TLS configs, or specify multiple individual ciphers in OpenSSL format.

Use the **no** variant of this command to remove the configured ciphers on a server.

**Syntax** `secure cipher {old|intermediate|modern}`  
`secure cipher <cipher-list>`  
`no secure cipher`

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| old           | Ciphers in Mozilla's old TLS config. Alongside the modern and intermediate ciphers, this includes the following ciphers:<br>DHE-RSA-CHACHA20-POLY1305,ECDHE-ECDSA-AES128SHA256,<br>ECDHE-RSA-AES128-SHA256,ECDHE-ECDSA-AES128-SHA,<br>ECDHE-RSA-AES128-SHA,ECDHE-ECDSA-AES256-SHA384,<br>ECDHE-RSA-AES256-SHA384, ECDHE-ECDSA-AES256-SHA,<br>ECDHE-RSA-AES256-SHA,DHE-RSA-AES128-SHA256, DHE-RSA-AES256-SHA256,<br>AES128-GCM-SHA256, AES256-GCM-SHA384,AES128-SHA256, AES256-SHA256,<br>AES128-SHA, AES256-SHA, DES-CBC3-SHA |
| intermediate  | Ciphers in Mozilla's intermediate TLS config. Alongside the modern ciphers, this includes the following ciphers:<br>ECDHE-ECDSA-AES128-GCM-SHA256,ECDHE-RSA-AES128-CM-SHA256,<br>ECDHE-ECDSA-AES256-GCM-SHA384,ECDHE-RSA-AES256-CM-SHA384,<br>ECDHE-ECDSA-CHACHA20-POLY1305,ECDHE-RSA-CHACHA20-POLY1305,<br>DHE-RSA-AES128-GCM-SHA256,DHE-RSA-AES256-GCM-SHA384                                                                                                                                                               |
| modern        | Ciphers in Mozilla's modern TLS config. Includes the following ciphers:<br>TLS_AES_128_GCM_SHA256,TLS_AES_256_GCM_SHA384,<br>TLS_CHACHA20_POLY1305_SHA256                                                                                                                                                                                                                                                                                                                                                                     |
| <cipher-list> | The name (or names) of a cipher in OpenSSL format. This is a <b>space</b> separated list of cipher names, for example:<br>DHE-DSS-AES256-GCM-SHA384 TLS_AES_256_GCM_SHA384                                                                                                                                                                                                                                                                                                                                                    |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To use the Intermediate Mozilla cipher suite on the LDAP server called Server1, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# secure cipher intermediate
```

To remove the configured ciphers on 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no secure cipher
```

To use the ciphers DHE-DSS-AES256-GCM-SHA384 and TLS\_AES\_256\_GCM\_SHA384 on 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# secure cipher
DHE-DSS-AES256-GCM-SHA384 TLS_AES_256_GCM_SHA384
```

[ldap-server](#)  
[port \(ldap-server\)](#)  
[secure mode \(ldap-server\)](#)  
[secure trustpoint \(ldap-server\)](#)

**Command  
changes**

Version 5.5.2-1.1: command added

## secure mode (ldap-server)

**Overview** Use this command to configure the LDAP server to use secure mode. Secure mode encrypts communications with the LDAP server using TLS (Transport Layer Security). If you don't specify a port number, the default port (636) is used.

For secure mode, you should also set the CA certificate using the [secure trustpoint \(ldap-server\)](#) command.

Use **no secure mode** to disable secure mode for communicating with this LDAP server.

Use **no secure mode secure-port** to reset the secure mode port to the default.

**Syntax** secure mode [secure-port <port>]  
no secure mode  
no secure mode secure-port

| Parameter | Description                                            |
|-----------|--------------------------------------------------------|
| <port>    | The secure port for communicating with the LDAP server |

**Default** Secure mode is disabled, and the default port is 636

**Mode** LDAP Server Configuration

**Example** To enable secure mode for communicating with the LDAP server called 'Server1', with the default port, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# secure mode
```

To disable secure mode for communicating with 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no secure mode
```

To enable secure mode with the port 1234 for communicating with 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# secure mode secure-port 1234
```

To reset the secure mode port to the default on 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no secure mode secure-port
```

**Related  
commands**

[ldap-server](#)  
[port \(ldap-server\)](#)  
[secure cipher \(ldap-server\)](#)  
[secure trustpoint \(ldap-server\)](#)

**Command  
changes**

Version 5.5.2-1.1: command added

# secure trustpoint (ldap-server)

**Overview** Use this command to link a preconfigured trustpoint to the LDAP server configuration. The trustpoint must be the LDAP server certificate and is required to successfully connect to the LDAP server when secure mode is enabled.

Use the **no** variant of this command to remove a trustpoint from an LDAP server.

**Syntax** `secure trustpoint <trustpoint>`  
`no secure trustpoint`

| Parameter                       | Description                                          |
|---------------------------------|------------------------------------------------------|
| <code>&lt;trustpoint&gt;</code> | The name of the trustpoint used for LDAP secure mode |

**Default** Not set

**Mode** LDAP Server Configuration

**Example** To set the trustpoint to Trustpoint1 for the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap server Server1
awplus(config-ldap-server)# secure trustpoint Trustpoint1
```

To remove the trustpoint from 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap server Server1
awplus(config-ldap-server)# no secure trustpoint
```

**Related commands** [host \(ldap-server\)](#)  
[ldap-server](#)  
[port \(ldap-server\)](#)  
[secure cipher \(ldap-server\)](#)  
[secure mode \(ldap-server\)](#)

**Command changes** Version 5.5.2-1.1: command added

# server (ldap-group)

**Overview** Use this command to add an LDAP server to an LDAP server group.

The server is identified by the name of the server, which is created using the [ldap-server](#) command.

Use the **no** variant of this command to remove an LDAP server from an LDAP server group.

**Syntax** `server <server-name>`  
`no server <server-name>`

| Parameter                        | Description                                                                 |
|----------------------------------|-----------------------------------------------------------------------------|
| <code>&lt;server-name&gt;</code> | The name of the LDAP server group, specified when creating the LDAP server. |

**Default** By default, LDAP servers are only added to the default 'ldap' server group.

**Mode** LDAP Server Group Configuration

**Usage notes** The server is appended to the server list of the group, and the order of configuration determines the precedence of servers.

**Example** To add the LDAP server called 'Server1' to the LDAP server group called 'Group1', use the commands:

```
awplus# configure terminal
awplus(config)# aaa group server ldap Group1
awplus(config-ldap-group)# server Server1
```

To remove 'Server1' from 'Group1', use the commands:

```
awplus# configure terminal
awplus(config)# aaa group server ldap Group1
awplus(config-ldap-group)# no server Server1
```

**Related commands** [aaa authentication login](#)  
[aaa group server](#)  
[ldap-server](#)  
[show ldap server group](#)

**Command changes** Version 5.5.2-1.1: command added

# show ldap server group

**Overview** Use this command to display information about LDAP server groups, their servers and the status of those servers.

**Syntax** `show ldap server group [<group-name>]`

| Parameter                       | Description                        |
|---------------------------------|------------------------------------|
| <code>&lt;group-name&gt;</code> | The name of the LDAP server group. |

**Mode** Global Configuration

**Usage notes** If you specify a single group name, you will only see information relating to that specific server group. Otherwise, all LDAP server groups are shown, including the 'ldap' group that contains every LDAP server.

**Example** To show all server groups, use the command:

```
awplus# show ldap server group
```

To show the default LDAP group that includes all the LDAP servers, use the command:

```
awplus# show ldap server group ldap
```

To show a server group named 'CustomGroup1', use the command:

```
awplus# show ldap server group CustomGroup1
```

**Output** Figure 45-1: Example output from **show ldap server group**

LDAP Group Configuration

Group Name : ldap

| LDAP server name | Server Host/IP Address | Port | Status        |
|------------------|------------------------|------|---------------|
| server_one       | 10.1.1.1               | N/A  | Alive         |
| server_two       | 10.2.1.1               | N/A  | Dead (1 hour) |

Group Name : CustomGroup1

| LDAP server name | Server Host/IP Address | Port | Status |
|------------------|------------------------|------|--------|
| server_one       | 10.1.1.1               | N/A  | Alive  |

Group Name : CustomGroup2

| LDAP server name                  | Server Host/IP Address | Port | Status |
|-----------------------------------|------------------------|------|--------|
| No LDAP servers currently defined |                        |      |        |

port (ldap-server)

server (ldap-group)

**Command changes** Version 5.5.2-1.1: command added

# timeout (ldap-server)

**Overview** Use this command to set the time to wait for a connection before reattempting to connect to the LDAP server.

Use the **no** variant of this command to reset the timeout back to the default value.

**Syntax** `timeout <1-1000>`  
`no timeout`

| Parameter                   | Description                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------|
| <code>&lt;1-1000&gt;</code> | The number of seconds to wait for a connection before reattempting to connect to the LDAP server. |

**Default** 5 seconds

**Mode** LDAP Server Configuration

**Example** To set the server timeout for the LDAP server called 'Server1' to 10 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# timeout 10
```

To set the server timeout for 'Server1' to the default, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no timeout
```

- [“undebug radius”](#) on page 2187

# auth-mac-promiscuous

**Overview** Use this command to enable promiscuous mode for MAC address authentication on a local RADIUS server.

Use the **no** variant of this command to disable MAC authentication promiscuous mode on a local RADIUS server.

**Syntax** `auth-mac-promiscuous`  
`no auth-mac-promiscuous`

**Default** Disabled.

**Mode** RADIUS Server Configuration

**Usage notes** In promiscuous mode, the RADIUS server will respond with an Access-Accept for any Access-Request with a Radius Service-Type attribute of 'Call-Check', when the supplicants credentials are NOT in the user database.

If the credentials do appear in the database, the behavior of the server is unchanged.

**Example** To disable MAC authentication promiscuous mode on a local RADIUS server, use the commands:

```
awplus# radius-server local
awplus(config-radsrv)# no auth-mac-promiscuous
```

**Related commands** [show radius local-server auth-mac-promiscuous](#)

**Command changes** Version 5.5.3-2.1: command added

# auth radius send nas-identifier

**Overview** Use this command to enable the device to include the NAS-Identifier(32) attribute in RADIUS authentication requests.

Use the **no** variant of this command to stop including the NAS-Identifier attribute.

**Syntax** `auth radius send nas-identifier {<name>|vlan-id}`  
`no auth radius send nas-identifier`

| Parameter | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <name>    | Send this user-defined text as the NAS-Identifier. You can specify up to 253 characters.                                                     |
| vlan-id   | Send the VLAN ID of the authentication port as the NAS-Identifier. This is the configured VLAN ID, not the dynamic VLAN ID or guest VLAN ID. |

**Mode** Global Configuration

**Example** To use a user-defined identifier of NASID100 as the NAS-Identifier attribute, use the commands:

```
awplus# configure terminal
awplus(config)# auth radius send nas-identifier NASID100
```

To use the VLAN ID as the NAS-Identifier attribute, use the commands:

```
awplus# configure terminal
awplus(config)# auth radius send nas-identifier vlan-id
```

To stop sending the NAS-Identifier attribute, use the commands:

```
awplus# configure terminal
awplus(config)# no auth radius send nas-identifier
```

**Related commands** [auth radius send service-type](#)

# auth radius send service-type

**Overview** Use this command to enable the device to include the Service-Type(6) attribute in RADIUS authentication requests. The Service-Type attribute has a value of:

- Framed(2) for 802.1x
- Call-Check(10) for MAC authentication
- Unbound(5) for Web authentication.

Use the **no** variant of this command to stop including the Service-Type attribute.

**Syntax** `auth radius send service-type`  
`no auth radius send service-type`

**Mode** Global Configuration

**Example** To send the Service-Type attribute, use the commands:

```
awplus# configure terminal
awplus(config)# auth radius send service-type
```

**Related commands** [auth radius send nas-identifier](#)

# clear radius dynamic-authorization counters

**Overview** Use this command to set the Dynamic Authorization message counters to zero.

**Syntax** `clear radius dynamic-authorization counters`

**Mode** Privileged Exec

**Example** To set the Dynamic Authorization message counters to zero, use the command:

```
awplus# clear radius dynamic-authorization counters
```

**Related commands** [radius dynamic-authorization-client](#)  
[show radius dynamic-authorization counters](#)

**Command changes** Version 5.5.1-1.1: command added

# deadtime (RADIUS server group)

**Overview** Use this command to configure the **deadtime** parameter for the RADIUS server group. This command overrides the global dead-time configured by the [radius-server deadtime](#) command. The configured deadtime is the time period in minutes to skip a RADIUS server for authentication or accounting requests if the server is 'dead'. Note that a RADIUS server is considered 'dead' if there is no response from the server within a defined time period.

Use the **no** variant of this command to reset the deadtime configured for the RADIUS server group. If the global deadtime for RADIUS server is configured the value will be used for the servers in the group. The global deadtime for the RADIUS server is set to 0 minutes by default.

**Syntax** `deadtime <0-1440>`  
`no deadtime`

| Parameter                   | Description                |
|-----------------------------|----------------------------|
| <code>&lt;0-1440&gt;</code> | Amount of time in minutes. |

**Default** The deadtime is set to 0 minutes by default.

**Mode** RADIUS Server Group Configuration

**Usage** If the RADIUS server does not respond to a request packet, the packet is retransmitted the number of times configured for the **retransmit** parameter (after waiting for a **timeout** period to expire). The server is then marked 'dead', and the time is recorded. The **deadtime** parameter configures the amount of time to skip a dead server; if a server is dead, no request message is sent to the server for the **deadtime** period.

**Examples** To configure the deadtime for 5 minutes for the RADIUS server group 'GROUP1', use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1
awplus(config-sg)# deadtime 5
```

To remove the deadtime configured for the RADIUS server group 'GROUP1', use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# no deadtime
```

**Related commands** [aaa group server](#)  
[radius-server deadtime](#)

# debug radius

**Overview** This command enables RADIUS debugging. If no option is specified, all debugging options are enabled.

Use the **no** variant of this command to disable RADIUS debugging. If no option is specified, all debugging options are disabled.

**Syntax** debug radius [packet|event|all]  
no debug radius [packet|event|all]

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| packet    | Debugging for RADIUS packets is enabled or disabled. |
| event     | Debugging for RADIUS events is enabled or disabled.  |
| all       | Enable or disable all debugging options.             |

**Default** RADIUS debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable debugging for RADIUS packets, use the command:

```
awplus# debug radius packet
```

To enable debugging for RADIUS events, use the command:

```
awplus# debug radius event
```

To disable debugging for RADIUS packets, use the command:

```
awplus# no debug radius packet
```

To disable debugging for RADIUS events, use the command:

```
awplus# no debug radius event
```

**Related commands** [show debugging radius](#)  
[undebug radius](#)

# ip radius require-message-authenticator

**Overview** Use this command to configure the RADIUS client to reject unverified RADIUS packets. This means it will discard any received RADIUS Access-Accept, Access-Challenge, and Access-Reject packets that do not have a valid Message-Authenticator attribute.

Use the **no** variant of this command to allow the client to accept unverified RADIUS packets.

**Syntax** `ip radius require-message-authenticator`  
`no ip radius require-message-authenticator`

**Default** Disabled

**Mode** Global Configuration

**Example** To require Message-Authenticator attributes in responses from RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# ip radius require-message-authenticator
```

**Related commands** [nas message-authenticator \(radsvr\)](#)  
[radius-server host](#)  
[show radius local-server nas](#)

**Command changes** Version 5.5.4-2.3: command added

# ip radius source-interface

**Overview** This command configures the source IP address of every outgoing RADIUS packet to use a specific IP address or the IP address of a specific interface. If the specified interface is down or there is no IP address on the interface, then the source IP address of outgoing RADIUS packets depends on the interface the packets leave.

Use the **no** variant of this command to remove the source interface configuration. The source IP address in outgoing RADIUS packets will be the IP address of the interface from which the packets are sent.

**Syntax** `ip radius source-interface {<interface>|<ip-address>}`  
`no ip radius source-interface`

| Parameter                       | Description                                      |
|---------------------------------|--------------------------------------------------|
| <code>&lt;interface&gt;</code>  | Interface name.                                  |
| <code>&lt;ip-address&gt;</code> | IP address in the dotted decimal format A.B.C.D. |

**Default** Source IP address of outgoing RADIUS packets depends on the interface the packets leave.

**Mode** Global Configuration

**Examples** To configure all outgoing RADIUS packets to use the IP address of the interface "vlan1" for the source IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# ip radius source-interface vlan1
```

To configure the source IP address of all outgoing RADIUS packets to use 192.168.1.10, use the following commands:

```
awplus# configure terminal
awplus(config)# ip radius source-interface 192.168.1.10
```

To reset the source interface configuration for all outgoing RADIUS packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip radius source-interface
```

**Related commands** [radius-server host](#)  
[show radius statistics](#)

# radius dynamic-authorization-client

**Overview** Use this command to add a Dynamic Authorization Client (DAC). A Network Access Server (NAS) will only accept Dynamic Authorization (DA) messages from DACs that have been authorized using this command.

Use the **no** variant of this command to remove a DAC from the list of authorized clients.

**Syntax** `radius dynamic-authorization-client <ip-address> key <key-string>`

`no radius dynamic-authorization-client <ip-address>`

When in secure mode (see the [crypto secure-mode](#) command), the syntax in config files will be:

`radius dynamic-authorization-client <ip-address> key-encrypted <encrypted-key-string>`

| Parameter                       | Description                                                                                                                                                                                                                                                        |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | IP address of the DAC, entered in the form A.B.C.D                                                                                                                                                                                                                 |
| <code>key</code>                | Sets the shared-key of the client.                                                                                                                                                                                                                                 |
| <code>key-encrypted</code>      | Set an encrypted shared secret key. When secure mode is enabled, the running configuration contains this parameter instead of the key parameter. It indicates that the device stores keys in the running configuration in encrypted form instead of in plain text. |

**Mode** Global Configuration

**Usage notes** The RADIUS protocol does not support unsolicited messages sent from the RADIUS server to the NAS. This means that the network access configuration a supplicant receives from a RADIUS server cannot be updated until the supplicant re-authenticates with the RADIUS server.

In some situations it is desirable to either update a supplicant's configuration, or even disconnect their session.

This command allows a Dynamic Authentication Client to send a message that will either update or terminate a supplicant's session.

**Example** To add a DAC with IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# radius dynamic-authorization-client 10.0.0.1
key secret-key
```

To remove the configuration for a DAC with IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# no radius dynamic-authorization-client 10.0.0.1
```

                              [show radius dynamic-authorization counters](#)

**Command changes**   Version 5.5.1-1.1: command added

# radius-server deadtime

**Overview** Use this command to specify the global **deadtime** for all RADIUS servers. If a RADIUS server is considered dead, it is skipped for the specified deadtime. This command specifies for how many minutes a RADIUS server that is not responding to authentication requests is passed over by requests for RADIUS authentication.

Use the **no** variant of this command to reset the global deadtime to the default of 0 seconds, so that RADIUS servers are not skipped even if they are dead.

**Syntax** `radius-server deadtime <minutes>`  
`no radius-server deadtime`

| Parameter | Description                                                          |
|-----------|----------------------------------------------------------------------|
| <minutes> | RADIUS server deadtime in minutes in the range 0 to 1440 (24 hours). |

**Default** The default RADIUS deadtime configured on the system is 0 seconds.

**Mode** Global Configuration

**Usage** The RADIUS client considers a RADIUS server to be dead if it fails to respond to a request after it has been retransmitted as often as specified globally by the [radius-server retransmit](#) command or for the server by the [radius-server host](#) command. To improve RADIUS response times when some servers may be unavailable, set a **deadtime** to skip dead servers.

**Examples** To set the dead time of the RADIUS server to 60 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server deadtime 60
```

To disable the dead time of the RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server deadtime
```

**Related commands** [deadtime \(RADIUS server group\)](#)  
[radius-server host](#)  
[radius-server retransmit](#)  
[show radius statistics](#)

# radius-server host

**Overview** Use this command to specify a remote RADIUS server host for authentication or accounting, and to set server-specific parameters. The parameters specified with this command override the corresponding global parameters for RADIUS servers. This command specifies the IP address or host name of the remote RADIUS server host and assigns authentication and accounting destination UDP port numbers.

This command adds the RADIUS server address and sets parameters to the RADIUS server. The RADIUS server is added to the running configuration after you issue this command. If parameters are not set using this command then common system settings are applied.

Use the **no** variant of this command to remove the specified server host as a RADIUS authentication and/or accounting server and set the destination port to the default RADIUS server port number (1812).

**Syntax**

```
radius-server host {<host-name>|<ip-address>} [acct-port
<0-65535>] [auth-port <0-65535>] [key <key-string>] [retransmit
<0-100>] [timeout <1-1000>]

radius-server host {<host-name>|<ip-address>} [acct-port
<0-65535>] [auth-port <0-65535>] [key-encrypted
<encrypted-key-string>] [retransmit <0-100>] [timeout <1-1000>]

no radius-server host {<host-name>|<ip-address>} [acct-port
<0-65535>] [auth-port <0-65535>]
```

| Parameter    | Description                                                                                                                                                                                                                      |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <host-name>  | Server host name. The DNS name of the RADIUS server host.                                                                                                                                                                        |
| <ip-address> | The IP address of the RADIUS server host.                                                                                                                                                                                        |
| acct-port    | Accounting port. Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the server is not used for accounting. The default UDP port for accounting is 1813.                                       |
| <0-65535>    | UDP port number. (Accounting port number is set to (accounting port number is set to 1813 by default) Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the host is not used for accounting. |
| auth-port    | Authentication port. Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the server is not used for authentication. The default UDP port for authentication is 1812.                       |
| <0-65535>    | UDP port number (authentication port number is set to 1812 by default). Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the host is not used for authentication.                       |
| timeout      | Specifies the amount of time to wait for a response from the server. If this parameter is not specified the global value configured by the <b>radius-server timeout</b> command is used.                                         |

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-1000>               | Time in seconds to wait for a server reply (timeout is set to 5 seconds by default). The time interval (in seconds to wait for the RADIUS server to reply before retransmitting a request or considering the server dead. This setting overrides the global value set by the <b>radius-server timeout</b> command. If no timeout value is specified for this server, the global value is used.                                                                                                                                                                                                                      |
| retransmit             | Specifies the number of retries before skip to the next server. If this parameter is not specified the global value configured by the <b>radius-server retransmit</b> command is used.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <0-100>                | Maximum number of retries (maximum number of retries is set to 3 by default). The maximum number of times to resend a RADIUS request to the server, if it does not respond within the timeout interval, before considering it dead and skipping to the next RADIUS server. This setting overrides the global setting of the <b>radius-server retransmit</b> command. If no retransmit value is specified, the global value is used.                                                                                                                                                                                 |
| key                    | Set shared secret key with RADIUS servers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <key-string>           | Shared key string applied. Specifies the shared secret authentication or encryption key for all RADIUS communications between this device and the RADIUS server. This key must match the encryption used on the RADIUS daemon. All leading spaces are ignored, but spaces within and at the end of the string are used.<br><br>If spaces are used in the string, do not enclose the string in quotation marks unless the quotation marks themselves are part of the key. This setting overrides the global setting of the <b>radius-server key</b> command. If no key value is specified, the global value is used. |
| key-encrypted          | Set an encrypted shared secret key. When secure mode is enabled, the running configuration contains this parameter instead of the key parameter. It indicates that the device stores keys in the running configuration in encrypted form instead of in plain text.                                                                                                                                                                                                                                                                                                                                                  |
| <encrypted-key-string> | Encrypted shared key string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Default** The RADIUS client address is not configured (null) by default. No RADIUS server is configured.

**Mode** Global Configuration

**Usage** Multiple **radius-server host** commands can be used to specify multiple hosts. The software searches for hosts in the order they are specified. If no host-specific timeout, retransmit, or key values are specified, the global values apply to that host. If there are multiple RADIUS servers for this client, use this command multiple times—once to specify each server.

If you specify a host without specifying the auth port or the acct port, it will by default be configured for both authentication and accounting, using the default UDP ports. To set a host to be a RADIUS server for authentication requests only, set

the **acct-port** parameter to 0; to set the host to be a RADIUS server for accounting requests only, set the **auth-port** parameter to 0.

A RADIUS server is identified by IP address, authentication port and accounting port. A single host can be configured multiple times with different authentication or accounting ports. All the RADIUS servers configured with this command are included in the predefined RADIUS server group **radius**, which may be used by AAA authentication, authorization and accounting commands. The client transmits (and retransmits, according to the **retransmit** and **timeout** parameters) RADIUS authentication or accounting requests to the servers in the order you specify them, until it gets a response.

**Examples** To add the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20
```

To set the secret key to 'mySecret' on the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20 key mySecret
```

To delete the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host 10.0.0.20
```

To configure rad1.company.com for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad1.company.com acct-port 0
```

To remove the RADIUS server rad1.company.com configured for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host rad1.company.com
acct-port 0
```

To configure rad2.company.com for accounting only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad2.company.com auth-port 0
```

To configure 192.168.1.1 with authentication port 1000, accounting port 1001 and retransmit count 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 192.168.1.1 auth-port 1000
acct-port 1001 retransmit 5
```

# radius-server key

**Overview** This command sets a global secret key for RADIUS authentication on the device. The shared secret text string is used for RADIUS authentication between the device and a RADIUS server.

Note that if no secret key is explicitly specified for a RADIUS server, the global secret key will be used for the shared secret for the server.

Use the **no** variant of this command to reset the secret key to the default (null).

**Syntax** `radius-server key <key-string>`  
`no radius-server key`

When in secure mode, the syntax in config files will be:

`radius-server key-encrypted <encrypted-key-string>`

| Parameter                                               | Description                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>key &lt;key-string&gt;</code>                     | Shared secret among RADIUS server and 802.1X client.                                                                                                                                                                                                                                                                                                                  |
| <code>key-encrypted &lt;encrypted-key-string&gt;</code> | This parameter indicates that the key is in its encrypted form. You would not normally enter this command. Instead, if you enter key and secure mode is enabled, the running config contains this parameter instead of the key parameter. This indicates that in secure mode the device stores keys in the running config in encrypted form instead of in plain text. |

**Default** The RADIUS server secret key on the system is not set by default (null).

**Mode** Global Configuration

**Usage** Use this command to set the global secret key shared between this client and its RADIUS servers. If no secret key is specified for a particular RADIUS server using the **radius-server host** command, this global key is used.

After enabling AAA authentication with the **aaa authentication login** command, set the authentication and encryption key using the **radius-server key** command so the key entered matches the key used on the RADIUS server.

**Examples** To set the global secret key to **allied** for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server key allied
```

To set the global secret key to **secret** for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server key secret
```

To delete the global secret key for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server key
```

**Related commands**   [radius-server host](#)  
[show radius statistics](#)

# radius-server retransmit

**Overview** This command sets the retransmit counter to use RADIUS authentication on the device. This command specifies how many times the device transmits each RADIUS request to the RADIUS server before giving up.

This command configures the **retransmit** parameter for RADIUS servers globally. If the **retransmit** parameter is not specified for a RADIUS server by the **radius-server host** command then the global configuration set by this command is used for the server instead.

Use the **no** variant of this command to reset the re-transmit counter to the default (3).

**Syntax** `radius-server retransmit <retries>`  
`no radius-server retransmit`

| Parameter | Description                                                                                                                                                                                                                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <retries> | RADIUS server retries in the range <0-100>. The number of times a request is resent to a RADIUS server that does not respond, before the server is considered dead and the next server is tried. If no retransmit value is specified for a particular RADIUS server using the <b>radius-server host</b> command, this global value is used. |

**Default** The default RADIUS retransmit count on the device is 3.

**Mode** Global Configuration

**Examples** To set the RADIUS **retransmit** count to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 1
```

To set the RADIUS **retransmit** count to the default (3), use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server retransmit
```

To configure the RADIUS **retransmit** count globally with 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 5
```

To disable retransmission of requests to a RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 0
```

# radius-server timeout

**Overview** Use this command to specify the RADIUS global timeout value. This is how long the device waits for a reply to a RADIUS request before retransmitting the request, or considering the server to be dead. If no timeout is specified for the particular RADIUS server by the **radius-server host** command, it uses this global timeout value.

Note that this command configures the **timeout** parameter for RADIUS servers globally.

The **no** variant of this command resets the transmit timeout to the default (5 seconds).

**Syntax** `radius-server timeout <seconds>`  
`no radius-server timeout`

| Parameter                    | Description                                                                                                                                                                                                                                                               |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;seconds&gt;</code> | RADIUS server timeout in seconds in the range 1 to 1000. The global time in seconds to wait for a RADIUS server to reply to a request before retransmitting the request, or considering the server to be dead (depending on the <b>radius-server retransmit</b> command). |

**Default** The default RADIUS transmit timeout on the system is 5 seconds.

**Mode** Global Configuration

**Examples** To globally set the device to wait 20 seconds before retransmitting a RADIUS request to unresponsive RADIUS servers, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 20
```

To set the RADIUS **timeout** parameter to 1 second, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 1
```

To set the RADIUS **timeout** parameter to the default (5 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server timeout
```

To configure the RADIUS server **timeout** period globally with 3 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 3
```

To reset the global **timeout** period for RADIUS servers to the default, use the following command:

```
awplus# configure terminal
awplus(config)# no radius-server timeout
```

## server (RADIUS server group)

**Overview** This command adds a RADIUS server to a server group in RADIUS Server Group Configuration mode. The RADIUS server should be configured by the [radius-server host](#) command.

The device adds each server to the end of the group's list of servers, so add the servers in order of priority. If you add a server and it is already in the list, it will be removed and then re-added to the end of the list.

The server is identified by IP address and authentication and accounting UDP port numbers. So a RADIUS server can have multiple entries in a group with different authentication and/or accounting UDP ports. The **auth-port** specifies the UDP destination port for authentication requests to the server. To disable authentication for the server, set **auth-port** to 0. If the authentication port is missing, the default port number is 1812. The **acct-port** specifies the UDP destination port for accounting requests to the server. To disable accounting for the server, set **acct-port** to 0. If the accounting port is missing, the default port number is 1813.

Use the **no** variant of this command to remove a RADIUS server from the server group.

**Syntax**

```
server {<hostname>|<ip-address>} [auth-port <0-65535>]
[acct-port <0-65535>]

no server {<hostname>|<ip-address>} [auth-port <0-65535>]
[acct-port <0-65535>]
```

| Parameter    | Description                                                                                                                                                                                                                                                            |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <hostname>   | Server host name                                                                                                                                                                                                                                                       |
| <ip-address> | Server IP address<br>The server is identified by IP address, authentication and accounting UDP port numbers. So a RADIUS server can have multiple entries in a group with different authentication and/or accounting UDP ports.                                        |
| auth-port    | Authentication port<br>The <b>auth-port</b> specifies the UDP destination port for authentication requests to the server. To disable authentication for the server, set <b>auth-port</b> to 0. If the authentication port is missing, the default port number is 1812. |
| <0-65535>    | UDP port number (default: 1812)                                                                                                                                                                                                                                        |
| acct-port    | Accounting port<br>The <b>acct-port</b> specifies the UDP destination port for accounting requests to the server. To disable accounting for the server, set <b>acct-port</b> to 0. If the accounting port is missing, the default port number is 1813.                 |
| <0-65535>    | UDP port number (default: 1813)                                                                                                                                                                                                                                        |

**Default** The default Authentication port number is 1812 and the default Accounting port number is 1813.

**Mode** RADIUS Server Group Configuration

**Usage notes** The RADIUS server to be added must be configured by the **radius-server host** command. In order to add or remove a server, the **auth-port** and **acct-port** parameters in this command must be the same as the corresponding parameters in the **radius-server host** command.

**Examples** To create a RADIUS server group 'RAD\_AUTH1' for authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius RAD_AUTH1
awplus(config-sg)# server 192.168.1.1 acct-port 0
awplus(config-sg)# server 192.168.2.1 auth-port 1000 acct-port 0
```

To create a RADIUS server group 'RAD\_ACCT1' for accounting, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius RAD_ACCT1
awplus(config-sg)# server 192.168.2.1 auth-port 0 acct-port 1001
awplus(config-sg)# server 192.168.3.1 auth-port 0
```

To remove server 192.168.3.1 from the existing server group 'GROUP1', use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# no server 192.168.3.1
```

| Secret Key : secret               |              |              |                |                |
| Timeout : 3 sec                   |              |              |                |                |
| Retransmit Count : 2              |              |              |                |                |
| Server Host : 192.168.1.11        |              |              |                |                |
| Authentication Port : 1812        |              |              |                |                |
| Accounting Port : not configured  |              |              |                |                |
| Server Name/<br>IP Address        | Auth<br>Port | Acct<br>Port | Auth<br>Status | Acct<br>Status |
| -----                             |              |              |                |                |
| 192.168.1.10                      | 1812         | 1813         | Alive          | Alive          |
| 192.168.1.11                      | 1812         | N/A          | Alive          | N/A            |

**Example** See the sample output below showing RADIUS client status and RADIUS configuration:

```
awplus# show radius
```

**Output** Figure 46-3: Example output from the **show radius** command showing RADIUS client status

```
RADIUS global interface name: awplus
Secret key:
Timeout: 5
Retransmit count: 3
Deadtime: 0

Server Address: 150.87.18.89
Auth destination port: 1812
Accounting port: 1813
Secret key: swg
Timeout: 5
Retransmit count: 3
Deadtime: 0
```

| Output Parameter    | Meaning                                                                                            |
|---------------------|----------------------------------------------------------------------------------------------------|
| Source Interface    | The interface name or IP address to be used for the source address of all outgoing RADIUS packets. |
| Secret Key          | A shared secret key to a radius server.                                                            |
| Timeout             | A time interval in seconds.                                                                        |
| Retransmit Count    | The number of retry count if a RADIUS server does not response.                                    |
| Deadtime            | A time interval in minutes to mark a RADIUS server as "dead".                                      |
| Interim-Update      | A time interval in minutes to send Interim-Update Accounting report.                               |
| Group Deadtime      | The deadtime configured for RADIUS servers within a server group.                                  |
| Server Host         | The RADIUS server hostname or IP address.                                                          |
| Authentication Port | The destination UDP port for RADIUS authentication requests.                                       |
| Accounting Port     | The destination UDP port for RADIUS accounting requests.                                           |

| Output Parameter | Meaning                                                                                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auth Status      | The status of the authentication port.<br>The status ("dead", "error", or "alive") of the RADIUS authentication server and, if dead, how long it has been dead for.                |
|                  | Alive      The server is alive.                                                                                                                                                    |
|                  | Error      The server is not responding.                                                                                                                                           |
|                  | Dead      The server is detected as dead and it will not be used for deadtime period. The time displayed in the output shows the server is in dead status for that amount of time. |
|                  | Unknown   The server is never used or the status is unknown.                                                                                                                       |
| Acct Status      | The status of the accounting port.<br>The status ("dead", "error", or "alive") of the RADIUS accounting server and, if dead, how long it has been dead for.                        |

# show radius dynamic-authorization counters

**Overview** Use this command to display the Dynamic Authorization message counters. It shows the count of sent and received messages, as well as a count of any error messages.

**Syntax** `show radius dynamic-authorization counters`

**Mode** Privileged Exec

**Example** To display the Dynamic Authorization message counters, use the following command:

```
awplus# show radius dynamic-authorization counters
```

**Output** Figure 46-4: Example output from **show radius dynamic-authorization counters**

```
awplus#show radius dynamic-authorization counters

RADIUS Dynamic Authorization packet counters

Received:
 Disconnect request : 9
 CoA request : 6

Sent:
 Disconnect ACK : 4
 CoA ACK : 0
 Disconnect NAK : 2
 CoA NAK : 6

Dropped:
 Duplicate packet : 2
 Expired packet : 1

Error-cause:
 Unsupported attribute : 0
 Missing attribute : 0
 Invalid request : 0
 NAS ID mismatch : 0
 No session context found : 3

Errors:
 Unknown message type : 0
 Unknown client : 0
 Bad attribute : 0
 Bad authenticator : 0
 Malformed packet : 0
```

**Related commands**   [radius dynamic-authorization-client](#)  
[clear radius dynamic-authorization counters](#)

**Command changes**   Version 5.5.1-1.1: command added

# show radius local-server auth-mac-promiscuous

**Overview** Use this command to show the status of the **auth-mac-promiscuous** command.

**Syntax** `show radius local-server auth-mac-promiscuous`

**Mode** User Exec

**Usage notes** In promiscuous mode, the RADIUS server will respond with an Access-Accept for any Access-Request with a Radius Service-Type attribute of 'Call-Check', when the supplicants credentials are NOT in the user database.

If the credentials do appear in the database, the behavior of the server is unchanged.

**Example** To display the status of the **auth-mac-promiscuous** command, use the command:

```
awplus# show radius local-server auth-mac-promiscuous
```

**Output** Figure 46-5: Example output from **show radius local-server auth-mac-promiscuous**

```
awplus#show radius local-server auth-mac-promiscuous
Auth-mac promiscuous mode: Disabled
...
```

**Related commands** [auth-mac-promiscuous](#)

**Command changes** Version 5.5.3-2.1: command added

# show radius statistics

**Overview** This command shows the RADIUS client statistics for the device.

**Syntax** `show radius statistics`

**Mode** User Exec and Privileged Exec

**Example** See the sample output below showing RADIUS client statistics and RADIUS configuration:

```
awplus# show radius statistics
```

**Output** Figure 46-6: Example output from the **show radius statistics** command:

```
RADIUS statistics for Server: 150.87.18.89
Access-Request Tx : 5 - Retransmit : 0
Access-Accept Rx : 1 - Access-Reject Rx : 2
Access-Challenge Rx : 2
Unknown Type : 0 - Bad Authenticator : 0
Malformed Access-Resp : 0 - Wrong Identifier : 0
Bad Attribute : 0 - Packet Dropped : 0
TimeOut : 0 - Dead count : 0
Pending Request : 0
```

# undebug radius

**Overview** This command applies the functionality of the **no debug radius** command.

# 47

# Local RADIUS Server Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure the local RADIUS server on the device. For more information, see the [Local RADIUS Server Feature Overview and Configuration Guide](#).

The local RADIUS server is not available in Secure Mode (see the [crypto secure-mode](#) command).

- Command List**
- ["attribute \(radsrv-grp\)"](#) on page 2190
  - ["authentication"](#) on page 2192

# attribute (radsrv-grp)

**Overview** Use this command to define a RADIUS attribute for the local RADIUS server user group.

For a complete list of defined RADIUS attributes and values, see the [Local RADIUS Server Feature Overview and Configuration Guide](#).

When used with the **value** parameter the **attribute** command configures RADIUS attributes to the user group. If the specified attribute is already defined then it is replaced with the new value.

Use the **no** variant of this command to delete an attribute from the local RADIUS server user group.

**Syntax** `attribute [repeated] {<attribute-name>|<attribute-id>} <value>`  
`no attribute {<attribute-name>|<attribute-id>}`

| Parameter        | Description                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| repeated         | This optional parameter allows you to set multiple instances of the same attribute name or attribute ID.                                                                                     |
| <attribute-name> | RADIUS attribute name for standard attributes or Vendor-Specific attributes (see the <a href="#">Local RADIUS Server Feature Overview and Configuration Guide</a> for tables of attributes). |
| <attribute-id>   | RADIUS attribute numeric identifier for standard attributes.                                                                                                                                 |
| <value>          | RADIUS attribute value.                                                                                                                                                                      |

**Default** By default, no attributes are configured.

**Mode** Local RADIUS Server User Group Configuration

**Usage notes** For the Standard attributes, the attribute may be specified using either the attribute name, or its numeric identifier. For example, the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause 1
```

will produce the same results as the command:

```
awplus(config-radsrv-group)# attribute 49 1
```

In the same way, where the specific attribute has a pre-defined value, the parameter <value> may be substituted with the Value Name or with its numeric value, for example the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause
user-request
```

will produce the same results as the command:

```
awplus(config-radsrv-group)# attribute 49 1
```

or the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause 1
```

You can define more than one instance of an attribute name (or id) by using the **repeated** parameter. For example:

```
awplus(config-radsrv-group)# attribute repeated
Nas-filter-Rule "deny in tcp from any to 0.0.0.0/0 23"

awplus(config-radsrv-group)# attribute repeated
Nas-filter-Rule "deny in tcp from any to fe80::b1 23"
```

**Examples** To define the attribute name 'Service-Type' with Administrative User (6) to the RADIUS User Group 'Admin', use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# attribute Service-Type 6
```

To delete the attribute 'Service-Type' from the RADIUS User Group 'Admin', use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# no attribute Service-Type
```

To define multiple values for attribute 'NAS-Filter-Rule', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group dynamicAcl
awplus(config-radsrv-group)# attribute repeated
NAS-Filter-Rule "deny in tcp from any to 0.0.0.0/0 23"

awplus(config-radsrv-group)# attribute repeated
NAS-Filter-Rule "deny in tcp from any to fe80::b1 23"
```

To delete a specific value from the attribute 'NAS-Filter-Rule', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group dynamicAcl
awplus(config-radsrv-group)# no attribute NAS-Filter-Rule "deny
in tcp from any to 0.0.0.0/0 23"
```

**Related  
commands** [egress-vlan-id \(radsrv-grp\)](#)  
[egress-vlan-name \(radsrv-grp\)](#)  
[help radius-attribute](#)

**Command  
changes** Version 5.5.0-1.1: **repeated** parameter added

# authentication

**Overview** Use this command to enable the specified authentication methods on the local RADIUS server.

Use the **no** variant of this command to disable specified authentication methods on the local RADIUS server.

**Syntax** `authentication {mac|eapmd5|eaptls|peap}`  
`no authentication {mac|eapmd5|eaptls|peap}`

| Parameter | Description                            |
|-----------|----------------------------------------|
| mac       | Enable MAC authentication method.      |
| eapmd5    | Enable EAP-MD5 authentication method.  |
| eaptls    | Enable EAP-TLS authentication method.  |
| peap      | Enable EAP-PEAP authentication method. |

**Default** All authentication methods are enabled by default.

**Mode** RADIUS Server Configuration

**Examples** The following commands enable EAP-MD5 authentication methods on the local RADIUS server.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# authentication eapmd5
```

The following commands disable EAP-MD5 authentication methods on Local RADIUS server.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no authentication eapmd5
```

**Related commands** [server enable](#)  
[show radius local-server statistics](#)

# client (radsecproxy-srv)

**Overview** Use this command to add a RadSec client (for example, a NAS device) to the RadSecProxy local-server application. The application will accept RADIUS requests from all configured clients.

Use the **no** variant of this command to delete a previously-configured client from the RadSecProxy local-server application.

**Syntax** `client {<hostname>|<ip-addr>} [name-check {on|off}]`  
`no client {<hostname>|<ip-addr>}`

| Parameter  | Description                                                                                                                                                                     |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <hostname> | Hostname of client.                                                                                                                                                             |
| <ip-addr>  | Specify the client IPv4 address, in dotted decimal notation (A.B.C.D).                                                                                                          |
| name-check | Specify whether or not to enforce certificate name checking for this client. If the parameter is not specified then the global behavior, which defaults to <b>on</b> , is used. |
| on         | Enable name checking for this client.                                                                                                                                           |
| off        | Disable name checking for this client.                                                                                                                                          |

**Mode** RadSecProxy Local Server Configuration

**Usage notes** The client may be specified by its domain name or by its IPv4 address. If a domain name is used, it must be resolvable using a configured DNS name server.

Each client may be configured to use certificate name-checking; if not specified, the global behavior defined by **client name-check** or **no client name-check** will be used. If name checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in this command.

**NOTE:** If mutual authentication is disabled then this parameter has no effect, see the [client mutual-authentication](#) command.

**Example** To add a client called 'mynas.local' with certificate name checking **off**, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# client mynas.local name-check
off
```

**Related commands** [client mutual-authentication](#)  
[client name-check](#)

client trustpoint  
radius-secure-proxy local-server

# client mutual-authentication

**Overview** This command enables or disables mutual certificate authentication for all RadSecProxy clients. When enabled, the RadSecProxy local-server application will request and validate an X.509 certificate from the client when establishing a connection.

The **no** variant of this command disables mutual certificate validation. The local-server application will still transmit the local server certificate to the client, but will not expect or validate a certificate from the client.

**Syntax** `client mutual-authentication`  
`no client mutual-authentication`

**Default** Mutual authentication is enabled by default.

**Mode** RadSecProxy Local Server Configuration

**Example** Disable mutual certificate validation with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radius-secure-proxy)# no client
mutual-authentication
```

**Related commands** [client \(radsecproxy-srv\)](#)  
[client name-check](#)  
[radius-secure-proxy local-server](#)

**Command changes** Version 5.4.6-2.1: command added

# client name-check

**Overview** This command sets the global behavior for certificate name-checking for the RadSecProxy localserver application to **on**. This behavior will be used for all clients associated with the application that do not specify a behavior on a per-client basis. If name-checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in the **client (radsecproxy-aaa)** command.

Use the **no** variant of this command to set the global behavior for certificate name checking to **off**

**Syntax** `client name-check`  
`no client name-check`

**Default** Certificate name checking is on by default.

**Mode** RadSecProxy Local Server Configuration

**Example** Disable certificate name checking globally with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# no client name-check
```

**Related commands** [client \(radsecproxy-srv\)](#)  
[client trustpoint](#)  
[radius-secure-proxy local-server](#)

# client trustpoint

**Overview** This command adds one or more trustpoints to be used with the RadSecProxy local-server application. Multiple trustpoints may be specified, or the command may be executed more than once, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

**Syntax** `client trustpoint [<trustpoint-list>]`  
`no client trustpoint [<trustpoint-list>]`

| Parameter         | Description                                             |
|-------------------|---------------------------------------------------------|
| <trustpoint-list> | Specify one or more trustpoints to be added or deleted. |

**Mode** RadSecProxy Local Server Configuration

**Usage notes** The device certificate associated with the first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If you enter **client trustpoint** without specifying a trustpoint, the trustpoint list will be unchanged.

If you enter **no client trustpoint** without specifying a trustpoint, all trustpoints will be disassociated from the application.

**Example** You can add multiple trustpoints to the RadSecProxy local-server by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# client trustpoint example_1
awplus(config-radsecproxy-srv)# client trustpoint example_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config-radsecproxy-srv)# client trustpoint example_3
example_4
```

Disassociate all trustpoints from the RadSecProxy local-server application using the command:

```
awplus(config-radsecproxy-srv)# no client trustpoint
```

# clear radius local-server statistics

**Overview** Use this command to clear the statistics stored on the device for the local RADIUS server.

Use this command without any parameters to clear all types of local RADIUS server statistics.

**Syntax** `clear radius local-server statistics [nas|server|user]`

| Parameter | Description                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| nas       | Clear the NAS (Network Access Server) statistics on the device. For example, clearing statistics stored for NAS server invalid passwords.    |
| server    | Clear the Local RADIUS Server statistics on the device. For example, clearing Local RADIUS Servers statistics for all failed login attempts. |
| user      | Clear the Local RADIUS Server user statistics. For example, clearing statistics stored for the number of successful user logins.             |

**Mode** Privileged Exec

**Usage** Refer to the sample output for the [show radius local-server statistics](#) for further information about the type of statistics each parameter option for this command clears. Both the **nas** and **server** parameters clear unknown username and invalid passwords statistics, while the **user** parameter clears the number of successful and failed logins for each local RADIUS server user.

**Examples** To clear the NAS (Network Access Server) statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics nas
```

To clear the local RADIUS server statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics server
```

To clear the local RADIUS server user statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics user
```

**Related commands** [show radius local-server statistics](#)

## copy fdb-radius-users (to file)

**Overview** Use this command to create a set of local RADIUS server users from MAC addresses in the local FDB. A local RADIUS server user created using this command can be used for MAC authentication.

**Syntax** `copy fdb-radius-users  
{local-radius-user-db|nvs|flash|usb|debug|tftp|scp|  
fserver|<url>} [interface <port>] [vlan <vid>] [group <name>]  
[export-vlan [<radius-group-name>]]`

| Parameter            | Description                                                                                                                                                                                                                                                                               |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| local-radius-user-db | Copy the local RADIUS server users created to the local RADIUS server.                                                                                                                                                                                                                    |
| nvs                  | Copy the local RADIUS server users created to NVS memory.                                                                                                                                                                                                                                 |
| flash                | Copy the local RADIUS server users created to Flash memory.                                                                                                                                                                                                                               |
| usb                  | Copy the local RADIUS server users created to USB storage device.                                                                                                                                                                                                                         |
| debug                | Copy the local RADIUS server users created to debug.                                                                                                                                                                                                                                      |
| tftp                 | Copy the local RADIUS server users created to the TFTP destination.                                                                                                                                                                                                                       |
| scp                  | Copy the local RADIUS server users created to the SCP destination.                                                                                                                                                                                                                        |
| fserver              | Copy the local RADIUS server users created to the remote file server.                                                                                                                                                                                                                     |
| <url>                | Copy the local RADIUS server users created to the specified URL.                                                                                                                                                                                                                          |
| interface <port>     | Copy only MAC addresses learned on a specified device port. Wildcards may be used when specifying an interface name. For example, if you specify interface port2.* in a stacked environment, then this command generates RADIUS server users for MAC addresses learned on stack member 2. |
| vlan <vid>           | Copy only MAC addresses learned on a specified VLAN.                                                                                                                                                                                                                                      |
| group <name>         | Assign a group name to the local RADIUS server users created.                                                                                                                                                                                                                             |
| export-vlan          | Export VLAN ID assigned to exported FDB entry.                                                                                                                                                                                                                                            |
| <radius-group-name>  | Prefix for Radius group name storing VLAN ID                                                                                                                                                                                                                                              |

**Mode** Privileged Exec

**Usage notes** The local RADIUS server users created are written to a specified destination file in local RADIUS user CSV (Comma Separated Values) format. The local RADIUS server

users can then be imported to a local RADIUS server using the [copy local-radius-user-db \(from file\)](#) command.

The name and password of the local RADIUS server users created use a MAC address, which can be used for MAC authentication.

This command does not copy a MAC address learned by the CPU or the management port.

This command can filter FDB entries by the interface name and the VLAN ID. When the interface name and the VLAN ID are specified, this command generates local RADIUS server users from only the MAC address learned on the specified interface and on the specified VLAN.

**Examples** To register the local RADIUS server users from the local FDB directly to the local RADIUS server, use the command:

```
awplus# copy fdb-radius-users local-radius-user-db
```

To register the local RADIUS server users from the interface port1.0.1 to the local RADIUS server, use the command:

```
awplus# copy fdb-radius-users local-radius-user-db interface
port1.0.1
```

To copy output generated as local RADIUS server user data from MAC addresses learned on vlan10 on interface port1.0.1 to the file radius-user.csv, use the command:

```
awplus# copy fdb-radius-users radius-user.csv interface
port1.0.1 vlan10
```

To copy output generated as local RADIUS server user data from MAC addresses learned on vlan10 on interface port1.0.1 to a file on the remote file server, use the command:

```
awplus# copy fdb-radius-users fserver interface port1.0.1
vlan10
```

**Related commands** [copy local-radius-user-db \(to file\)](#)  
[copy local-radius-user-db \(from file\)](#)

# copy local-radius-user-db (from file)

**Overview** Use this command to copy the Local RADIUS server user data from a file. The file, including the RADIUS user data in the file, must be in the CSV (Comma Separated Values) format.

You can select **add** or **replace** as the copy method. The **add** parameter option copies the contents of specified file to the local RADIUS server user database. If the same user exists then the old user is removed before adding a new user. The **replace** parameter option deletes all contents of the local RADIUS server user database before copying the contents of specified file.

**Syntax** `copy <source-url> local-radius-user-db [add|replace]`

| Parameter    | Description                                                           |
|--------------|-----------------------------------------------------------------------|
| <source-url> | URL of the source file.                                               |
| add          | Add file contents to local RADIUS server user database.               |
| replace      | Replace current local RADIUS server user database with file contents. |

**Default** When no copy method is specified with this command the **replace** option is applied.

**Mode** Privileged Exec

**Examples** To replace the current local RADIUS server user data to the contents of `http://datahost/ user.csv`, use the following command:

```
awplus# copy http://datahost/user.csv local-radius-user-db
```

To add the contents of `http://datahost/user.csv` to the current local RADIUS server user database, use the following command:

```
awplus# copy http://datahost/user.csv local-radius-user-db add
```

**Related commands** [copy fdb-radius-users \(to file\)](#)  
[copy local-radius-user-db \(to file\)](#)

## copy local-radius-user-db (to file)

**Overview** Use this command to copy the local RADIUS server user data to a file. The output file produced is CSV (Comma Separated Values) format.

**Syntax** `copy local-radius-user-db  
{nvs|flash|usb|tftp|scp|<destination-url>}`

| Parameter         | Description                  |
|-------------------|------------------------------|
| nvs               | Copy to NVS memory.          |
| flash             | Copy to Flash memory.        |
| usb               | Copy to USB storage device.  |
| tftp              | Copy to TFTP destination.    |
| scp               | Copy to SCP destination.     |
| <destination-url> | URL of the Destination file. |

**Mode** Privileged Exec

**Example** Copy the current local RADIUS server user data to `http://datahost/user.csv`.

```
awplus# copy local-radius-user-db http://datahost/user.csv
```

**Related commands** [copy fdb-radius-users \(to file\)](#)

```

Note that “local” is a valid name for a trustpoint, so you do not need to modify existing configurations or scripts.

# debug crypto pki (deleted)

**Overview** This command is no longer available.

# domain-style

**Overview** Use this command to enable a specified domain style on the local RADIUS server. The local RADIUS server decodes the domain portion of a username login string when this command is enabled.

Use the **no** variant of this command to disable the specified domain style on the local RADIUS server.

**Syntax** `domain-style {suffix-atsign|ntdomain}`  
`no domain-style {suffix-atsign|ntdomain}`

| Parameter                  | Description                                                    |
|----------------------------|----------------------------------------------------------------|
| <code>suffix-atsign</code> | Enable at sign "@" delimited suffix style, i.e. "user@domain". |
| <code>ntdomain</code>      | Enable NT domain style, i.e. "domain\user".                    |

**Default** This feature is disabled by default.

**Mode** RADIUS Server Configuration

**Usage notes** When both domain styles are enabled, the first domain style configured has the highest priority. A username login string is matched against the first domain style enabled. Then, if the username login string is not decoded, it is matched against the second domain style enabled.

**Examples** To enable NT domain style on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# domain-style ntdomain
```

To disable NT domain style on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no domain-style ntdomain
```

**Related commands** [server enable](#)

## egress-vlan-id (radsrv-grp)

**Overview** Use this command to configure the standard RADIUS attribute 'Egress-VLANID (56)' for the local RADIUS Server user group.

Use the **no** variant of this command to remove the Egress-VLANID attribute from the local RADIUS server user group.

**Syntax** `egress-vlan-id <vid> [tagged|untagged]`  
`no egress-vlan-id`

| Parameter | Description                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------|
| <vid>     | The VLAN identifier to be used for the Egress VLANID attribute, in the range 1 to 4094.                                           |
| tagged    | Set frames on the VLAN as tagged. This sets the tag indication field to indicate that all frames on this VLAN are tagged.         |
| untagged  | Set all frames on the VLAN as untagged. This sets the tag indication field to indicate that all frames on this VLAN are untagged. |

**Default** By default, no Egress-VLANID attributes are configured.

**Mode** Local RADIUS Server User Group Configuration

**Usage** When a Voice VLAN is configured for dynamic VLAN allocation ([switchport voice vlan](#) command), the RADIUS server must be configured to send the VLAN information when an IP phone is successfully authenticated. Use either the [egress-vlan-id \(radsrv-grp\)](#) command or the [egress-vlan-name \(radsrv-grp\)](#) command, and specify the **tagged** parameter.

**Examples** To set the 'Egress-VLANID' attribute for the 'NormalUsers' local RADIUS server user group to VLAN identifier 200, with tagged frames, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# egress-vlan-id 200 tagged
```

To remove the 'Egress-VLANID' attribute for the 'NormalUsers' local RADIUS server user group, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no egress-vlan-id
```

**Related commands**    `attribute (radsrv-grp)`  
                          `egress-vlan-name (radsrv-grp)`  
                          `switchport voice vlan`

## egress-vlan-name (radsrv-grp)

**Overview** Use this command to configure the standard RADIUS attribute 'Egress-VLAN-Name (58)' for the local RADIUS server user group.

Use the **no** variant of this command to remove the Egress-VLAN-Name attribute from the local RADIUS server user group.

**Syntax** `egress-vlan-name <vlan-name> [tagged|untagged]`  
`no egress-vlan-name`

| Parameter   | Description                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <vlan-name> | The VLAN name to be configured as the Egress-VLAN-Name attribute.                                                                 |
| tagged      | Set frames on the VLAN as tagged. This sets the tag indication field to indicate that all frames on this VLAN are tagged.         |
| untagged    | Set all frames on the VLAN as untagged. This sets the tag indication field to indicate that all frames on this VLAN are untagged. |

**Default** By default, no Egress-VLAN-Name attributes are configured.

**Mode** Local RADIUS Server User Group Configuration

**Usage** When a Voice VLAN is configured for dynamic VLAN allocation ([switchport voice vlan](#) command), the RADIUS server must be configured to send the VLAN information when an IP phone is successfully authenticated. Use either the [egress-vlan-id \(radsrv-grp\)](#) command or the [egress-vlan-name \(radsrv-grp\)](#) command, and specify the **tagged** parameter.

**Examples** To configure the 'Egress-VLAN-Name' attribute for the RADIUS server user group 'NormalUsers' with the VLAN name vlan2 and all frames on this VLAN tagged, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# egress-vlan-name vlan2 tagged
```

To delete the 'Egress-VLAN-Name' attribute for the 'NormalUsers' group, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no egress-vlan-name
```

**Related  
commands**    `attribute (radsrv-grp)`  
                  `egress-vlan-id (radsrv-grp)`  
                  `switchport voice vlan`

## group (radsrv)

**Overview** Use this command to create a local RADIUS server user group, and enter local RADIUS Server User Group Configuration mode.

Use the **no** variant of this command to delete the local RADIUS server user group.

**Syntax** `group <user-group-name>`  
`no group <user-group-name>`

| Parameter                            | Description             |
|--------------------------------------|-------------------------|
| <code>&lt;user-group-name&gt;</code> | User group name string. |

**Mode** RADIUS Server Configuration

**Examples** The following command creates the user group NormalUsers.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
```

The following command deletes the user group NormalUsers.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no group NormalUsers
```

**Related commands** [user \(radsrv\)](#)  
[show radius local-server user](#)  
[vlan \(radsrv-grp\)](#)

# help radius-attribute

**Overview** Use this command to display a list of standard and vendor specific valid RADIUS attributes that are supported by the local RADIUS server.

**Syntax** `help radius-attribute [<attribute-name>|<attribute-ID>]`

| Parameter                           | Description                                                        |
|-------------------------------------|--------------------------------------------------------------------|
| <code>&lt;attribute-name&gt;</code> | List the details and predefined values for the named attribute.    |
| <code>&lt;attribute-ID&gt;</code>   | List the details and predefined values for the given attribute ID. |

**Mode** Privileged Exec

**Usage notes** When used without a parameter, this command lists all of the available RADIUS attributes.

When used with an attribute name or ID, this command displays the attribute name, value type, and any predefined values.

**Example** To list all available RADIUS attributes, use the following command:

```
awplus# help radius-attribute
```

```
awplus#help radius-attribute
Standard Attributes:
 1 User-Name
 2 User-Password
 3 CHAP-Password
 4 NAS-IP-Address
 5 NAS-Port
 6 Service-Type
...
```

To display the details for the RADIUS attribute Frag-Status, use the following command:

```
awplus# help radius-attribute frag-status
```

```
awplus#help radius-attribute frag-status
Frag-Status : integer (Integer number)

Pre-defined values :
 Fragmentation-Supported (1)
 More-Data-Pending (2)
 More-Data-Request (3)
 Reserved (0)
```

**Related commands** [attribute \(radsrv-grp\)](#)

**Command changes** Version 5.4.8-0.2: command added  
Version 5.4.9-0.1: added to x530 Series products

# nas

**Overview** This command adds a client device (the Network Access Server or the NAS) to the list of devices that are able to send authentication requests to the local RADIUS server. The NAS is identified by its IP address and a shared secret (also referred to as a shared key) must be defined that the NAS will use to establish its identity.

Use the **no** variant of this command to remove a NAS client from the list of devices that are allowed to send authentication requests to the local RADIUS server.

**Syntax** `nas <ip-address> key <nas-keystring>`  
`no nas <ip-address>`

| Parameter                          | Description            |
|------------------------------------|------------------------|
| <code>&lt;ip-address&gt;</code>    | RADIUS NAS IP address. |
| <code>&lt;nas-keystring&gt;</code> | NAS shared keystring.  |

**Mode** RADIUS Server Configuration

**Examples** The following commands add the NAS with an IP address of 192.168.1.2 to the list of clients that may send authentication requests to the local RADIUS server. Note the shared key that this NAS will use to establish its identity is NAS\_PASSWORD.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# nas 192.168.1.2 key NAS_PASSWORD
```

The following commands remove the NAS with an IP address of 192.168.1.2 from the list of clients that are allowed to send authentication requests to the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no nas 192.168.1.2
```

**Related commands** [nas message-authenticator \(radsrv\)](#)  
[show radius local-server nas](#)

## nas message-authenticator (radsvr)

**Overview** Use this command to decide whether or not to require verification of RADIUS packets for a specific NAS. Verification prevents RADIUS protocol forgery attacks. It is achieved by putting a Message-Authenticator attribute in Access-Requests from the NAS.

Use the **no** variant of this command to return the setting to the default.

**Syntax** `nas <ip-address> message-authenticator  
{required|optional|auto}`  
`no nas <ip-address> message-authenticator`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                       |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address> | The IP address of the NAS.                                                                                                                                                                                                                                                                                                                        |
| required     | Discard Access-Requests that have no Message-Authenticator attribute, or that have an invalid Message-Authenticator attribute.                                                                                                                                                                                                                    |
| optional     | Allow Access-Requests that have no Message-Authenticator attribute, and discard Access-Requests that have an invalid Message-Authenticator attribute.                                                                                                                                                                                             |
| auto         | Determine the mode based on the content of the first Access-Request received. On the basis of this, the device will produce a log message to tell you which mode you should configure. Only use <b>auto</b> temporarily while you are transitioning an existing network or adding new NAS devices with unknown support for Message-Authenticator. |

**Default** auto

**Mode** RADIUS Server Configuration

**Usage notes** If you use both MAC authentication and web authentication to authenticate the same TQ Series access point, make sure you set this to **optional**. Otherwise, web authentication may fail.

This is because if the first packet that the server receives from the client contains a valid Message-Authenticator attribute, then by default all subsequent packets from that client must also contain the same Message-Authenticator attribute. If packets don't contain the attribute, the server drops them. This can cause an issue on TQ series APs, because on these APs, MAC authentication's initial packet contains the attribute, and web authentication's initial packet doesn't. This means that web authentication will fail if MAC authentication has already happened.

Setting this to **optional** allows the server to accept packets from a client when the packets don't have a Message-Authenticator attribute, even if the server has already received a packet from that client that contained a Message-Authenticator attribute. This means both web authentication and MAC authentication will succeed, no matter which happens first.

**Examples** To require Message-Authenticator attributes in messages from a registered NAS whose IP address is 192.168.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsvr)# nas 192.168.1.2 message-authenticator
required
```

To make Message-Authenticator attributes optional in messages from a registered NAS whose IP address is 192.168.1.9, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsvr)# nas 192.168.1.9 message-authenticator
optional
```

To return to the default behavior of **auto** for the NAS whose IP address is 192.168.1.9, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsvr)# no nas 192.168.1.9 message-authenticator
```

**Command changes** Version 5.5.4-2.3: command added

# radius-secure-proxy local-server

**Overview** Use this command to enter the RadSecProxy local-server application configuration mode. This application allows remote RadSec clients to communicate with the local RADIUS server process via a secure (TLS) proxy.

**Syntax** `radius-secure-proxy local-server`

**Mode** Global Configuration Mode

**Example** To change mode from User Exec mode to the RadSecProxy local-server configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)#
```

**Related commands**

- `client (radsecproxy-srv)`
- `client name-check`
- `client trustpoint`

# radius-server local

**Overview** Use this command to navigate to the Local RADIUS server configuration mode (`config-radsrv`) from the Global Configuration mode (`config`).

**Syntax** `radius-server local`

**Mode** Global Configuration

**Example** Local RADIUS Server commands are available from `config-radsrv` configuration mode. To change mode from User Exec mode to the Local RADIUS Server mode (`config-radsrv`), use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)#
```

## Output

```
awplus(config)#radius-server local
Creating Local CA repository.....OK
Enrolling Local System to local trustpoint..OK
awplus(config-radsrv)#
```

**Related commands**

# server auth-port

**Overview** Use this command to change the UDP port number for local RADIUS server authentication.

Use the **no** variant of this command to reset the RADIUS server authentication port back to the default.

**Syntax** `server auth-port <1-65535>`  
`no server auth-port`

| Parameter | Description      |
|-----------|------------------|
| <1-65535> | UDP port number. |

**Default** The default local RADIUS server UDP authentication port number is 1812.

**Mode** RADIUS Server Configuration

**Examples** The following commands set the RADIUS server authentication port to 10000.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server auth-port 10000
```

The following commands reset the RADIUS server authentication port back to the default UDP port of 1812.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no server auth-port
```

**Related commands** [server enable](#)  
[show radius local-server statistics](#)

# server enable

**Overview** This command enables the local RADIUS server. The local RADIUS server feature is started immediately when this command is issued.

The **no** variant of this command disables local RADIUS server. When this command is issued, the local RADIUS server stops operating.

**Syntax** `server enable`  
`no server enable`

**Default** The local RADIUS server is disabled by default and must be enabled for use with this command.

**Mode** RADIUS Server Configuration

**Examples** To enable the local RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server enable
```

To disable the local RADIUS server, use the command:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no server enable
```

**Related commands** [server auth-port](#)  
[show radius local-server statistics](#)

# server trustpoint (radsrv)

**Overview** Use this command to add one or more trustpoints to the local RADIUS server. You can specify multiple trustpoints on one line, or execute the command more than once to add multiple trustpoints to the local RADIUS server.

Use the **no** variant to remove one or more trustpoints from the local RADIUS server.

**Syntax** `server trustpoint [<trustpoint-list>]`  
`no server trustpoint [<trustpoint-list>]`

| Parameter         | Description                                            |
|-------------------|--------------------------------------------------------|
| <trustpoint-list> | Specify one or more trustpoints to be added or deleted |

**Default** By default, the local trustpoint is associated with the local RADIUS server.

**Mode** RADIUS Server Configuration

**Usage Notes** If you do not specify any trustpoints, the command displays a list of trustpoints but leaves the list unchanged.

If you use the **no server trustpoint** command without specifying any trustpoints, then all trustpoints will be removed from the local RADIUS server.

**Example** To configure a trustpoint called 'my\_trustpoint' on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server trustpoint my_trustpoint
```

You can add multiple trustpoints to the local RADIUS server by executing the **server trustpoint** command multiple times:

```
awplus(config-radsrv)# server trustpoint my_trustpoint1
my_trustpoint2
```

To remove the trustpoint called 'my\_trustpoint' from the local RADIUS server, use the command:

```
awplus(config-radsrv)# no server trustpoint my_trustpoint
```

To remove all trustpoints from the local RADIUS server, use the command:

```
awplus(config-radsrv)# no server trustpoint
```

**Related commands**

- [show radius local-server trustpoint](#)
- [server enable](#)

# show radius local-server group

**Overview** Use this command to display information about the local RADIUS server user group.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show radius local-server group [<user-group-name>]`

| Parameter                            | Description             |
|--------------------------------------|-------------------------|
| <code>&lt;user-group-name&gt;</code> | User group name string. |

**Mode** User Exec and Privileged Exec

**Example** The following command displays Local RADIUS server user group information.

```
awplus# show radius local-server group
```

## Output

**Table 1:** Example output from the **show radius local-server group** command

|                  |               |
|------------------|---------------|
| Group-Name       | Vlan          |
| -----            |               |
| NetworkOperators | ManagementNet |
| NormalUsers      | CommonNet     |

**Table 2:** Parameters in the output of the **show radius local-server group** command

| Parameter  | Description                      |
|------------|----------------------------------|
| Group-Name | Group name.                      |
| Vlan       | VLAN name assigned to the group. |

# show radius local-server nas

**Overview** Use this command to display information about NAS (Network Access Servers) registered to the local RADIUS server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show radius local-server nas [<ip-address>]`

| Parameter    | Description                             |
|--------------|-----------------------------------------|
| <ip-address> | Specify NAS IP address for show output. |

**Mode** User Exec and Privileged Exec

**Example** The following command displays NAS information.

```
awplus# show radius local-server nas
```

## Output

**Table 3:** Example output from the **show radius local-server nas** command

| NAS-Address | Shared-Key (encrypted) | Message Authenticator |
|-------------|------------------------|-----------------------|
| 127.0.0.1   | dbSQ8ED....            | optional              |

**Table 4:** Parameters in the output of the **show radius local-server nas** command

| Parameter             | Description                            |
|-----------------------|----------------------------------------|
| NAS-Address           | IP address of NAS.                     |
| Shared-Key            | Shared key used for RADIUS connection. |
| Message Authenticator | The message-authenticator mode.        |

# show radius local-server trustpoint

**Overview** Displays the PKI trustpoints associated with the local RADIUS server.

**Syntax** `show radius local-server trustpoint`

**Mode** User Exec

**Example** To show the local RADIUS server trustpoint(s), use the commands:

```
show radius local-server trustpoint
```

**Output** Figure 47-1: Example output from **show radius local-server trustpoint**

```
show radius local-server trustpoint
Current PKI trustpoints for RADIUS EAP-TLS:
 my_trustpoint
```

**Related commands**

**Command changes** Version 5.4.6-1.1: command added

# show radius local-server user

**Overview** Use this command to display information about the local RADIUS server user.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax**

```
show radius local-server user [<user-name>]
show radius local-server user [<user-name>] format csv
show radius local-server user [<user-name>] detail
```

| Parameter   | Description                                                                             |
|-------------|-----------------------------------------------------------------------------------------|
| <user-name> | RADIUS user name. If no user name is specified, information for all users is displayed. |
| format csv  | Format output as CSV. This parameter is only available in Privileged Exec mode.         |
| detail      | Display detailed information about the user.                                            |

**Mode** User Exec and Privileged Exec

**Examples** The following command displays Local RADIUS server user information for user Tom.

```
awplus# show radius local-server user Tom
```

**Table 6:** Example output from the **show radius local-server user** command

| User-Name | Group            | Vlan          |
|-----------|------------------|---------------|
| Tom       | NetworkOperators | ManagementNet |

The following command displays all Local RADIUS server information for all users.

```
awplus# show radius local-server user
```

The following command displays Local RADIUS server user information for Tom in CSV format (only available in Privileged Exec mode).

```
awplus# show radius local-server user Tom format csv
```

**Table 7:** Example output from the **show radius local-server user Tom format csv** command

|                                                                                                                                                          |
|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| true,"NetworkOperators","Tom","abcd",0,2099/01/01,1,"","","ManagementNet"false,3600,false,0,"",false,"",false,false,"","",false,false,,false,0,0,"",true |
|----------------------------------------------------------------------------------------------------------------------------------------------------------|

The following command displays detailed Local RADIUS server user information for all users.

```
awplus# show radius local-server user detail
```

**Table 8:** Example output from the **show radius local-server user detail** command

```
awplus# show radius local-server user detail
Total users: 1
Maximum users allowed by license: 3

Username : Tom
Group : NetworkOperators
Vlan : VlanName
```

**Table 9:** Parameters in the output from the **show radius local-server user** command

| Parameter | Description                      |
|-----------|----------------------------------|
| User-Name | User name.                       |
| Group     | Group name assigned to the user. |
| Vlan      | VLAN name assigned to the user.  |

**Related commands**    [group \(radsrv\)](#)  
                          [user \(radsrv\)](#)

**Command changes**    Version 5.4.9-0.1: **detail** parameter added

## user (radsrv)

**Overview** Use this command to register a user to the local RADIUS server.

Use the **no** variant of this command to delete a user from the local RADIUS server.

**Syntax** `user <radius-user-name> [encrypted] password <user-password>  
[group <user-group>]`

`no user <radius-user-name>`

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <radius-user-name> | RADIUS user name. This can also be a MAC address in the IEEE standard format of HH-HH-HH-HH-HH-HH if you are configuring MAC authentication to use local RADIUS server.                                                                                                                                                                                                                                                                                                                                                                           |
| encrypted          | Specifies that the password is being entered in its encrypted form, so that it is not further encrypted. When creating a new user, enter the password in plaintext, and do not use the <b>encrypted</b> parameter. Use the <b>encrypted</b> parameter only when referring to a user that has previously been created. For instance, when adding an existing user from another RADIUS server, use the <b>encrypted</b> parameter, and enter the encrypted version of the password that appears in the output of <b>show</b> commands for the user. |
| <user-password>    | User password. This can also be a MAC address in the IEEE standard format of HH-HH-HH-HH-HH-HH if you are configuring MAC authentication to use local RADIUS server.                                                                                                                                                                                                                                                                                                                                                                              |
| group              | Specify the group for the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <user-group>       | User group name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Mode** RADIUS Server Configuration

**Usage notes** RADIUS user names cannot contain question mark (?), space ( ), or quote (" ") characters. RADIUS user names containing the below characters cannot use certificate authentication:

/ \ '\$ & ( ) \* ; < > ` |

Certificates cannot be created and exported for RADIUS user names that contain the above characters. We advise you to avoid using these characters in RADIUS user names if you need to use certificate authentication, because you will not be able to create and export certificates.

You also can use the IEEE standard format hexadecimal notation (HH-HH-HH-HH-HH-HH) to specify a supplicant MAC address to configure the user name and user password parameters to use local RADIUS server for MAC Authentication. See the [AAA and Port\\_Authentication Feature Overview and Configuration\\_Guide](#) for a sample MAC configuration. See also the command **user**

**00-db-59-ab-70-37 password 00-db-59-ab-70-37** as shown in the command examples.

**Examples** The following commands add user 'Tom' to the local RADIUS server and sets his password to 'QwerSD'.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user Tom password QwerSD
```

The following commands add user 'Tom' to the local RADIUS server user group 'NormalUsers' and sets his password 'QwerSD'.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user Tom password QwerSD group
NormalUsers
```

The following commands remove user 'Tom' from the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no user Tom
```

The following commands add the supplicant MAC address 00-d0-59-ab-70-37 to the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user 00-db-59-ab-70-37 password
00-db-59-ab-70-37
```

The following commands remove the supplicant MAC address 00-d0-59-ab-70-37 from the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no user 00-db-59-ab-70-37
```

**Related commands** [group \(radsrv\)](#)  
[show radius local-server user](#)

## vlan (radsrv-grp)

**Overview** Use this command to set the VLAN ID or name for the local RADIUS server user group. The VLAN information is used for authentication with the dynamic VLAN feature.

Use the **no** variant of this command to clear the VLAN ID or VLAN name for the local RADIUS server user group.

**Syntax** `vlan {<vid>|<vlan-name>}`  
`no vlan`

| Parameter                      | Description |
|--------------------------------|-------------|
| <code>&lt;vid&gt;</code>       | VLAN ID.    |
| <code>&lt;vlan-name&gt;</code> | VLAN name.  |

**Default** VLAN information is not set by default.

**Mode** Local RADIUS Server User Group Configuration

**Examples** The following commands set VLAN ID 200 to the group named 'NormalUsers':

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# vlan 200
```

The following commands remove VLAN ID 200 from the group named 'NormalUsers':

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no vlan
```

# crypto key generate rsa

**Overview** Use this command to generate a cryptographic public/private key pair for the Rivest-Shamir-Adleman (RSA) encryption algorithm.

**Syntax** `crypto key generate rsa [label <keylabel>] [<1024-16384>]`

| Parameter    | Description                                                                                                                                                                                                                                                                                 |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| label        | Specify and optional label for the key.                                                                                                                                                                                                                                                     |
| <keylabel>   | The name of the key to be created. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters. If no label is specified the default value "server-default" is used. |
| <1024-16384> | The bit length for the key. If no bit length is specified the default of 2048 is used.                                                                                                                                                                                                      |

**Mode** Privileged Exec

**Usage notes** The generated key may be used for multiple server certificates in the system. A key is referenced by its label. A bit length between 1024 and 16384 bits may be specified. Larger bit lengths are more secure, but require more computation time.  
The specified key must not already exist.

**Example** To create a key with the label 'example-server-key' and a bit length of 4096, use the commands:

```
awplus> enable
awplus# crypto key generate rsa label example-server-key 4096
```

**Related commands** [crypto key zeroize](#)  
[rsakeypair \(ca-trustpoint\)](#)  
[show crypto key mypubkey rsa](#)

**Command changes** Version 5.5.2-2.1: Key length increased to 16384

# crypto key zeroize

**Overview** Use this command to delete one or all cryptographic public/private key pairs.

**Syntax** `crypto key zeroize rsa <keylabel>`  
`crypto key zeroize all`

| Parameter                         | Description                                                                        |
|-----------------------------------|------------------------------------------------------------------------------------|
| <code>rsa &lt;keylabel&gt;</code> | Delete a single key pair for the Rivest-Shamir-Adleman (RSA) encryption algorithm. |
| <code>all</code>                  | Delete all keys.                                                                   |

**Mode** Privileged Exec

**Usage notes** When the system is in secure mode, this command will securely delete the file (the file's sectors in NVS will be overwritten with random data three times before deletion). When the device is not in secure mode, this command has the same effect as using the **delete** command (it deletes the file from Flash memory but does not overwrite it with zeros).

The specified key must exist but must not be in use for any existing server certificates.

A key may not be deleted if it is associated with the server certificate or server certificate signing request for an existing trustpoint. To remove a server certificate so that the key may be deleted, use the **no crypto pki enroll** command to de-enroll the server.

**Example** To delete an RSA key named "example-server-key", use the following command:

```
awplus# crypto key zeroize rsa example-server-key
```

**Related commands** [crypto key generate rsa](#)  
[show crypto key mypubkey rsa](#)  
[crypto secure-mode](#)

**Command changes** Version 5.4.6-1.1: zeroize functionality added to x930 Series  
Version 5.4.8-1.2: zeroize functionality added to x220, XS900MX, x550 Series  
Version 5.4.8-2.1: zeroize functionality added to SBx908 GEN2, x950 Series

# crypto pki authenticate

**Overview** Use this command to authenticate a trustpoint by generating or importing the root CA certificate. This must be done before the server can be enrolled to the trustpoint.

**Syntax** `crypto pki authenticate <trustpoint>`

| Parameter                       | Description                                     |
|---------------------------------|-------------------------------------------------|
| <code>&lt;trustpoint&gt;</code> | The name of the trustpoint to be authenticated. |

**Mode** Privileged Exec

**Usage notes** If the trustpoint's **enrollment** setting is "selfsigned", then this command causes a private key to be generated for the root CA, and a self-signed certificate to be generated based on that key.

If the trustpoint's **enrollment** setting is "terminal", then this command prompts the user to paste a certificate Privacy Enhanced Mail (PEM) file at the CLI terminal. If the certificate is a valid selfsigned CA certificate, then it will be stored as the trustpoint's root CA certificate.

The specified trustpoint must already exist, and its enrollment mode must have been defined.

**Example** To show the **enrollment** setting of a trustpoint named "example" and then generate a certificate from it, use the commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# enrollment selfsigned
awplus(config)# exit
awplus# exit
awplus# crypto pki authenticate example
```

**Related commands** [crypto pki import pem](#)  
[crypto pki trustpoint](#)  
[enrollment \(ca-trustpoint\)](#)

# crypto pki enroll

**Overview** Use this command to enroll the local server to the specified trustpoint.  
Use the **no** variant of this command to de-enroll the server by removing its certificate

**Syntax** `crypto pki enroll <trustpoint>`  
`no crypto pki enroll <trustpoint>`

| Parameter                       | Description                               |
|---------------------------------|-------------------------------------------|
| <code>&lt;trustpoint&gt;</code> | The name of the trustpoint to be enrolled |

**Mode** Privileged Exec

**Usage notes** For the local server, “enrollment” is the process of creating of a certificate for the server that has been signed by a CA associated with the trustpoint. The public portion of the RSA key pair specified using the `rsakeypair` parameter for the trustpoint will be included in the server certificate.

If the trustpoint represents a locally self-signed certificate authority, then this command results in the direct generation of the server certificate, signed by the root CA for the trustpoint.

If the trustpoint represents an external certificate authority, then this command results in the generation of a Certificate Signing Request (CSR) file, which is displayed at the terminal in Privacy-Enhanced Mail (PEM) format, suitable for copying and pasting into a file or message. The CSR must be sent to the external CA for processing. When the CA replies with the signed certificate, that certificate should be imported using the `crypto pki import pem` command, to complete the enrollment process.

The specified trustpoint must already exist, and it must already be authenticated.

**Example** To enroll the local server with the trustpoint “example”, use the following commands:

```
awplus> enable
awplus# crypto pki enroll example
```

**Related commands** [crypto pki enroll user](#)  
[crypto pki import pem](#)  
[crypto pki trustpoint](#)  
[enrollment \(ca-trustpoint\)](#)

# crypto pki enroll user

**Overview** Use this command to enroll a single RADIUS user or all RADIUS users to the specified trustpoint.

Use the **no** variant of this command to remove the PKCS#12 file from the system. Note that the PKCS#12 files are generated in a temporary (volatile) file system, so a system restart also results in removal of all of the files.

**Syntax**

```
crypto pki enroll <trustpoint>
{user <username>|local-radius-all-users}

no crypto pki enroll <trustpoint>
{user <username>|local-radius-all-users}
```

| Parameter    | Description                                                   |
|--------------|---------------------------------------------------------------|
| <trustpoint> | The name of the trustpoint to which users are to be enrolled. |
| <username>   | The name of the user to enroll to the trustpoint.             |

**Mode** Privileged Exec

**Usage notes** For RADIUS users, “enrollment” is the process of generating a private key and a corresponding client certificate for each user, with the certificate signed by the root CA for the trustpoint. The resulting certificates may be exported to client devices, for use with PEAP or EAP-TLS authentication with the local RADIUS server.

The specified trustpoint must represent a locally self-signed certificate authority.

The private key and certificate are packaged into a PKCS#12-formatted file, suitable for export using the **crypto pki export pkcs12** command. The private key is encrypted for security, with a passphrase that is entered at the command line. The passphrase is required when the PKCS#12 file is imported on the client system. The passphrase is not stored anywhere on the device, so users are responsible for remembering it until the export-import process is complete.

If **local-radius-all-users** is specified instead of an individual user, then keys and certificates for all RADIUS users will be generated at once. All the keys will be encrypted using the same passphrase.

The specified trustpoint must already exist, it must represent a locally self-signed CA, and it must already have been authenticated.

**Example** To enroll the user “example-user” with the trustpoint “example”, use the following commands:

```
awplus> enable
awplus# crypto pki enroll example user example-user
```

To enroll all local RADIUS users with the trustpoint “example”, use the following commands:

```
awplus> enable
```

```
awplus# crypto pki enroll example local-radius-all-users
```

**Related  
commands**

[crypto pki export pkcs12](#)

[crypto pki trustpoint](#)

# crypto pki export pem

**Overview** Use this command to export the root CA certificate for the given trustpoint to a file in Privacy-Enhanced Mail (PEM) format. The file may be transferred to the specified destination URL, or displayed at the terminal.

**Syntax** `crypto pki export <trustpoint> pem [terminal|<url>]`

| Parameter    | Description                                                                     |
|--------------|---------------------------------------------------------------------------------|
| <trustpoint> | The name of the trustpoint for which the root CA certificate is to be exported. |
| terminal     | Display the PEM file to the terminal.                                           |
| <url>        | Transfer the PEM file to the specified URL.                                     |

**Default** The PEM will be displayed to the terminal by default.

**Mode** Privileged Exec

**Usage notes** The specified trustpoint must already exist, and it must already be authenticated.

**Example** To display the PEM file for the trustpoint "example" to the terminal, use the following commands:

```
awplus> enable
awplus# crypto pki export example pem terminal
```

To export the PEM file "example.pem" for the trustpoint "example" to the URL "tftp://server\_a/", use the following commands:

```
awplus> enable
awplus# crypto pki export example pem
tftp://server_a/example.pem
```

**Related commands**

- [crypto pki authenticate](#)
- [crypto pki import pem](#)
- [crypto pki trustpoint](#)

# crypto pki export pkcs12

**Overview** Use this command to export a certificate and private key for an entity in a trustpoint to a file in PKCS#12 format at the specified URL. The private key is encrypted with a passphrase for security.

**Syntax** `crypto pki export <trustpoint> pkcs12 {ca|server|<username>} <url>`

| Parameter    | Description                                                                                                                                                                                                                                        |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <trustpoint> | The name of the trustpoint for which the certificate and key are to be exported.                                                                                                                                                                   |
| ca           | If this option is specified, the command exports the root CA certificate and corresponding key.                                                                                                                                                    |
| server       | If this option is specified, the command exports the server certificate and corresponding key.                                                                                                                                                     |
| <username>   | If a RADIUS username is specified, the command exports the PKCS#12 file that was previously generated using the <code>crypto pki enroll user</code> command. To avoid ambiguity with keywords, the username may be prefixed by the string "user:". |
| <url>        | The destination URL for the PKCS#12 file. The format of the URL is the same as any valid destination for a file copy command.                                                                                                                      |

**Mode** Privileged Exec

**Usage notes** If the **ca** option is specified, this command exports the root CA certificate and the corresponding private key, if the trustpoint has been authenticated as a locally selfsigned CA. (If the trustpoint represents an external CA, then there is no private key on the system corresponding to the root CA certificate. Use the **crypto pki export pem** file to export the certificate by itself.) The command prompts for a passphrase to encrypt the private key.

If the **server** option is specified, this command exports the server certificate and the corresponding private key, if the server has been enrolled to the trustpoint. The command prompts for a passphrase to encrypt the private key.

If a RADIUS username is specified, this command exports the PKCS#12 file that was generated using the **crypto pki enroll user** command. (The key within the file was already encrypted as part of the user enrollment process.)

In the event that there is a RADIUS user named "ca" or "server", enter "user:ca" or "user:server" as the username.

The key and certificate must already exist.

**Example** To export the PKCS#12 file "example.pk12" for the trustpoint "example" to the URL "tftp://backup/", use the following commands:

```
awplus> enable

awplus# crypto pki export example pkcs12 ca
tftp://backup/example.pk12
```

**Related commands**

- crypto pki enroll user
- crypto pki export pem
- crypto pki import pkcs12

# crypto pki import pem

**Overview** This command imports a certificate for the given trustpoint from a file in Privacy-Enhanced Mail (PEM) format. The file may be transferred from the specified destination URL, or entered at the terminal.

**Syntax** `crypto pki import <trustpoint> pem [terminal|<url>]`

| Parameter    | Description                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <trustpoint> | The name of the trustpoint for which the root CA certificate is to be imported.                                                                                            |
| terminal     | Optional parameter, If specified, the command prompts the user to enter (or paste) the PEM file at the terminal. If parameter is specified terminal is assumed by default. |
| <url>        | Optional parameter, If specified, the PEM file is transferred from the specified URL                                                                                       |

**Default** The PEM will be imported from the terminal by default.

**Mode** Privileged Exec

**Usage notes** The command is generally used for trustpoints representing external certificate authorities. It accepts root CA certificates, intermediate CA certificates, and server certificates. The system automatically detects the certificate type upon import.

Using this command to import root CA certificates at the terminal is identical to the functionality provided by the `crypto pki authenticate` command, for external certificate authorities. The imported certificate is validated to ensure it is a proper CA certificate.

Intermediate CA certificates are validated to ensure they are proper CA certificates, and that the issuer chain ends in a root CA certificate already installed for the trustpoint. If there is no root CA certificate for the trustpoint (i.e., if the trustpoint is unauthenticated) then intermediate CA certificates may not be imported.

Server certificates are validated to ensure that the issuer chain ends in a root CA certificate already installed for the trustpoint. If there is no root CA certificate for the trustpoint (i.e., if the trustpoint is unauthenticated) then server certificates may not be imported.

The specified trustpoint must already exist. If the imported certificate is self-signed, then no certificates may exist for the trustpoint. Otherwise, the issuer's certificate must already be present for the trustpoint.

**Example** To import the PEM file for the trustpoint "example" from the terminal, use the following commands:

```
awplus> enable
awplus# crypto pki import example pem
```

To import the PEM file for the trustpoint “example” from the URL “tftp://server\_a/”, use the following commands:

```
awplus> enable
awplus# crypto pki import example pem
tftp://server_a/example.pem
```

**Related  
commands**

[crypto pki authenticate](#)  
[crypto pki export pem](#)  
[crypto pki trustpoint](#)

# crypto pki import pkcs12

**Overview** This command imports a certificate and private key for an entity in a trustpoint from a file in PKCS#12 format at the specified URL. The command prompts for a passphrase to decrypt the private key within the file.

**Syntax** `crypto pki import <trustpoint> pkcs12 {ca|server} <url>`

| Parameter    | Description                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------------------|
| <trustpoint> | The name of the trustpoint for which the certificate and key are to be imported.                                         |
| ca           | If this option is specified, the command imports the root CA certificate and corresponding key.                          |
| server       | If this option is specified, the command imports the server certificate and corresponding key.                           |
| <url>        | The source URL for the PKCS#12 file. The format of the URL is the same as any valid destination for a file copy command. |

**Mode** Privileged Exec

**Usage notes** If the **ca** option is specified, this command imports the root CA certificate and the corresponding private key. This is only valid if the root CA certificate does not already exist for the trustpoint (i.e., if the trustpoint is unauthenticated).

If the **server** option is specified, this command imports the server certificate and the corresponding private key. The imported private key is given a new unique label of the form "localN", where N is a non-negative integer. This operation is only valid if the server certificate does not already exist for the trustpoint (i.e., if the server is not enrolled to the trustpoint).

PKCS#12 files for RADIUS users may not be imported with this command. (There is no value in doing so, as the files are not needed on the local system.)

The specified trustpoint must already exist. The key and certificate must not already exist.

**Example** To import the PKCS#12 file "example.pk12" for the trustpoint "example" to the URL "tftp://backup/", use the following commands:

```
awplus> enable
awplus# crypto pki import example pkcs12 ca
tftp://backup/example.pk12
```

**Related commands** [crypto pki export pkcs12](#)  
[crypto pki import pem](#)

# crypto pki trustpoint

**Overview** Use this command to declare the named trustpoint and enter trustpoint configuration mode.

Use the **no** variant of this command to destroy the trustpoint.

**Syntax** `crypto pki trustpoint <trustpoint>`  
`no crypto pki trustpoint <trustpoint>`

| Parameter    | Description                                                                                                                                                                                                     |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <trustpoint> | The name of the trustpoint. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters. |

**Mode** Global Configuration

**Usage notes** If the trustpoint did not previously exist, it is created as a new trustpoint. The trustpoint will be empty (unauthenticated) unless the name “local” is selected, in which case the system will automatically authenticate the trustpoint as a local self-signed certificate authority.

The **no** variant of this command destroys the trustpoint by removing all CA and server certificates associated with the trustpoint, as well as the private key associated with the root certificate (if the root certificate was locally self-signed). This is a destructive and irreversible operation, so this command should be used with caution.

**Example** To configure a trustpoint named “example”, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
```

**Related commands** [show crypto pki certificates](#)

Version 5.4.8-2.1: command added to SBx908 GEN2, x950 Series

# crypto secure-mode

**Overview** Use this command to put the device into Secure Mode. When in Secure Mode, the following are disabled:

- Telnet
- SSHv1
- SNMPv1/v2
- All privilege levels except 1 and 15
- Algorithms that are not supported under FIPS, including MD5, RSA-1 and DSA
- The ability to store passwords in cleartext and to specify an **enable** password.

In Secure Mode, the web server on the device (used by the Device GUI) only accepts AES128-SHA ciphers.

*Note: Stacking is not supported in Secure Mode.*

Use the **no** variant of this command to leave Secure Mode. You should delete all sensitive information first; see the ["Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide](#).

**Syntax** `crypto secure-mode`  
`no crypto secure-mode`

**Default** By default, the device is not in Secure Mode.

**Mode** Global Configuration

**Example** For step-by-step instructions about how to enter and leave Secure Mode, see "How to Enable Secure Mode" in the ["Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide](#).

**Related commands** [boot system](#)

**Command changes** Version 5.4.6-1.1: command added to x930 Series  
Version 5.4.8-1.2: command added to x220, XS900MX, x550 Series  
Version 5.4.8-2.1: command added to SBx908 GEN2, x950 Series

# crypto secure-mode delete hostkey

**Overview** Use this command to delete the encryption key used for securing configuration secrets in secure mode. Note that doing this will make these secrets impossible to decrypt, potentially impacting the device configuration.

**Syntax** `crypto secure-mode delete hostkey`

**Default** Not set.

**Mode** Privileged Exec

**Example** To delete the encrypted key, use the command:

```
awplus# crypto secure-mode delete hostkey
```

**Related commands**

- [radius-server host](#)
- [radius-server key](#)
- [ntp authentication-key](#)
- [crypto secure-mode](#)

**Command changes** Version 5.4.9-2.1: command added

# crypto verify

**Overview** Use this command to compare the SHA256 checksum of a file with its correct checksum. This confirms that the file has not been corrupted or interfered with during download. You can verify any kind of file, but you cannot specify a file path, so the file must be stored in the top level of the device's flash memory.

**CAUTION:** *If a file fails to verify and you believe the file may have been interfered with, we recommend immediately performing a security audit of your network.*

Once the device has verified the file, you can use the **copy running-config startup-config** command to save the file/hash pair in the running configuration. If you do this, the device will verify the file every time it boots up and will take action if the verification fails.

The action taken when verification fails on boot-up depends on the type of file and whether the device is in Secure Mode:

- If the device is in Secure Mode and the boot-up firmware file fails verification, the device will not boot. Contact Allied Telesis support if this happens.
- If the device is not in Secure Mode and the boot-up firmware file fails verification, the device will display the following warning message after booting: "% Verification Failed". If this occurs because the saved hash is incorrect, use this command to replace the hash. If this occurs because the firmware file is corrupted or may have been interfered with, ensure that your device is secure, then replace the failed file with a known good file and reboot.
- If you use the **gui** parameter and the GUI fails verification, the device will boot up but the GUI will be disabled (the **service http** command will be disabled).
- If any other file fails verification, the device will display the following warning message after booting: "% Verification Failed"

You can use the **show hash** command to see the current hash of a file.

Use the **no** variant of this command to remove a verified filename/hash combination from the running configuration.

**Syntax**

```
crypto verify <filename> <hash-value>
crypto verify gui <hash-value>
no crypto verify <filename>
```

| Parameter    | Description                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <filename>   | The AlliedWare Plus file that you want to verify                                                                                                                                    |
| gui          | Verify the current Device GUI file                                                                                                                                                  |
| <hash-value> | The known correct checksum of the file. For firmware and GUI files, the correct checksum is listed in the sha256sum file that is available from the Allied Telesis Download Center. |

**Default** No default

**Mode** Global Configuration

**Usage notes** All models of a particular series run the same firmware file and therefore have the same checksum for that firmware file. For example, all x930 Series switches have the same checksum.

If your network has extremely strict security requirements, such as FIPS compliance, you may need to verify the bootloader on boot-up and use signature verification for the firmware file. To configure these, use the commands [crypto verify bootrom](#) and [crypto verify signed](#). These commands make it difficult to upgrade the bootloader or firmware, so only use them if necessary.

**Examples** To verify the firmware file for 5.5.3-0.1 on an x930 Series switch, use the commands:

```
awplus# configure terminal
awplus(config)# crypto verify x930-5.5.3-0.1.rel
7f22d8a30c991a4ddc0a2aed47246282b23b4e4a865e07f79795c0959c47de
78
```

**Related commands**

- [crypto secure-mode](#)
- [crypto verify bootrom](#)
- [crypto verify signed](#)
- [show hash](#)
- [show secure-mode](#)

**Command changes** Version 5.5.3-0.1: **gui** parameter added; **<filename>** parameter expanded to cover all file types

# crypto verify bootrom

**Overview** Use this command to compare the SHA256 checksum hash value of a bootloader with its correct checksum. This confirms that the bootloader has not been corrupted or interfered with.

If the verification fails, contact Allied Telesis customer support.

If the device is in Secure Mode, running **crypto verify bootrom** also stores the hash value permanently. When in Secure Mode, we recommend only using this command in networks with extremely strict security requirements, such as in FIPS-compliant networks. This is because you can only remove the hash value by erasing flash memory (for example, by using the [erase factory-default](#) command).

If the device is not in Secure Mode, you can use the **write** command to save the hash value to the boot configuration file. The device will verify the checksum every time it boots up and will warn you if it fails the verification.

When not in Secure Mode, you can use the **no** variant of this command to remove the bootrom/hash combination from the running configuration.

**Syntax** `crypto verify bootrom <hash-value>`  
`no crypto verify <filename>`

| Parameter                       | Description                                                                                                                                                                                                      |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;hash-value&gt;</code> | The known correct checksum of the bootloader. To see the correct hash value, run the command <b>show hash bootrom</b> straight after you first boot the device up, or check the Deployment Guide for the device. |

**Default** No default

**Mode** Global Configuration

**Usage notes** All models of a particular series run the same bootloader file and therefore have the same checksum. For example, all x930 Series switches have the same bootloader checksum.

**Examples** To verify the bootrom file, use the commands:

```
awplus# configure terminal
awplus(config)# crypto verify bootrom
5e80e70b6a2200965abf5f62f72af1bdc1654f3726bdf554afcbd76270c91
```

Note that the hash in this example is an example only; it is not the hash of the device's bootloader.

**Related commands** [crypto secure-mode](#)  
[crypto verify](#)  
[crypto verify signed](#)

`show hash`

`show secure-mode`

# crypto verify signed

**Overview** Use this command to compare the HMAC-SHA checksum hash value of a firmware file with its correct checksum. This confirms that the firmware has not been corrupted or interfered with. When the device is in Secure Mode, this command also forces the device to check the hash whenever it boots up, and prevents the device from booting if the verification fails.

**Caution:**

If the device is in Secure Mode, this command makes it difficult to upgrade the device's firmware file. Therefore, only use this command if the device is in Secure Mode and you have extremely strict security requirements, such as in FIPS-compliant networks. Otherwise, use the [crypto verify](#) command. See the Usage Notes below for more detail.

If the verification fails, contact Allied Telesis customer support.

**Syntax** `crypto verify signed <filename> <hash-value>`

| Parameter                       | Description                                                                                                                                                                  |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;filename&gt;</code>   | The AlliedWare Plus file that you want to verify                                                                                                                             |
| <code>&lt;hash-value&gt;</code> | The known correct checksum of the file. This is a keyed HMAC-SHA hash. This is available in a .sig file, which you can get from your Allied Telesis customer representative. |

**Default** No default

**Mode** Global Configuration

**Usage notes** **Caution:**

If the device is in Secure Mode, and if the firmware file verified is the boot release and signed verification succeeds, then the device stores the signed hash and uses it to verify the firmware file on all subsequent reboots. This means that if you change the firmware version, the switch will not boot up. You can only change the firmware version if you reset the switch to the factory defaults **before** changing the firmware version, by using the command [erase factory-default](#).

If the device is not in Secure Mode, you can use the **write** command to save the hash value to the boot configuration file. The device will verify the checksum every time it boots up and will warn you if it fails the verification.

All models of a particular series run the same release file and therefore have the same checksum. For example, all x930 Series switches have the same checksum.

**Examples** To use signature verification to verify the firmware file for 5.5.3-0.1 on an x930 Series switch, use the commands:

```
awplus# configure terminal
awplus(config)# crypto verify signed x930-5.5.3-0.1.rel
3f50420644aebd277dd48b3aee30639801348896fffce231fc5615995ecde5
d9
```

**Related commands**

- [crypto secure-mode](#)
- [crypto verify](#)
- [crypto verify bootrom](#)
- [show hash](#)
- [show secure-mode](#)

# enrollment (ca-trustpoint)

**Overview** Use this command to declare how certificates will be added to the system for the current trustpoint.

**Syntax** `enrollment {selfsigned|terminal}`

| Parameter               | Description                                                        |
|-------------------------|--------------------------------------------------------------------|
| <code>selfsigned</code> | Sets the enrollment mode for the current trustpoint to selfsigned. |
| <code>terminal</code>   | Sets the enrollment mode for the current trustpoint to terminal.   |

**Mode** Trustpoint Configuration

**Usage notes** If the enrollment is set to **selfsigned**, then the system will generate a root CA certificate and its associated key when the **crypto pki authenticate** command is issued. It will generate a server certificate (signed by the root CA certificate) when the **crypto pki enroll** command is issued.

If the enrollment is set to **terminal**, then the system will prompt the user to paste the root CA certificate Privacy Enhanced Mail (PEM) file at the terminal, when the **crypto pki authenticate** command is issued. It will create a Certificate Signing Request (CSR) file for the local server when the **crypto pki enroll** command is issued. The server certificate received from the external CA should be imported using the **crypto pki import pem** command.

The trustpoint named "local" may only use the **selfsigned** enrollment setting.

If no enrollment mode is specified, the **crypto pki authenticate** command will fail for the trustpoint.

**Example** To configure the trustpoint named "example" and set its enrollment to **selfsigned**, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# enrollment selfsigned
```

**Related commands** [crypto pki enroll](#)

# fingerprint (ca-trustpoint)

**Overview** Use this command to declare that certificates with the specified fingerprint should be automatically accepted, when importing certificates from an external certificate authority. This can affect the behavior of the **crypto pki authenticate** and **crypto pki import pem** commands.

Use the **no** variant of this command to remove the specified fingerprint from the pre-accepted list.

**Syntax** `fingerprint <word>`  
`no fingerprint <word>`

| Parameter                 | Description                                                                                                     |
|---------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>&lt;word&gt;</code> | The fingerprint as a series of 40 hexadecimal characters, optionally separated into multiple character strings. |

**Default** By default, no fingerprints are pre-accepted for the trustpoint.

**Mode** Trustpoint Configuration

**Usage notes** Specifying a fingerprint adds it to a list of pre-accepted fingerprints for the trustpoint. When a certificate is imported, if it matches any of the pre-accepted values, then it will be saved in the system automatically. If the imported certificate's fingerprint does not match any pre-accepted value, then the user will be prompted to verify the certificate contents and fingerprint visually.

This command is useful when certificates from an external certificate authority are being transmitted over an insecure channel. If the certificate fingerprint is delivered via a separate messaging channel, then pre-entering the fingerprint value via cut-and-paste may be less errorprone than attempting to verify the fingerprint value visually.

The fingerprint is a series of 40 hexadecimal characters. It may be entered as a continuous string, or as a series of up to multiple strings separated by spaces. The input format is flexible because different certificate authorities may provide the fingerprint string in different formats.

**Example** To configure a fingerprint "5A81D34C 759CC4DA CFCA9F65 0303AD83 410B03AF" for the trustpoint named "example", use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# fingerprint 5A81D34C 759CC4DA CFCA9F65
0303AD83 410B03AF
```

**Related commands** [crypto pki authenticate](#)

`crypto pki import pem`

# no crypto pki certificate

**Overview** Use this command to delete a certificate with the specified fingerprint from the specified trustpoint.

**Syntax** no crypto pki certificate *<trustpoint>* *<word>*

| Parameter                 | Description                                                                                                     |
|---------------------------|-----------------------------------------------------------------------------------------------------------------|
| <i>&lt;trustpoint&gt;</i> | The name of the trustpoint.                                                                                     |
| <i>&lt;word&gt;</i>       | The fingerprint as a series of 40 hexadecimal characters, optionally separated into multiple character strings. |

**Default** By default, no fingerprints are pre-accepted for the trustpoint.

**Mode** Privileged Exec

**Usage notes** The fingerprint can be found in the output of the **show crypto pki certificates** command. If there are dependent certificates in the trustpoint (i.e., if other certificates were signed by the specified certificate), the command will be rejected.

If the specified certificate is the root CA certificate and the trustpoint represents a locally selfsigned CA, then the corresponding private key is also deleted from the system. Deleting the root CA certificate effectively resets the trustpoint to an unauthenticated state.

**Example** To delete a certificate with the fingerprint "594EDEF9 C7C4308C 36D408E0 77E784F0 A59E8792" from the trustpoint "example", use the following commands:

```
awplus> enable
awplus# no crypto pki certificate example
594EDEF9 C7C4308C 36D408E0 77E784F0 A59E8792
```

**Related commands** [no crypto pki trustpoint](#)  
[show crypto pki certificates](#)

# rsakeypair (ca-trustpoint)

**Overview** Use this command to declare which RSA key pair should be used to enroll the local server with the trustpoint. Note that this defines the key pair used with the server certificate, not the key pair used with the root CA certificate.

Use the **no** variant of this command to restore the default value, "server-default".

**Syntax** `rsakeypair <keylabel> [<1024-4096>]`  
`no rsakeypair`

| Parameter   | Description                                                                                                                                                                                                                                             |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <keylabel>  | The key to be used with the server certificate for this trustpoint. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters. |
| <1024-4096> | The bit length for the key, to be used if the key is implicitly generated during server enrollment.                                                                                                                                                     |

**Default** The default value for **keylabel** is "server-default".  
The default value for the key bit length is 2048.

**Mode** Trustpoint Configuration

**Usage notes** If the label specified does not refer to an existing key created by the **crypto key generate rsa** command, the key will be implicitly generated when the **crypto pki enroll** command is issued to generate the server certificate or the server certificate signing request. The optional numeric parameter defines the bit length for the key, and is only applicable for keys that are implicitly created during enrollment.

This command does not affect server certificates or server certificate signing requests that have already been generated. The trustpoint's server certificate is set to use whatever key pair was specified for the trustpoint at the time the **crypto pki enroll** command is issued.

The default key pair is "server-default". The default bit length is 2048 bits.

**Example** To configure trustpoint "example" to use the key pair "example-server-key" with a bit length of 2048, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# rsakeypair example-server-key 2048
```

**Related commands** [crypto key generate rsa](#)

# show crypto key mypubkey rsa

**Overview** Use this command to display information about the specified Rivest-Shamir-Adleman encryption key.

**Syntax** `show crypto key mypubkey rsa [<keylabel>]`

| Parameter  | Description                                    |
|------------|------------------------------------------------|
| <keylabel> | The name of the key to be shown, if specified. |

**Default** By default, all keys will be shown.

**Mode** Privileged Exec

**Usage notes** If no key label is specified, information about all keys is shown. The command displays the bit length of the key, a key fingerprint (a hash of the key contents to help uniquely identify a key), and a list of trustpoints in which the server certificate is using the key.

The specified keys must exist.

**Example** To show all keys, use the following commands:

```
awplus> enable
awplus# show crypto key mypubkey rsa
```

**Output** Figure 48-1: Example output from **show crypto key mypubkey rsa**

```
awplus#show crypto key mypubkey rsa

RSA Key Pair "example-server-key":
 Key size : 2048 bits
 Fingerprint : 1A605D73 C2274CB7 853886B3 1C802FC6 7CDE45FB
 Trustpoints : example

RSA Key Pair "server-default":
 Key size : 2048 bits
 Fingerprint : 34AC4D2D 5249A168 29D426A3 434FFC59 C4A19901
 Trustpoints : local
```

**Related commands** [crypto key generate rsa](#)

# show crypto pki certificates

**Overview** Use this command to display information about existing certificates for the specified trustpoint.

**Syntax** `show crypto pki certificates [<trustpoint>]`

| Parameter                       | Description                                                |
|---------------------------------|------------------------------------------------------------|
| <code>&lt;trustpoint&gt;</code> | The trustpoint for which the certificates are to be shown. |

**Default** By default, the certificates for all trustpoints are shown.

**Mode** Privileged Exec

**Usage notes** If no trustpoint is specified, certificates for all trustpoints are shown. The command displays the certificates organized into certificate chains. It starts with the server certificate and then displays its issuer, and continues up the issuer chain until the root CA certificate is reached.

For each certificate, the command displays the certificate type, the subject's distinguished name (the entity identified by the certificate), the issuer's distinguished name (the entity that signed the certificate), the validity dates for the certificate, and the fingerprint of the certificate. The fingerprint is a cryptographic hash of the certificate contents that uniquely identifies the certificate.

The specified trustpoints must already exist.

**Example** To show the certificates for the trustpoint "example", use the following command:

```
awplus> enable
awplus# show crypto pki certificates example
```

**Output** Figure 48-2: Example output from **show crypto pki certificates**

```
awplus>enable
awplus#show crypto pki certificates example

Trustpoint "example" Certificate Chain

**Related commands** [crypto pki trustpoint](#)

# show crypto pki enrollment user

**Overview** Use this command to display a list of trustpoints for which RADIUS user enrollments have been performed, using the **crypto pki enroll user** command. This indicates that PKCS#12 files for the user are available for export for the given trustpoints, using the **crypto pki export pkcs12** command.

**Syntax** `crypto pki enrollment user <username>`

| Parameter                     | Description                                     |
|-------------------------------|-------------------------------------------------|
| <code>&lt;username&gt;</code> | The user for which enrollments are to be shown. |

**Mode** Privileged Exec

**Example** To show the list of trustpoints to which user "exampleuser1" is enrolled, use the following commands:

```
awplus> enable
awplus(config)# show crypto pki enrollment user exampleuser1
```

**Output** Figure 48-3: Example output from **show crypto pki enrollment user**

```
awplus> enable
awplus# show crypto pki enrollment user exampleuser1
User "exampleuser1" is enrolled to the following trustpoints:
local,example
```

**Related commands** [crypto pki enroll user](#)  
[crypto pki export pkcs12](#)

# show crypto pki trustpoint

**Overview** Use this command to display information about the specified trustpoint.

**Syntax** `show crypto pki trustpoint [<trustpoint>]`

| Parameter    | Description                            |
|--------------|----------------------------------------|
| <trustpoint> | The name of the trustpoint to be shown |

**Default** By default, all trustpoints are shown.

**Mode** Privileged Exec

**Usage notes** If no trustpoint is specified, information about all trustpoints is shown. The command displays the authentication status of the trustpoint, the fingerprint of the root CA certificate (if it exists), the enrollment status of the local server with the trustpoint, a list of any applications that are configured to use the trustpoint, and the trustpoint parameters that were configured from trustpoint-configuration mode.

The specified trustpoints must already exist.

**Example** To show the details of the trustpoint "example", use the following commands:

```
awplus> enable
awplus# show crypto pki trustpoint example
```

**Output** Figure 48-4: Example output from **show crypto pki trustpoint**

```
awplus> enable
awplus# show crypto pki trustpoint example

Trustpoint "example"
 Type : Self-signed certificate authority
 Root Certificate: 50C1856B EEC7555A 0F3A61F6 690D9463 67DF74D1
 Local Server : The server is enrolled to this trustpoint.
 Server Key : example-server-key
 Applications : RADIUS

Authentication and Enrollment Parameters:
 Enrollment : selfsigned
 RSA Key Pair : example-server-key (2048 bits)

```

**Related commands** [crypto pki trustpoint](#)  
[show crypto pki certificates](#)

# show hash

**Overview** Use this command to display the hash for a specified file on the device, or for the device's current bootloader.

**Syntax** `show hash <filename>`  
`show hash bootrom`

| Parameter  | Description                                   |
|------------|-----------------------------------------------|
| <filename> | The name of the file to display the hash for. |
| bootrom    | Display the hash for the current bootloader.  |

**Mode** Privileged Exec

**Examples** To show the hash for the GUI file named `awplus-gui_552_27.gui`, use the command:

```
awplus# show hash awplus-gui_552_27.gui
```

To show the hash for a file named 'example.txt', which is in the folder named 'example' in flash memory, use the command:

```
awplus# show hash flash://example/example.txt
```

To show the hash for the bootloader, use the command:

```
awplus# show hash bootrom
```

**Output** Figure 48-5: Example output from **show hash**

```
awplus#show hash awplus-gui_552_27.gui
b793e2c7fc5580513472017f964316f3bb0e79fbf1ddfd6f3844a2a8311c5c64
```

- [crypto verify](#)
- [crypto verify bootrom](#)

**Command changes** Version 5.5.3-0.1: command added

# show secure-mode

**Overview** Use this command to see whether secure mode is enabled or not. Secure mode disables a number of insecure features, such as Telnet.

**Syntax** `show secure-mode`

**Mode** User Exec/Privileged Exec

**Example** To see if secure mode is enabled, use the command:

```
awplus# show secure-mode
```

**Output** Figure 48-6: Example output from **show secure-mode**

```
awplus#show secure-mode
Secure mode is enabled
```

**Related commands** [crypto secure-mode](#)

# subject-name (ca-trustpoint)

**Overview** Use this command to specify the distinguished name string that should be used for the subject field in the server certificate, when enrolling the server (generating the server certificate or server certificate signing request).

**Syntax** `subject-name <word>`

| Parameter                 | Description                                                                                                                                                   |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;word&gt;</code> | Specify the subject name as a distinguished name string. Complex strings (e.g., strings containing spaces) should be surrounded with double-quote characters. |

**Default** If no subject name is specified for the trustpoint, then the system automatically builds a name of the form `"/O=AlliedWare Plus/CN=xxxx.yyyy.zzz"`, where `"xxxx"` is the hostname of the system and `"yyy.zzz"` is the default search domain for the system.

**Mode** Trustpoint Configuration

**Usage notes** The subject name is specified as a variable number of fields, where each field begins with a forward-slash character (`/`). Each field is of the form `"XX=value"`, where `"XX"` is the abbreviation of the node type in the tree.

Common values include:

- `"C"` (country),
- `"ST"` (state),
- `"L"` (locality),
- `"O"` (organization),
- `"OU"` (organizational unit), and
- `"CN"` (common name).

Of these fields, `"CN"` is usually the most important.

**NOTE:** For a server certificate, many applications require that the network name of the server matches the common name in the server's certificate.

**Example** To configure the trustpoint named "example" and set its subject name, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# subject-name "/O=My
Company/CN=192.168.1.1"
```

# TACACS+ Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure the device to use TACACS+ servers. For more information about TACACS+, see the [TACACS+ Feature Overview and Configuration Guide](#).

TACACS+ is not available in Secure Mode (see the [crypto secure-mode](#) command).

- Command List**

# aaa authorization commands

**Overview** This command configures a method list for commands authorization that can be applied to console or VTY lines. When command authorization is enabled for a privilege level, only authorized users can executed commands in that privilege level.

Use the **no** variant of this command to remove a named method list or disable the default method list for a privilege level.

**Syntax**

```
aaa authorization commands <privilege-level>
{default|<list-name>} group tacacs+ [none]

no aaa authorization commands <privilege-level>
{default|<list-name>}
```

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <privilege-level> | The privilege level of the set of commands the method list will be applied to.<br>AlliedWare Plus defines three sets of commands, that are indexed by a level value:<br><b>Level = 1:</b> All commands that can be accessed by a user with privilege level between 1 and 6 inclusive<br><b>Level = 7:</b> All commands that can be accessed by a user with privilege level between 7 and 14 inclusive<br><b>Level = 15:</b> All commands that can be accessed by a user with privilege level 15 |
| group             | Specify the server group where authorization messages are sent. Only the <code>tacacs+</code> group is available for this command.                                                                                                                                                                                                                                                                                                                                                              |
| tacacs+           | Use all TACACS+ servers configured by the <code>tacacs-server host</code> command.                                                                                                                                                                                                                                                                                                                                                                                                              |
| default           | Configure the default authorization commands method list.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <list-name>       | Configure a named authorization commands method list                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| none              | If specified, this provides a local fallback to command authorization so that if authorization servers become unavailable then the device will accept all commands normally allowed for the privilege level of the user.                                                                                                                                                                                                                                                                        |

**Mode** Global Configuration

**Usage notes** TACACS+ command authorization provides centralized control of the commands available to a user of an AlliedWare Plus device. Once enabled:

- The command string and username are encrypted and sent to the first available configured TACACS+ server (the first server configured) for authorization.

- The TACACS+ server decides if the user is authorized to execute the command and returns the decision to the AlliedWare Plus device.
- Depending on this decision the device will then either execute the command or notify the user that authorization has failed.

If multiple TACACS+ servers are configured, and the first server is unreachable or does not respond, the other servers will be queried, in turn, for an authorization decision. If all servers are unreachable and a local fallback has been configured, with the **none** parameter, then commands are authorized based on the user's privilege level; the same behavior as if command authorization had not been configured. If, however, the local fallback is not configured and all servers become unreachable then all commands except **logout**, **exit**, and **quit** will be denied.

The **default** method list is defined with a local fallback unless configured differently using this command.

**Example** To configure a commands authorization method list, named TAC15, using all TACACS+ servers to authorize commands for privilege level 15, with a local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 15 TAC15 group
tacacs+ none
```

To configure the default method list to authorize commands for privilege level 7, with no local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 7 default group
tacacs+
```

To remove the authorization method list TAC15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization commands 15 TAC15
```

**Related commands** [aaa authorization config-commands](#)  
[authorization commands](#)  
[tacacs-server host](#)

**Command changes** Version 5.4.6-2.1: command added

# aaa authorization config-commands

**Overview** Use this command to enable command authorization on configuration mode commands. By default, command authorization applies to commands in exec mode only.

Use the **no** variant of this command to disable command authorization on configuration mode commands.

**Syntax** `aaa authorization config-commands`  
`no aaa authorization config-commands`

**Default** By default, command authorization is disabled on configuration mode commands.

**Mode** Global Configuration

**Usage notes** If authorization of configuration mode commands is not enabled then all configuration commands are accepted by default, including command authorization commands.

**NOTE:** *Authorization of configuration commands is required for a secure TACACS+ command authorization configuration as it prevents the feature from being disabled to gain access to unauthorized exec mode commands.*

**Example** To enable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authorization config-commands
```

To disable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization config-commands
```

**Related commands** [aaa authorization commands](#)  
[authorization commands](#)  
[tacacs-server host](#)

**Command changes** Version 5.4.6-2.1: command added

# authorization commands

**Overview** This command applies a command authorization method list, defined using the [aaa authorization commands](#) command, to console and VTY lines.

Use the **no** variant of this command to reset the command authorization configuration on the console and VTY lines.

**Syntax** `authorization commands <privilege-level> {default|<list-name>}`  
`no authorization commands <privilege-level>`

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <privilege-level> | The privilege level of the set of commands the method list will be applied to.<br>AlliedWare Plus defines three sets of commands, that are indexed by a level value:<br><b>Level = 1:</b> All commands that can be accessed by a user with privilege level between 1 and 6 inclusive<br><b>Level = 7:</b> All commands that can be accessed by a user with privilege level between 7 and 14 inclusive<br><b>Level = 15:</b> All commands that can be accessed by a user with privilege level 15 |
| default           | Configure the default authorization commands method list.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <list-name>       | Configure a named authorization commands method list                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Default** The **default** method list is applied to each console and VTY line by default.

**Mode** Line Configuration

**Usage notes** If the specified method list does not exist users will not be able to execute any commands in the specified method list on the specified VTY lines.

**Example** To apply the TAC15 command authorization method list with privilege level 15 to VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# authorization commands 15 TAC15
```

To reset the command authorization configuration with privilege level 15 on VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# no authorization commands 15
```

**Related commands** [aaa authorization commands](#)

aaa authorization config-commands

tacacs-server host

**Command  
changes**

Version 5.4.6-2.1: command added

# ip tacacs source-interface

**Overview** This command sets the source interface, or IP address, to use for all TACACS+ packets sent from the device. By default, TACACS+ packets use the source IP address of the egress interface.

Use the **no** variant of this command to remove the source interface configuration and use the source IP address of the egress interface.

**Syntax** `ip tacacs source-interface {<interface>|<ip-address>}`  
`no ip tacacs source-interface`

| Parameter                       | Description                                      |
|---------------------------------|--------------------------------------------------|
| <code>&lt;interface&gt;</code>  | Interface name.                                  |
| <code>&lt;ip-address&gt;</code> | IP address in the dotted decimal format A.B.C.D. |

**Default** The source IP address of outgoing TACACS+ packets default to the IP address of the egress interface.

**Mode** Global Configuration

**Usage notes** Setting the source interface ensures that all TACACS+ packets sent from the device will have the same source IP address. Once configured this affects all TACACS+ packets, namely accounting, authentication, and authorization.

If the specified interface is down or there is no IP address on the interface, then the source IP address of outgoing TACACS+ packets will default to the IP address of the egress interface.

**Example** To configure all outgoing TACACS+ packets to use the IP address of the loop-back "lo" interface as the source IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# ip tacacs source-interface lo
```

To reset the source interface configuration for all TACACS+ packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip tacacs source-interface
```

**Related commands** [tacacs-server host](#)  
[show tacacs+](#)

**Command changes** Version 5.4.6-2.1: command added

# show tacacs+

**Overview** This command displays the current TACACS+ server configuration and status.

**Syntax** show tacacs+

**Mode** User Exec and Privileged Exec

**Example** To display the current status of TACACS+ servers, use the command:

```
awplus# show tacacs+
```

**Output** Figure 49-1: Example output from the **show tacacs+** command

```
TACACS+ Global Configuration
Source Interface : not configured
Timeout : 5 sec

Server Host/ Server
IP Address Status

192.168.1.10 Alive
192.168.1.11 Unknown
```

**Table 1:** Parameters in the output of the **show tacacs+** command

| Output Parameter       | Meaning                                                                                      |
|------------------------|----------------------------------------------------------------------------------------------|
| Source Interface       | IP address of source interface if set with <a href="#">ip tacacs source-interface</a> .      |
| Timeout                | A time interval in seconds.                                                                  |
| Server Host/IP Address | TACACS+ server hostname or IP address.                                                       |
| Server Status          | The status of the authentication port.                                                       |
|                        | Alive            The server is alive.                                                        |
|                        | Dead            The server has timed out.                                                    |
|                        | Error           The server is not responding or there is an error in the key string entered. |
|                        | Unknown        The server is never used or the status is unknown.                            |
|                        | Unreachable    The server is unreachable.                                                    |
|                        | Unresolved     The server name can not be resolved.                                          |

**Command changes** Version 5.4.6-2.1: **Source Interface** parameter added

# tacacs-server host

**Overview** Use this command to specify a remote TACACS+ server host for authentication, authorization and accounting, and to set the shared secret key to use with the TACACS+ server. The parameters specified with this command override the corresponding global parameters for TACACS+ servers.

Use the **no** variant of this command to remove the specified server host as a TACACS+ authentication and authorization server.

**Syntax** `tacacs-server host {<host-name>|<ip-address>} [key [8]  
<key-string>]`  
`no tacacs-server host {<host-name>|<ip-address>}`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <host-name>  | Server host name. The DNS name of the TACACS+ server host.                                                                                                                                                                                                                                                                                                                                                                     |
| <ip-address> | The IP address of the TACACS+ server host, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                                                                                                                                 |
| key          | Set shared secret key with TACACS+ servers.                                                                                                                                                                                                                                                                                                                                                                                    |
| 8            | Specifies that you are entering a password as a string that has already been encrypted instead of entering a plain text password. The running config displays the new password as an encrypted string even if password encryption is turned off.                                                                                                                                                                               |
| <key-string> | Shared key string applied, a value in the range 1 to 64 characters. Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and the TACACS+ server. This key must match the encryption used on the TACACS+ server. This setting overrides the global setting of the <a href="#">tacacs-server key</a> command. If no key value is specified, the global value is used. |

**Default** No TACACS+ server is configured by default.

**Mode** Global Configuration

**Usage** A TACACS+ server host cannot be configured multiple times like a RADIUS server.

As many as four TACACS+ servers can be configured and consulted for login authentication, enable password authentication and accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, not if a login authentication attempt is rejected. The reasons a server would fail are:

- it is not network reachable
- it is not currently TACACS+ capable

- it cannot communicate with the switch properly due to the switch and the server having different secret keys

**Examples** To add the server tac1.company.com as the TACACS+ server host, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host tac1.company.com
```

To set the secret key to 'secret' on the TACACS+ server 192.168.1.1, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host 192.168.1.1 key secret
```

To remove the TACACS+ server tac1.company.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server host tac1.company.com
```

**Command changes** Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

# tacacs-server key

**Overview** This command sets a global secret key for TACACS+ authentication, authorization and accounting. The shared secret text string is used for TACACS+ communications between the switch and all TACACS+ servers.

Note that if no secret key is explicitly specified for a TACACS+ server with the [tacacs-server host](#) command, the global secret key will be used for the shared secret for the server.

Use the **no** variant of this command to remove the global secret key.

**Syntax** `tacacs-server key [8] <key-string>`  
`no tacacs-server key`

| Parameter    | Description                                                                                                                                                                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8            | Specifies a string in an encrypted format instead of plain text. The running config will display the new password as an encrypted string even if password encryption is turned off.                                                                                         |
| <key-string> | Shared key string applied, a value in the range 1 to 64 characters. Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and all TACACS+ servers. This key must match the encryption used on the TACACS+ server. |

**Mode** Global Configuration

**Usage notes** Use this command to set the global secret key shared between this client and its TACACS+ servers. If no secret key is specified for a particular TACACS+ server using the [tacacs-server host](#) command, this global key is used.

**Examples** To set the global secret key to `secret` for TACACS+ server, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server key secret
```

To delete the global secret key for TACACS+ server, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server key
```

**Related commands** [tacacs-server host](#)  
[show tacacs+](#)

# tacacs-server timeout

- Overview** Use this command to specify the TACACS+ global timeout value. The timeout value is how long the device waits for a reply to a TACACS+ request before considering the server to be dead.
- Note that this command configures the **timeout** parameter for TACACS+ servers globally.
- The **no** variant of this command resets the transmit timeout to the default (5 seconds).

**Syntax** `tacacs-server timeout <seconds>`  
`no tacacs-server timeout`

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| <seconds> | TACACS+ server timeout in seconds, in the range 1 to 1000. |

**Default** The default timeout value is 5 seconds.

**Mode** Global Configuration

**Examples** To set the timeout value to 3 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server timeout 3
```

To reset the timeout period for TACACS+ servers to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server timeout
```

# DHCP Snooping Commands

## Introduction

**Overview** This chapter gives detailed information about the commands used to configure DHCP snooping. For detailed descriptions of related ACL commands, see [IPv4 Hardware Access Control List \(ACL\) Commands](#). For more information about DHCP snooping, see the [DHCP Snooping Feature Overview and Configuration Guide](#).

DHCP snooping can operate on static link aggregators (e.g. sa2) and dynamic link aggregators (e.g. po2), as well as on switch ports (e.g. port1.0.2).

# arp security

**Overview** Use this command to enable ARP security on untrusted ports in the VLANs, so that the switch only responds to/forwards ARP packets if they have recognized IP and MAC source addresses.

Use the **no** variant of this command to disable ARP security on the VLANs.

**Syntax** `arp security`  
`no arp security`

**Default** Disabled

**Mode** Interface Configuration (VLANs)

**Usage** Enable ARP security to provide protection against ARP spoofing. DHCP snooping must also be enabled on the switch ([service dhcp-snooping](#) command), and on the VLANs ([ip dhcp snooping](#) command).

**Example** To enable ARP security on VLANs 2 to 4, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# arp security
```

**Related commands** [arp security violation](#)  
[show arp security](#)  
[show arp security interface](#)  
[show arp security statistics](#)

# arp security drop link-local-arps

**Overview** Use this command to enable ARP security on a per-port basis. This means that IPv4 link-local ARPs will be dropped without causing an ARP security violation when received.

Use the **no** variant of this command to return to the default setting of disabled.

**Syntax** `arp security drop link-local-arps`  
`no arp security drop link-local-arps`

**Default** Disabled by default.

**Mode** Interface Configuration

**Usage notes** Hosts that implement RFC 3927 may automatically assign themselves link-local IPv4 addresses in the subnet 169.254.0.0/16, if they are configured to learn their IP addresses via DHCP but are unable to contact a DHCP server. This is common behavior for all versions of Microsoft Windows since Windows XP. In an attempt to avoid IP address collision with other devices on the local network, the host will broadcast ARP probes for its randomly selected link-local IP address.

By default, ARP security will treat these ARP probes as violations and carry out the configured violation action on the port they are received on. If the violation action is configured as link-down, this will result in the host being disconnected from the network, which will interrupt any DHCP IP address discovery that was in progress.

Use this command to configure ARP Security to drop these ARP probes, and any other ARPs that contain link-local IP addresses, without raising a violation on the affected port. The count of ARPs dropped in this manner can be seen in the output of **show arp security statistics detail**.

**Example** To configure ARP security to drop IPv4 link local ARPs on port1.0.1 to port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# arp security drop link-local-arps
```

**Related commands** [arp security](#)  
[arp security violation](#)  
[show arp security statistics](#)

**Command changes** Version 5.4.9-1.1: command added.

# arp security violation

**Overview** Use this command to specify an additional action to perform if an ARP security violation is detected on the ports. ARP security must also be enabled ([arp security](#) command).

Use the **no** variant of this command to remove the specified action, or all actions. Traffic violating ARP security will be dropped, but no other action will be taken.

**Syntax** `arp security violation {log|trap|link-down} ...`  
`no arp security violation [log|trap|link-down] ...`

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| log       | Generate a log message. To display these messages, use the <a href="#">show log</a> command.                                                                                                                                                                                                                                                                                                                                           |
| trap      | Generate an SNMP notification (trap). To send SNMP notifications, SNMP must also be configured, and DHCP snooping notifications must be enabled using the <a href="#">snmp-server enable trap</a> command. Notifications are limited to one per second and to one per source MAC and violation reason. Additional violations within a second of a notification being sent will not result in further notifications. Default: disabled. |
| link-down | Shut down the port that received the packet. Default: disabled.                                                                                                                                                                                                                                                                                                                                                                        |

**Default** When the switch detects an ARP security violation, it drops the packet. By default, it does not perform any other violation actions.

**Mode** Interface Configuration (switch ports, static or dynamic aggregated links)

**Usage notes** When the switch detects an ARP security violation on an untrusted port in a VLAN that has ARP security enabled, it drops the packet. This command sets the switch to perform additional actions in response to ARP violations.

If a port has been shut down in response to a violation, to bring it back up again after any issues have been resolved, use the [shutdown](#) command.

**Example** To send SNMP notifications for ARP security violations on ports 1.0.1 to 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap dhcpsnooping
awplus(config)# interface port1.0.1-port1.0.6
awplus(config-if)# arp security violation trap
```

**Related commands**

- [arp security](#)
- [show arp security interface](#)
- [show arp security statistics](#)
- [show log](#)
- [snmp-server enable trap](#)

# clear arp security statistics

**Overview** Use this command to clear ARP security statistics for the specified ports, or for all ports.

**Syntax** `clear arp security statistics [interface <port-list>]`

| Parameter   | Description                                                                                                                                                               |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port-list> | The ports to clear statistics for. If no ports are specified, statistics are cleared for all ports. The ports may be switch ports, or static or dynamic link aggregators. |

**Mode** Privileged Exec

**Example** To clear statistics for ARP security on interface port1.0.1, use the command:

```
awplus# clear arp security statistics interface port1.0.1
```

**Related commands**

- [arp security violation](#)
- [show arp security](#)
- [show arp security statistics](#)

# clear ip dhcp snooping binding

**Overview** Use this command to remove one or more DHCP Snooping dynamic entries from the DHCP Snooping binding database. If no options are specified, all entries are removed from the database.

**CAUTION:** *If you remove entries from the database for current clients, they will lose IP connectivity until they request and receive a new DHCP lease. If you clear all entries, all clients connected to untrusted ports will lose connectivity.*

**Syntax** `clear ip dhcp snooping binding [<ipaddr>] [interface <port-list>] [vlan <vid-list>]`

| Parameter   | Description                                                                                                                          |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <ipaddr>    | Remove the entry for this client IP address.                                                                                         |
| <port-list> | Remove all entries for these ports. The port list may contain switch ports, and static or dynamic link aggregators (channel groups). |
| <vid-list>  | Remove all entries associated with these VLANs.                                                                                      |

**Mode** Privileged Exec

**Usage** This command removes dynamic entries from the database. Note that dynamic entries can also be deleted by using the **no** variant of the [ip dhcp snooping binding](#) command.

Dynamic entries can individually restored by using the [ip dhcp snooping binding](#) command.

To remove static entries, use the **no** variant of the [ip source binding](#) command.

**Example** To remove a dynamic lease entry from the DHCP snooping database for a client with the IP address 192.168.1.2, use the command:

```
awplus# clear ip dhcp snooping binding 192.168.1.2
```

**Related commands** [ip dhcp snooping binding](#)  
[ip source binding](#)  
[show ip dhcp snooping binding](#)

# clear ip dhcp snooping statistics

**Overview** Use this command to clear DHCP snooping statistics for the specified ports, or for all ports.

**Syntax** `clear ip dhcp snooping statistics [interface <port-list>]`

| Parameter   | Description                                                                                                                                                                        |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port-list> | The ports to clear statistics for. If no ports are specified, statistics are cleared for all ports. The port list can contain switch ports, or static or dynamic link aggregators. |

**Mode** Privileged Exec

**Example** To clear statistics for the DHCP snooping on interface port1.0.1, use the command:

```
awplus# clear ip dhcp snooping statistics interface port1.0.1
```

**Related commands**

- [clear arp security statistics](#)
- [show ip dhcp snooping](#)
- [show ip dhcp snooping statistics](#)

# debug arp security

**Overview** Use this command to enable ARP security debugging.  
Use the **no** variant of this command to disable debugging for ARP security.

**Syntax** `debug arp security`  
`no debug arp security`

**Default** Disabled

**Mode** Privileged Exec

**Example** To enable ARP security debugging, use the commands:

```
awplus# debug arp security
```

**Related commands** [show debugging arp security](#)  
[show log](#)  
[terminal monitor](#)

# debug ip dhcp snooping

**Overview** Use this command to enable the specified types of debugging for DHCP snooping. Use the **no** variant of this command to disable the specified types of debugging.

**Syntax** `debug ip dhcp snooping {all|acl|db|packet [detail]}`  
`no debug ip dhcp snooping {all|acl|db|packet [detail]}`

| Parameter | Description                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------|
| all       | All DHCP snooping debug.                                                                                                                   |
| acl       | DHCP snooping access list debug.                                                                                                           |
| db        | DHCP snooping binding database debug.                                                                                                      |
| packet    | DHCP snooping packet debug. For the <b>no</b> variant of this command, this option also disables detailed packet debug, if it was enabled. |
| detail    | Detailed packet debug.                                                                                                                     |

**Default** Disabled

**Mode** Privileged Exec

**Example** To enable access list debugging for DHCP snooping, use the commands:

```
awplus# debug ip dhcp snooping acl
```

**Related commands** [debug arp security](#)  
[show debugging ip dhcp snooping](#)  
[show log](#)  
[terminal monitor](#)

# ip dhcp snooping

**Overview** Use this command to enable DHCP snooping on one or more VLANs.  
Use the **no** variant of this command to disable DHCP snooping on the VLANs.

**Syntax** `ip dhcp snooping`  
`no ip dhcp snooping`

**Default** DHCP snooping is disabled on VLANs by default.

**Mode** Interface Configuration (VLANs)

**Usage notes** **Enabling DHCP snooping**

For DHCP snooping to operate on a VLAN, you must:

- enable the service on the switch by using the [service dhcp-snooping](#) command, and
- enable DHCP snooping on the particular VLAN by using the [ip dhcp snooping](#) command, and
- if there is an external DHCP server, configure the port connected to the server as a trusted port, by using the [ip dhcp snooping trust](#) command

**Disabling DHCP snooping**

Use **no service dhcp-snooping** to disable DHCP snooping.

Disabling DHCP snooping removes all DHCP snooping configuration from the running configuration, except for:

- any DHCP snooping maximum bindings settings ([ip dhcp snooping max-bindings](#)), and
- any additional DHCP snooping-based ACLs you have created for filtering on untrusted ports.

You must remove any such additional DHCP snooping-based ACLs, using the **no access-group** command. This is because these ACLs block all traffic except for traffic that matches DHCP snooping entries. Once you have disabled DHCP snooping, these ACLs will block all traffic. Note that if you disable DHCP snooping on particular VLANs (using the **no ip dhcp snooping** command), you need to make sure you remove any such additional ACLs that apply to those VLANs.

If you re-enable the service, the switch repopulates the DHCP snooping database from the dynamic lease entries in the database backup file (see the [ip dhcp snooping database](#) command). It also updates the lease expiry times.

**Examples** To enable DHCP snooping on VLANs 2 to 4, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ip dhcp snooping
```

To disable DHCP snooping on the switch, use the command:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no ip dhcp snooping
```

**Related  
commands**

[ip dhcp snooping trust](#)  
[service dhcp-snooping](#)  
[show ip dhcp snooping](#)

# ip dhcp snooping agent-option

**Overview** Use this command to enable DHCP Relay Agent Option 82 information insertion on the switch. When this is enabled, the switch:

- inserts DHCP Relay Agent Option 82 information into DHCP packets that it receives on untrusted ports
- removes DHCP Relay Agent Option 82 information from DHCP packets that it sends to untrusted ports.

Use the **no** variant of this command to disable DHCP Relay Agent Option 82 insertion.

**Syntax** `ip dhcp snooping agent-option`  
`no ip dhcp snooping agent-option`

**Default** DHCP Relay Agent Option 82 insertion is enabled by default when DHCP snooping is enabled.

**Mode** Global Configuration

**Usage notes** DHCP snooping must also be enabled on the switch ([service dhcp-snooping](#) command), and on the VLANs ([ip dhcp snooping](#) command).

If a subscriber ID is configured for the port ([ip dhcp snooping subscriber-id](#) command), the switch includes this in the DHCP Relay Agent Option 82 information it inserts into DHCP packets received on the port.

**Example** To disable DHCP Relay Agent Option 82 on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping agent-option
```

**Related commands** [ip dhcp snooping](#)  
[ip dhcp snooping agent-option allow-untrusted](#)  
[ip dhcp snooping subscriber-id](#)  
[service dhcp-snooping](#)  
[show ip dhcp snooping](#)

# ip dhcp snooping agent-option allow-untrusted

**Overview** Use this command to enable DHCP Relay Agent Option 82 information reception on untrusted ports. When this is enabled, the switch accepts incoming DHCP packets that contain DHCP Relay Agent Option 82 information on untrusted ports. Use the **no** variant of this command to disable DHCP Relay Agent Option 82 information reception on untrusted ports.

**Syntax** `ip dhcp snooping agent-option allow-untrusted`  
`no ip dhcp snooping agent-option allow-untrusted`

**Default** Disabled

**Mode** Global Configuration

**Usage notes** If the switch is connected via untrusted ports to edge switches that insert DHCP Relay Agent Option 82 information into DHCP packets, you may need to allow these DHCP packets through the untrusted ports, by using this command. When this is disabled (default), the switch treats incoming DHCP packets on untrusted ports that contain DHCP Relay Agent Option 82 information as DHCP snooping violations: it drops them and applies any violation action specified by the [ip dhcp snooping violation](#) command. The switch stores statistics for packets dropped; to display these statistics, use the [show ip dhcp snooping statistics](#) command.

**Example** To enable DHCP snooping Option 82 information reception on untrusted ports, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping agent-option allow-untrusted
```

**Related commands** [ip dhcp snooping agent-option](#)  
[ip dhcp snooping violation](#)  
[show ip dhcp snooping](#)  
[show ip dhcp snooping statistics](#)

# ip dhcp snooping agent-option circuit-id vlantriplet

**Overview** Use this command to specify the Circuit ID sub-option of the DHCP Relay Agent Option 82 field as the VLAN ID and port number. The Circuit ID specifies the switch port and VLAN ID that the client-originated DHCP packet was received on.

Use the **no** variant of this command to set the Circuit ID to the default, the VLAN ID and Ifindex (interface number).

**Syntax** `ip dhcp snooping agent-option circuit-id vlantriplet`  
`no ip dhcp snooping agent-option circuit-id`

**Default** By default, the Circuit ID is the VLAN ID and Ifindex (interface number).

**Mode** Interface Configuration for a VLAN interface.

**Usage** The Circuit ID sub-option is included in the DHCP Relay Agent Option 82 field of forwarded client DHCP packets:

- DHCP snooping Option 82 information insertion is enabled ([ip dhcp snooping agent-option](#) command; enabled by default), and
- DHCP snooping is enabled on the switch ([service dhcp-snooping](#)) and on the VLAN to which the port belongs ([ip dhcp snooping](#))

**Examples** To set the Circuit ID to `vlantriplet` for client DHCP packets received on `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp snooping agent-option circuit-id
vlantriplet
```

To return the Circuit ID format to the default for `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp snooping agent-option circuit-id
```

**Related commands** [ip dhcp snooping agent-option](#)  
[ip dhcp snooping agent-option remote-id](#)  
[show ip dhcp snooping](#)  
[show ip dhcp snooping agent-option](#)

# ip dhcp snooping agent-option remote-id

**Overview** Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field. The Remote ID identifies the device that inserted the Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the switch's MAC address.

Use the **no** variant of this command to set the Remote ID to the default, the switch's MAC address.

**Syntax** `ip dhcp snooping agent-option remote-id <remote-id>`  
`no ip dhcp snooping agent-option remote-id`

| Parameter                      | Description                                                                                                                                                      |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;remote-id&gt;</code> | An alphanumeric (ASCII) string, 1 to 63 characters in length. If the Remote ID contains spaces, it must be enclosed in double quotes. Wildcards are not allowed. |

**Default** The Remote ID is set to the switch's MAC address by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage** The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of forwarded client DHCP packets:

- DHCP snooping Option 82 information insertion is enabled ([ip dhcp snooping agent-option](#) command; enabled by default), and
- DHCP snooping is enabled on the switch ([service dhcp-snooping](#)) and on the VLAN to which the port belongs ([ip dhcp snooping](#))

**Examples** To set the Remote ID to `myid` for client DHCP packets received on `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp snooping agent-option remote-id myid
```

To return the Remote ID format to the default for `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp snooping agent-option remote-id
```

**Related commands** [ip dhcp snooping agent-option](#)  
[ip dhcp snooping agent-option circuit-id vlantriplet](#)  
[show ip dhcp snooping](#)  
[show ip dhcp snooping agent-option](#)

# ip dhcp snooping binding

**Overview** Use this command to manually add a dynamic-like entry (with an expiry time) to the DHCP snooping database. Once added to the database, this entry is treated as a dynamic entry, and is stored in the DHCP snooping database backup file. This command is not stored in the switch's running configuration.

Use the **no** variant of this command to delete a dynamic entry for an IP address from the DHCP snooping database, or to delete all dynamic entries from the database.

**CAUTION:** *If you remove entries from the database for current clients, they will lose IP connectivity until they request and receive a new DHCP lease. If you clear all entries, all clients connected to untrusted ports will lose connectivity.*

**Syntax** `ip dhcp snooping binding <ipaddr> [<macaddr>] vlan <vid>  
interface <port> expiry <expiry-time>  
no ip dhcp snooping binding [<ipaddr>]`

| Parameter     | Description                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------|
| <ipaddr>      | Client's IP address.                                                                                                         |
| <macaddr>     | Client's MAC address in HHHH.HHHH.HHHH format.                                                                               |
| <vid>         | The VLAN ID for the entry, in the range 1 to 4094.                                                                           |
| <port>        | The port the client is connected to. The port can be a switch port, or a static or dynamic link aggregation (channel group). |
| <expiry-time> | The expiry time for the entry, in the range 5 to 2147483647 seconds.                                                         |

**Mode** Privileged Exec

**Usage notes** Note that dynamic entries can also be deleted from the DHCP snooping database by using the [clear ip dhcp snooping binding](#) command.

To add or remove static entries from the database, use the [ip source binding](#) command.

**Example** To restore an entry in the DHCP snooping database for a DHCP client with the IP address 192.168.1.2, MAC address 0001.0002.0003, on port1.0.6 of vlan6, and with an expiry time of 1 hour, use the commands:

```
awplus# ip dhcp snooping binding 192.168.1.2 0001.0002.0003
vlan 6 interface port1.0.6 expiry 3600
```

**Related commands** [clear ip dhcp snooping binding](#)  
[ip source binding](#)  
[show ip dhcp snooping binding](#)

# ip dhcp snooping database

**Overview** Use this command to set the location of the file to which the dynamic entries in the DHCP snooping database are written. This file provides a backup for the DHCP snooping database.

Use the **no** variant of this command to set the database location back to the default, **nvs**.

**Syntax** `ip dhcp snooping database {nvs|flash|usb}`  
`no ip dhcp snooping database`

| Parameter | Description                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------|
| nvs       | The switch checks the database and writes the file to non-volatile storage (NVS) on the switch at 2 second intervals if it has changed.     |
| flash     | The switch checks the database and writes the file to Flash memory on the switch at 60 second intervals if it has changed.                  |
| usb       | The switch checks the database and writes the file to a USB storage device installed in the switch at 2 second intervals if it has changed. |

**Default** nvs

**Mode** Global Configuration

**Usage notes** In a stack, the backup file is automatically synchronized across all stack members to the location configured. If the backup file is stored on a USB storage device on the stack master, it is only synchronized across stack members that also have USB storage devices installed.

If the location of the backup file is changed by using this command, a new file is created in the new location, and the old version of the file remains in the old location. This can be removed if necessary (hidden file: **.dhcp.dsn.gz**).

**Example** To set the location of the DHCP snooping database to Flash memory, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping database flash
```

**Related commands** [show ip dhcp snooping](#)

# ip dhcp snooping delete-by-client

**Overview** Use this command to set the switch to remove a dynamic entry from the DHCP snooping database when it receives a valid DHCP release message with matching IP address, VLAN ID, and client hardware address on an untrusted port, and to discard release messages that do not match an entry in the database.

Use the **no** variant of this command to set the switch to forward DHCP release messages received on untrusted ports without removing any entries from the database.

**Syntax** `ip dhcp snooping delete-by-client`  
`no ip dhcp snooping delete-by-client`

**Default** Enabled: by default, DHCP lease entries are deleted from the DHCP snooping database when matching DHCP release messages are received.

**Mode** Global Configuration

**Usage** DHCP clients send a release message when they no longer wish to use the IP address they have been allocated by a DHCP server. Use this command to enable DHCP snooping to use the information in these messages to remove entries from its database immediately. Use the **no** variant of this command to ignore these release messages. Lease entries corresponding to ignored DHCP release messages eventually time out when the lease expires.

**Examples** To set the switch to delete DHCP snooping lease entries from the DHCP snooping database when a matching release message is received, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping delete-by-client
```

To set the switch to forward and ignore the content of any DHCP release messages it receives, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping delete-by-client
```

**Related commands** [show ip dhcp snooping](#)

# ip dhcp snooping delete-by-linkdown

**Overview** Use this command to set the switch to remove a dynamic entry from the DHCP snooping database when its port goes down. If the port is part of an aggregated link, the entries in the database are only deleted if all the ports in the aggregated link are down.

Use the **no** variant of this command to set the switch not to delete entries when ports go down.

**Syntax** `ip dhcp snooping delete-by-linkdown`  
`no ip dhcp snooping delete-by-linkdown`

**Default** Disabled: by default DHCP Snooping bindings are not deleted when an interface goes down.

**Mode** Global Configuration

**Usage notes** If this command is enabled in a stack, and the master goes down and is replaced by a new master, entries in the DHCP snooping database for ports on the master are removed, unless they are part of link aggregators that are still up.

**Examples** To set the switch to delete DHCP snooping lease entries from the DHCP snooping database when links go down, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping delete-by-linkdown
```

To set the switch not to delete DHCP snooping lease entries from the DHCP snooping database when links go down, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping delete-by-linkdown
```

**Related commands** [show ip dhcp snooping](#)

# ip dhcp snooping max-bindings

**Overview** Use this command to set the maximum number of DHCP lease entries that can be stored in the DHCP snooping database for each of the ports. Once this limit has been reached, no further DHCP lease allocations made to devices on the port are stored in the database.

Use the **no** variant of this command to reset the maximum to the default, 1.

**Syntax** `ip dhcp snooping max-bindings <0-520>`  
`no ip dhcp snooping max-bindings`

| Parameter | Description                                                                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-520>   | The maximum number of bindings that will be stored for the port in the DHCP snooping binding database. If 0 is specified, no entries will be stored in the database for the port. |

**Default** The default for maximum bindings is 1.

**Mode** Interface Configuration (port)

**Usage notes** The maximum number of leases cannot be changed for a port while there are DHCP snooping Access Control Lists (ACL) associated with the port. Before using this command, remove any DHCP snooping ACLs associated with the ports. To display ACLs used for DHCP snooping, use the [show ip dhcp snooping acl](#) command.

In general, the default (1) will work well on an edge port with a single directly connected DHCP client. If the port is on an aggregation switch that is connected to an edge switch with multiple DHCP clients connected through it, then use this command to increase the number of lease entries for the port.

If there are multiple VLANs configured on the port, the limit is shared between all the VLANs on this port. For example, the default only allows one lease to be stored for one VLAN. To allow connectivity for the other VLANs, use this command to increase the number of lease entries for the port.

**Example** To set the maximum number of bindings to be stored in the DHCP snooping database to 10 per port for ports 1.0.1 to 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.6
awplus(config-if)# ip dhcp snooping max-bindings 10
```

**Related commands** [access-group](#)  
[show ip dhcp snooping acl](#)  
[show ip dhcp snooping interface](#)

# ip dhcp snooping subscriber-id

**Overview** Use this command to set a Subscriber ID for the ports.  
Use the **no** variant of this command to remove Subscriber IDs from the ports.

**Syntax** `ip dhcp snooping subscriber-id [<sub-id>]`  
`no ip dhcp snooping subscriber-id`

| Parameter | Description                                                                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <sub-id>  | The Subscriber ID; an alphanumeric (ASCII) string 1 to 50 characters in length. If the Subscriber ID contains spaces, it must be enclosed in double quotes. Wildcards are not allowed. |

**Default** No Subscriber ID.

**Mode** Interface Configuration (port)

**Usage notes** The Subscriber ID sub-option is included in the DHCP Relay Agent Option 82 field of client DHCP packets forwarded from a port if:

- a Subscriber ID is specified for the port using this command, and
- DHCP snooping Option 82 information insertion is enabled ([ip dhcp snooping agent-option](#) command; enabled by default), and
- DHCP snooping is enabled on the switch ([service dhcp-snooping](#)) and on the VLAN to which the port belongs ([ip dhcp snooping](#))

**Examples** To set the Subscriber ID for port 1.0.3 to **room\_534**, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# ip dhcp snooping subscriber-id room_534
```

To remove the Subscriber ID from port 1.0.3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# no ip dhcp snooping subscriber-id
```

**Related commands** [ip dhcp snooping agent-option](#)  
[show ip dhcp snooping interface](#)

# ip dhcp snooping trust

**Overview** Use this command to set the ports to be DHCP snooping trusted ports.  
Use the **no** variant of this command to return the ports to their default as untrusted ports.

**Syntax** `ip dhcp snooping trust`  
`no ip dhcp snooping trust`

**Default** All ports are untrusted by default.

**Mode** Interface Configuration (port)

**Usage notes** Typically, ports connecting the switch to trusted elements in the network (towards the core) are set as trusted ports, while ports connecting untrusted network elements are set as untrusted. Configure ports connected to DHCP servers as trusted ports.

**Example** To set switch ports 1.0.1 and 1.0.2 to be trusted ports, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.2
awplus(config-if)# ip dhcp snooping trust
```

**Related commands** [show ip dhcp snooping interface](#)

# ip dhcp snooping verify mac-address

**Overview** Use this command to verify that the source MAC address and client hardware address match in DHCP packets received on untrusted ports.

Use the **no** variant of this command to disable MAC address verification.

**Syntax** `ip dhcp snooping verify mac-address`  
`no ip dhcp snooping verify mac-address`

**Default** Enabled—source MAC addresses are verified by default.

**Mode** Global Configuration

**Usage** When MAC address verification is enabled, the switch treats DHCP packets with source MAC address and client hardware address that do not match as DHCP snooping violations: it drops them and applies any other violation action specified by the [ip dhcp snooping violation](#) command. To bring the port back up again after any issues have been resolved, use the [shutdown](#) command.

**Example** To disable MAC address verification on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping verify mac-address
```

**Related commands** [ip dhcp snooping violation](#)  
[show ip dhcp snooping](#)  
[show ip dhcp snooping statistics](#)

# ip dhcp snooping violation

**Overview** Use this command to specify the action the switch will take when it detects a DHCP snooping violation by a DHCP packet on the ports.

Use the **no** variant of this command to disable the specified violation actions, or all violation actions.

**Syntax** `ip dhcp snooping violation {log|trap|link-down} ...`  
`no ip dhcp snooping violation [{log|trap|link-down} ...]`

| Parameter | Description                                                                                                                                                                                                                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| log       | Generate a log message. To display these messages, use the <a href="#">show log</a> command.<br>Default: disabled.                                                                                                                                                                                                           |
| trap      | Generate an SNMP notification (trap). To send SNMP notifications, SNMP must also be configured, and DHCP snooping notifications must be enabled using the <a href="#">snmp-server enable trap</a> command. Notifications are limited to one per second and to one per source MAC and violation reason.<br>Default: disabled. |
| link-down | Set the port status to link-down.<br>Default: disabled.                                                                                                                                                                                                                                                                      |

**Default** By default, DHCP packets that violate DHCP snooping are dropped, but no other violation action is taken.

**Mode** Interface Configuration (port)

**Usage notes** If a port has been shut down in response to a violation, to bring it back up again after any issues have been resolved, use the [shutdown](#) command.

IP packets dropped by DHCP snooping filters do not result in other DHCP snooping violation actions.

**Example** To set the switch to send an SNMP notification and set the link status to link-down if it detects a DHCP snooping violation on switch ports 1.0.1 to 1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap dhcpsnooping
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# ip dhcp snooping violation trap link-down
```

**Related commands** [show ip dhcp snooping interface](#)  
[show log](#)  
[snmp-server enable trap](#)

# ip source binding

**Overview** Use this command to add or replace a static entry in the DHCP snooping database. Use the **no** variant of this command to delete the specified static entry or all static entries from the database.

**Syntax** `ip source binding <ipaddr> [<macaddr>] vlan <vid> interface <port>`  
`no ip source binding [<ipaddr>]`

| Parameter | Description                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipaddr>  | Client's IP address. If there is already an entry in the DHCP snooping database for this IP address, then this command replaces it with the new entry. |
| <macaddr> | Client's MAC address in HHHH.HHHH.HHHH format.                                                                                                         |
| <vid>     | The VLAN ID associated with the entry.                                                                                                                 |
| <port>    | The port the client is connected to.                                                                                                                   |

**Mode** Global Configuration

**Usage notes** This command removes static entries from the database. To remove dynamic entries, use the [clear ip dhcp snooping binding](#) command or the **no** variant of the [ip dhcp snooping binding](#) command.

**Examples** To add a static entry to the DHCP snooping database for a client with the IP address 192.168.1.2, MAC address 0001.0002.0003, on port1.0.6 of vlan6, use the command:

```
awplus# configure terminal
awplus(config)# ip source binding 192.168.1.2 0001.0002.0003
vlan 6 interface port1.0.6
```

To remove the static entry for IP address 192.168.1.2 from the database, use the commands:

```
awplus# configure terminal
awplus(config)# no ip source binding 192.168.1.2
```

To remove all static entries from the database, use the commands:

```
awplus# configure terminal
awplus(config)# no ip source binding
```

**Related commands**

- [clear ip dhcp snooping binding](#)
- [ip dhcp snooping binding](#)
- [show ip dhcp snooping binding](#)
- [show ip source binding](#)

# service dhcp-snooping

**Overview** Use the **service dhcp-snooping** command to enable the DHCP snooping service globally on the switch. As well, you need to enable it on the desired VLANs, using the **ip dhcp snooping** command. The switch creates a global DHCP snooping Access Control list (ACL) the first time you use the **ip dhcp snooping** command, to send DHCP packets to the CPU for processing. Note that the switch will forward all DHCP traffic to the CPU, no matter what VLAN it belongs to.

Use the **no** variant of this command to disable the DHCP snooping service on the switch.

**Syntax** `service dhcp-snooping`  
`no service dhcp-snooping`

**Default** Disabled

**Mode** Global Configuration

**Usage notes** **Enabling DHCP snooping**

For DHCP snooping to operate on a VLAN, you must:

- enable the service on the switch by using this command, and
- enable DHCP snooping on the particular VLAN by using the **ip dhcp snooping** command, and
- if there is an external DHCP server, configure the port connected to the server as a trusted port, by using the **ip dhcp snooping trust** command

**Disabling DHCP snooping**

Use **no service dhcp-snooping** to disable DHCP snooping.

Disabling DHCP snooping removes all DHCP snooping configuration from the running configuration, except for:

- any DHCP snooping maximum bindings settings (**ip dhcp snooping max-bindings**), and
- any additional DHCP snooping-based ACLs you have created for filtering on untrusted ports.

You must remove any such additional DHCP snooping-based ACLs, using the **no access-group** command. This is because these ACLs block all traffic except for traffic that matches DHCP snooping entries. Once you have disabled DHCP snooping, these ACLs will block all traffic. Note that if you disable DHCP snooping on particular VLANs (using the **no ip dhcp snooping** command), you need to make sure you remove any such additional ACLs that apply to those VLANs.

If you re-enable the service, the switch repopulates the DHCP snooping database from the dynamic lease entries in the database backup file (see the **ip dhcp snooping database** command). It also updates the lease expiry times.

**Examples** To enable the DHCP snooping service on only the VLANs that have DHCP snooping enabled, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-snooping
```

To disable the DHCP snooping service on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-snooping
```

Version 5.4.9-2.1: **per-vlan** parameter added for SBx8100, x530, and x320 series.

Version 5.4.9-2.1: **per-vlan** parameter added for IE510, IE340, IE300, SBx908 GEN2, x950, x930, and x510 series.

# show arp security

**Overview** Use this command to display ARP security configuration.

**Syntax** show arp security

**Mode** User Exec and Privileged Exec

**Example** To display ARP security configuration on the switch use the command:

```
awplus# show arp security
```

**Table 1:** Example output from the **show arp security** command

```
awplus# show arp security

ARP Security Information:
 Total VLANs enabled 2
 Total VLANs disabled 11
 vlan1 Disabled
 vlan2 Disabled
 vlan3 Disabled
 vlan4 Disabled
 vlan5 Disabled
 vlan100 Disabled
 vlan101 Disabled
 vlan102 Disabled
 vlan103 Disabled
 vlan104 Disabled
 vlan105 Enabled
 vlan1000 Disabled
 vlan1001 Enabled
```

**Table 2:** Parameters in the output from the **show arp security** command

| Parameter            | Description                                          |
|----------------------|------------------------------------------------------|
| Total VLANs enabled  | The number of VLANs that have ARP security enabled.  |
| Total VLANs disabled | The number of VLANs that have ARP security disabled. |

# show arp security interface

**Overview** Use this command to display ARP security configuration for the specified ports or all ports.

**Syntax** `show arp security interface [<port-list>]`

| Parameter   | Description                                                                                                                          |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <port-list> | The ports to display ARP security information about. The port list can include switch ports, and static or dynamic aggregated links. |

**Mode** User Exec and Privileged Exec

**Example** To display ARP security configuration for ports, use the command:

```
awplus# show arp security interface
```

**Table 3:** Example output from the **show arp security interface** command

|                                                                |          |

# show arp security statistics

**Overview** Use this command to display ARP security statistics for the specified ports or all ports.

**Syntax** `show arp security statistics [detail] [interface <port-list>]`

| Parameter             | Description                                                                                                                |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------|
| detail                | Display detailed statistics.                                                                                               |
| interface <port-list> | Display statistics for the specified ports. The port list can include switch ports, and static or dynamic aggregated links |

**Mode** User Exec and Privileged Exec

**Example** To display the brief statistics for the ARP security, use the command:

```
awplus# show arp security statistics
```

**Table 5:** Example output from the **show arp security statistics** command

|                                        |               |                |  |

# show debugging arp security

**Overview** Use this command to display the ARP security debugging configuration.

**Syntax** `show debugging arp security`

**Mode** User and Privileged Exec

**Example** To display the debugging settings for ARP security on the switch, use the command:

```
awplus# show debugging arp security
```

**Table 8:** Example output from the **show debugging arp security** command

```
awplus# show debugging arp security

ARP Security debugging status:
 ARP Security debugging is off
```

**Related commands** [arp security violation](#)  
[debug arp security](#)

# show debugging ip dhcp snooping

**Overview** Use this command to display the DHCP snooping debugging configuration.

**Syntax** show debugging ip dhcp snooping

**Mode** User Exec and Privileged Exec

**Example** To display the DHCP snooping debugging configuration, use the command:

```
awplus# show debugging ip dhcp snooping
```

**Table 9:** Example output from the **show debugging ip dhcp snooping** command

```
awplus# show debugging ip dhcp snooping

DHCP snooping debugging status:
 DHCP snooping debugging is off
 DHCP snooping all debugging is off
 DHCP snooping acl debugging is off
 DHCP snooping binding DB debugging is off
 DHCP snooping packet debugging is off
 DHCP snooping detailed packet debugging is off
```

**Related commands** [debug ip dhcp snooping](#)  
[show log](#)

# show ip dhcp snooping

**Overview** Use this command to display DHCP snooping global configuration on the switch.

**Syntax** `show ip dhcp snooping`

**Mode** User Exec and Privileged Exec

**Example** To display global DHCP snooping configuration on the switch, use the command:

```
awplus# show ip dhcp snooping
```

Table 50-1: Example output from **show ip dhcp snooping**

```
DHCP Snooping Information:
 DHCP Snooping service Enabled

Option 82 insertion Enabled

Option 82 on untrusted ports Not allowed
 Binding delete by client Disabled
 Binding delete by link down Disabled
 Verify MAC address Disabled
 SNMP DHCP Snooping trap Disabled

DHCP Snooping database:
 Database location nvs
 Number of entries in database 2

DHCP Snooping VLANs:
 Total VLANs enabled 1
 Total VLANs disabled 9
 vlan1 Enabled
 vlan2 Disabled
 vlan3 Disabled
 vlan4 Disabled
 vlan5 Disabled
 vlan100 Disabled
 vlan101 Disabled
 vlan105 Disabled
 vlan1000 Disabled
 vlan1001 Disabled
```

# show ip dhcp snooping acl

**Overview** Use this command to display information about the Access Control Lists (ACL) that are using the DHCP snooping database.

**Syntax** `show ip dhcp snooping acl`  
`show ip dhcp snooping acl [detail|hardware] [interface`  
`<interface-list>]`

| Parameter        | Description                                  |
|------------------|----------------------------------------------|
| detail           | Detailed DHCP Snooping ACL information.      |
| hardware         | DHCP Snooping hardware ACL information.      |
| interface        | ACL Interface information.                   |
| <interface-list> | The interfaces to display information about. |

**Mode** User Exec and Privileged Exec

**Example** To display DHCP snooping ACL information, use the command:

```
awplus# show ip dhcp snooping acl
```

**Table 51:** Example output from the **show ip dhcp snooping acl** command

| awplus#show ip dhcp snooping acl     |          |                  |                  |                           |

# show ip dhcp snooping agent-option

**Overview** Use this command to display DHCP snooping Option 82 information for all interfaces, a specific interface or a range of interfaces.

**Syntax** `show ip dhcp snooping agent-option [interface <interface-list>]`

| Parameter        | Description                              |
|------------------|------------------------------------------|
| interface        | Specify the interface.                   |
| <interface-list> | The name of the interface or interfaces. |

**Mode** User Exec and Privileged Exec

**Examples** To display DHCP snooping Option 82 information for all interfaces, use the command:

```
awplus# show ip dhcp snooping agent-option
```

To display DHCP snooping Option 82 information for vlan1, use the command:

```
awplus# show ip dhcp snooping agent-option interface vlan1
```

To display DHCP snooping Option 82 information for port1.0.1, use the command:

```
awplus# show ip dhcp snooping agent-option interface port1.0.1
```

**Output** Figure 50-1: Example output from the **show ip dhcp snooping agent-option** command

```
awplus#show ip dhcp snooping agent-option

DHCP Snooping Option 82 Configuration:

Key: C Id = Circuit Id Format
 R Id = Remote Id
 S Id = Subscriber Id

# show ip dhcp snooping interface

**Overview** Use this command to display information about DHCP snooping configuration and leases for the specified ports, or all ports.

**Syntax** `show ip dhcp snooping interface [<port-list>]`

| Parameter   | Description                                                                                                                          |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <port-list> | The ports to display DHCP snooping configuration information for. If no ports are specified, information for all ports is displayed. |

**Mode** User Exec and Privileged Exec

**Example** To display DHCP snooping information for all ports, use the command:

```
awplus# show ip dhcp snooping interface
```

**Table 56:** Example output from the **show ip dhcp snooping interface** command

| awplus#show ip dhcp snooping interface                         |           |             |            |          |                    |  |
|----------------------------------------------------------------|-----------|-------------|------------|----------|--------------------|--|
| DHCP Snooping Port Status and Configuration:                   |           |             |            |          |                    |  |
| Port: Provisioned ports marked with brackets, e.g. (portx.y.z) |           |             |            |          |                    |  |
| Action: LG = Log                                               |           |             |            |          |                    |  |
| TR = Trap                                                      |           |             |            |          |                    |  |
| LD = Link down                                                 |           |             |            |          |                    |  |
| Port                                                           | Status    | Full Leases | Max Leases | Action   | Subscriber-ID      |  |

| port1.0.9                                                      | Untrusted | 0           | 1          | -- TR -- |                    |  |
| port1.0.10                                                     | Untrusted | 0           | 1          | -- -- LD |                    |  |
| port1.0.11                                                     | Trusted   | 0           | 1          | -- -- -- |                    |  |
| port1.0.12                                                     | Trusted   | 0           | 1          | -- -- -- |                    |  |

**Table 57:** Parameters in the output from the **show ip dhcp snooping interface** command

| Parameter     | Description                                                                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port          | The port interface name.                                                                                                                                                                                             |
| Status        | The port status: untrusted (default) or trusted.                                                                                                                                                                     |
| Full Leases   | The number of entries in the DHCP snooping database for the port.                                                                                                                                                    |
| Max Leases    | The maximum number of entries that can be stored in the database for the port.                                                                                                                                       |
| Action        | The DHCP snooping violation actions for the port.                                                                                                                                                                    |
| Subscriber ID | The subscriber ID for the port. If the subscriber ID is longer than 34 characters, only the first 34 characters are displayed. To display the whole subscriber ID, use the command <b>show running-config dhcp</b> . |

# show ip dhcp snooping statistics

**Overview** Use this command to display DHCP snooping statistics.

**Syntax** `show ip dhcp snooping statistics [detail] [interface <interface-list>]`

| Parameter                     | Description                                                                                                                                                  |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| detail                        | Display detailed statistics.                                                                                                                                 |
| interface<br><interface-list> | Display statistics for the specified interfaces. The interface list can contain switch ports, static or dynamic link aggregators (channel groups), or VLANs. |

**Mode** User Exec and Privileged Exec

**Example** To show the current DHCP snooping statistics for all interfaces, use the command:

```
awplus# show ip dhcp snooping statistics
```

**Table 58:** Example output from the **show ip dhcp snooping statistics** command

|                                          |                     |                      |               |                |

**Table 60:** Parameters in the output from the **show ip dhcp snooping statistics** command

| Parameter                 | Description                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------|
| Interface                 | The interface name.                                                                          |
| In Packets                | The total number of incoming packets that are processed by DHCP Snooping.                    |
| In BOOTP Requests         | The total number of incoming BOOTP Requests.                                                 |
| In BOOTP Replies          | The total number of incoming BOOTP Replies.                                                  |
| In Discards               | The total number of incoming packets that have been discarded.                               |
| Invalid BOOTP Information | Packet contained invalid BOOTP information, such as an invalid BOOTP.OPCode.                 |
| Invalid DHCP ACK          | A DHCP ACK message was discarded, for reasons such as missing Server Option or Lease Option. |

**Table 60:** Parameters in the output from the **show ip dhcp snooping statistics** command (cont.)

| Parameter                            | Description                                                                                                                               |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Invalid DHCP Release or Decline      | A DHCP Release or Decline message was discarded, for reasons such as mismatch between received interface and current binding information. |
| Invalid IP/UDP Header                | A problem was detected in the IP or UDP header of the packet.                                                                             |
| Max Bindings Exceeded                | Accepting the packet would cause the maximum number of bindings on a port to be exceeded.                                                 |
| Option 82 Insert Error               | An error occurred while trying to insert DHCP Relay Agent Option 82 information.                                                          |
| Option 82 Received Invalid           | The DHCP Relay Agent Option 82 information received did not match the information inserted by DHCP Snooping.                              |
| Option 82 Received On Untrusted Port | A packet containing DHCP Relay Agent Option 82 information was received on an untrusted port.                                             |
| Option 82 Transmit On Untrusted Port | A packet containing DHCP Relay Agent Option 82 information was to be sent on an untrusted port.                                           |
| Reply Received On Untrusted Port     | A BOOTP reply was received on an untrusted port.                                                                                          |
| Source MAC/CHADDR Mismatch           | The L2 Source MAC address of the packet did not match the client hardware address field (BOOTP.CHADDR).                                   |
| Static Entry Already Exists          | An entry could not be added as a static entry already exists.                                                                             |

# show ip source binding

**Overview** Use this command to display static entries in the DHCP snooping database. These are the entries that have been added by using the [ip source binding](#) command.

**Syntax** `show ip source binding`

**Mode** User Exec and Privileged Exec

**Example** To display static entries in the DHCP snooping database information, use the command:

```
awplus# show ip source binding
```

| IP Address                     | Address        | VLAN | Port      | (sec)    | Type   |  |
| -----                          |                |      |           |          |        |  |
| 1.1.1.1                        | 0000.1111.2222 | 1    | port1.0.1 | Infinite | Static |  |

**Table 62:** Parameters in the output from the **show ip source binding** command

| Parameter         | Description                                                                                                |
|-------------------|------------------------------------------------------------------------------------------------------------|
| Client IP Address | The IP address of the DHCP client.                                                                         |
| MAC Address       | The MAC address of the DHCP client.                                                                        |
| VLAN              | The VLAN ID the packet is received on.                                                                     |
| Port              | The Layer 2 port name the packet is received on.                                                           |
| Expires (sec)     | Always infinite for static bindings, or when the leave time in the DHCP message was 0xffffffff (infinite). |
| Type              | DHCP Snooping binding type: Static                                                                         |

# openflow

**Overview** Use this command to specify a port or static aggregator as a data plane port. The ingress and egress traffic on the data plane port become controlled by the OpenFlow Controller. A data plane port number is assigned to the port automatically.

Use the **no** variant of this command to cancel the setting of a port as a data plane port.

**Syntax** `openflow`  
`no openflow`

**Default** All the ports are non-data plane ports by default.

**Mode** Interface mode for a switch port (e.g. port1.0.1) or static aggregator (e.g. sa1)

**Example** To specify port1.0.1 as a data plane port:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# openflow
```

**Related commands** [show openflow config](#)

**Command changes**

- Version 5.4.6-1.1: command added
- Version 5.4.7-1.1: command added to GS900MX, XS900MX, x550 series products
- Version 5.4.7-2.1: command added to IE300, IE500 series products
- Version 5.4.8-0.2: added to SBx908 GEN2
- Version 5.4.8-1.1: added to IE210L series products

# openflow controller

**Overview** Use this command to specify the name, address, and port number of the OpenFlow Controller. If you do not specify a controller name, a name will automatically be created using the following format: 'ocxx', where 'xx' is a sequential number starting from 1.

You can specify one or more OpenFlow Controllers to the switch.

Use the **no** variant of this command to delete one or more OpenFlow Controllers specified to the switch.

You can delete a controller by specifying only the controller name. If you do not know the controller name, you can identify it from the **show openflow config** command output.

**Syntax**

```
openflow controller <protocol> <address> <port>
openflow controller <controller-name> <protocol> <address>
<port> [in-band]
no openflow controller <controller-name>
```

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <controller-name> | The user specified or auto-generated (in the case of legacy syntax) controller name that can contain alphanumeric and/or special characters other than the following set of characters: ':', '=', ',', '[', ']', '{', '}', ' ', '<', '>'                                                                                                                                                                                                        |
| <protocol>        | The protocol type to communicate with the OpenFlow Controller.<br>There are two options, TCP and SSL:<br>Use <b>TCP</b> for an insecure connection.<br>Use <b>SSL</b> for a connection protected by TLS.<br>OpenFlow switches support TLSv1.2 and v1.3. The TLS version used between an OpenFlow switch and OpenFlow Controller is determined by peer negotiation. The peer negotiation will select the highest version supported by both ends. |
| <address>         | The IPv4 address of the Controller.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <port>            | Port number used to communicate with the Controller. The IANA has assigned the number 6653 for this purpose, but a different number can be used for local reasons.                                                                                                                                                                                                                                                                              |
| in-band           | Optional: Specifies that the controller be set up as an in-band controller. Out-of-band is the alternative choice (denoted by leaving out the in-band parameter) and is the default.                                                                                                                                                                                                                                                            |

**Default** No OpenFlow Controller is configured by default.

**Mode** Global Configuration

**Usage notes** The older version of this command is supported. If you enter the legacy CLI syntax (without the controller name), it will automatically adapt and display in the running configuration as the newer syntax.

For example, entering the legacy command:

```
awplus(config)# openflow controller tcp 192.168.1.2 6653
```

Displays as following in the running-config:

```
awplus(config)# openflow controller ocl tcp 192.168.1.2 6653
```

**Examples** To add an OpenFlow Controller with the address 10.1.1.1 using the TCP protocol and the IANA assigned port number of 6653, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# openflow controller tcp 10.1.1.1 6653
```

To add an OpenFlow Controller for the switch whose name is 'controller1', with the address 10.1.2.1 using the TCP protocol on port number 6653, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# openflow controller controller1 tcp 10.1.2.1
6653
```

To add on OpenFlow Controller for the switch whose name is 'controller1', with the address 10.1.2.1, using the TCP protocol on port number 6653. This is also an in-band Controller.

```
awplus# configure terminal
```

```
awplus(config)# openflow controller controller1 tcp 10.1.2.1
6653 in-band
```

To delete an OpenFlow Controller whose name is 'controller1', use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no openflow controller controller1
```

**Related commands** [show openflow config](#)

**Command changes**

- Version 5.4.7-1.1: command added
- Version 5.4.7-2.1: command added to IE300, IE500 series products
- Version 5.4.8-0.2: command added to SBx908 GEN2
- Version 5.4.8-1.1: command added to IE210L series products
- Version 5.4.8-2.1: <controller-name> parameter added
- Version 5.5.3-0.1: TLSv1.0 and 1.2 support removed
- Version 5.5.3-1.1: TLSv1.3 support added
- Version 5.5.3-1.2: **in-band** parameter added

# openflow datapath-id

**Overview** Use this command to change the Datapath Identifier (DPID) of the OpenFlow switch.

Use the **no** variant of this command to revert back to the default DPID.

**Syntax** `openflow datapath-id <dpid>`  
`no openflow datapath-id`

| Parameter | Description                                                                                                                             |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <dpid>    | The DPID field consists of 16 Hex digits. If you specify a DPID less than 16 Hex digits, then the upper bits are padded out with zeros. |

**Default** Each OpenFlow instance on a switch is identified by a Datapath Identifier. This is a 64 bit number. By default, the lower 48 bits are configured based on the switch MAC address. The top 16 bits are padded with zeros.

**Mode** Global Configuration

**Usage notes** This command changes the DPID, which is used as the OpenFlow switch ID in OpenFlow Controller(s).

**Example** To change the DPID to "0000000000000001", use the commands:

```
awplus# configure terminal
awplus(config)# openflow datapath-id 1
```

To revert back to the default DPID, use the commands:

```
awplus# configure terminal
awplus(config)# no openflow datapath-id
```

**Related commands** [show openflow status](#)

**Command changes** Version 5.4.7-1.1: command added  
Version 5.4.7-2.1: command added to IE300, IE500 series products  
Version 5.4.8-0.2: added to SBx908 GEN2  
Version 5.4.8-1.1: added to IE210L series products

# openflow failmode

**Overview** Use this command to set the operation mode for the switch when the Controller connection fails or no Controllers are defined.

Use the **no** variant of this command to return to the default mode.

**Syntax**

```
openflow failmode secure non-rule-expired
openflow failmode standalone
no openflow failmode
```

| Parameter               | Description                                                                 |
|-------------------------|-----------------------------------------------------------------------------|
| secure non-rule-expired | Set the mode to secure non-rule-expired. See the Usage section for details. |
| standalone              | Set the mode to standalone. See the Usage section for details.              |

**Default** Secure mode, without the **non-rule-expired** option

**Mode** Global Configuration

**Usage notes** If an OpenFlow switch loses contact with all Controllers as a result of echo request timeouts, then the OpenFlow switch goes into **fail mode**. There are three fail modes available:

- In **standalone** mode, if no message is received from the OpenFlow Controller for three times the inactivity probe interval, then OpenFlow will take over responsibility for setting up flows. OpenFlow will cause the switch to act like an ordinary MAC-learning switch, but continue to retry connecting to the Controller in the background. When the connection succeeds, it will discontinue its standalone behavior.

**NOTE:** If the OpenFlow switch is in fail mode, and you change the configured fail mode to or from standalone mode, OpenFlow will flush all existing rules.

- In **secure** mode, OpenFlow will not set up new flows on its own when the Controller connection fails or when no Controllers are defined, but all existing flows are left in place. The switch will continue to retry connecting to any defined Controllers forever, unless a rule timeout causes it to expire.

This mode is the default, and you can also set it by using the command **no openflow failmode**.

- In **secure non-rule-expired** mode, OpenFlow will not set up new flows on its own when the Controller connection fails or when no Controllers are defined, but all existing flows are left in place. The switch will continue to retry connecting to any defined Controllers forever. The **non-rule-expired** parameter means that existing rules won't be expired regardless of their timeouts while under fail mode. In other words, the OpenFlow switch will

ignore timeout values of both idle timeout and hard timeout in existing rules.

**Example** To set the fail mode to **standalone** mode, use the commands:

```
awplus# configure terminal
awplus(config)# openflow failmode standalone
```

To set the fail mode to **secure non-rule-expired** mode, use the commands:

```
awplus# configure terminal
awplus(config)# openflow failmode secure non-rule-expired mode
```

To revert the fail mode to the default mode, use the commands:

```
awplus# configure terminal
awplus(config)# no openflow failmode
```

**Related commands** [openflow controller](#)

**Command changes**

- Version 5.4.7-1.1: command added
- Version 5.4.7-2.1: command added to IE300, IE500 series products
- Version 5.4.8-0.1: non-rule-expired parameter added
- Version 5.4.8-0.2: added to SBx908 GEN2
- Version 5.4.8-1.1: added to IE210L series products

# openflow inactivity

**Overview** Use this command to set the value of the Controller inactivity timeout.

Use the **no** variant of this command to reset the inactivity timeout value to its default.

**Syntax** `openflow inactivity <5-2073600>`  
`no openflow inactivity`

| Parameter                      | Description                            |
|--------------------------------|----------------------------------------|
| <code>&lt;5-2073600&gt;</code> | Specifies the timeout value in seconds |
| <code>inactivity</code>        | OpenFlow inactivity probe              |

**Default** 10 seconds.

**Mode** Global Configuration

**Usage notes** OpenFlow uses the inactivity probe timer to monitor its connection to Controller(s). If no message is received from any Controller for three times the inactivity probe interval, then OpenFlow will take over responsibility for setting up flows, if in standalone mode.

**Example** To configure the inactivity probe timeout to 20 seconds, enter the commands:

```
awplus# configure terminal
awplus(config)# openflow inactivity 20
```

To reset the inactivity probe timeout to its default value of 10 seconds, enter the commands:

```
awplus# configure terminal
awplus(config)# no openflow inactivity
```

**Related commands** [openflow controller](#)

**Command changes**

- Version 5.4.7-1.1: command added
- Version 5.4.7-2.1: command added to IE300, IE500 series products

- Version 5.4.8-1.1: added to IE210L series products

# openflow native vlan

**Overview** Use this command to specify a VLAN as a native VLAN for the data plane ports. You must create a VLAN (using the [vlan database](#) command) before specifying the VLAN as a native VLAN.

The OpenFlow native VLAN **must** be different from the native VLAN of the control plane. This prevents the OpenFlow ports from receiving any broadcast or multicast traffic flooded on the control plane native VLAN.

The VLAN used as the OpenFlow native VLAN should not be used on non-OpenFlow ports.

Use the **no** variant of this command to change the native VLAN for the data plane ports back to the default VLAN 1.

**Syntax** `openflow native vlan <vlan-id>`  
`no openflow native vlan`

| Parameter | Description                   |
|-----------|-------------------------------|
| <vlan-id> | VLAN ID in the range <1-4090> |

**Default** The native VLAN for the data plane ports is VLAN 1 by default.

**Mode** Global Configuration

**Example** To specify VLAN 100 as a native VLAN for the data plane ports:

```
awplus# configure terminal
awplus(config)# openflow native vlan 100
```

To change the native VLAN for the data plane ports back to the VLAN 1:

```
awplus# configure terminal
awplus(config)# no openflow native vlan
```

**Related commands** [show openflow config](#)

**Command changes**

- Version 5.4.6-1.1: command added
- Version 5.4.7-1.1: command added to GS900MX, XS900MX, x550 series products
- Version 5.4.7-2.1: command added to IE300, IE500 series products
- Version 5.4.8-0.2: added to SBx908 GEN2
- Version 5.4.8-1.1: added to IE210L series products

# openflow ssl peer certificate

**Overview** Use this command to enable a peer certificate to be sent from the machine that the OpenFlow Controller is running.

Use the **no** variant of this command to disable a peer certificate from being sent from the machine that the OpenFlow Controller is running.

**Syntax** `openflow ssl peer certificate {<file>|bootstrap}`  
`no openflow ssl peer certificate`

| Parameter | Description                                                                                                                                                                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <file>    | The CA certificate of an OpenFlow Controller must be in PEM format and specified with an absolute path using the format <code>flash:cacert.pem</code> .<br>You must copy the file from the machine on which the OpenFlow Controller is running beforehand to the OpenFlow switch. |
| bootstrap | In bootstrap mode, when the switch first connects to the OpenFlow Controller, it accepts and saves to RAM a self-signed CA certificate sent from the Controller. Thereafter, the OpenFlow switch will only connect to OpenFlow Controllers signed by the same CA certificate.     |

**Default** Peer certificate validation is disabled by default.

**Mode** Global Configuration

**Usage notes** This command enables or disables peer certification on an OpenFlow Controller.

**Example** To validate a peer certificate using the bootstrap mode, use the commands:

```
awplus# configure terminal
awplus(config)# openflow ssl peer certificate bootstrap
```

To disable peer certificate validation, use the commands:

```
awplus# configure terminal
awplus(config)# no openflow ssl peer certificate
```

# openflow ssl trustpoint

**Overview** Use this command to configure the local trustpoint to be used for authentication.  
Use the **no** variant of this command to disable the local trustpoint.

**Syntax** `openflow ssl trustpoint local`  
`no openflow ssl trustpoint local`

**Default** There is no trustpoint configured by default.

**Mode** Global Configuration mode.

**Usage notes** Use this command to specify a local self-signed certificate authority trustpoint for authentication. You must first create the trustpoint using the **crypto pki trustpoint** command.

**Example** To configure a local trustpoint, use the commands:

```
awplus# configure terminal
awplus(config)# openflow ssl trustpoint local
```

To delete the local trustpoint, use the command:

```
awplus(config)# no openflow ssl trustpoint
```

Version 5.4.8-1.1: added to IE210L series products

# openflow version

**Overview** Use this command to change the supported OpenFlow version numbers on the switch. You can specify a list of version numbers.

Use the **no** variant of this command to change the version number of the OpenFlow protocol back to the default version 1.3.

**Syntax** `openflow version <version-list>`  
`no openflow version`

| Parameter                         | Description                                                                                    |
|-----------------------------------|------------------------------------------------------------------------------------------------|
| <code>&lt;version-list&gt;</code> | Specifies a list of version numbers separated by a space. The version numbers are 1.0 and 1.3. |

**Default** The OpenFlow version is set to 1.3 by default.

**Mode** Global Configuration

**Usage notes** This command overwrites any previously configured OpenFlow versions with the default OpenFlow version 1.3.

**Example** To change the OpenFlow protocol version to 1.0 and 1.3:

```
awplus(config)# openflow version 1.0 1.3
```

To change the OpenFlow protocol version to the default 1.3:

```
awplus(config)# no openflow version
```

# show openflow config

**Overview** Use this command to display the OpenFlow configuration database on the switch.

**Syntax** show openflow config

**Mode** User Exec/Privileged Exec

**Example** To show the contents of the OpenFlow configuration database on the switch:

```
awplus# show openflow config
```

**Output** Figure 51-1: Example output from **show openflow config**

```
awplus# show openflow config
258a3d74-d349-4d18-9d75-09ab66e19d81
 Bridge of0
 Controller "tcp:192.168.1.2:6653"
 is_connected: true

# show openflow coverage

**Overview** Use this command to display the OpenFlow counters from the Open vSwitch.

**Syntax** show openflow coverage

**Mode** User Exec/Privileged Exec

**Usage** The information displayed by this command is for troubleshooting. Contact Allied Telesis Technical Support for assistance.

**Example** To show OpenFlow counters:

```
awplus# show openflow coverage
```

**Output** Figure 51-2: Example output from **show openflow coverage**

```
awplus# show openflow coverage
Event coverage, avg rate over last: 5 seconds, last minute, last hour,

# show openflow flows

**Overview** Use this command to display all the entries in the switch's flow tables that resulted from receiving packets on OpenFlow ports.

**Syntax** `show openflow flows`

**Mode** Privileged Exec

**Usage notes** The switch uses OpenFlow rules from the Controller to create a rule table that tells the switch what to do with packets. From the rules, the switch creates a software flow table to process packets. From the software flow table, the switch creates entries in its silicon hardware flow tables, when possible. When silicon table entries exist, the switch uses them to switch packets. When silicon table entries do not exist, the switch uses the software flow table to process packets.

See the "Communication and Packet Processing" section of the OpenFlow Feature Overview and Configuration Guide for a detailed explanation of how the switch puts entries into the software and silicon flow tables.

This command displays flows in both the software and silicon flow tables. A symbol at the start of each flow output indicates whether it is a silicon or software table entry:

- # indicates silicon flow table entries, and
- ~ indicates software flow table entries

**Example** To show the entries of the flow tables on the switch:

```
awplus# show openflow flows
```

**Output** Where possible, the switch uses OpenFlow rules from the Controller to create entries in its silicon hardware flow tables, and switches packets according to the silicon flow tables.

In the following example output, the OpenFlow ports are port1.0.14, port1.0.15, port1.0.16, port1.0.33 and sa3 (port1.0.27 and port1.0.38). As LOCAL and LAG ports are now supported, the first OpenFlow port number is used as the local port.

OpenFlow port numbering becomes:

- port1.0.14 is OpenFlow port number 2
- port1.0.15 is OpenFlow port number 3
- port1.0.33 is OpenFlow port number 5
- sa3 is OpenFlow port number 6

The clients are connected to port1.0.15 and port1.0.33 in this scenario and sa3 is used as OpenFlow ports for the uplink. The **show openflow flows** command shows the following:

Figure 51-3: Example output from **show openflow flows**

```
awplus# show openflow flows

~recirc_id(0),in_port(3),eth(src=08:00:27:9a:b6:7f,dst=08:00:27:4b:ef:3b),eth_type(0x0800),ipv4(frag=no), packets:0, bytes:0, used:never, actions:push_vlan(vid=79,pcp=0),6

~recirc_id(0),in_port(6),eth(dst=08:00:27:96:2d:48),eth_type(0x8100),vlan(vid=79,pcp=0),encap(eth_type(0x0806)), packets:1, bytes:64, used:8.990s, actions:pop_vlan,5

~recirc_id(0),in_port(6),eth(dst=08:00:27:9a:b6:7f),eth_type(0x8100),vlan(vid=79,pcp=0),encap(eth_type(0x0800),ipv4(frag=no)), packets:1, bytes:346, used:3.938s, actions:pop_vlan,3

```

**NOTE:** This output includes added line spacing for readability purposes

Table 51-3: Parameters in the output from **show openflow flows**

| Parameter | Description                                                                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| recirc_id | Used to select the next packet processing steps among multiple instances of recirculation. Packets initially enter the process with an ID of 0, which indicates no recirculation. |
| in_port   | The OpenFlow port number                                                                                                                                                          |
| eth       | The source and destination MAC address of the packet                                                                                                                              |
| eth_type  | The Ethernet type                                                                                                                                                                 |
| ipv4      | The information in the IPv4 header                                                                                                                                                |
| packets   | The number of matched packets                                                                                                                                                     |
| bytes     | The number of matched bytes                                                                                                                                                       |
| actions   | A set of actions for the packets that match the key                                                                                                                               |

# show openflow rules

**Overview** Use this command to display the software flow table and rules set by the OpenFlow controller.

**Syntax** show openflow rules

**Mode** User Exec/Privileged Exec

**Example** To show the contents of the flow table on the switch:

```
awplus# show openflow rules
```

**Output** Figure 51-4: Example output from **show openflow rules**

```
awplus# show openflow rules
duration=14s, n_packets=0, n_bytes=0,
priority=399,in_port=1,dl_src=ec:cd:6d:c4:21:bd,actions=drop

Table 51-4: Parameters in the output from **show openflow rules**

| Parameter | Description                                                                                             |
|-----------|---------------------------------------------------------------------------------------------------------|
| duration  | The duration of the flow entry in seconds                                                               |
| n_packets | The number of packets that match the flow entry                                                         |
| n_bytes   | The number of bytes that match the flow entry                                                           |
| priority  | The priority of the flow entry                                                                          |
| in_port   | The OpenFlow port number on which the packets are received                                              |
| dl_src    | The source address                                                                                      |
| dl_dst    | The destination address                                                                                 |
| actions   | A set of actions applied to a packet. The actions are: "drop", "goto_table", "pop_vlan", or "push_vlan" |
| table_id  | The table ID of the flow entry                                                                          |

# show openflow ssl

**Overview** Use this command to display the current SSL configuration for OpenFlow.

**Syntax** `show openflow ssl`

**Mode** Privileged Exec

**Usage notes** This command displays the current SSL configuration for OpenFlow.

**Example** To display the current SSL configuration for OpenFlow, use the command:

```
awplus# show openflow ssl
```

**Output** Figure 51-5: Example output from **show openflow ssl**

```
awplus#show openflow ssl
Private key: /flash/.certs/pki/local/cakey.pem
Certificate: /flash/.certs/pki/local/cacert.pem
CA Certificate: /etc/openvswitch/cacert.pem
Bootstrap: true
```

# show openflow status

**Overview** Use this command to display the status of each data plane port and the OpenFlow protocol messages queried by the OpenFlow Controller.

**Syntax** show openflow status

**Mode** Privileged Exec

**Example** To show the status of a switch with four OpenFlow ports, enter the command:

```
awplus# show openflow status
```

**Output** Figure 51-6: Example output from **show openflow status**

```
awplus#show openflow status

# Virtual Chassis Stacking (VCStack™) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for Virtual Chassis Stacking (VCStack™) commands.

For information on stacking, see [VCStack Feature Overview and Configuration Guide](#).

VCStack is not available in Secure Mode (see the [crypto secure-mode](#) command).

Also note the following stacking trigger commands that are documented in the Triggers chapter:

- [type stack disabled-master](#)
- [type stack master-fail](#)
- [type stack member](#)
- [type stack link](#)

In addition to the stacking commands shown in this chapter, stacking content also exists in the following commands:

- [hostname](#)
- [reboot](#)
- [reload](#)
- [show cpu](#)
- [show cpu history](#)
- [show exception log](#)
- [show file systems](#)
- [show memory](#)
- [show memory history](#)
- [show process](#)

- [show system](#)

**CAUTION:** Stack operation is only supported if **stack virtual-mac** is enabled. For more information refer to [stack virtual-mac](#).

**Command List**

# clear counter stack

**Overview** This command clears all stack counters for all stack members.

**Syntax** `clear counter stack`

**Mode** Privileged Exec

**Example** To clear all stack counters:

```
awplus# clear counter stack
```

**Related commands** [show counter stack](#)

# clear port counter stackports

**Overview** Use this command to allow accumulating stackport counters to be cleared.

**Syntax** `clear port counter stackports`

**Mode** Privileged Exec

**Example** To clear the packet counter for all stackports, use the command:

```
awplus# clear port counter stackports
```

**Related commands** [clear port counter](#)

**Command changes** Version 5.4.6-0: command added

# debug stack

**Overview** This command enables the stacking debugging facilities.

**Syntax** `debug stack [link|topology|trace]`  
`no debug stack [link|topology|trace]`

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| link      | Stacking neighbor discovery events on stack links. |
| topology  | Stacking topology discovery messages.              |
| trace     | Notable stacking events.                           |

**Default** Stack trace debugging is enabled.

**Mode** Privileged Exec and Global Configuration

**Usage notes** The command displays debug information about the stacked devices. If no parameter is specified, all the stack debugging information will be displayed, including link events, topology discovery messages and all notable stacking events. If link parameter is specified, only the link events debugging information will be displayed.

**Examples** To enable debugging, enter the following command on the stack master:

```
awplus# debug stack
```

To enable link debugging, enter the following command on the stack master:

```
awplus# debug stack link
```

To enable topology discovery debugging, enter the following command on the stack master:

```
awplus# debug stack topology
```

To enable stack trace debugging, enter the following command on the stack master:

```
awplus# debug stack trace
```

**Related commands** [undebug stack](#)

# delete stack-wide force

**Overview** Use this command to delete files from all members of a stack.

**Syntax** `delete stack-wide force [recursive] <name>`

| Parameter                 | Description                                                                                                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>recursive</code>    | Delete directories that match the name, including their contents.                                                                                                                                    |
| <code>&lt;name&gt;</code> | The name of the files or directories to delete.<br>The filename can include the wildcard *. Use the wildcard with caution, because this command does not ask for confirmation before deleting files. |

**Mode** Privileged Exec.

**Usage notes** This is a non-interactive command, so if the specified file or files exist, they are deleted without question or warning. This is indicated by the mandatory **force** parameter.

You can use this command within an AMF working set.

**Examples** To delete a file "test.scp" that is located in flash memory on all stack members, use the following command:

```
awplus# delete stack-wide force test.scp
```

To remove directories "output1" and "output2" from an external USB memory device on all stack members, use the following command:

```
awplus# delete stack-wide force recursive usb:output*
```

**Related commands** [cd](#)  
[dir stack-wide](#)

**Command changes** Version 5.4.7-0.1: command added.

# dir stack-wide

**Overview** This command lists the files on all stack members at once. If you don't specify a directory or file, then this command lists the files in the current directory.

**Syntax** `dir stack-wide [recursive] [sort [reverse] [name|size|time]] [<filename>|debug|flash|nvs|usb]`

| Parameter  | Description                                                                                                                              |
|------------|------------------------------------------------------------------------------------------------------------------------------------------|
| recursive  | List the contents of directories recursively.                                                                                            |
| sort       | Sort directory listing.                                                                                                                  |
| reverse    | Sort using reverse order.                                                                                                                |
| name       | Sort by name.                                                                                                                            |
| size       | Sort by size.                                                                                                                            |
| time       | Sort by modification time (default).                                                                                                     |
| <filename> | The name of the directory or file. If you don't specify a directory or file, then this command lists the files in the current directory. |
| debug      | Debug root directory                                                                                                                     |
| flash      | Flash memory root directory                                                                                                              |
| nvs        | NVS memory root directory                                                                                                                |
| usb        | USB storage device root directory                                                                                                        |

**Mode** Privileged Exec

**Usage notes** The **dir stack-wide** command behaves the same as the **dir** command, except for running on all stack members.

**Examples** To list the files in the current directory across all stack members, use the command:

```
awplus# dir stack-wide
```

To list files in the root flash directory across all stack members, use the command:

```
awplus# dir stack-wide flash
```

To list files recursively in the root flash directory across all stack members, use the command:

```
awplus# dir stack-wide recursive flash
```

To list the files in alphabetical order, use the command:

```
awplus# dir stack-wide sort name
```

To list the files by size, smallest to largest, use the command:

```
awplus# dir stack-wide sort reverse size
```

To sort the files by modification time, oldest to newest, use the command:

```
awplus# dir stack-wide sort reverse time
```

**Output** Figure 52-1: Example output from using the **dir stack-wide** command to list files that start with atmf

```
awplus#dir stack-wide atmf*

Stack member 1:
263 rw Nov 15 2017 15:22:52 flash:/atmfStableNodes.sh
3117 rw Nov 14 2017 13:26:31 flash:/atmf-find.sh
2346 rw Nov 14 2017 13:26:19 flash:/atmf-rec.sh

Stack member 2:
263 rw Nov 15 2017 15:22:52 flash:/atmfStableNodes.sh
3117 rw Nov 14 2017 13:26:31 flash:/atmf-find.sh
2346 rw Nov 14 2017 13:26:19 flash:/atmf-rec.sh
```

changes**

Version 5.4.8-0.2: command added.

# mac address-table vcs-sync-mode

**Overview** Use this command to allow a MAC address learnt on one stack member to be used on any other stack member. Note that this command is only necessary in unusual circumstances, as described in the Usage section below.

**Syntax** `mac address-table vcs-sync-mode`  
`no mac address-table vcs-sync-mode`

**Default** Disabled

**Mode** Global configuration

**Usage notes** MAC addresses are automatically learnt by stack members when a packet is seen by that stack member. Normally this is sufficient to make sure that all stack members that need the MAC address learn it.

If aggregators are used, it is possible for the path taken by packets travelling from host A to B to traverse different stack members than packets travelling from host B to A. In this case, the MAC addresses may not be learnt and traffic could be flooded. Even in this case, a broadcast packet from each unit, such as an ARP packet, would be enough to cause all stack members to learn these MAC addresses.

However, in very unusual cases, the automatic learning can still lead to some flooding. This command resolves such situations by synchronising MAC address entries between stack members. This will prevent the flooding that would otherwise occur in these unusual cases.

Note that enabling this feature has a small impact on CPU performance, because it slightly increases the numbers of packets sent to the CPU.

**Example** To make a MAC address learned by one stack member available to all members in the stack, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table vcs-sync-mode
```

**Related commands** [show mac address-table](#)

# reboot rolling

**Overview** This command reboots a stack in a rolling sequence to minimize downtime.

The stack master is rebooted, causing the remaining stack members to failover and elect a new master. The rebooted unit remains separate from the remaining stack and boots up as a stand-alone unit. Once the rebooted unit has finished running its configuration and has brought its ports up, it reboots all the remaining stack members at once.

**Syntax** `reboot rolling`

| Parameter            | Description                     |
|----------------------|---------------------------------|
| <code>reboot</code>  | Halt and perform a cold restart |
| <code>rolling</code> | Rolling reboot of the stack     |

**Mode** Privileged Exec

**Usage notes** When stacking is used with EPSR, the EPSR **failovertime** must be set to at least 5 seconds to avoid any broadcast storms during failover. Broadcast storms may occur if the switch cannot failover quickly enough before the EPSR **failovertime** expires. For further information about EPSR **failovertime**, see the [epsr](#) command.

**Examples** To rolling reboot the stack, use the commands:

```
awplus# reboot rolling
```

```
Continue the rolling reboot of the stack? (y/n):
```

After running this command, the stack master will reboot immediately with the configuration file settings. The remaining stack members will then reboot once the master has finished re-configuring.

```
Continue the rolling reboot of the stack? (y/n):
```

```
awplus# y
```

**Related commands** [boot system](#)  
[epsr](#)

# reload rolling

**Overview** This command performs the same function as the [reboot rolling](#) command.

# remote-command (deleted)

**Overview** This command has been deleted in Software Version 5.4.4-1.1 and later. Instead, please use the [remote-login](#) command and then run the command you need to run remotely.

# remote-login

**Overview** This command is used only on the master in order to log onto the CLI of another stack member. In most respects the result of this is similar to being logged into the stack master. Configuration commands are still applied to all stack members, but show commands and commands that access the file system are executed locally.

The specific output obtained will vary greatly depending on the show command chosen.

**Syntax** `remote-login <stack-ID>`

| Parameter                     | Description                       |
|-------------------------------|-----------------------------------|
| <code>&lt;stack-ID&gt;</code> | Stack member number, from 1 to 8. |

**Mode** Privileged Exec

**Usage notes** Note that some commands such as **ping** or **telnet** are not available when the remote-login is used.

**Example** To log onto stack member 2, use the following command:

```
awplus# remote-login 2
```

To return to the command prompt on the master stack member, type **exit**.

# show counter stack

**Overview** Use this command to display stack related counter information.

**Syntax** show counter stack

**Default** All counters are reset when the stack member is rebooted.

**Mode** User Exec and Privileged Exec

**Usage notes** This displays the stacking counter information for every stack member.

**Examples** To display the stacking counter information about the whole stack, use the following command:

```
awplus# show counter stack
```

Figure 52-2: Example output from the **show counter stack** command

**Table 1:** Parameters in the output of the **show counter stack** command

| Parameters              | Description                                             |
|-------------------------|---------------------------------------------------------|
| Topology Event Counters |                                                         |
| Units joined            | Number of times that the stack acquires a member.       |
| Units left              | Number of times that the stack loses a member.          |
| Links up                | Number of times that a stack link is up in the stack.   |
| Links down              | Number of times that a stack link is down in the stack. |

**Table 1:** Parameters in the output of the **show counter stack** command (cont.)

| Parameters                | Description                                                               |
|---------------------------|---------------------------------------------------------------------------|
| ID conflict               | Number of times that stack-ID conflicts.                                  |
| Master conflict           | Number of times that stack master conflict occurs.                        |
| Master failover           | Number of times that stack master fails.                                  |
| Master elected            | Number of times that stack master is elected.                             |
| Master discovered         | Number of times that stack master is discovered.                          |
| SW autoupgrades           | Number of times that the software in the stack members are auto upgraded. |
| Stack port                |                                                                           |
| Link up                   | Number of times that this unit's physical stack link has come up.         |
| Link down                 | Number of times that this unit's physical stack link has come down.       |
| Nbr re-init               | Number of times that the neighbor is detected as having reinitialized.    |
| Nbr incompatible          | Number of times that the neighbor is detected as incompatible.            |
| Nbr 2way comms            | Number of times that the neighbor is in two way communication status.     |
| Nbr full comms            | Number of times that the neighbor is in full communication status.        |
| Topology message counters |                                                                           |
| Total                     | Total number of topology messages.                                        |
| Hellos                    | Number of hello messages.                                                 |
| Topology DB               | Number of topology database messages.                                     |
| Topology update           | Number of topology database update messages.                              |
| Link event                | Number of link event messages.                                            |
| Reinitialise              | Number of reinitialize messages.                                          |
| 1-hop transport           | Number of 1-hop transport messages.                                       |
| Layer-2 transport         | Number of layer 2 transport messages.                                     |

**Table 1:** Parameters in the output of the **show counter stack** command (cont.)

| Parameters              | Description                                                                                                                                                                                         |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Link event              | Number of link event messages.                                                                                                                                                                      |
| Reinitialise            | Number of reinitialize messages.                                                                                                                                                                    |
| 1-hop transport         | Number of 1-hop transport messages.                                                                                                                                                                 |
| Layer-2 transport       | Number of Layer 2 transport messages.                                                                                                                                                               |
| Topology error counters | Reasons why a neighboring unit could not join the stack.                                                                                                                                            |
| Version unsupported     | Number of stack software version unsupported errors.                                                                                                                                                |
| Product unsupported     | Number of product unsupported errors.                                                                                                                                                               |
| XEM unsupported         | Number of XEM unsupported errors.                                                                                                                                                                   |
| Too many units          | Number of too many units errors.                                                                                                                                                                    |
| Invalid messages        | Number of invalid messages.                                                                                                                                                                         |
| Health status good      | The number of times that the resiliency link has successfully carried healthchecks following a failure at startup.                                                                                  |
| Health status bad       | The number of times that the resiliency link healthcheck has timed out. A timeout occurs when a backup stack member detects a delay greater than two seconds between healthcheck messages received. |
| Rx                      | The total number of healthcheck messages that a stack member has received from the stack master.                                                                                                    |
| Rx Error                | The total number of invalid healthcheck messages that have been received from the master. This message is not applicable to the stack master.                                                       |

**Related commands** [show stack](#)  
[switch provision \(stack\)](#)

# show debugging stack

**Overview** This command shows which debugging modes are currently enabled for stacking.

**Syntax** `show debugging stack`

**Mode** User Exec and Privileged Exec

**Example** To display the stack debugging mode status, use the command:

```
awplus# show debugging stack
```

Figure 52-3: Example output from the **show debugging stack** command

```
Virtual Chassis Stacking debugging status:
VCS link debugging is on
VCS topology debugging is on
VCS trace debugging is on
```

**Related commands** [debug stack](#)

# show running-config stack

**Overview** Use this command to display the running system information specific to the stack.

```
show running-config stack
```

**Mode** Privileged Exec and Global Configuration

**Example** To display the stacking running configuration information, use the command:

```
awplus# show running-config stack
```

**Output** Figure 52-4: Example output from the **show running-config stack** command

```
awplus#show running-config stack

stack virtual-mac
stack virtual-chassis-id 1982
stack management vlan 4000
stack management subnet 192.168.254.0
stack resiliencylink port1.0.1
stack enable
stack 2 priority 20
```

**Related commands** [show running-config](#)

# show provisioning (stack)

**Overview** Use this command to display the provisioning status of all installed or provisioned hardware. Provisioning is the preconfiguration necessary to accommodate future connection of hardware items such as a switch.

**Syntax** `show provisioning`

**Mode** User Exec and Privileged Exec

**Example** To show provisioning, use the following command:

```
awplus# show provisioning
```

**Output** Figure 52-5: Example output from **show provisioning**

```
Switch provisioning summary information

ID Board class Status
1.0 x330-20 Hardware present
```

**Table 2:** Parameters in the output of the **show provisioning** command

| Parameter   | Description                                                                                                                                                                                                                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID          | The unit bay-location of the hardware provision.                                                                                                                                                                                                                                                            |
| Board class | The hardware type.                                                                                                                                                                                                                                                                                          |
| Status      | The provisioned state: <ul style="list-style-type: none"><li>Hardware Present means that the hardware is currently installed in the stack.</li><li>Provisioned means that although the hardware is not currently installed, the stack is preconfigured ready to accept the hardware installation.</li></ul> |

# show stack detail

**Overview** Use this command to display detailed information about current stack members.

**Syntax** `show stack detail`

**Mode** User Exec and Privileged Exec

**Usage notes** This command displays detailed information about current stack members. See the command [show stack](#) to display summary stack information only.

**Example** To display the detailed stacking information about the stack's overall status, use the following command:

```
awplus# show stack detail
```

Figure 52-7: Example output from **show stack detail**

| Stack port2.0.28 status          | Learnt neighbor 1, connected port1.0.27 |

**Table 4:** Parameters in the output from the **show stack detail** command

| Parameter                        | Description                                                                                                                                                                                                                                        |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| S/W version auto synchronization | Whether the software-auto-synchronization feature is turned on or off.                                                                                                                                                                             |
| Host name                        | The host name of the stack member.                                                                                                                                                                                                                 |
| ID                               | Stack-ID .                                                                                                                                                                                                                                         |
| Pending ID                       | The pending stack member ID. This displays if you have used the command <a href="#">stack renumber</a> to change the stack ID and have not yet applied the change by rebooting the switch. If there is no pending ID, the "-" symbol will display. |
| Last Role Change                 | The date and time the stack member last changed its role in the stack.                                                                                                                                                                             |
| MAC address                      | Stack member MAC address.                                                                                                                                                                                                                          |
| Management VLAN ID               | The VLAN ID currently used for stack management: the default is 4094.                                                                                                                                                                              |
| Management VLAN subnet address   | The current stacking management VLAN subnet address.                                                                                                                                                                                               |
| Virtual Chassis ID               | The Virtual Chassis ID determines the last 12 bits of the Virtual MAC address: 0000.cd37.0xxx                                                                                                                                                      |
| Virtual MAC Address              | The Virtual MAC address of the stack.                                                                                                                                                                                                              |
| Disabled Master Monitoring       | The current Disabled Master Monitoring status. This can be: <ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> <li>• Inactive</li> </ul>                                                                                    |

**Table 4:** Parameters in the output from the **show stack detail** command (cont.)

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Operational Status | <p>The status of the stack. This can be:</p> <ul style="list-style-type: none"><li>• <b>Normal operation:</b><br/>If any other status is displayed, it may warrant further investigation.</li><li>• <b>Stacking hardware disabled:</b><br/>Use the <b>stack enable</b> command to activate the stacking feature.</li><li>• <b>Operating in failover mode:</b><br/>This stack member has become separated from the rest of the stack, or it failed to join the stack correctly.</li><li>• <b>Standalone unit:</b><br/>Stacking is enabled, but no other stack members are present.</li><li>• <b>Not all stack ports are up:</b><br/>One or more stacking ports may be down, or stacking discovery may not have detected the neighbor successfully.</li></ul> |
| Stack Status       | <p>The stack's overall status. Note that a warning is issued if the stack is not connected in a standard ring topology.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Stack port status  | <p>The status of the stack port. This can be:</p> <ul style="list-style-type: none"><li>• Down</li><li>• Neighbor incompatible</li><li>• Discovering neighbor</li><li>• Learned neighbor</li></ul> <p>If the stack has learned a neighbor, the status also shows the neighbor's stacking number and the port the stack members are connected through.</p>                                                                                                                                                                                                                                                                                                                                                                                                   |
| Priority           | <p>Stack member master election priority (between 1 and 255)<br/>Note that the lowest number has the highest priority.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Product Type       | <p>The switch series that the stack member belongs to.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Provisioned        | <p>Indicates that the stack position is provisionally configured, i.e. ready to accept a particular switch type into the stack.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 4:** Parameters in the output from the **show stack detail** command (cont.)

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

# show stack resiliencylink

**Overview** Use this command to display information about the current status of the resiliency-link across the members of the stack.

**Syntax** `show stack resiliencylink`

**Mode** User Exec and Privileged Exec

**Example** To display information about the current status of the resiliency-link across the stack members, use the command:

```
awplus# show stack resiliencylink
```

**Output** Figure 52-8: Example output from the **show stack resiliencylink** command

```
awplus(config)# show stack resiliencylink
Stack member 1:

Status Configured
Interface vlan4093
Interface state UP
Resiliency-link port(s) port1.0.11

Stack member 2:

Status Successful
Interface vlan4093
Interface state UP
Resiliency-link port(s) port2.0.11
```

**Table 5:** Parameters in the output of the **show stack resiliencylink** command

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status                  | <p>The current status of the stack member's resiliency link. Can be one of:</p> <ul style="list-style-type: none"><li>• <b>Not configured</b> (Master or Member).</li><li>• <b>Configured</b> (Master only).</li><li>• <b>Successful:</b><br/>Successfully receiving healthchecks from the Active Master.</li><li>• <b>Failed</b> (Member only):<br/>Not receiving any healthchecks from the Active Master.</li><li>• <b>Stopped:</b><br/>The resiliency link is configured, but is inactive. This may occur in a Disabled Master stack, for example if the Disabled Master Monitoring feature is not used.</li></ul> |
| Interface               | The name of the VLAN interface that is connected to the resiliency link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Interface state         | The current status of the interface. Can be either up or down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Resiliency-link port(s) | The switch port(s) the resiliency link is connected to.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

# stack mixed-mode

**Overview** Use this command to enable x530 and x530L switches to stack together.

Use the **no** variant of this command to disable mixed-mode stacking.

**Syntax** `stack mixed-mode`  
`no stack mixed-mode`

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** To use mixed-mode VStacking, you must have a mixed-mode license installed on each device in the stack. When in mixed-mode, the table limits (routing limits) on ALL units in the VStack will be aligned to the base license of the x530L.

To configure mixed-mode stacking, on each unit in the stack you must:

- Install the mixed-mode stacking license
- Enter the mixed-mode command
- Save the configuration and re-boot

**Example** To enable mixed-mode stacking, use the following commands:

```
awplus# configure terminal
awplus(config)# stack mixed-mode
```

Then, save the config and restart the system for the change to take effect.

**Related commands** [show stack detail](#)

**Command changes** Version 5.4.9-0.1: command added

# stack disabled-master-monitoring

**Overview** This command enables the Disabled Master Monitoring (DMM) feature. If a stack member becomes a disabled master, the DMM feature will use the stack resiliency link to continue monitoring the health of the separated stack master.

Use the **no** variant of this command to disable the DMM feature.

**Syntax** `stack disabled-master-monitoring`  
`no stack disabled-master-monitoring`

**Default** By default, Disabled Master Monitoring is enabled. However, it only operates if there is a resiliency link.

**Mode** Global Configuration

**Usage** This command enables additional stack resiliency link functionality, which is used if a stack separation occurs. For DMM to operate, a resiliency link must also be configured (see the [stack resiliencylink](#) command). A stack separation could result in a stack member becoming a disabled master, which has the configuration as a normal stack master except that all its switchports are shutdown.

For more information about the disabled master state, see the [VCStack Feature Overview and Configuration Guide](#).

When the DMM feature is enabled, the disabled master will continue to monitor the health of the original stack master over the stack resiliency link connection. If the original stack master were to fail, when the DMM feature is enabled, then the disabled master will detect this and will automatically re-enable its switchports. This ensures that the stack will continue to pass network traffic, even if a catastrophic stack failure occurs.

For more information about the DMM feature when the stack member is a disabled master, see the [VCStack Feature Overview and Configuration Guide](#).

**Examples** To enable the DMM feature, use the following commands:

```
awplus# configure terminal
awplus(config)# stack disabled-master-monitoring
```

To disable the DMM feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no stack disabled-master-monitoring
```

[show stack](#)  
[stack resiliencylink](#)  
[type stack disabled-master](#)  
[type stack master-fail](#)

# stack enable

**Overview** This command is used on a stackable stand-alone switch to manually turn on the VcStack feature.

This command can also be used to return a switch to stacking operation, if the switch has previously been removed from a stack (by using the **no** variant of this command).

The **no** variant of this command removes a specified stack member switch from the virtual chassis stack. We recommend you uncable the stack member from the stack before issuing the **no** command.

**Syntax** `stack enable`  
`no stack <stack-ID> enable`

| Parameter  | Description                       |
|------------|-----------------------------------|
| <stack-ID> | Stack member number, from 1 to 8. |

**Default** The VcStack feature is enabled by default. The feature automatically starts when hardware is present.

**Mode** Global Configuration

**Usage** For step-by-step instructions on how to set up a stack, see the [Virtual Chassis Stacking \(VcStack\) Feature Overview and Configuration Guide](#).

When **stack enable** is entered, the `stack virtual-mac` command is automatically enabled. The `stack virtual-mac` command is required in order to minimize disruption on failover.

## Disabling stacking on a switch

Running the **no** variant of this command will remove the selected stack member from the stack. At this point the removed member will act as a stand-alone master and will disable all of its ports. The switch can then only be accessed via its console port. If the command is run on the master then all current members of the stack will be disabled. We recommend you uncable the stack member from the stack before disabling stacking on it.

Note the following when using the **no** variant of this command:

- If the specified stack-ID is not used by any current stack member, the command will be rejected.

**CAUTION:** *Disabling a stack member can significantly degrade the throughput capability of the stack.*

## Returning a switch to a stack

To return the switch to stack membership, first connect to the switch via its console port, then run the **stack enable** command. Then save the configuration and run

the [reboot](#) command. This will reboot the switch and it will re-join the stack as an ordinary member.

If the switch was previously the stack master, you might want to return it to its original stack master status. To do this you must run the [reboot](#) command again. This time—because the switch is now a stack member—the command will reboot the whole stack, which will result in a new master election.

For more information, see the [Virtual Chassis Stacking \(VCStack\) Feature Overview and Configuration Guide](#).

**Example** To turn on stacking on a stackable stand-alone unit, use the commands:

```
awplus# configure terminal
awplus(config)# stack enable
```

**Related  
commands** [license](#)  
[reboot](#)

**Command  
changes** Version 5.5.4-1.2: command added on x240

# stack management subnet

**Overview** This command configures the subnet address used by the stack management VLAN.

Use the **no** variant of this command to reset the stack's VLAN subnet management address back to the default address and mask (192.168.255.0/27).

**Syntax** `stack management subnet <ip-address>`  
`no stack management subnet`

| Parameter                       | Description                                           |
|---------------------------------|-------------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | The new subnet address for the stack management VLAN. |

**Default** The default stacking management VLAN subnet address is 192.168.255.0 with a subnet mask 255.255.255.224 or /27.

**Mode** Global Configuration

**Usage notes** This command configures the stack management VLAN subnet address.

The management VLAN will be used for high speed communication between stacked units via the stacking ports. Although this command enables you to change the IP address command, the subnet mask must always remain as shown.

The stack management IP subnet is solely used internally to the stacked devices, and cannot be reached external to the stack. You should only change the stack management VLAN subnet address if it causes a conflict within your network.

Note that several separate stacks can use the same default management VLAN subnet address even though their user ports may share the same external network. If the stack subnet address is changed, then the configuration for any new units must also be updated before they are inserted into the stack.

If the management VLAN subnet address is changed by this command, you can use the **no** variant of this command to reset it to its default.

**Example** To set the management VLAN subnet address to 192.168.255.144:

```
awplus# configure terminal
awplus(config)# stack management subnet 192.168.255.144
```

**Related commands** [stack management vlan](#)

# stack management vlan

**Overview** Use this command to configure the stack management VLAN ID.

Use the **no** variant of this command to change the stack management VLAN ID back to the default (VLAN ID 4094).

**Syntax** `stack management vlan <2-4094>`  
`no stack management vlan`

| Parameter                   | Description               |
|-----------------------------|---------------------------|
| <code>&lt;2-4094&gt;</code> | Stack management VLAN ID. |

**Default** VLAN ID 4094

**Mode** Global Configuration

**Usage notes** The management VLAN is used for high speed communication between stacked units. This command enables you to change the ID of this VLAN.

The default stacking management VLAN ID is 4094, which is the last configurable VLAN ID in the switch.

The stack management VLAN is created and configured automatically so that the stack VLAN cannot be used in the stack's VLAN configuration commands. This means you cannot enter commands such as:

```
awplus(config-vlan)# vlan <stack-management-VLAN-ID>
```

You should only change the management VLAN if the VLAN ID 4094 needs to be used in the stack's VLAN configuration.

If necessary, you can use the **no** variant of this command to change the management VLAN back to its default value.

Changes to the stacking management VLAN configuration will take effect once the stack is restarted.

**Examples** To set the management VLAN to 4000, enter the following commands:

```
awplus# configure terminal
awplus(config)# stack management vlan 4000
```

To reset the management VLAN back to the default (4094), enter the following commands:

```
awplus# configure terminal
awplus(config)# no stack management vlan
```

**Related commands** [stack management subnet](#)

# stack priority

**Overview** When creating a stack, use this command to set the priority of the switch you want to be master for the stack.

**Syntax** `stack <stack-ID> priority <0-255>`  
`no stack <stack-ID> priority`

| Parameter  | Description                                                                                                   |
|------------|---------------------------------------------------------------------------------------------------------------|
| <stack-ID> | Stack member number, from 1 to 8.                                                                             |
| priority   | The stack member's election priority value.                                                                   |
| <0-255>    | The stack member's new priority value. The lowest value is assigned the highest priority. The default is 128. |

**Mode** Global Configuration

**Usage notes** This command is used to change the value of a specific stack member's master-election priority. If the specified stack-ID is not used by any current stack member, the command will be rejected.

The election criteria selects the stack member with the lowest priority value to become the stack master. Where two stack members both have the same lowest priority value, then the stack member with the lowest MAC address will be elected as master.

**NOTE:** Assigning a new priority value will not immediately change the current stack master. In order to force a master re-election after the new priority value is assigned, use `reboot stack-member <master's ID>` to reboot the current stack master, a new stack master will then be elected based on the new priority values.

**Example** To change the priority of stack member 2 to be 3, use the command:

```
awplus# configure terminal
awplus(config)# stack 2 priority 3
```

**Validation Command** `show stack`

# stack renumber

**Overview** Use this command to renumber a specific stack member.

**Syntax** `stack <existing stack-ID> renumber <new stack-ID>`

| Parameter           | Description                                                                                                                                        |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <existing stack-ID> | Enter the existing stack-ID, 1 or 2.                                                                                                               |
| renumber            | Change the existing stack-ID.                                                                                                                      |
| <new stack-ID>      | Enter the new stack-ID, 1 or 2.<br>For clarity, we recommend that you use only numbers 1 to 2 for a 2 unit stack, or 1 to 4 for a four unit stack. |

**Default** Every stack unit will initially try to use a stack-ID of 1.

**Mode** Global Configuration

**Usage notes** This command is used to change the ID of a specific stack member, primarily when exchanging stack members. The changes made by this command will not take effect until the switch is rebooted.

You can see renumbering changes that have not yet taken effect by checking the Pending ID field in the output of the [show stack](#) command.

**NOTE:** This command does not alter any of the stack's existing configuration, apart from the stack-ID specified. For example, if stack member 2 were removed from the stack and a new stack unit is assigned the member 2 stack-ID, then the interface configuration that existed for the removed stack member 2 will be applied to the new stack member 2.

The existing stack-ID must already be assigned to an existing stack member. To avoid duplicating IDs, a warning message will appear if you assign a new stack-ID that is currently assigned to another stack member. However, you can continue to renumber the stack-IDs and remove ID duplications. If you do not remove the duplications, then one of the devices will be forced to automatically renumber to an unused ID. Once you have removed any duplicate IDs, you can reboot the switch to implement your changes.

Note that the configured stack-ID is saved immediately on the renumbered member, and so is not reliant on using the **copy running-config** command for it to take effect.

**Example** To renumber stack 1 to stack 2, use the commands:

```
awplus# configure terminal
awplus(config)# stack 1 renumber 2
```

**Validation**    `show stack`  
**Command**

# stack renumber cascade

**Overview** This command is used to renumber the members of a stack so that their IDs are ordered sequentially, relative to the member's physical position within the stack.

**CAUTION:** *Changing the stack numbering will upset the existing stack member configurations such as port settings. This command is intended for use when the stack is either initially commissioned, or has undergone a major reconfiguration. In this situation you run the stack renumber command (which will automatically reboot the switch), then configure the stack members to meet the new requirements.*

**Syntax** `stack <stack-ID> renumber cascade [<new-stack-ID>]`

| Parameter      | Description                                                        |
|----------------|--------------------------------------------------------------------|
| <stack-ID>     | The ID of the stack member to start renumbering from, from 1 to 8. |
| renumber       | Change the existing stack-ID.                                      |
| cascade        | Renumber the existing stack-ID in cascade order.                   |
| <new-stack-ID> | The new ID for the first member renumbered, from 1 to 8.           |

**Default** If no new-stack-ID is specified, the member will take the default ID of 1.

**Mode** Global Configuration

**Usage notes** This command is used to renumber the members of a stack so that their stack-IDs are ordered sequentially. This would normally be done either when the stack is initially configured or following a major reconfiguration.

The renumber will start on the specified stack member. If that stack-ID is not used by any of the existing stack members, the command will be rejected.

The starting stack member will be renumbered with the new stack-ID specified, or the default of member ID of 1. The stack-ID of the next physically will be the starting member's ID + 1, for example member ID 2. This renumbering will continue in cascading order around the stack members.

The changes will take place immediately and reboot all stack members. For this reason a confirmation prompt follows this command entry, asking whether you are sure you want to renumber and reboot the entire stack.

**Example** `awplus(config)# stack 1 renumber cascade`

Any existing interface configuration  
may no longer be valid.

Are you sure you want to renumber and reboot the entire  
stack?(y/n): y

**Related  
commands**    [show stack](#)  
                  [switch provision \(stack\)](#)  
                  [stack renumber](#)

# stack resiliencylink

**Overview** This command configures the resiliency link used by the stack.

The interface used is a dedicated VLAN (resiliencylink VLAN) to which switch ports may become members. This VLAN is dedicated to the resiliency link function and must not be the stack management VLAN.

**Syntax** `stack resiliencylink <interface>`  
`no stack resiliencylink`

| Parameters  | Description                                                                                             |
|-------------|---------------------------------------------------------------------------------------------------------|
| <interface> | The name of the interface that is connected to the resiliency link.<br>This is the resiliencylink VLAN. |

**Mode** Global Configuration

**Usage notes** The resiliency-link is only used when a backup member loses connectivity with the master via the stacking cables. Such a communication loss would occur if:

- a stacking link is removed or fails
- two or more stacking link cables are unplugged or fail
- the stack master itself fails due to a reboot or power failure

The resiliency-link allows the backup member to determine if the master is still present in the network by the reception of healthcheck messages sent by the master over the resiliency-link interface.

Reply healthcheck messages are received if the master is still online, but the stack will now split into two different “stubs”. The stub containing the existing master will continue operating as normal. The members in the masterless stub will now use a “type stack disabled-master” trigger to run a configuration to form a second temporary stack. This utilizes the remaining stack members' resources without conflicting directly with the master's configuration. If no “type stack disabled-master” trigger was configured on the switches, then the masterless stub members will disable their switch ports.

If no healthcheck messages are received, then the master is assumed to be completely offline, and so the other stack members can safely take over the master's configuration.

**CAUTION:** *The purpose of the resiliency link is to enable the stack members (particularly the backup master) to check the status of the master under fault conditions. If the resiliency link is not configured, and the master loses communication with its other stack members, then the stack will assume the master is NOT present in the network, which could cause network conflicts if the master is still online. Note that this is a change to the behavior of stacking in releases prior to version 5.3.1.*

**Example** To set the resiliency link to be VLAN 4093, first create VLAN 4093 as the resiliencylink VLAN. You do not have to use **vlan database** to create the VLAN, because the **stack resiliencylink** command creates it:

```
awplus# configure terminal
awplus(config)# stack resiliencylink vlan4093
```

Next assign VLAN 4093 to the interface port, in this case port1.0.1:

```
awplus(config)# interface port1.0.1
awplus(config-if)# switchport resiliencylink
```

- [show stack resiliencylink](#)
- [stack disabled-master-monitoring](#)
- [switchport resiliencylink](#)

# stack software-auto-synchronize

**Overview** This command re-enables the software version auto-synchronization feature either on a specified stack member or all stack members.

Use the **no** variant of this command to turn the software version auto-synchronization feature off.

**Syntax** `stack {all|<stack-ID>} software-auto-synchronize`  
`no stack {all|<stack-ID>} software-auto-synchronize`

| Parameter  | Description                       |
|------------|-----------------------------------|
| all        | All stack members.                |
| <stack-ID> | Stack member number, from 1 to 8. |

**Default** Enabled on all stack members

**Mode** Global Configuration

**Usage notes** This command is used to enable the software version auto-synchronization feature for either a specific stack member or all stack members and candidates.

Note that if a device attempts to join a stack but is running a software release that is different to the other stack members, the software version auto-synchronization feature will copy the master's software release onto the new member. If the software version auto-synchronization feature is not enabled, then the device will be unable to join the stack.

Note that the software version auto-synchronization feature may also result in the stack member downgrading its software release if the master is running an older software version.

**Examples** To turn on the software-auto-synchronize feature on stack member 2, which was previously turned off, use the following commands:

```
awplus# configure terminal
awplus(config)# stack 2 software-auto-synchronize
```

To turn on the software-auto-synchronize feature for all stack members, which were previously turned off, use the following commands:

```
awplus# configure terminal
awplus(config)# stack all software-auto-synchronize
```

**Related commands** [show stack](#)

# stack virtual-chassis-id

**Overview** This command specifies the stack virtual chassis ID. The ID selected will determine which virtual MAC address the stack will use. The MAC address assigned to a stack must be unique within its network.

**NOTE:** *The command will not take effect until the switch has been rebooted.*

**Syntax** `stack virtual-chassis-id <id>`

| Parameter | Description                                                          |
|-----------|----------------------------------------------------------------------|
| <id>      | The value of the ID - enter a decimal number in the range 0 to 4095. |

**Mode** Global Configuration

**Usage notes** The virtual-chassis-id entered will form the last 12 bits of a pre-selected MAC prefix component; that is, 0000.cd37.0xxx. If you enable the stack virtual MAC address feature (by using the [stack virtual-mac](#) command) without using the stack virtual-chassis-id command to select the virtual-chassis-id, then the stack will select a virtual-chassis-id from a number within the assigned range.

**Example** To set the stack virtual-chassis-id to 63 use the commands

```
awplus# configure terminal
```

```
awplus(config)# stack virtual-chassis-id 63
```

This will result in a virtual MAC address of 0000.cd37.003f.

**Related commands**

- [show running-config](#)
- [show stack](#)
- [switch provision \(stack\)](#)
- [stack virtual-mac](#)

# stack virtual-mac

**Overview** This command enables the stack virtual MAC address feature. For more information on this topic, see the [VCStack Feature Overview and Configuration Guide](#). With this command set, the value used as the virtual MAC address is determined by the setting of the command [stack virtual-chassis-id](#).

You must enable **stack virtual-mac**, in order to minimize data loss if a new stack member is required to become the VCStack master.

Before enabling the virtual MAC address feature, you should check that the stack's virtual-chassis-id is not already used by another stack in the network. Otherwise the duplicate MAC addresses will cause problems for the network traffic.

**Syntax** `stack virtual-mac`  
`no stack virtual-mac`

**Default** The stack virtual MAC address feature is disabled by default. However, if you manually turn on stacking (by entering the **stack enable** command), then that enables the stack virtual MAC address feature as well.

**Mode** Global Configuration

**Usage notes** Note that this command will not take effect until the switch has been rebooted.

**Example** `awplus# configure terminal`  
`awplus(config)# stack virtual-mac`

**Related commands** [show running-config](#)  
[show stack](#)  
[switch provision \(stack\)](#)  
[stack virtual-chassis-id](#)

# switch provision (stack)

**Overview** This command enables you to provide the configuration for a new stack member switch prior to physically connecting it to the stack. To run this command, the stack position must be vacant. The selected hardware type must be compatible with existing stack hardware.

Use the **no** variant of this command to remove an existing switch provision.

**Syntax** `switch <stack-ID> provision {x330-20|x330-28|x330-52}`  
`no switch <stack-ID> provision`

| Parameter  | Description                                                                                                 |
|------------|-------------------------------------------------------------------------------------------------------------|
| <stack-ID> | Stack member number, from 1 to 8.                                                                           |
| provision  | Provides settings within the stack configuration ready for a specific switch type to become a stack member. |
| x330-20    | Provision a 20-port x330 Series switch.                                                                     |
| x330-28    | Provision a 28-port x330 Series switch.                                                                     |
| x330-52    | Provision a 52-port x330 Series switch.                                                                     |

**Mode** Global Configuration

**Usage notes** Note that although the syntax appears to allow provisioning on up to 8 stackable switches, in practice a maximum of 6 are configurable.

Normally you would number the stack members 1 to 6. However, you can number the stack units with any numbers between 1 and 8. For example you could number your six stack members 1, 2, 4, 6, 7 and 8, if you wish. In this case you could provision any of the stack members by using one of those numbers. We advise against numbering your stacks in this way.

**Examples** To provision an x330-20GTX switch as stack member 3, use the following commands:

```
awplus# configure terminal
awplus(config)# switch 3 provision x330-20
```

To remove the provision of the x330-20GTX switch as stack member 3, use the following commands:

```
awplus# configure terminal
awplus(config)# no switch 3 provision
```

**Related commands** [show provisioning \(stack\)](#)  
[show stack](#)

**Command changes** Version 5.4.8-1.1: SBx908 GEN2 syntax changed

# switchport resiliencylink

**Overview** This command configures the switch port to be a member of the stack resiliency link VLAN. Note that this switchport will only be used for stack resiliency-link traffic and will not perform any other function, or carry any other traffic.

The **no** variant of this command removes the switchport from the resiliency link VLAN.

**Syntax** `switchport resiliencylink`  
`no switchport resiliencylink`

**Mode** Interface Configuration

**Usage notes** Note that a resiliency link cannot be part of a static or dynamic aggregator group.

**Examples** To set the resiliency link to be VLAN 4093:

First, use the **stack resiliencylink** command to create the resiliency-link vlan  
vlan4093

```
awplus# configure terminal
awplus(config)# stack resiliencylink vlan4093
```

Next, use the **switchport resiliencylink** command to assign the resiliency-link  
vlan to the port, in this case port1.0.1.

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport resiliencylink
```

**Related commands** [stack resiliencylink](#)  
[show stack resiliencylink](#)

## vlan mode stack-local-vlan

**Overview** This command enables you to create stack-local-VLANs and use ICMP to monitor and diagnose issues within specific members of the stack. When a VLAN is added using this method, all its traffic will be trapped to and processed by the CPU of the specific local stack member, rather than the CPU of the stack master.

The **no** variant of this command destroys the specified VLAN.

**Syntax** `vlan <vid> mode stack-local-vlan <member-id>`  
`no vlan <vid>`

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <vid>                 | The VID of the VLAN to be created in the range 2-4094. We recommend that the first stack-local-vlan be assigned the number 4001 for the first stack member, then incremented by one for each stack member. For example, a stack of four members would be assigned the following VID numbers: <ul style="list-style-type: none"><li>• stack member one: VID 4001</li><li>• stack member two: VID 4002</li><li>• stack member three: VID 4003</li><li>• stack member four: VID 4004</li></ul> |
| mode stack-local-vlan | Specifies that the new VLAN will function as a stack-local-VLAN.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <member-id>           | Specifies the stack member ID. Enter a decimal number in the range 1-8.                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Default** By default, VLANs are automatically enabled as they are added.

**Mode** VLAN Configuration

**Usage notes** If IGMP snooping is operating on a stack-local-VLAN, the device will try to process some multicast traffic via that VLAN, if it is connected to a Microsoft Windows PC. To avoid this, we recommend disabling IGMP snooping on stack-local-VLANs, by using the command **no ip igmp snooping**.

**Examples** To add a stack-local-VLAN with the VID of 4002 and assign it to stack member 2, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 4002 mode stack-local-vlan 2
awplus(config-vlan)# exit
awplus(config)# interface vlan4002
awplus(config-if)# no ip igmp snooping
```

To remove VLAN 4002, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no vlan 4002
```

# advertisement-interval

**Overview** Use this command to configure the advertisement interval of the virtual router. This is the length of time, in seconds, between each advertisement sent from the master to its backup(s).

IPv6 VRRP advertisements are sent to the multicast address assigned to the VRRP group (ff02:0:0:0:0) and a backup virtual router has to join all multicast groups within this range. VRRP advertisements are sent to a multicast address (ff02::12) every second by default.

Use the **no** variant of this command to remove an advertisement interval of the virtual router, which has been set using the **advertisement-interval** command, and revert to the default advertisement interval of 1 second.

**Syntax** advertisement-interval [**<1-255>**|csec **<1-4095>**]  
no advertisement-interval

| Parameter             | Description                                                         |
|-----------------------|---------------------------------------------------------------------|
| <b>&lt;1-255&gt;</b>  | Specifies the advertisement interval in seconds.                    |
| csec                  | Use centiseconds instead of seconds for the advertisement interval. |
| <b>&lt;1-4095&gt;</b> | Specifies the advertisement interval in centiseconds.               |

**Default** The default advertisement interval is 1 second.

**Mode** Router Configuration

**Usage notes** Note when using VRRP with VCStacking, ensure the VRRP advertisement-interval is larger than the VCStacking failover time to avoid VCStacking failovers causing VRRP failovers.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about:

- setting the advertisement-interval when configuring VRRP
- using seconds for VRRPv2 host compatibility whenever you use [transition-mode](#) to upgrade or transition from VRRPv2 to VRRPv3
- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details

**NOTE:** When using VRRPv3 with VCStacking, ensure that the VRRPv3 advertisement-interval is configured to a longer time than the VCStacking failover time.

If the VRRPv3 advertisement-interval is shorter than the VCStacking failover time, then a VRRPv3 failover will also occur whenever a VCStacking failover occurs. Use seconds not centiseconds to ensure interoperability with VRRPv2.

**Examples** The example below shows you how to configure the advertisement interval to 6 seconds for the VRRP IPv4 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# advertisement-interval 6
```

The example below shows you how to reset the advertisement interval to the default of 1 second for the VRRP IPv4 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no advertisement-interval
```

The example below shows you how to configure the advertisement interval to 6 seconds for the VRRPv3 IPv6 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 5 vlan2
awplus(config-router)# advertisement-interval 6
```

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# alternate-checksum-mode

**Overview** Use this command to enable an alternate checksum mode for VRRPv3 to allow inter-operability with some other vendors' products. The IPv4 checksum for VRRPv3 advertisements will then use a pseudo header in the calculation.

This mode may be required if the other product indicates checksum errors on VRRP packets sent by AlliedWare Plus devices.

Use the **no** variant of this command to disable the alternate checksum mode.

**Syntax** `alternate-checksum-mode`  
`no alternate-checksum-mode`

**Default** Disabled

**Mode** Router Configuration

**Example** To turn on the alternate checksum mode for VRRP instance 1 on VLAN1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# alternate-checksum-mode
```

To turn off the alternate checksum mode for VRRP instance 1 on VLAN1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# no alternate-checksum-mode
```

**Related commands** [show running-config](#)

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud  
Version 5.4.7-1.1: command added

# circuit-failover

**Overview** Use this command to enable the VRRP circuit failover feature.

Circuit failover enables the device to take action if the uplink interface goes down, so that the VRRP backup, whose uplink interface is still active, takes over as VRRP master. See the Usage section below and the [VRRP Feature Overview and Configuration Guide](#) for more information.

Use the **no** variant of this command to disable this feature.

**Syntax** `circuit-failover <interface> <1-253>`  
`no circuit-failover [<interface> <1-253>]`

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface> | The interface of the router that is monitored. The interface must exist on the router, and is usually an upstream interface. Should the interface go down, then another router that is configured as a backup router in the group takes over as the master. You should configure the circuit failover on an interface other than the active VRRP interface - generally the uplink interface. |
| <1-253>     | Delta value. The value by which virtual routers decrement their priority value during a circuit failover event. Configure this value to be greater than the difference of priorities on the master and backup routers. In the case of failover, this priority delta value is subtracted from the current VR Master Router priority value.                                                    |

**Mode** Router Configuration

**Usage notes** You can use Circuit Failover to monitor up to 32 interfaces per VRRP instance. If a VRRP instance is configured to monitor multiple interfaces, the VRRP priority will be cumulatively decremented by the configured delta for each interface as it goes down.

For example, if VRRP is configured to monitor VLAN2 and VLAN3 with the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip address 192.168.1.1/24
awplus(config-if)# exit
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# virtual-ip 192.168.1.10 backup
awplus(config-router)# priority 100
awplus(config-router)# circuit-failover vlan2 10
awplus(config-router)# circuit-failover vlan3 20
```

then the following examples explain the effect of each VLAN going down:

- If only VLAN2 fails, then the VRRP priority will be decremented by 10. VRRP priority would be adjusted to become 90, because  $100 - 10 = 90$ .
- If only VLAN3 fails, then the VRRP priority will be decremented by 20. VRRP priority would be adjusted to become 80, because  $100 - 20 = 80$ .
- If both VLAN2 and VLAN3 fail, then the VRRP priority will be decremented by the cumulative delta values of all monitored interfaces. VRRP priority would therefore be adjusted to become 70, because  $100 - 10 - 20 = 70$ .

As each monitored interface recovers, the VRRP priority is incremented by the same delta value.

When you configure the delta values of the monitored interfaces, make sure their sum is high enough to ensure that the VRRP priority stays above zero if all the interfaces go down.

**Examples** To configure circuit failover on an IPv4 VRRP instance on interface VLAN2, so that if VLAN3 goes down, then the priority of VRRP instance 1 is reduced by 30, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan2
awplus(config-router)# circuit-failover vlan3 30
```

To remove all configured circuit failovers for the VRRP IPv4 session with VR ID 1 on interface VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan2
awplus(config-router)# no circuit-failover
```

To configure circuit failover on a VRRPv3 IPv6 session with VR ID 1 on interface VLAN2, so that when interface VLAN3 goes down, the priority of VRRP instance 1 is reduced by 30, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 1 vlan2
awplus(config-router)# circuit-failover vlan3 30
```

To remove all configured circuit failovers for the VRRPv3 IPv6 session with VR ID 1 on interface VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 1 vlan2
awplus(config-router)# no circuit-failover
```

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# debug vrrp

**Overview** Use this command to specify debugging options for VRRP. The **all** parameter turns on all the debugging options.

Use the **no** variant of this command to disable this function.

**Syntax** `debug vrrp [all]`  
`no debug vrrp [all]`

**Mode** Privileged Exec and Global Configuration

**Usage notes** See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Examples** The example below shows you how to enable all debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp all
```

The example below shows you how to disable all debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp all
```

**Related commands** [show debugging vrrp](#)  
[undebug vrrp](#)

# debug vrrp events

**Overview** Use this command to specify debugging options for VRRP event troubleshooting.  
Use the **no** variant of this command to disable this function.

**Syntax** `debug vrrp events`  
`no debug vrrp events`

**Mode** Privileged Exec and Global Configuration

**Usage notes** The **debug vrrp events** command enables the display of debug information related to VRRP internal events.  
See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Examples** The example below shows you how to enable events debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp events
```

The example below shows you how to disable events debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp events
```

**Related commands** [show debugging vrrp](#)  
[undebg vrrp events](#)

# debug vrrp packet

**Overview** Use this command to specify debugging options for VRRP packets.  
Use the **no** variant of this command to disable this function.

**Syntax** debug vrrp packet [send|recv]  
no debug vrrp packet [send|recv]

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| send      | Specifies the debug option set for sent packets.     |
| recv      | Specifies the debug option set for received packets. |

**Mode** Privileged Exec and Global Configuration

**Usage notes** The **debug vrrp packet** command enables the display of debug information related to the sending and receiving of packets.  
See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Examples** The example below shows you how to enable received and sent packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet
```

The example below shows you how to enable only received packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet recv
```

The example below shows you how to enable only sent packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet send
```

The example below shows you how to disable packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp packet
```

**Related commands** [show debugging vrrp](#)  
[undebug vrrp packet](#)

# disable (VRRP)

**Overview** Use this command to disable a VRRP IPv4 session or a VRRPv3 IPv6 session on the router to stop it participating in virtual routing. Note that when this command is configured then a backup router assumes the role of master router depending on its priority. See the [enable \(VRRP\)](#) command to enable a VRRP IPv4 session or a VRRPv3 IPv6 session on the router.

**Syntax** `disable`

**Mode** Router Configuration

**Usage notes** See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 and IPv6 configuration details.

**Examples** The example below shows you how to disable the VRRP session for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# disable
```

The example below shows you how to disable the VRRPv3 session for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# disable
```

**Related commands** [enable \(VRRP\)](#)

[router ipv6 vrrp \(interface\)](#)  
[show vrrp](#)

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# enable (VRRP)

**Overview** Use this command to enable the VRRP session on the router to make it participate in virtual routing. To make changes to the VRRP configuration, first disable the router from participating in virtual routing using the [disable \(VRRP\)](#) command.

**Syntax** enable

**Mode** Router Configuration

**Usage notes** You must configure the virtual IP address and define the interface for the VRRP session (using the [virtual-ip](#) or [virtual-ipv6](#) and the [router vrrp \(interface\)](#) or [router ipv6 vrrp \(interface\)](#) commands) before using this command.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 and IPv6 configuration details.

**Examples** To enable the VRRP session for VRRP VR ID 5 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# enable
```

To enable the VRRPv3 session for VRRPv3 VR ID 3 on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# enable
```

**Related commands**

- [disable \(VRRP\)](#)
- [router vrrp \(interface\)](#)
- [router ipv6 vrrp \(interface\)](#)
- [show vrrp](#)
- [virtual-ip](#)
- [virtual-ipv6](#)

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# preempt-mode

**Overview** Use this command to configure preempt mode. If preempt-mode is set to **true**, then the highest priority backup will always be the master when the default master is unavailable.

If preempt-mode is set to **false**, then a higher priority backup will not preempt a lower priority backup who is acting as master.

If preempt-mode is set to **true**, an extra parameter is available called **delay-time**. If the delay-time parameter is used, a VRRP router with a higher priority will wait the configured length of time before it preempts the lower priority VRRP router to take over as master.

**Syntax** `preempt-mode {true|false}[delay-time <0-3600>]`

| Parameter  | Description                                                                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| true       | Preemption is enabled.                                                                                                                                            |
| false      | Preemption is disabled.                                                                                                                                           |
| delay-time | Enable preempting but delay the preempt by the amount of seconds specified by the delay-time value. Note, a delay-time of 0 means delayed preempting is disabled. |

**Default** The default is **true**.

**Mode** Router Configuration

**Usage notes** When the master router fails, the backup routers come online in priority order—highest to lowest. Preempt mode means that a higher priority back up router will take over the master role from a lower priority back up. Preempt mode set to **true** allows a higher priority backup router to relieve a lower priority backup router.

By default, a preemptive scheme is enabled whereby a higher priority backup virtual router that becomes available takes over from the backup virtual router that was previously elected to become the master virtual router.

This preemptive scheme can be disabled using the **preempt-mode false** command. If preemption is disabled on a backup virtual router that is starting up, and this router has a higher priority than the current master, the higher priority backup will not preempt the current master, and the lower priority master will stay in the master role.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about:

- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details
- preempt mode and preempt delay-time

**Examples** The example below shows you how to configure preempt-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# preempt-mode true
```

The example below shows you how to configure preempt-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# preempt-mode false
```

The example below shows you how to configure preempt-mode as true for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# preempt-mode true
```

The example below shows you how to configure preempt-mode as false for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# preempt-mode false
```

The example below shows you how to configure delay-time as 20 seconds for VRRPv3 VR ID 5 on vlan5:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 5 vlan5
awplus(config-router)# preempt-mode true delay-time 20
```

**Related commands**

- [circuit-failover](#)
- [priority](#)
- [router vrrp \(interface\)](#)
- [router ipv6 vrrp \(interface\)](#)

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# priority

**Overview** Use this command to configure the VRRP router priority within the virtual router. The highest priority router is Master (unless [preempt-mode](#) is false).

Use the **no** variant of this command to remove the VRRP router priority within the virtual router, which has been set using the **priority** command.

**Syntax** `priority <1-255>`  
`no priority`

| Parameter                  | Description                                                                                                       |
|----------------------------|-------------------------------------------------------------------------------------------------------------------|
| <code>&lt;1-255&gt;</code> | The priority. For the master router, use 255 for this parameter; otherwise use any number from the range <1-254>. |

**Default** On a master router default priority is 255; on a backup router, default priority is 100.

**Mode** Router Configuration

**Usage notes** Priority determines the role that each VRRP router plays and what happens if the master virtual router fails. If a VRRP router owns the IP address of the virtual router and the IP address of the interface, then this VRRP router functions as the master virtual router.

Priority also determines whether a VRRP router functions as a backup virtual router and the order of ascendancy to becoming a master virtual router if the master virtual router fails. Configure the priority of each backup virtual router with a value of 1 through 254.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 and IPv6 configuration details.

**Examples** The example below shows you how to configure 101 as the priority for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# priority 101
```

The example below shows you how to remove the priority configured for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no priority
```

The example below shows you how to configure 101 as the priority for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# priority 101
```

The example below shows you how to remove the configured priority for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# no priority
```

**Related commands** [circuit-failover](#)  
[preempt-mode](#)

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# router ipv6 vrrp (interface)

**Overview** Use this command to configure VRRPv3 for IPv6 and define the interface that will participate in virtual routing to send and receive advertisement messages. This command allows you to enter the Router Configuration mode.

Use the **no** variant of this command to remove the VRRPv3 for IPv6 configuration. Disable the VRRP session before using the **no** variant of this command.

**Syntax** `router ipv6 vrrp <vrid> <interface>`  
`no router ipv6 vrrp <vrid> <interface>`

| Parameter   | Description                                                                                                                                                                                            |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <vrid>      | <1-255> The ID of the virtual router VRRPv3 IPv6 session to create.                                                                                                                                    |
| <interface> | Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRPv3 IPv6 advertisement messages. |

**Mode** Global Configuration

**Usage notes** Use the required <interface> placeholder to define the interface that will participate in virtual routing. This interface is used for two purposes - to send/receive advertisement messages and to forward on behalf of the virtual router when in master state.

**NOTE:** *Configuring a high number of instances may adversely affect the device's performance, depending on the device CPU, the other protocols it is running, and whether you set the advertisement interval to less than 1 second.*

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Examples** The example below shows you how to enable a VRRPv3 session with VR ID 3 on vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan2
awplus(config-router)# enable
```

The example below shows you how to disable a VRRPv3 session with VR ID 3 on vlan2:

```
awplus(config-router)# disable
awplus(config-router)# exit
awplus(config)# no router ipv6 vrrp 3 vlan2
```

**Related commands** [advertisement-interval](#)  
[circuit-failover](#)

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# router vrrp (interface)

**Overview** Use this command to configure VRRP IPv4 and define the interface that will participate in virtual routing to send and receive advertisement messages. This command allows you to enter the Router Configuration mode.

Use the **no** variant of this command to remove the VRRP IPv4 configuration. Disable the VRRP session before using the **no** variant of this command.

**Syntax** `router vrrp <vrid> <interface>`  
`no router vrrp <vrid> <interface>`

| Parameter   | Description                                                                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <vrid>      | <1-255> The ID of the virtual router VRRP IPv4 session to create.                                                                                                                                    |
| <interface> | Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRP IPv4 advertisement messages. |

**Mode** Global Configuration

**Usage notes** Use the required <interface> placeholder to define the interface that will participate in virtual routing. This interface is used for two purposes - to send/receive advertisement messages and to forward on behalf of the virtual router when in master state.

**NOTE:** *Configuring a high number of instances may adversely affect the device's performance, depending on the device CPU, the other protocols it is running, and whether you set the advertisement interval to less than 1 second.*

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Examples** To enable a VRRP session with VR ID 5 on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan1
awplus(config-router)# enable
```

To disable a VRRP session with VR ID 5 on vlan1, use the commands:

```
awplus(config-router)# disable
awplus(config-router)# exit
awplus(config)# no router vrrp 5 vlan1
```

**Related commands**

- advertisement-interval
- circuit-failover
- disable (VRRP)
- enable (VRRP)

**Command changes**    Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# show debugging vrrp

**Overview** Use this command to display the set VRRP debugging option. Use the terminal monitor command to display output on the console otherwise debug output is in the log file.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Syntax** `show debugging vrrp`

**Mode** User Exec and Privileged Exec

**Example** The example below shows you how to display VRRP debugging:

```
awplus# show debugging vrrp
```

**Related commands**

- [debug vrrp](#)
- [debug vrrp events](#)
- [debug vrrp packet](#)

# show running-config router ipv6 vrrp

**Overview** Use this command to show the running configuration for VRRPv3 IPv6.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Syntax** `show running-config router vrrp`

**Mode** Privileged Exec, Global Configuration, Line Configuration, and Interface Configuration.

**Example** The example below shows you how to display the running configuration for VRRPv3 IPv6:

```
awplus# show running-config router ipv6 vrrp
```

**Output** Figure 53-1: Example output from the **show running-config router ipv6 vrrp** command

```
!
router ipv6 vrrp 3 vlan3
 virtual-ip fe80::202:b3ff:fed5:983e master
 circuit-failover vlan3 3
 advertisement-interval 6
 preempt-mode false
!
```

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# show running-config router vrrp

**Overview** Use this command to show the running configuration for VRRP IPv4.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Syntax** `show running-config router vrrp`

**Mode** Privileged Exec, Global Configuration, Line Configuration, and Interface Configuration.

**Example** The example below shows you how to display the running configuration for VRRP IPv4:

```
awplus# show running-config router vrrp
```

**Output** Figure 53-2: Example output from the **show running-config router vrrp** command

```
!
router vrrp 2 vlan2
 circuit-failover vlan2 2
 advertisement-interval 4
 preempt-mode true
!
```

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# show vrrp

**Overview** Use this command to display information about all VRRP IPv4 sessions. This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Syntax** `show vrrp [brief]`

| Parameter | Description                     |
|-----------|---------------------------------|
| brief     | Brief summary of VRRP sessions. |

**Mode** User Exec and Privileged Exec

**Example** To display information about all VRRP IPv4 sessions, enter the command:

```
awplus# show vrrp
```

To display brief summary output about VRRP IPv4 sessions, enter the command:

```
awplus# show vrrp brief
```

**Output** Figure 53-3: Example output from the **show vrrp** command

```
awplus#show vrrp
VMAC enabled
Address family IPv4
VRRP Id: 1 on interface: vlan2
State: AdminUp - Master
Virtual IP address: 192.168.1.2 (Not-owner)
Priority is 100
Advertisement interval: 100 centiseconds
Preempt mode: TRUE
Multicast membership on IPv4 interface vlan2: JOINED
Transition mode: FALSE
Accept mode: FALSE
Master address: 192.168.1.3
```

Figure 53-4: Example output from the **show vrrp brief** command

```
awplus#show vrrp brief
Interface Grp Prio Own Pre State Master addr Group addr
vlan10 1 200 N P Master 192.168.10.4 192.168.10.253
vlan10 2 150 N P Backup 192.168.10.4 192.168.10.254
vlan11 3 200 N P Master 192.168.11.4 192.168.11.253
vlan11 4 150 N P Backup 192.168.11.4 192.168.11.254
```

**Command  
changes**    Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# show vrrp counters

**Overview** This command displays VRRP SNMP counters on the console, as described in the VRRP MIB and RFC2787, for debugging use while you configure VRRP with commands in this chapter.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show vrrp counters`

**Mode** User Exec and Privileged Exec

**Usage notes** The output has a section for global counters and a section of counters for each VRRP instance configured. See the descriptions of the counters below the sample output as per RFC2787.

**NOTE:** Note that the counters displayed with this commands are the same counters as described in RFC 2787, except for the “Monitored Circuit Up” and “Monitored Circuit Down” counters, which are additions beyond the MIB.

**Example** To display information about VRRP SNMP counters on the console, enter the command:

```
awplus# show vrrp counters
```

Figure 53-5: Example output from the **show vrrp counters** command

```
awplus#show vrrp counters
VRRP Global Counters:
 Checksum Errors 230
 Version Errors 0
 VRID Errors 230

VRRP IPv4 counters for VR 10/vlan10:
 Master Transitions 0
 Received Advertisements ... 0
 Internal Errors 0
 TTL Errors 0
 Received Priority 0 Pkt ... 0
 Sent Priority 0 Pkt 0
 Received Invalid Type 0
 Address List Errors 0
 Packet Length Errors 0
 Monitored Circuit Up 0
 Monitored Circuit Down..... 0
```

```
VRRP IPv4 counters for VR 100/vlan100:
Master Transitions 1
Received Advertisements ... 1614
Internal Errors 0
TTL Errors 0
Received Priority 0 Pkt ... 0
Sent Priority 0 Pkt 0
Received Invalid Type 0
Address List Errors 0
Packet Length Errors 0
Monitored Circuit Up 0
Monitored Circuit Down..... 2
```

**Table 1:** Global counters with descriptions for the **show vrrp counters** command:

| Counter         | Description                                                                              |
|-----------------|------------------------------------------------------------------------------------------|
| Checksum Errors | The total number of VRRP packets received with an invalid VRRP checksum value.           |
| Version Errors  | The total number of VRRP packets received with an unknown or unsupported version number. |
| VRID Errors     | The total number of VRRP packets received with an invalid VRID for this virtual router.  |

**Table 2:** Per VR counters with descriptions for the **show vrrp counters** command:

| Counter                 | Description                                                                                                                                                     |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Master Transitions      | The total number of times that this virtual router's state has transitioned to MASTER.                                                                          |
| Received Advertisements | The total number of VRRP advertisements received by this virtual router.                                                                                        |
| Internal Errors         | The total number of VRRP advertisement packets received for which the advertisement interval is different than the one configured for the local virtual router. |
| TTL Errors              | The total number of VRRP packets received by the virtual router with IP TTL (Time-To-Live) not equal to 255.                                                    |
| Received Priority 0 Pkt | The total number of VRRP packets received by the virtual router with a priority of '0'.                                                                         |
| Sent Priority 0 Pkt     | The total number of VRRP packets sent by the virtual router with a priority of '0'.                                                                             |
| Received Invalid Type   | The number of VRRP packets received by the virtual router with an invalid value in the 'type' field.                                                            |
| Address List Errors     | The total number of packets received for which the address list does not match the locally configured list for the virtual router.                              |

**Table 2:** Per VR counters with descriptions for the **show vrrp counters** command: (cont.)

| Counter                | Description                                                                                        |
|------------------------|----------------------------------------------------------------------------------------------------|
| Packet Length Errors   | The total number of packets received with a packet length less than the length of the VRRP header. |
| Monitored Circuit Up   | The total number of times the monitored circuit has generated the UP event.                        |
| Monitored Circuit Down | The total number of times the monitored circuit has generated the down event.                      |

**Command changes**

Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# show vrrp ipv6

**Overview** Use this command to display information about all configured VRRPv3 IPv6 sessions for all interfaces, or all VRRPv3 IPv6 sessions for a given interface with the optional parameter.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Syntax** `show vrrp ipv6 [<interface>]`

| Parameter   | Description                                                                                                                                                                                            |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface> | Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRPv3 IPv6 advertisement messages. |

**Mode** User Exec and Privileged Exec

**Example** To display information about all VRRPv3 IPv6 sessions, enter the command:

```
awplus# show vrrp ipv6
```

**Output** Figure 53-6: Example output from the **show vrrp ipv6** command for a specific interface

```
awplus#show vrrp ipv6 vlan2
VrId <1>
State is Master
Virtual IP is fe80::202:b3ff:fed5:983e (Owner)
Interface is vlan2
Priority is 255
Advertisement interval is 4 sec
Preempt mode is FALSE
```

**Related commands** [enable \(VRRP\)](#)  
[disable \(VRRP\)](#)

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# show vrrp (session)

**Overview** Use this command to display information for a particular VRRP session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Syntax** `show vrrp <vrid> <interface>`

| Parameter   | Description                                                                                 |
|-------------|---------------------------------------------------------------------------------------------|
| <vrid>      | <1-255> The virtual router ID for which to display information. Session must already exist. |
| <interface> | The interface to display information about.                                                 |

**Mode** User Exec and Privileged Exec

**Example** To display information about VRRP session 1 configured on vlan2, use the command:

```
awplus# show vrrp 1 vlan2
```

**Output** Figure 53-7: Example output from the **show vrrp** command for a specific interface

```
awplus#show vrrp 1 vlan2
Address family IPv4
VrId <1>
 Interface is vlan2
 State is Initialize
 Virtual IP address is 10.10.11.250 (Not IP owner)
 Priority is 100
 Advertisement interval is 1 sec
```

In this example, the output shows that a Virtual IP address has been set.

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# transition-mode

**Overview** Use this command to configure the IPv4 transition mode. Transition mode allows you to upgrade from VRRPv2 to VRRPv3 and gives interoperability between VRRPv2 and VRRPv3.

If transition-mode is set to **true**, then the IPv4 transition mode is enabled and VRRPv2 and VRRPv3 advertisements are sent allowing VRRPv2 and VRRPv3 interoperability. Received VRRPv2 advertisement packets are accepted and processed when transition-mode is true.

If transition-mode is set to **false**, then the IPv4 transition mode is disabled and only VRRPv3 advertisements are sent. Received VRRPv2 advertisement packets are dropped.

Note the [advertisement-interval](#) should not be configured to less than 1 second when using transition-mode. VRRPv2 can only use advertisements in whole second intervals.

**Syntax** `transition-mode {true|false}`

| Parameter | Description                                                                                                                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| true      | Transition mode is enabled. This results in VRRPv2 and VRRPv3 IPv4 advertisements being sent. Transition mode is only available on VRRPv3 for interoperability with VRRPv2 while upgrading to VRRPv3. |
| false     | Transition mode is disabled. This stops VRRPv2 IPv4 advertisements being sent. Only VRRPv3 advertisements are sent when disabled. Disable transition-mode after upgrading from VRRPv2 to VRRPv3.      |

**Default** The default is **false**.

**Mode** Router Configuration

**Usage notes** See the [VRRP Feature Overview and Configuration Guide](#) for more information about:

- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details
- configuring transition mode to upgrade from VRRPv2 to VRRPv3.

**Examples** The example below shows you how to configure IPv4 transition-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# transition-mode true
```

The example below shows you how to configure IPv4 transition-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# transition-mode false
```

**Related commands** [router vrrp \(interface\)](#)

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# undebg vrrp

**Overview** Use this command to disable all VRRP debugging.

**Syntax** undebg vrrp all

**Mode** Privileged Exec

**Example** The example below shows you how to disable all VRRP debugging:

```
awplus# undebg vrrp all
```

**Related commands** [debug vrrp](#)

# undebg vrrp events

**Overview** Use this command to disable debugging options for VRRP event troubleshooting.

**Syntax** undebg vrrp events

**Mode** Privileged Exec

**Example** The example below shows you how to disable VRRP event debugging:

```
awplus# undebg vrrp events
```

**Related commands** [debug vrrp events](#)

# undebg vrrp packet

**Overview** Use this command to disable debugging options for VRRP packets.

**Syntax** `undebg vrrp packet [send|recv]`

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| send      | Disable the debug option set for sent packets.     |
| recv      | Disable the debug option set for received packets. |

**Mode** Privileged Exec

**Examples** The example below shows you how to disable VRRP sent packet debugging:

```
awplus# undebg vrrp packet send
```

The example below shows you how to disable VRRP received packet debugging:

```
awplus# undebg vrrp packet recv
```

The example below shows you how to disable all VRRP packet debugging:

```
awplus# undebg vrrp packet
```

**Related commands** [debug vrrp packet](#)

# virtual-ip

**Overview** Use this command to set the virtual IP address for the VRRP session. This is the IP address of the virtual router that end hosts set as their default gateway.

Use the **no** variant of this command to disable this feature.

**Syntax** `virtual-ip <ip-address> [master|backup|owner]`  
`no virtual-ip`

| Parameter    | Description                                                                                                                                                                                                       |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address> | The virtual IPv4 address of the virtual router, entered in dotted decimal format A.B.C.D.                                                                                                                         |
| master       | Sets the default state of the VRRP router within the Virtual Router as <b>master</b> . For master, the router must own the Virtual IP address. Specify the <b>owner</b> option before using <b>master</b> option. |
| backup       | Sets the default state of the VRRP router within the Virtual Router as <b>backup</b> .                                                                                                                            |
| owner        | Sets the IPv6 address of the VRRP router within the Virtual Router as the <b>owner</b> . Specify this before using the <b>master</b> option.                                                                      |

**Mode** Router Configuration

**Usage notes** The VRRP master and owner of the virtual IPv4 address for the VRRP session only responds to the packets destined to the virtual IPv4 address. The VRRP master that is not an owner of the virtual IPv4 address for the VRRP session does not respond to the packets destined to the virtual IPv4 address, but forwards packets with a VMAC as the destination address. See the [vrrp vmac](#) command to enable and disable this feature.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Examples** The example below shows you how to set the virtual IP address for VRRP VR ID 5 and the router as the VRRP master:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 master
```

The example below shows you how to set the virtual IPv4 address for VRRP VR ID 5 and the router as the VRRP backup:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 backup
```

The example below shows you how to set the virtual IPv4 address for VRRP VR ID 5 and the router as owner of the virtual IPv4 address:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 owner
```

The example below shows you how to disable the virtual IPv4 address for VRRP VR ID 5

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no virtual-ip
```

**Command  
changes**

Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

# virtual-ipv6

**Overview** Use this command to set the virtual IPv6 address for the VRRPv3 session. This is the IPv6 address of the virtual router that end hosts set as their default gateway.

Note that the primary IPv6 address specified is an IPv6 link-local address. See the Usage note below for further information.

Use the **no** variant of this command to disable this feature.

**Syntax** `virtual-ipv6 <ipv6-address> [master|backup]  
[primary|secondary]  
no virtual-ipv6`

| Parameter                         | Description                                                                                                                                                                                                                                          |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-address&gt;</code> | The IPv6 address of the virtual router, entered in hexadecimal, in the format X:X::X:X.                                                                                                                                                              |
| <code>master</code>               | Sets <b>master</b> to be the default state of the VRRPv3 router within the Virtual Router. For <b>master</b> , we recommend using a Virtual IP address that is not owned by any of the VRRP routers in the same grouping (that share the same VRID). |
| <code>backup</code>               | Sets <b>backup</b> to be the default state of the VRRPv3 router within the Virtual Router.                                                                                                                                                           |
| <code>primary</code>              | Sets the specified address as the primary IPv6 address. The primary address must be a link-local IPv6 address.                                                                                                                                       |
| <code>secondary</code>            | Sets the specified address as the secondary IPv6 address. Normally this would be a globally-routable IPv6 address. This enables you to specify a globally-routable address as the default gateway address for all the hosts on an interface.         |

**Mode** Router Configuration

**Usage notes** The virtual router will reply to ping, telnet, and SSH requests to the virtual IP address. The virtual router will reply even if it does not own the virtual IP address.

The AlliedWare Plus VRRPv3 implementation supports one IPv6 virtual link local address per virtual router ID. Note that in the command examples fe80::1 is an IPv6 link-local address. An IPv6 link-local address is used because IPv6 link-local addresses are used by IPv6 ND (Neighbor Discovery). A host's default route to a router points to the IPv6 link-local address, not a specific global IPv6 address for the router. For the host's traffic to switch over to a backup router, the IPv6 link-local address of the router is used by VRRPv3.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Examples** The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as the VRRPv3 master:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 master
```

The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as the VRRPv3 backup:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 backup
```

The example below shows you disable the virtual IPv6 address for VRRPv3 VR ID 3:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# no virtual-ipv6
```

**Command changes** Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

## vrrp vmac

**Overview** Use this command to enable or disable the VRRP Virtual MAC feature. This feature is used by VRRP to make the hosts use the virtual MAC address as the physical hardware address of their gateway.

A VRRP router master will use the virtual MAC address for any ARP responses associated with the virtual IP address, or any gratuitous ARPs sent on behalf of the virtual IP address.

All VRRP advertisements are sent using this virtual MAC address as the source MAC address.

The virtual MAC address has the form 00:00:5e:00:01:<VRID>, where VRID is the ID of the Virtual Router.

**Syntax** `vrrp vmac {enable|disable}`

**Mode** Global Configuration

**Examples** To enable Virtual MAC enter:

```
awplus# configure terminal
awplus(config)# vrrp vmac enable
```

To disable Virtual MAC enter:

```
awplus# configure terminal
awplus(config)# vrrp vmac disable
```

# debug epsr

**Overview** This command enables EPSR debugging.

The **no** variant of this command disables EPSR debugging.

**Syntax** `debug epsr {info|msg|pkt|state|timer|all}`  
`no debug epsr {info|msg|pkt|state|timer|all}`

| Parameter | Description                                                                                                                                                                                                              |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| info      | Send general EPSR information to the console.<br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude the above information from being sent to the console.                                |
| msg       | Send the decoded received and transmitted EPSR packets to the console.<br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude the above packets from being sent to the console.           |
| pkt       | Send the received and transmitted EPSR packets as raw ASCII text to the console.<br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude the above packets from being sent to the console. |
| state     | Send EPSR state transitions to the console.<br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude state transitions from being sent to the console.                                      |
| timer     | Send EPSR timer information to the console.<br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude timer information from being sent to the console.                                      |
| all       | Send all EPSR debugging information to the console.<br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude any debugging information from being sent to the console.                      |

**Mode** Privileged Exec and Global Configuration

**Examples** To enable state transition debugging, use the command:

```
awplus# debug epsr state
```

To disable EPSR packet debugging, use the command:

```
awplus# no debug epsr pkt
```

**Related commands** [undebg epsr](#)

## epsr

**Overview** This command sets the timer values for an EPSR instance. These are only valid for master nodes.

**NOTE:** This command will only run on switches that are capable of running as an EPSR master node. However, even if your switch cannot function as an EPSR master node, you still may need to configure this command on whatever switch is the master within your EPSR network.

**Syntax** `epsr <epsr-instance> {hellotime <1-32767>|failovertime <2-65535> ringflaptime <0-65535>}`  
`no epsr <epsr-instance>`

**CAUTION:** Using the no variant of this command will remove the specified EPSR instance.

| Parameter                                 | Description                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;epsr-instance&gt;</code>        | Name of the EPSR instance.                                                                                                                                                                                                                                                                                                           |
| <code>hellotime &lt;1-32767&gt;</code>    | The number of seconds between the transmission of health check messages.                                                                                                                                                                                                                                                             |
| <code>failovertime &lt;2-65535&gt;</code> | The number of seconds that a master waits for a returning health check message before entering the failed state. <b>The failover time should be greater than twice the hellotime.</b> This is to force the master node to wait until it detects the absence of two sequential healthcheck messages before entering the failed state. |
| <code>ringflaptime &lt;0-65535&gt;</code> | The minimum number of seconds that a master must remain in the failed state.                                                                                                                                                                                                                                                         |

**Mode** EPSR Configuration

**Examples** To set the hellotimer to 5 seconds for the EPSR instance called blue, use the command:

```
awplus(config-epsr)# epsr blue hellotime 5
```

**NOTE:** When stacking is used with EPSR, the EPSR **failovertime** should be at least 5 seconds.

To delete the EPSR instance called blue, use the command:

```
awplus(config-epsr)# no epsr blue
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr mode transit controlvlan](#)  
[epsr configuration](#)

[epsr datavlan](#)

[epsr state](#)

[epsr trap](#)

[show epsr](#)

# epsr configuration

**Overview** Use this command to enter EPSR Configuration mode so that EPSR can be configured.

**Syntax** `epsr configuration`

**Mode** Global Configuration

**Example** To change to EPSR mode, use the command:

```
awplus(config)# epsr configuration
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr](#)  
[show epsr](#)

# epsr datavlan

**Overview** This command adds a data VLAN or a range of VLAN identifiers to a specified EPSR instance.

The **no** variant of this command removes a data VLAN or data VLAN range from an EPSR instance.

**Syntax** `epsr <epsr-instance> datavlan {<vlanid>|<vlanid-range>}`  
`no epsr <epsr-instance> datavlan {<vlanid>|<vlanid-range>}`

| Parameter                          | Description                                                                                      |
|------------------------------------|--------------------------------------------------------------------------------------------------|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance.                                                                       |
| <code>datavlan</code>              | Adds a data VLAN to be protected by the EPSR instance.                                           |
| <code>&lt;vlanid&gt;</code>        | The VLAN's VID - a number between 1 and 4094 excluding the number selected for the control VLAN. |
| <code>&lt;vlanid-range&gt;</code>  | Specify a range of VLAN identifiers using a hyphen to separate identifiers.                      |

**Mode** EPSR Configuration

**Usage notes** We recommend you

- set the EPSR control VLAN to `vlan2`, using the [epsr mode master controlvlan primary port](#) and [epsr mode transit controlvlan](#) commands, then
- set the EPSR data VLAN between to be a value between 3 and 4094, using the [epsr datavlan](#) command.

**Examples** To add `vlan3` to the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue datavlan vlan3
```

To add `vlan2` and `vlan3` to the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue datavlan vlan2-vlan3
```

To remove `vlan3` from the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue datavlan vlan3
```

To remove `vlan2` and `vlan3` from the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue datavlan vlan2-vlan3
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr mode transit controlvlan](#)  
[show epsr](#)

# epsr enhancedrecovery enable

**Overview** This command enables EPSR's enhanced recovery mode. Enhanced recovery mode enables a ring to apply additional recovery procedures when a ring with more than one break partially mends. For more information, see the [EPSR Feature Overview and Configuration Guide](#).

The **no** variant of this command disables the enhanced recovery mode.

**Syntax** `epsr <epsr-instance> enhancedrecovery enable`  
`no epsr <epsr-instance> enhancedrecovery enable`

| Parameter                          | Description                |
|------------------------------------|----------------------------|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance. |

**Default** Default is that enhanced recovery mode disabled.

**Mode** EPSR Configuration

**Example** To apply enhanced recovery on the EPSR instance called `blue`, use the command:  
`awplus(config-epsr)# epsr blue enhancedrecovery enable`

**Related commands** [show epsr](#)

# epsr flush-type

**Overview** Use this command to set how EPSR flushes Layer 2 entries when a topology change occurs. It can be configured to flush all Layer 2 entries on its EPSR interfaces or only flush the Layer 2 entries on its EPSR data VLANs.

Use the **no** variant of this command to revert to the default setting.

**Syntax** `epsr <epsr-name> flush-type {interface|vlan}`  
`no epsr <epsr-name> flush-type`

| Parameter   | Description                                                                          |
|-------------|--------------------------------------------------------------------------------------|
| <epsr-name> | The name of the EPSR instance to set the flush-type for.                             |
| interface   | Flush all Layer 2 entries from the EPSR interface on a topology change.              |
| vlan        | Flush the Layer 2 entries on the EPSR interface and data VLANs on a topology change. |

**Default** The default flush-type is vlan

**Mode** EPSR Configuration

**Usage notes** To flush all entries on the EPSR interface (including non-EPSR data VLANs) the flush-type command must be explicitly configured on the EPSR ring with the **interface** parameter.

Select **interface** as the flush-type to help reduce latency caused during EPSR topology changes. This type of flushing is quicker and less granular than flushing per data vlan, as flushing on a data **vlan** may incur a higher overhead, reducing EPSR responsiveness to ring topology changes.

Interface flushing can be used to optimize EPSR rings with a large number of VLANs. It will however also require relearning on any VLANs that are on an EPSR interface but not part of the EPSR configuration.

**Example** To configure the behavior of EPSR ring 'red' transit node on topology changes to flush all Layer 2 entries on its EPSR ring interfaces, use the following commands:

```
awplus# configure terminal
awplus(config)# epsr configuration
awplus(config-epsr)# epsr red mode transit controlvlan 10
awplus(config-epsr)# epsr red datavlan 20-29
awplus(config-epsr)# epsr red flush-type interface
awplus(config-epsr)# epsr red state enable
```

**Related commands** [show epsr](#)

**Command changes** Version 5.4.9-1.1: command added

# epsr mode master controlvlan primary port

**Overview** This command creates a master EPSR instance.

**NOTE:** This command will only run on switches that are capable of running as an EPSR master node. However, even if your switch cannot function as an EPSR master node, you still need to configure this command on whatever switch is the master within your EPSR network.

**Syntax** `epsr <epsr-instance> mode master controlvlan <2-4094>  
primaryport <port>`

| Parameter       | Description                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <epsr-instance> | Name of the EPSR instance.                                                                                                                          |
| mode            | Determines the node is acting as a master.                                                                                                          |
| master          | Sets switch to be the master node for the named EPSR ring.                                                                                          |
| controlvlan     | The VLAN that will transmit EPSR control frames.                                                                                                    |
| <2-4094>        | VLAN id.                                                                                                                                            |
| primaryport     | Primary port for the EPSR instance.                                                                                                                 |
| <port>          | The primary port. The port may be a switch port (e.g. port1.0.4) or a static channel group (e.g. sa3). It cannot be a dynamic (LACP) channel group. |

**NOTE:** The software allows you to configure more than two ports or static channel groups to the control VLAN within a single switch or stacked node. However, we advise against this because in certain situations it can produce unpredictable results.

**Mode** EPSR Configuration

**Example** To create a master EPSR instance called blue with vlan2 as the control VLAN and port1.0.1 as the primary port, use the command:

```
awplus(config-epsr)# epsr blue mode master controlvlan vlan2
primaryport port1.0.1
```

**Related commands** [epsr mode transit controlvlan](#)  
[show epsr](#)

# epsr mode transit controlvlan

**Overview** This command creates a transit EPSR instance.

**Syntax** `epsr <epsr-instance> mode transit controlvlan <2-4094>`

| Parameter       | Description                                                 |
|-----------------|-------------------------------------------------------------|
| <epsr-instance> | Name of the EPSR instance.                                  |
| mode            | Determines the node is acting as a transit node.            |
| transit         | Sets switch to be the transit node for the named EPSR ring. |
| controlvlan     | The VLAN that will transmit EPSR control frames.            |
| <2-4094>        | VLAN id.                                                    |

**NOTE:** The software allows you to configure more than two ports or static channel groups to the control VLAN within a single switch or stacked node. However, we advise against this because in certain situations it can produce unpredictable results.

If the control VLAN contains more than two ports (or static channels) an algorithm selects the two ports or channels with the lowest number to be the ring ports. However if the switch has only one channel group is defined to the control vlan, EPSR will not operate on the secondary port.

EPSR does not support Dynamic link aggregation (LACP).

**Mode** EPSR Configuration

**Example** To create a transit EPSR instance called `blue` with `vlan2` as the control VLAN, use the command:

```
awplus(config-epsr)# epsr blue mode transit controlvlan vlan2
```

## epsr priority

**Overview** This command sets the priority of an EPSR instance on an EPSR node. Priority is used to prevent “superloops” forming under fault conditions with particular ring configurations. Setting a node to have a priority greater than one turns on **superloop protection**.

The **no** variant of this command returns the priority of the EPSR instance back to its default value of 0, which also disables EPSR Superloop prevention.

**Syntax** `epsr <epsr-instance> priority <0-127>`  
`no <epsr-instance> priority`

| Parameter                          | Description                                                                                   |
|------------------------------------|-----------------------------------------------------------------------------------------------|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance.                                                                    |
| <code>priority</code>              | The priority of the ring instance selected by the <code>epsr-name</code> parameter.           |
| <code>&lt;0-127&gt;</code>         | The priority to be applied (0 is the lowest priority and represents no superloop protection). |

**Default** The default priority of an EPSR instance on an EPSR node is 0. The negated form of this command resets the priority of an EPSR instance on an EPSR node to the default value.

**Mode** EPSR Configuration

**Example** To set the priority of the EPSR instance called ‘blue’ to the highest priority (127), use the command:

```
awplus(config-epsr)# epsr blue priority 127
```

To reset the priority of the EPSR instance called ‘blue’ to the default (0), use the command:

```
awplus(config-epsr)# no epsr blue priority
```

## epsr state

**Overview** This command enables or disables an EPSR instance.

**Syntax** `epsr <epsr-instance> state {enabled|disabled}`

| Parameter                          | Description                        |
|------------------------------------|------------------------------------|
| <code>&lt;epsr-instance&gt;</code> | The name of the EPSR instance.     |
| <code>state</code>                 | The operational state of the ring. |
| <code>enabled</code>               | EPSR instance is enabled.          |
| <code>disabled</code>              | EPSR instance is disabled.         |

**Mode** EPSR Configuration

**Usage notes** In a super-loop protection scenario, if you have:

- a device on the common segment acting as the master node for multiple EPSR rings,
- and you disable the rings and later re-enable them (e.g., when doing EPSR configuration changes),
- then you must re-enable the ring with the highest EPSR SLP priority **last**.

If you do not re-enable the rings in that order, the primary port may end up permanently in a blocking state. If the primary port does end up in a permanent blocking state, recover by disabling and re-enabling the EPSR ring that has the highest priority.

**Example** To enable the EPSR instance called 'blue', use the command:

```
awplus(config-epsr)# epsr blue state enabled
```

[epsr mode transit controlvlan](#)

# epsr topology-change

**Overview** Use this command to allow the given EPSR instance to accept notifications from other topology protocols, namely G.8032, for Topology Change Notifications (TCN).

Use the **no** variant of this command to return the EPSR instance to where it does not accept TCNs from the other specified protocol, and as a result does not send out a "flush FDB" message.

**Syntax** `epsr <epsr-name> topology-change g8032`  
`no epsr <epsr-name> topology-change g8032`

| Parameter       | Description                                                                                                                                                                             |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <epsr-name>     | The name of the EPSR instance for which the topology-change applies to.                                                                                                                 |
| topology-change | The topology-change value to be set for the instance.                                                                                                                                   |
| g8032           | Specify that G.8032 is the other protocol that the topology-change notifications are allowed to be accepted from in order to send "flush FDB" messages to other EPSR nodes in the ring. |

**Default** The default value is no notifications are accepted and in turn no "flush FDB" messages are sent.

**Mode** EPSR Configuration

**Usage notes** The purpose of this command is to allow EPSR to accept notifications from other topology protocols, namely G.8032, about Topology Change Notifications (TCN). Once EPSR accepts the TCN, it will in turn notify the other nodes on the EPSR ring to perform an FDB flush.

**Example** To configure an EPSR instance named "red" to accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# epsr red topology-change g8032
```

To configure an EPSR instance named "red" to no longer accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# no epsr red topology-change g8032
```

## epsr trap

**Overview** This command enables SNMP traps for an EPSR instance. The traps will be sent when the EPSR instance changes state.

The **no** variant of this command disables SNMP traps for an EPSR instance. The traps will no longer be sent when the EPSR instance changes state.

**Syntax** `epsr <epsr-instance> trap`  
`no epsr <epsr-instance> trap`

| Parameter                          | Description                      |
|------------------------------------|----------------------------------|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance.       |
| <code>trap</code>                  | SNMP trap for the EPSR instance. |

**Mode** EPSR Configuration

**Example** To enable traps for the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue trap
```

To disable traps for the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue trap
```

**NOTE:** The above output is only displayed on an EPSR master.

**Table 4:** Example output from the **show epsr** command run on a Transit Node

```

EPSR Information

Name test4
Mode Transit
Status Enabled
State Complete
Control Vlan 4
Data VLAN(s) 20
Interface Mode Ports Only
Primary Port port1.0.3
 Status Forwarding (logically blocking)
 Is On Common Segment No
 Blocking Control Physical
Secondary Port port1.0.4
 Status Blocked
 Is On Common Segment No
 Blocking Control Physical
Hello Time 1 s
Failover Time 2 s
Ring Flap Time 0 s
Trap Enabled
Enhanced Recovery Disabled
SLP Priority 12

```

**Table 5:** Parameters displayed in the output of the **show epsr** command

| Parameter on Master Node | Parameter on Transit Node | Description                                                                                                                                                       |
|--------------------------|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                     | Name                      | The name of the EPSR instance.                                                                                                                                    |
| Mode                     | Mode                      | The mode in which the EPSR instance is configured - either Master or Transit                                                                                      |
| Status                   | Status                    | Indicates whether the EPSR instance is enabled or disabled                                                                                                        |
| State                    | State                     | Indicates state of the EPSR instance's state machine. Master states are: Idle, Complete, and Failed. Transit states are Links-Up, Links-Down, and Pre-Forwarding. |
| Control Vlan             | Control Vlan              | Displays the VID of the EPSR instance's control VLAN.                                                                                                             |
| Data VLAN(s)             | Data VLAN(s)              | The VID(s) of the instance's data VLANs.                                                                                                                          |
| Interface Mode           | Interface Mode            | Whether the EPSR instance's ring ports are both physical ports (Ports Only) or are both static aggregators (Channel Groups Only).                                 |
| Primary Port             | First Port                | The EPSR instance's primary ring port.                                                                                                                            |

**Table 5:** Parameters displayed in the output of the **show epsr** command (cont.)

| Parameter on Master Node | Parameter on Transit Node | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| - Status                 | - Status                  | Whether the ring port is forwarding (Forwarding) or blocking (Blocked), or has link down (Down), and if forwarding or blocking, "(logical)" indicates the instance has only logically set the blocking state of the port because it does not have physical control of it.                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                          | - Direction               | The ring port on which the last EPSR control packet was received is indicated by "Upstream". The other ring port is then "Downstream"                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| - Status                 | - Status                  | Whether the ring port is forwarding (Forwarding) or blocking (Blocked), or has link down (Down), and if forwarding or blocking, "(logical)" indicates the instance has only logically set the blocking state of the port, because it does not have physical control of it. Note that on a master configured for SuperLoop Prevention (non-zero priority) its secondary ring port can be physically forwarding, but logically blocking. This situation arises when it is not the highest priority node in the topology (and so does not receive LINKS-DOWN messages upon common segment breaks) and a break on a common segment in its ring is preventing reception of its own health messages. |
|                          | - Direction               | The ring port on which the last EPSR control packet was received is indicated by "Upstream". # show epsr common segments

**Overview** This command displays information about all the superloop common segment ports on the switch.

**Syntax** `show epsr common segments`

**Example** To display information about all the superloop common segment ports on the switch, use the command:

```
awplus# show epsr common segments
```

**Table 6:** Example output from the **show epsr common segments** command

| EPSR Common Segments    |                  |         |      |              |                       |                     |
|-------------------------|------------------|---------|------|--------------|-----------------------|---------------------|
| Common Seg<br>Ring Port | EPSR<br>Instance | Mode    | Prio | Port<br>Type | Phys Ctrl<br>of Port? | Ring<br>Port Status |
| port1.0.4               | test_inst_Red    | Transit | 127  | Second       | Yes                   | Fwding              |

# show epsr config-check

**Overview** This command checks the configuration of a specified EPSR instance, or all EPSR instances.

If an instance is enabled, this command will check for the following errors or warnings:

- The control VLAN has the wrong number of ports.
- There are no data VLANs.
- Some of the data VLANs are not assigned to the ring ports.
- The failover time is less than 5 seconds for a stacked device.
- The instance is a master with its secondary port on a common segment.

**Syntax** `show epsr [<instance>] config-check`

| Parameter  | Description                            |
|------------|----------------------------------------|
| <instance> | Name of the EPSR instance to check on. |

**Mode** User Exec and Privileged Exec

**Example** To check the configuration of all EPSR instances and display the results, use the command:

```
awplus# show epsr config-check
```

Table 54-1: Example output from **show epsr config-check**

| EPSR Instance                                                                                        | Status  | Description                                                     |
|------------------------------------------------------------------------------------------------------|---------|-----------------------------------------------------------------|
| red                                                                                                  | Warning | Failover time is 2s but should be 5s because device is stacked. |
| white                                                                                                | OK.     |                                                                 |
| blue                                                                                                 | Warning | Primary port is not in data VLANs 29-99.                        |
| orange                                                                                               | OK.     |                                                                 |
| Don't forget to check that this node's configuration is consistent with all other nodes in the ring. |         |                                                                 |

**Related commands** [show epsr](#)

# show epsr <epsr-instance>

**Overview** This command displays information about the specified EPSR instance.

**Syntax** `show epsr <epsr-instance>`

| Parameter                          | Description                |
|------------------------------------|----------------------------|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance. |

**Mode** User Exec and Privileged Exec

**Example** To show the current settings of the EPSR instance called `blue`, use the command:

```
awplus# show epsr blue
```

**Related commands**

- [epsr mode master controlvlan primary port](#)
- [epsr mode transit controlvlan](#)
- [show epsr counters](#)

# show epsr <epsr-instance> counters

**Overview** This command displays counter information about the specified EPSR instance.

**Syntax** `show epsr <epsr-instance> counters`

| Parameter                          | Description                |
|------------------------------------|----------------------------|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance. |

**Mode** User Exec and Privileged Exec

**Example** To show the counters of the EPSR instance called `blue`, use the command:

```
awplus# show epsr blue counters
```

**Related commands**

- [epsr mode master controlvlan primary port](#)
- [epsr mode transit controlvlan](#)
- [show epsr](#)

# show epsr counters

**Overview** This command displays counter information about all EPSR instances.

**Syntax** `show epsr counters`

**Mode** User Exec and Privileged Exec

**Example** To show the counters of all EPSR instances, use the command:

```
awplus# show epsr counters
```

**Related commands**

- [epsr mode master controlvlan primary port](#)
- [epsr mode transit controlvlan](#)
- [show epsr](#)

# show epsr summary

**Overview** This command displays summary information about all EPSR instances on the switch

**Syntax** show epsr summary

**Mode** User Exec and Privileged Exec

**Example** To display EPSR summary information, use the command:

```
awplus# show epsr summary
```

**Table 55:** Example output from the **show epsr summary** command

|                                                                                               |      |          |            |           |                       |                |                           |

## cfm-sf-notify

**Overview** Use this command to configure this ERP instance to receive signal fail notifications from a Local MEP(s). This command can be used multiple times to allow multiple Local MEPs to be specified.

Use the **no** variant of this command to remove a Local MEP from sending notifications to this G.8032 ERP instance.

**Syntax** `cfm-sf-notify mep mpid <mep-id> domain <domain-name> service <ma-name>`  
`no cfm-sf-notify mep mpid <mep-id> domain <domain-name> service <ma-name>`

| Parameter     | Description                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------|
| mep           | Specify that a Local Maintenance End Point (MEP) is to provide the Signal Fail notification to this G.8032 ERP instance. |
| mpid          | Specify that the Local MEP is to be identified by MEP-id.                                                                |
| <mep-id>      | 1-8191. Specify the Local MEP's ID.                                                                                      |
| domain        | Specify the Maintenance Domain that the Local MEP is associated with.                                                    |
| <domain-name> | Specify the Maintenance Domain's CLI instance name.                                                                      |
| service       | Specify the Maintenance Association that the Local MEP is associated with.                                               |
| <ma-name>     | Specify the Maintenance Association's CLI instance name.                                                                 |

**Mode** G8032 Configure Switch

**Usage notes** CFM and Continuity Check Messaging (CCM) can be configured to detect link faults on the East or West interface ports as a whole, or faults on the R-APS VLAN on the East or West interface. In this situation CFM Local MEPs can notify G.8032 of defects it detects. G.8032 will treat these notifications as a Signal Fail (SF) for that East or West ring port. Similarly, CFM Local MEPs can notify G.8032 that the fault has cleared. When this command is used, this G.8032 ERP instance will ensure that the specified Local MEP is a Down MEP for the East or West interface used by this instance or for the R-APS VLAN on the East or West interface used by this instance.

**Example** To configure an ERP instance to receive signal fail notifications from a local MEP with an MEP ID of "12", an MD named "MD-INST1", and an MA named "MA-INST1-1", use the following commands:

```
awplus(config)# g8032 erp-instance ring2
awplus(g8032-config-switch)# cfm-sf-notify mep mpid 12 domain
MD-INST1 service MA-INST1-1
```

**Related commands**

- ethernet cfm mep
- g8032 erp-instance
- service ma-name
- show g8032 erp-instance

**Command changes**

- Version 5.4.7-0.1: command added
- Version 5.4.7-1.1: added to x310 series products
- Version 5.4.7-2.1: added to x550 series products
- Version 5.4.8-0.2: added to SBx8100 series products
- Version 5.4.8-1.1: added to SBx908 GEN2 series products

# clear g8032 erp-instance

**Overview** Use this command to:

- trigger a reversion immediately, without waiting for timers to expire, or
- clear a forced-switch or manual-switch command that was previously successfully entered on a G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `clear g8032 erp-instance <erp-instance-name>`

| Parameter                              | Description                         |
|----------------------------------------|-------------------------------------|
| <code>&lt;erp-instance-name&gt;</code> | The name of the G.8032 ERP instance |

**Mode** Privileged Exec

**Usage notes** This command can be used after a protection switch has occurred and the failure has cleared. If reversion is enabled, this command will trigger a reversion immediately, without having to wait for certain timers to expire (such as WTB or WTR). If reversion has been disabled, this command will trigger a reversion.

Alternatively, this command can be used on an ERP instance where a forced-switch or manual-switch command has been successfully entered to clear that action. The command will be ignored if a force-switch or manual-switch command had not been previously entered successfully, even if such node is in the FORCED\_SWITCH or MANUAL\_SWITCH state.

**Examples** To trigger a reversion immediately without waiting for a timer to expire on an ERP instance named "blue", use the following command:

```
awplus# clear g8032 erp-instance blue
```

Alternatively, to clear a previously applied forced-switch from an ERP instance named "blue", use the following command:

```
awplus# clear g8032 erp-instance blue
```

The forced-switch would be created using a command like this one, which forces a protection switch on the East interface of an ERP instance named "blue":

```
awplus# g8032 forced-switch erp-instance blue east-interface
```

**Related commands**

- [g8032 erp-instance](#)
- [g8032 forced-switch erp-instance](#)
- [g8032 manual-switch erp-instance](#)

**Command changes**

- Version 5.4.7-0.1: command added
- Version 5.4.7-1.1: added to x310 series products
- Version 5.4.7-2.1: added to x550 series products

Version 5.4.8-0.2: added to SBx8100 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# clear g8032 erp-instance statistics

**Overview** Use this command to clear the statistics data being collected by a G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `clear g8032 erp-instance <erp-instance-name> statistics`

| Parameter                              | Description                                |
|----------------------------------------|--------------------------------------------|
| <code>&lt;erp-instance-name&gt;</code> | The name of a specific G.8032 ERP instance |

**Mode** Privileged Exec

**Usage notes** A G.8032 ERP instance keeps statistical data as counts on a variety of data such as the number of certain types of Ring-Automatic Protection Switching (R-APS) messages sent and received over its ring port(s) and error conditions detected. Use this command to clear the statistics data.

**Example** To clear the statistics for an ERP instance named "blue", use the following command:

```
awplus# clear g8032 erp-instance blue statistics
```

**Related commands** [g8032 erp-instance](#)  
[show g8032 erp-instance statistics](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# data-traffic

**Overview** Use this command to add a data traffic VLAN or a range of VLANs to be protected by this G.8032 Ethernet Ring Protection (ERP) instance.

Use the **no** variant of this command to remove a data traffic VLAN or a range of VLANs.

**Syntax** `data-traffic <vid-list>`  
`no data-traffic <vid-list>`

| Parameter                     | Description                                                                                                                                                                                                     |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;vid-list&gt;</code> | The data traffic VLAN ID(s). This can be a single VLAN ID, or can be a range of VLAN IDs separated by hyphen, or a comma separated list of VLAN IDs and ranges. Each VLAN ID can take on the range of 1 to 4094 |

**Mode** G8032 Configure Switch

- Usage notes**
- A G.8032 ERP instance can protect 0, 1 or more VLANs carrying data traffic.
  - This ERP instance must be associated with a physical ring instance.
  - Other ERP instances using the same physical ring instance are not allowed to have the same data traffic VLAN(s) as this ERP instance.
  - The data VLAN(s) must already exist.
  - The data VLAN(s)' port members should be members of the ring interface(s), but it is not enforced.
  - When a data traffic VLAN(s) is removed, any blocks that were in place on the ring ports for this VLAN(s) are removed. The user should make sure when removing the VLAN(s) from the ERP instance that a loop is not formed.
  - Data traffic VLAN(s) can be added or removed while the ERP instance is enabled or disabled.

**Example** To add a data traffic VLAN with a VLAN ID of "103" to an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# data-traffic 103
```

# debug g8032

**Overview** Use this command to enable G.8032 debugging.  
Use the **no** variant of this command to disable G.8032 debugging.

**Syntax** `debug g8032 {all|event|rx|tx}`  
`no debug g8032 {all|event|rx|tx}`

| Parameter | Description                       |
|-----------|-----------------------------------|
| all       | Turn on all G.8032 debugging      |
| event     | Turn on G.8032 Event debugging    |
| rx        | Turn on G.8032 Receive debugging  |
| tx        | Turn on G.8032 Transmit debugging |

**Mode** Privileged Exec

**Example** To enable all G.8032 debugging, use the following command:  
`awplus# debug g8032 all`

**Related commands** [show debugging](#)  
[show debugging g8032](#)

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# enable (g8032-profile)

**Overview** Use this command to change the revertive or non-revertive operation of the associated G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `enable {revertive|non-revertive}`

| Parameter     | Description                                                                                  |
|---------------|----------------------------------------------------------------------------------------------|
| revertive     | This allows the ERP instance associated with this profile to operate in revertive mode.      |
| non-revertive | This allows the ERP instance associated with this profile to operate in non- revertive mode. |

**Default** By default, the mode of operation is revertive.

**Mode** G8032 Profile Configuration

**Usage notes** An ERP instance uses a profile which contains timer configurations and configurations for revertive modes of operation. Once a ring failure has abated, a G.8032 ring instance will check its mode of operation, and if the mode is revertive, it will attempt to revert back to where the RPL-Owner controls the blocking of the ring. Otherwise, it operates in non-revertive mode.

**Example** To enable revertive mode for a profile named "prof\_1", use the following commands:

```
awplus(config)# g8032 profile prof_1
awplus(g8032-profile-config)# enable revertive
```

**Related commands** [g8032 profile](#)

Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# epsr topology-change

**Overview** Use this command to allow the given EPSR instance to accept notifications from other topology protocols, namely G.8032, for Topology Change Notifications (TCN).

Use the **no** variant of this command to return the EPSR instance to where it does not accept TCNs from the other specified protocol, and as a result does not send out a "flush FDB" message.

**Syntax** `epsr <epsr-name> topology-change g8032`  
`no epsr <epsr-name> topology-change g8032`

| Parameter       | Description                                                                                                                                                                             |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <epsr-name>     | The name of the EPSR instance for which the topology-change applies to.                                                                                                                 |
| topology-change | The topology-change value to be set for the instance.                                                                                                                                   |
| g8032           | Specify that G.8032 is the other protocol that the topology-change notifications are allowed to be accepted from in order to send "flush FDB" messages to other EPSR nodes in the ring. |

**Default** The default value is no notifications are accepted and in turn no "flush FDB" messages are sent.

**Mode** EPSR Configuration

**Usage notes** The purpose of this command is to allow EPSR to accept notifications from other topology protocols, namely G.8032, about Topology Change Notifications (TCN). Once EPSR accepts the TCN, it will in turn notify the other nodes on the EPSR ring to perform an FDB flush.

**Example** To configure an EPSR instance named "red" to accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# epsr red topology-change g8032
```

To configure an EPSR instance named "red" to no longer accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# no epsr red topology-change g8032
```

**Related commands** [show epsr](#)  
[show g8032 erp-instance](#)

**Command changes** Version 5.4.7-1.1: command added

# erp-instance

**Overview** Use this command to enable or disable a G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `erp-instance {enabled|disabled}`

| Parameter | Description                         |
|-----------|-------------------------------------|
| enabled   | The G.8032 ERP instance is enabled  |
| disabled  | The G.8032 ERP instance is disabled |

**Default** The ERP instance is disabled.

**Mode** G8032 Configure Switch

**Usage notes** Once a G.8032 ERP instance has been configured with the correct parameter settings or defaults, it can be enabled to run the G.8032 protocol. To change certain ERP instance parameters, the instance may need to be disabled.

When enabled, the instance is restarted back to the G8032\_ST\_INIT state. In this state, if the node has an RPL-Owner or RPL-Neighbor port, it will be blocked. Otherwise the node will block one of its ring ports. All the nodes will send Ring-Automatic Protection Switching (R-APS) messages initially. The G.8032 protocol and state machines will transition the ring into another more appropriate state.

When disabled, the ERP instance will no longer process incoming R-APS messages for that instance, nor send any R-APS messages. The raps-channel VLAN and any data-traffic VLANs used by this instance will be put in the forwarding state for its physical ring ports. Caution should be taken to avoid loops when disabling an ERP instance.

**Example** To enable an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# erp-instance enabled
```

# g8032 erp-instance

**Overview** Use this command to create a G.8032 Ethernet Ring Protection (ERP) instance, or to enter an existing instance's context.

Use the **no** variant of this command to destroy the specified instance.

**Syntax** `g8032 erp-instance <erp-instance-name>`  
`no g8032 erp-instance <erp-instance-name>`

| Parameter                              | Description                                                           |
|----------------------------------------|-----------------------------------------------------------------------|
| <code>&lt;erp-instance-name&gt;</code> | The name of the G.8032 ERP instance. This can be up to 32 characters. |

**Mode** Global Configuration

**Usage notes** The ERP protocol in AlliedWare Plus™ can run one or more instances. A G.8032 ERP instance is made up of:

- two ERP ring ports,
- a Control VLAN that carries Ring-Automatic Protection Switching (R-APS) messages, and
- zero, one, or more Protected traffic data VLANs that the instance protects when the ring fails.

An ERP instance must be associated with a G.8032 physical ring and a G.8032 profile.

**Example** To enter the context of an instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)#
```

# g8032 forced-switch erp-instance

**Overview** Use this command to force a protection switch on a G.8032 Ethernet Ring Protection (ERP) instance ring port.

**Syntax** `g8032 forced-switch erp-instance <erp-instance-name>  
{east-interface|west-interface|terminating-interface}`

| Parameter                              | Description                                     |
|----------------------------------------|-------------------------------------------------|
| <code>&lt;erp-instance-name&gt;</code> | The name of the G.8032 ERP instance             |
| <code>east-interface</code>            | The G.8032 ERP instance's East ring port        |
| <code>west-interface</code>            | The G.8032 ERP instance's West ring port        |
| <code>terminating-interface</code>     | The G.8032 ERP instance's Terminating ring port |

**Mode** Privileged Exec

**Usage notes** G.8032 supports a Forced Protection Switch action initiated by the operator. A Forced Protection Switch command is to be issued at a given G.8032 node and given port in the ring. This results in a block being applied at that ring port (and an unblock on the opposite ring port), and a R-APS designated Forced Switch message to flow around the ring causing the RPL to become unblocked.

Multiple Forced Switch actions can take place along a G.8032 ring. Care must be taken when using the Force Switch command as it can only be undone by issuing a Clear command and not by a failure nor the clearing of a failure. If a node that was issued a Force Switch command later fails, then it becomes difficult to remove the Force Switch condition from the ring. In this situation, the operator has to go to the nodes that are adjacent to the failed node, and for each one, issue a Forced Switch command on the ring link facing the failed node followed by a Clear command.

If the G.8032 Physical Ring instance associated with the specified ERP instance is set to terminating-interface, then only one ring port is available and terminating-interface must be used in this command, otherwise specify the east-interface or the west-interface.

To clear this action command, use the [clear g8032 erp-instance](#) command.

**Example** To issue a Forced Protection Switch on the East interface of an ERP instance named "blue", use the following command:

```
awplus# g8032 forced-switch erp-instance blue east-interface
```

**Related commands** [clear g8032 erp-instance](#)  
[g8032 erp-instance](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products

Version 5.4.7-2.1: added to x550 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# g8032 manual-switch erp-instance

**Overview** Use this command to manually cause a protection switch on a G.8032 Ethernet Ring Protection (ERP) instance ring port.

**Syntax** `g8032 manual-switch erp-instance <erp-instance-name>  
{east-interface|west-interface|terminating-interface}`

| Parameter             | Description                                     |
|-----------------------|-------------------------------------------------|
| <erp-instance-name>   | The name of the G.8032 ERP instance             |
| east-interface        | The G.8032 ERP instance's East ring port        |
| west-interface        | The G.8032 ERP instance's West ring port        |
| terminating-interface | The G.8032 ERP instance's Terminating ring port |

**Mode** Privileged Exec

**Usage notes** G.8032 supports a Manual Protection Switch action initiated by the operator. A Manual Protection Switch command is to be issued at a given G.8032 node and given port in the ring. This results in a block being applied at that ring port (and an unblock on the opposite ring port), and a R-APS designated Manual Switch message to flow around the ring causing the RPL to become unblocked.

The difference between a Manual switch and a Forced switch is that the Manual Switch will be ignored under various conditions. In particular, only one Manual Switch is allowed on a G.8032 ring at a time.

If the G.8032 Physical Ring instance associated with the specified ERP instance is set to terminating-interface, then only one ring port is available and terminating-interface must be used in this command, otherwise specify the east-interface or the west-interface.

To clear this action command, use the [clear g8032 erp-instance](#) command.

**Example** To issue a Manual Protection Switch on the East interface of an ERP instance named "blue", use the following command:

```
awplus# g8032 manual-switch erp-instance blue east-interface
```

**Related commands** [clear g8032 erp-instance](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# g8032 physical-ring

**Overview** Use this command to create a G.8032 Ethernet Ring Protection (ERP) physical ring profile which specifies the Ethernet ports that will be used as G.8032 ring ports.

**Syntax** `g8032 physical-ring <physical-ring-name> {east-interface <interface-name1> west-interface <interface-name2>| terminating-interface <interface-name>}`  
`no g8032 physical-ring <physical-ring-name>`

| Parameter             | Description                                                                                                                     |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <physical-ring-name>  | The name of the profile (up to 37 characters)                                                                                   |
| east-interface        | The East G.8032 ring port                                                                                                       |
| <interface-name1>     | The name of the switch interface, either port or channel group, for the East ring port. It must differ from the West ring port. |
| west-interface        | The West G.8032 ring port                                                                                                       |
| <interface-name2>     | The name of the switch interface, either port or channel group, for the West ring port. It must differ from the East ring port. |
| terminating-interface | The Terminating ring port. This should only be used for G.8032 ERP instance that is at the end of a sub-ring.                   |
| <interface-name>      | The name of the switch interface, either port or channel group, for the Terminating ring port.                                  |

**Mode** Global Configuration

**Usage notes** Each ERP instance will be associated with a physical ring profile. A physical ring profile is made up of two physical Ethernet ports or aggregated interfaces, unless it is the terminating point of a sub-ring in which case only one port is needed. When two ports are used, they are referred to as East and West ports. When only a single port is used, it is referred to as a Terminating port.

**Example** To create a physical ring profile named "red" where the East interface port is port1.0.4 and the West interface port is port1.0.8, use the following commands:

```
awplus# configure terminal
awplus(config)# g8032 physical-ring red east-interface
port1.0.4 west-interface port1.0.8
```

**Related commands** [physical-ring](#)

# g8032 profile

**Overview** Use this command to create a G.8032 Ethernet Ring Protection (ERP) instance profile, or to enter that instance's profile context.

Use the **no** variant of this command to destroy the specified instance.

**Syntax** `g8032 profile {<erp-profile-name>|default-profile}`  
`no g8032 profile <erp-profile-name>`

| Parameter                             | Description                                                                                                                        |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;erp-profile-name&gt;</code> | The name of the G.8032 profile. This can be up to 32 characters.                                                                   |
| <code>default-profile</code>          | The name of the system's default profile for G.8032. This profile is created by the system automatically and can not be destroyed. |

**Default** A profile with the name "default-profile" will exist in the system and is used by default by an ERP instance. All the parameters in the default profile take on the default values.

**Mode** Global Configuration

**Example** To enter the context of a profile named "prof\_1", use the following commands:

```
awplus(config)# g8032 profile prof_1
awplus(g8032-profile-config)#
```

**Related commands** [enable \(g8032-profile\)](#)  
[profile name](#)  
[show g8032 profile](#)  
[timer \(g8032-profile\)](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# level (g8032-switch)

**Overview** Use this command to configure the level for Ring-Automatic Protection Switching (R-APS) messages.

**Syntax** `level <0-7>`

| Parameter                | Description                                |
|--------------------------|--------------------------------------------|
| <code>&lt;0-7&gt;</code> | The level used by the G.8032 ERP instance. |

**Default** The default level is 0.

**Mode** G8032 Configure Switch

**Usage notes** Inside the R-APS messages is the Level field. The G.8032 Ethernet Ring Protection (ERP) instance will use the configured level for sending R-APS messages, and is the level that the instance expects to receive. If the node receives an R-APS message with the improper level then the message will not be processed.

The ERP instance must be disabled to change the level, otherwise the setting is denied.

**Example** To set the R-APS message level field for an ERP instance named "blue" to 3, use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# level 3
```

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# physical-ring

**Overview** Use this command to specify which G.8032 physical ring instance is to be used by this G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `physical-ring <physical-ring-name>`

| Parameter                               | Description                             |
|-----------------------------------------|-----------------------------------------|
| <code>&lt;physical-ring-name&gt;</code> | The name of the physical ring instance. |

**Mode** G8032 Configure Switch

**Usage notes** A G.8032 ERP instance in general has two ring ports, unless it is at the end of a sub-ring in which case it has only one ring port. Ring port(s) are specified using a G.8032 physical ring instance.

This command can only be accepted when the ERP instance is disabled.

**Example** To configure an ERP instance named "blue" to use a physical ring instance named "red", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# physical-ring red
```

# profile name

**Overview** Use this command to associate a G.8032 profile instance with this G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `profile name <erp-profile-name>`

| Parameter                             | Description                    |
|---------------------------------------|--------------------------------|
| <code>&lt;erp-profile-name&gt;</code> | The name of the G.8032 profile |

**Default** If this command is not used, a profile with the name "default-profile" will be used for this G.8032 ERP instance.

**Mode** G8032 Configure Switch Mode

**Usage notes** A G.8032 ERP instance uses a profile which contains timer configurations and configurations for revertive modes of operation. This configuration can be accepted regardless of the ERP instance being disabled or enabled. Any parameters from a changed profile will take effect the next time the G.8032 state machine uses the parameters in the updated profile.

**Example** To associate a G.8032 profile named "prof\_1" with a G.8032 ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# profile name prof_1
```

- Version 5.4.8-1.1: added to SBx908 GEN2 series products

# raps-channel

**Overview** Use this command to specify which VLAN to use as a channel for G.8032 Ring-Automatic Protection Switching (R-APS) messages sent and received by this G.8032 Ethernet Ring Protection (ERP) instance.

Use the **no** variant of this command to remove the VLAN from being used as the R-APS channel VLAN.

**Syntax** `raps-channel <vid>`  
`no raps-channel`

| Parameter                | Description                              |
|--------------------------|------------------------------------------|
| <code>&lt;vid&gt;</code> | A single VLAN-id in the range 2 to 4094. |

**Mode** G8032 Configure Switch

**Usage notes** For a G.8032 ERP instance, a VLAN is used as a channel for carrying an R-APS message. This VLAN is also used to identify the proper ring instance to all the other nodes in the ring.

The VLAN must be tagged members of the G.8032 physical ring instance associated with this ERP instance. A G.8032 physical ring instance must be associated with this ERP instance. The ERP instance can not be enabled until this raps-channel VLAN has been configured properly.

The ERP instance must be disabled when using the **no** variant.

**Example** To configure a VLAN with a VLAN-id of "103" as a R-APS channel for an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# raps-channel 103
```

## service onm

**Overview** Use this command to enable the ONM service, which underlies CFM and G.8032.  
Use the **no** version of the command to disable the unused ONM service.

**Syntax** `service onm`  
`no service onm`

**Default** Enabled

**Mode** Global Configuration

**Usage notes** Disabling the service can reduce memory usage on the switch, particularly when many VLANs are configured on ports.  
Disabling the service will only take effect after you save the configuration and restart the device.

**Example** To disable the ONM service, use the commands:

```
awplus# configure terminal
awplus(config)# no service onm
```

**Output** Figure 55-1: Example output from **no service onm**

```
awplus(config)#no service onm
% Save the config and restart the device for this change to take
effect
```

**Command changes** Version 5.5.0-2.1: command added

## rpl role

**Overview** Use this command to specify the role of each G.8032 Ethernet Ring Protection (ERP) ring port (also known as a link). The role can be specified as to whether it is a Ring Protection Link (RPL) or not, and if it is an RPL, whether it is the Owner or Neighbor end of an RPL.

Use the **none** variant of this command to set all the ERP instance's ring ports' RPL role to **none**.

**Syntax** `rpl role {owner|neighbor}{east-interface|west-interface|terminating-interface}`  
`rpl role none`

| Parameter             | Description                                                    |
|-----------------------|----------------------------------------------------------------|
| owner                 | This sets the specified ring port to be an RPL Owner           |
| neighbor              | This sets the specified ring port to be an RPL Neighbor        |
| east-interface        | The ring port's east-interface.                                |
| west-interface        | The ring port's west-interface.                                |
| terminating-interface | The ring port's terminating-interface                          |
| none                  | This sets all the ERP instance's ring ports' RPL role to none. |

**Default** A RPL role of "none" is the default.

**Mode** G8032 Configure Switch

**Usage notes** If a node has one of its ring ports set to Owner or Neighbor, then **none** is automatically set on any other ring port as **none** is the only possible setting for the other ring port.

When using this command to set the RPL role to **none**, an interface need not be specified, as this command will set all the ring ports RPL role to **none**.

The command can only be accepted when the G.8032 ERP Instance is disabled, and the ERP instance must also have an association to a ERP Physical Ring instance.

As in the case of a sub-ring with only one physical ring port, use **terminating-interface** when specifying the RPL role as Owner or Neighbor.

**Example** To configure the east-interface of a ring port named "blue" to be an RPL Owner, use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# rpl role owner east-interface
```

# show debugging g8032

**Overview** Use this command to show the debugging modes enabled for G.8032.

**Syntax** show debugging g8032

**Mode** User Exec and Privileged Exec

**Example** To show the debugging modes enabled for G.8032, use the following command:

```
awplus# show debugging g8032
```

**Output** Figure 55-2: Example output from the **show debugging g8032** command.

```
awplus#show debugging g8032
G.8032 event debugging is off
G.8032 receive debugging is off
G.8032 transmit debugging is off
```

# show g8032 erp-instance

**Overview** Use this command to show one or all G.8032 Ethernet Ring Protection (ERP) instance(s) configuration and dynamic state data.

**Syntax** `show g8032 erp-instance {<erp-instance-name>|all}`

| Parameter                              | Description                                 |
|----------------------------------------|---------------------------------------------|
| <code>&lt;erp-instance-name&gt;</code> | The name of a specific G.8032 ERP instance. |
| <code>all</code>                       | Use this to show all instances.             |

**Mode** User Exec and Privileged Exec

**Example** To show the configuration and dynamic state data for an ERP instance named "blue", use the following command:

```
awplus# show g8032 erp-instance blue
```

**Output** Figure 55-3: Example output from the **show g8032 erp-instance** command.

```
awplus#show g8032 erp-instance blue

**Table 1:** Parameters in the output from the **show g8032 erp-instance** command.

| Parameter                       | Description                                                                                                                                                                                                                                                                                   |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Instance name                   | The configured <erp-instance-name> for this instance.                                                                                                                                                                                                                                         |
| Admin State                     | The configured administrative state of this instance, either enabled or disabled. When the ERP instance is disabled, all dynamic data for other parameters in this table will be shown as "-", except for the East Link or West Link which will show the last known block or unblocked state. |
| G.8032 State                    | A dynamic parameter showing the current state of the instance per the G.8032 state machine. If the ERP Instance is disabled, it will be in the INIT state.                                                                                                                                    |
| Phy Ring                        | Shows the Physical Ring Instance name that this ERP Instance is associated with along with the East/West or Terminating Interface used by the Physical Ring Instance.                                                                                                                         |
| East Link or West Link          | A dynamic variable showing whether the instance's ring port and its VLANs are blocked or not. In the special case of an interconnection node where a sub-ring terminates, both the East Link and the West Link are the same.                                                                  |
| RPL Role East Link or West Link | Shows the configuration of the link's role.                                                                                                                                                                                                                                                   |

**Table 1:** Parameters in the output from the **show g8032 erp-instance** command. (cont.)

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CFM MEP East or West | Identifies the configured MEP, if any, that is being used to provide a CFM based Signal Fail indication to this instance. The MEP is identified by its direction (Up or Down), its MEP-id, and the Maintenance Domain (MD) and Maintenance Association (MA) it is associated with by name.                                                                                                                                                                                                        |
| ERP Profile          | Identifies the ERP Profile instance that was configured for use by this ERP Ring instance.                                                                                                                                                                                                                                                                                                                                                                                                        |
| Level                | The Level that was configured for R-APS messages that are used by this ERP Ring instance.                                                                                                                                                                                                                                                                                                                                                                                                         |
| Ring-ID              | The Ring-ID that is to be used by this ERP instance.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| RAPS-Channel VLAN    | The VLAN-id that is configured used for sending and receiving R-APS messages for this ERP instance.                                                                                                                                                                                                                                                                                                                                                                                               |
| Sub-ring             | Specifies whether the ring is operating as a Sub-ring or otherwise as a Major ring.                                                                                                                                                                                                                                                                                                                                                                                                               |
| Virtual Channel      | Specifies whether the sub-ring is operating with a virtual channel or not.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Data Traffic VLANs   | A comma-separated list of configured VLAN-ids (individually, or range) that are used for data-traffic and protected by this ERP instance.                                                                                                                                                                                                                                                                                                                                                         |
| TCN To Inst          | A comma-separated list of protocols and their instances that are to be notified when a Topology Change Notification occurs for this ERP instance. This only applies to a sub-ring with a Terminating interface and in which case "-" will be displayed if no target instances have been identified. Otherwise a "-" is displayed anyway. Identifies the protocol to notify. Only "G8032" will be supported initially. <instance-name> - Identifies the instance to notify for the given protocol. |
| TCN Flush Event      | Specifies if this instance as a target instance is to send out Flush FDB messages upon TCN notifications by a detecting instance. Identifies the notifying protocol allowed. Only "G8032" will be supported initially. If no protocols have been configured then display "-".                                                                                                                                                                                                                     |
| SNMP Traps           | Indicates whether SNMP traps have been enabled or disabled for this ERP instance.                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 1:** Parameters in the output from the **show g8032 erp-instance** command. (cont.)

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Signal Fail         | Indicates whether a Signal Fail condition is being received over the East or West ring interface. <signal-fail> consists of:<br>"-" no Signal Fail is being indicated<br>"Link" - indicates the interface port or LAG has gone operationally down.<br>"CFM MEP <mep-id>" - indicates that a local CFM MEP has indicated a Signal Fail, and which MEP by mep-id.                                                                                                                                                                                                                                                                                                                                                     |
| Failure of Protocol | Indicates that there are defects in the receipt of an R-APS message. There are the following types:<br>FOP-PM (Provisioning Mismatch) - "true" indicates per G.8032, that the RPL-Owner is receiving R-APS(NR,RB) messages with a node-id not of itself. In addition, since the initial implementation does not support version 1, any R-APS messages with version 1 will also indicate a FOP-PM error. The FOP-PM error can occur on an East or a West Port.<br>FOP-TO (Time Out) - "true" indicates that a node has not received an R-APS message on any of its ring ports for 3.5 times the R-APS message interval even though one or both ring ports are capable of receiving R-APS messages (no SF, Admin Up). |
| Version             | The version of the R-APS message that is being received or sent over the East or West ring interface. An R-APS message version of "1" corresponds to G.8032 version 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Request             | Indicates the protection switch request being sent or received in the R-APS message. Consists of one of: NR - No Request for protection switching SF - Signal Fail MS - Manual Switch request FS - Force Switch request Event - Request a Flush to be performed. Note this is a transient condition.                                                                                                                                                                                                                                                                                                                                                                                                                |
| RPL Block           | Indicates whether the RPL is being blocked or not. consists of one of the following: "RB" - RPL Block is being applied by the RPL-Owner. "-" - No RPL Block is being applied by the RPL-Owner, or the R-APS message originated from a non-RPL-Owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| DNF                 | Indicates the value of the Do Not Flush bit in the R-APS message. The value is either "0" or "1".                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Block Port Ref      | Block Port Reference refers to the node's East or West port that is being blocked and shows as "0" or "1" in accordance to G.8032.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Node-ID             | The MAC address of this Node or the MAC address used in sending/receiving R-APS messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 1:** Parameters in the output from the **show g8032 erp-instance** command. (cont.)

| Parameter                       | Description                                                                                                                                                                                                                          |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| East Sending or<br>West Sending | If this local node is not sending R-APS, then all the fields are shown as "-"                                                                                                                                                        |
| Timers                          | Wait-to-Restore - "Running" indicates this timer is active, otherwise is "-".Wait-to-Block - "Running" indicates this timer is active, otherwise is "-".Hold Off Timer - "Running" indicates this timer is active, otherwise is "-". |

# show g8032 erp-instance statistics

**Overview** Use this command to show the G.8032 Ethernet Ring Protection (ERP) instance statistics.

**Syntax** `show g8032 erp-instance <erp-instance-name> statistics`

| Parameter                              | Description                                |
|----------------------------------------|--------------------------------------------|
| <code>&lt;erp-instance-name&gt;</code> | The name of a specific G.8032 ERP instance |

**Mode** User Exec and Privileged Exec

**Example** To show the statistics for an ERP instance named "blue", use the following command:

```
awplus# show g8032 erp-instance blue statistics
```

**Output** Figure 55-4: Example output from the **show g8032 erp-instance statistics** command.

**Table 2:** Parameters in the output from the **show g8032 erp-instance statistics** command

| Parameter     | Description                                                                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Instance Name | The configured <erp-instance-name> for this instance.                                                                                                                                         |
| Local clear   | The number of Clear commands invoked locally.                                                                                                                                                 |
| FOP-TO        | The number of Failure of Protocol Time Out events seen locally.                                                                                                                               |
| RAPS NR       | The number of R-APS messages with a No Request (NR) being received or sent.                                                                                                                   |
| RAPS NR-RB    | The number of R-APS messages with a No Request, RPL Blocked (NR,RB) being received or sent.                                                                                                   |
| RAPS SF       | The number of R-APS messages with Signal Fail (SF) being received or sent.                                                                                                                    |
| RAPS FS       | The number of R-APS messages with Forced Switch (FS) being received or sent.                                                                                                                  |
| RAPS MS       | The number of R-APS messages with Manual Switch (MS) being received or sent.                                                                                                                  |
| RAPS Event    | The number of R-APS messages with Event (Flush) being received or sent.                                                                                                                       |
| Drop Guard    | The number of R-APS messages discarded due to Guard Timer.                                                                                                                                    |
| Drop Error    | The number of R-APS messages discarded due to incorrect MAC Address (unmatched Ring-ID), incorrect version, unusable Request/State, or other invalid code point in one of the message fields. |
| Local SF      | The number of Signal Fail events seen locally.                                                                                                                                                |
| FOP-PM        | The number of Failure of Protocol events seen locally.                                                                                                                                        |

# show g8032 physical-ring

**Overview** Use this command to show the G.8032 physical ring instance information.

**Syntax** show g8032 physical-ring {<physical-ring-name>|all}

| Parameter            | Description                                                      |
|----------------------|------------------------------------------------------------------|
| <physical-ring-name> | The name of the physical ring                                    |
| all                  | This shows all physical ring instances that have been configured |

**Mode** User Exec and Privileged Exec

**Example** To show the details of a physical ring instance named "red", use the following command:

```
awplus# show g8032 physical-ring red
```

**Output** Figure 55-5: Example output from the **show g8032 physical-ring** command.

```
awplus#show g8032 physical-ring red
Ring : red
=====
East : port1.0.4
West : port1.0.8
ERP Inst : blue
```

**Table 3:** Parameters in the output from the **show g8032 physical-ring** command.

| Parameter               | Description                                                                                                                                              |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ring                    | The name of the physical ring that was configured for this physical ring instance.                                                                       |
| East, West, Terminating | The physical interface port or LAG of the East or West Ring interface, or the Terminating interface that was configured for this physical ring instance. |
| ERP Inst                | A comma-separated list of ERP instances by name that have been configured to use this physical ring instance, or "-" if none.                            |

# show g8032 profile

**Overview** Use this command to show one specific G.8032 profile or all G.8032 profiles, and the configured information within each profile.

**Syntax** `show g8032 profile {<erp-profile-name>|default-profile|all}`

| Parameter          | Description                                                                          |
|--------------------|--------------------------------------------------------------------------------------|
| <erp-profile-name> | The name of the G.8032 profile that was created by the user.                         |
| default-profile    | The default name of the G.8032 profile that was created automatically by the system. |
| all                | Using this will show all G.8032 profiles.                                            |

**Mode** User Exec and Privileged Exec

**Example** To show the profile details for a profile named "prof1", use the following command:

```
awplus# show g8032 profile prof1
```

**Output** Figure 55-6: Example output from the **show g8032 profile** command.

```
awplus#show g8032 profile prof1
Profile : prof1
=====
Wait-To-Restore : 5 mins
Hold Off Timer : 0 ms
Guard Timer : 500 ms
Wait-To-Block : 5500 ms
Protection Type : Revertive
ERP Inst : blue
```

**Table 4:** Parameters in the output from **show g8032 profile** command.

| Parameter       | Description                                                                                                      |
|-----------------|------------------------------------------------------------------------------------------------------------------|
| Wait-To-Restore | The configured value in <1-12> minutes.                                                                          |
| Hold Off Timer  | The configured value but shown instead in milliseconds which ranges from 0 to 10,000 (10s) in 100 ms increments. |
| Guard Timer     | The configured value which ranges from 10 to 2000 in 10 ms increments.                                           |

**Table 4:** Parameters in the output from **show g8032 profile** command. (cont.)

| Parameter     | Description                                                                         |
|---------------|-------------------------------------------------------------------------------------|
| Wait-To-Block | 5 seconds more than the configured Guard Time. The range is 5010 to 5200.           |
| ERP Inst      | Comma separated list of ERP instances using this profile, or "-" if there are none. |

# sub-ring

**Overview** Use this command to configure the mode of operation for the G.8032 Ethernet Ring Protection (ERP) instance as a sub-ring.

Use the **no** variant of this command to change the mode of operation to that of a normal fully enclosed ring.

**Syntax** `sub-ring`  
`no sub-ring`

**Default** By default the mode is **no sub-ring**.

**Mode** G8032 Configure Switch

**Usage notes** An ERP instance can operate normally as a fully enclosed ring, commonly called a major ring, or as a partially enclosed ring, called a sub-ring. Sub-rings must be attached to either a major ring (one that is fully closed) or to other sub-rings where one of the other sub-rings itself is attached to a major ring.

Setting the mode to sub-ring should also be set for all nodes in the sub-ring, as the G.8032 state machine is different from that of a major ring.

This configuration can only be accepted when the ERP instance is disabled.

When the physical ring instance used by this ERP instance is configured for terminating interface, then this ERP instance will automatically be configured to be in the sub-ring mode and can not be changed.

**Example** To configure an ERP instance named "blue" as a sub-ring, use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# sub-ring
```

Version 5.4.8-1.1: added to SBx908 GEN2 series products

## timer (g8032-profile)

**Overview** Use this command to configure a timer for a specified G.8032 Ethernet Ring Protection (ERP) instance profile.

**Syntax**

```
timer wait-to-restore {<1-12>|default}
timer hold-off {<0-100>|default}
timer guard-timer {<1-200>|default}
```

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wait-to-restore | This timer is used to soak signal failure abatement to ensure the signal failure abatement is not intermittent. This timer is only used by the RPL Owner when in the revertive operation, and thus is attempting to restore the ring. It is configurable in steps of 1 to 12 minutes (default is 5 minutes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| hold-off        | This timer allows any other underlying protection schemes to recover before G.8032 reacts to its defect as this gives time for the G.8032 defect to clear. A classic example is when the ERP Physical ring port is carried over a SONET/SDH transmission system that itself has 50ms recovery times. If G.8032 detects a failure, then increasing this timer to some value greater than 50ms would allow the SONET/SDH system to recover and have the defect that G.8032 detected disappear thus preventing the need for G.8032 to try and recover. The Hold Off timer is configurable in 0 to 10 seconds in steps of 100ms (default is 0 ms).                                                                                                                                                                                        |
| guard-timer     | This is the amount of time that an ERP instance discards most R-APS messages before being allowed to process them. It is used when a clearing condition occurs yet at the same time older messages are still propagating around the ring with failure indications. For example two nodes that just noticed a link failure abatement condition could start clearing and almost immediately one of them could receive an old Signal Fail indication message from the other node (that was still in flight) which in turn causes the receiving node to react to the Signal Fail inadvertently. This timer is particularly useful where R-APS propagation time through the ring is large. Refer to ITU-T G.8032 for more information. The Guard timer is configurable in 10ms steps between 10ms and 2 seconds (default is 50 for 500ms). |

**Mode** G8032 Profile Configuration

**Example** To set the wait-to-restore timer of a profile named "prof\_1" to a value of 1 minute, use the following commands:

```
awplus(config)# g8032 profile prof_1
awplus(g8032-profile-config)# timer wait-to-restore 1
```

**Related commands**   [g8032 profile](#)

                              Version 5.4.8-1.1: added to SBx908 GEN2 series products

# topology-change

**Overview** Use this command to enable this G.8032 Ethernet Ring Protection (ERP) instance to send a Flush Event message after notification of a Topology Change Notification (TCN) by a detecting instance.

Use the **no** variant of this command to disable the sending of the Flush Event.

**Syntax** `topology-change {g8032}`  
`no topology-change {g8032}`

| Parameter | Description                                                           |
|-----------|-----------------------------------------------------------------------|
| g8032     | Specify that G.8032 is the protocol that is affected by this command. |

**Default** Topology change is enabled by default for G.8032.

**Mode** G8032 Configure Switch

**Usage notes** If this ERP instance is on an interconnecting node, then the ERP instance may need to be notified of a topology change that occurred in another G.8032 sub-ring attached to this node. The former will be termed the "target" ERP instance, and the latter the "detecting" ERP instance.

The criteria for notification is:

- the detecting ERP instance is configured as a sub-ring with a Terminating interface,
- it is protecting the same data VLANs as the target instance, and
- the target ERP instance must have two ring ports.

When the detecting ERP instance detects a topology change on its sub-ring, AlliedWare Plus™ will automatically determine which target ERP instance(s) needs to be notified. It does this by comparing the same data VLANs in the detecting ERP instance with all the other instances.

If target ERP instances are identified and these instances also have both an East and a West interface configured, then those target instances are notified. Upon notification, the target ERP instance has a couple of actions that it has to perform:

- To flush the FDB on both its East and West interfaces for the protected VLANs.
- To send out an R-APS flush event message over its East and West interfaces. The flush event message is sent around the target ring and each node on the target ring will perform an FDB flush of its protected VLANs. The sending of a R-APS flush event may not be needed in some cases and as such it is configurable.

**Example** To enable sending of R-APS flush event messages on an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# topology-change g8032
```

# trap (g8032-switch)

**Overview** Use this command to enable or disable SNMP traps for a G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** trap {enabled|disabled}

| Parameter | Description                                      |
|-----------|--------------------------------------------------|
| enabled   | Enable this ERP instance to generate traps.      |
| disabled  | Disable this ERP instance from generating traps. |

**Default** The SNMP traps for the ERP instance are enabled.

**Mode** G8032 Configure Switch

**Usage notes** Globally, ERP traps are disabled by default but can be enabled globally using the [snmp-server enable trap](#) command.

**Example** To disable the SNMP traps for an ERP instance named “blue”, use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# trap disabled
```

**Related commands** [erp-instance](#)

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# undebug g8032

**Overview** Use this command to turn off debugging for various G.8032 debug attributes.

**Syntax** `undebug g8032 {all|event|rx|tx}`

| Parameter | Description                          |
|-----------|--------------------------------------|
| all       | All G.8032 debugging                 |
| event     | G.8032 debugging events              |
| rx        | G.8032 debugging Receive activities  |
| tx        | G.8032 debugging Transmit activities |

**Mode** Privileged Exec

**Example** To turn off all G.8032 debugging, use the following command:

```
awplus# undebug g8032 all
```

**Related commands** [debug g8032](#)  
[show debugging g8032](#)

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# Part 7: Network Management

# 56

# AMF and AMF Plus Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for AMF and AMF Plus commands. AMF is the Allied Telesis Autonomous Management Framework™, and AMF Plus is an expanded version of AMF. Both AMF and AMF Plus are a suite of features that combine to simplify network management across all supported network equipment from the core to the edge. They also integrate with Vista Manager, our graphical monitoring and management platform.

On the AlliedWare Plus command line, AMF and AMF Plus are identical. The difference between them is in Vista Manager, where AMF Plus includes additional AMF Plus intent-based networking features.

**In the rest of this chapter, we use 'AMF' to refer to both AMF and AMF Plus.**

**AMF master nodes** Every AMF network must have at least one master node, which acts as the core of the AMF network. Not all AlliedWare Plus devices are capable of acting as a AMF master. See the [AMF Feature Overview and Configuration Guide](#) for information about master support.

**AMF edge** AlliedWare Plus CentreCOM® Series switches can only be used as edge switches in an AMF network. The full management power and convenience of AMF is available on these switches, but they can only link to one other AMF node. They cannot form cross-links or virtual links.

**AMF naming convention** When AMF is enabled on a device, it will automatically be assigned a host name. If a host name has already been assigned, by using the command [hostname](#) on page 289, this will remain. If however, no host name has been assigned, then the name applied will be the prefix, **host\_** followed (without a space) by the MAC address of the device. For example, a device whose MAC address is **0016.76b1.7a5e** will have the name **host\_0016\_76b1\_7a5e** assigned to it.

To efficiently manage your network using AMF, we strongly advise that you devise a naming convention for your network devices, and apply an appropriate hostname to each device in your AMF network.

---

**AMF and STP** On AR-Series UTM firewalls and Secure VPN routers, you cannot use STP at the same time as AMF.

# application-proxy ip-filter

**Overview** Use this command to enable global IP filtering on a device. Once enabled the device will add a global ACL in response to a threat message from an AMF Security (AMF-Sec) Controller.

Use the **no** variant of this command to disable global IP filtering.

**Syntax** `application-proxy ip-filter`  
`no application-proxy ip-filter`

**Default** Global IP filtering is disabled by default.

**Mode** Global Configuration

**Usage notes** For this feature to work, the AMF Application Proxy service needs to be enabled on your network, using the command [service atmf-application-proxy](#).

**Example** To enable global IP filtering, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy ip-filter
```

To disable global IP filtering, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy ip-filter
```

**Related commands** [application-proxy redirect-url](#)  
[application-proxy threat-protection](#)  
[clear application-proxy threat-protection](#)  
[service atmf-application-proxy](#)  
[show application-proxy threat-protection](#)

**Command changes** Version 5.4.7-2.5: command added

# application-proxy quarantine-vlan

**Overview** Use this command to set the quarantine VLAN to use when an AMF Security (AMF-Sec) Controller detects a threat. The port/s on which the threat is detected are moved to this VLAN if the [application-proxy threat-protection](#) action is set to **quarantine**.

Use the **no** variant of this command to delete the quarantine VLAN. If no quarantine VLAN is specified then no quarantine action will be performed.

**Syntax** `application-proxy quarantine-vlan <vlan-id>`  
`no application-proxy quarantine-vlan`

| Parameter                    | Description                                     |
|------------------------------|-------------------------------------------------|
| <code>&lt;vlan-id&gt;</code> | The ID of the VLAN to use. In the range 1-4094. |

**Default** By default, no quarantine VLAN is configured.

**Mode** Global Configuration

**Example** To configure VLAN 100 as the quarantine VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy quarantine-vlan 100
```

To delete the quarantine VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy quarantine-vlan
```

**Related commands** [application-proxy threat-protection](#)

**Command changes** Version 5.4.7-2.2: command added

# application-proxy redirect-url

**Overview** Use this command to redirect a user to a helpful URL when they are blocked because of an [application-proxy ip-filter](#).

Use the **no** variant of this command to remove the URL redirect.

**Syntax** `application-proxy redirect-url <url>`  
`no application-proxy redirect-url`

| Parameter                | Description                  |
|--------------------------|------------------------------|
| <code>&lt;url&gt;</code> | URL to redirect the user to. |

**Default** No URL is configured by default.

**Mode** Global Configuration

**Example** To configure a redirect URL, use the command:

```
awplus# application-proxy redirect-url http://my.dom/help.html
```

To remove a redirect URL, use the command:

```
awplus# no application-proxy redirect-url
```

**Related commands** [application-proxy ip-filter](#)  
[application-proxy threat-protection](#)  
[clear application-proxy threat-protection](#)  
[service atmf-application-proxy](#)  
[show application-proxy threat-protection](#)

**Command changes** Version 5.4.9-0.1: command added

# application-proxy threat-protection

**Overview** Use this command to set the blocking action to take when a threat detected message is received from an AMF Security (AMF-Sec) Controller.

Use the **no** variant of this command to disable threat protection blocking actions on the port.

**Syntax** `application-proxy threat-protection  
{drop|link-down|quarantine|log-only}  
no application-proxy threat-protection`

| Parameter  | Description                                                                                                                                                                      |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| drop       | Drop the traffic that generates the threat reports. This is a Layer 2 drop. Note that the device will only drop packets that arrive at the port, not packets sent from the port. |
| link-down  | Take the link down in response to threats, by setting it to error disabled.                                                                                                      |
| quarantine | Move the offending port to a quarantine VLAN.                                                                                                                                    |
| log-only   | Log when a threat is detected.                                                                                                                                                   |

**Default** Threat protection is disabled by default.

**Mode** Interface Configuration

**Example** To set the threat protection blocking action on port1.0.4 to drop, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# application-proxy threat-protection drop
```

To disable threat protection blocking actions on port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no application-proxy threat-protection
```

- [clear application-proxy threat-protection](#)
- [service atmf-application-proxy](#)
- [show application-proxy threat-protection](#)

**Command changes**

- Version 5.5.2-0.1: added to switch ports on AR series devices
- Version 5.4.9-0.1: **log-only** parameter added
- Version 5.4.7-2.2: command added

# application-proxy threat-protection send-summary

**Overview** Use this command to send a summary of all current threat-protection blocking requests to all AMF Application Proxy service nodes. This command can only be performed on an AMF master.

**Syntax** `application-proxy threat-protection send-summary`

**Mode** Privileged Exec

**Example** To send a summary of all current threat-protection blocking requests to all AMF Application Proxy service nodes, use the command:

```
awplus# application-proxy threat-protection send-summary
```

**Related commands**

- [application-proxy quarantine-vlan](#)
- [application-proxy threat-protection](#)
- [clear application-proxy threat-protection](#)
- [service atmf-application-proxy](#)
- [show application-proxy threat-protection](#)

**Command changes** Version 5.4.7-2.2: command added

# application-proxy whitelist advertised-address

**Overview** Use this command to register a Layer 3 interface, and the IPv4 address that is attached to this interface, as the advertised application-proxy whitelist address for a device.

Use the **no** variant of this command to stop advertising the Layer 3 interface and its associated IPv4 address.

**Syntax** `application-proxy whitelist advertised-address <interface>`  
`no application-proxy whitelist advertised-address`

| Parameter                      | Description                                               |
|--------------------------------|-----------------------------------------------------------|
| <code>&lt;interface&gt;</code> | Layer 3 interface to configure as the advertised address. |

**Default** No address advertised by default.

**Mode** Global Configuration

**Example** To configure the IPv4 address attached to VLAN 1 as the advertised address, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist advertised-address
vlan1
```

To remove the advertised address, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist
advertised-address
```

**Related commands** [application-proxy whitelist server](#)  
[show application-proxy whitelist advertised-address](#)

**Command changes** Version 5.4.9-1.1: command added

# application-proxy whitelist enable

**Overview** Use this command to enable application-proxy whitelist based authentication on an interface.

Use the **no** variant of this command to disable the whitelist authentication.

**Syntax** `application-proxy whitelist enable`  
`no application-proxy whitelist enable`

**Default** Application-proxy whitelist is disabled by default.

**Mode** Interface Configuration

**Usage notes** When **port-control** is set to **auto**, the 802.1X authentication feature is executed on the interface, but only if the **aaa authentication dot1x** command has been issued.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

**Example** To enable application-proxy whitelist authentication on the interface port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# application-proxy whitelist enable
```

To disable application-proxy whitelist authentication on the interface port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no application-proxy whitelist enable
```

**Related commands** [application-proxy whitelist server](#)  
[show application-proxy whitelist interface](#)  
[show application-proxy whitelist server](#)  
[show application-proxy whitelist supplicant](#)

**Command changes** Version 5.4.9-0.1: command added

# application-proxy whitelist protection tls

**Overview** Use this command to configure the application-proxy whitelist control channel to use TLS protection. If no trustpoint is specified then TLS will operate without authentication.

Use the **no** variant of this command to stop using TLS.

**Syntax** `application-proxy whitelist protection tls [trustpoint <name>]`  
`no application-proxy whitelist protection tls`

| Parameter  | Description                                                                                                 |
|------------|-------------------------------------------------------------------------------------------------------------|
| trustpoint | Specify an optional trustpoint. If no trustpoint is specified then TLS will operate without authentication. |
| <name>     | Name of the trustpoint.                                                                                     |

**Default** TLS is disabled by default.

**Mode** Global Configuration

**Example** To configure an AMF application-proxy whitelist to use TLS with the trustpoint 'corpca', use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist protection tls
trustpoint corpca
```

To configure an AMF application-proxy whitelist to stop using TLS, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist protection tls
```

**Related commands** [application-proxy whitelist enable](#)  
[application-proxy whitelist server](#)  
[show application-proxy whitelist server](#)

**Command changes** Version 5.5.0-2.1: command added

# application-proxy whitelist server

**Overview** Use this command to set an AMF master to act as a whitelist authentication proxy between AMF members, acting as Network Access Servers, and an external whitelist RADIUS server.

Use the **no** variant of this command to disable the whitelist proxy functionality.

**Syntax** `application-proxy whitelist server <ip-address> key <key>  
[auth-port <1-65535>]`  
`no application-proxy whitelist server`

| Parameter                              | Description                                                                                            |
|----------------------------------------|--------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code>        | IPv4 address of the upstream RADIUS server in dotted decimal format A.B.C.D.                           |
| <code>key &lt;key&gt;</code>           | Set the shared secret encryption key for communication with the upstream RADIUS server.                |
| <code>auth-port &lt;1-65535&gt;</code> | Set the RADIUS server UDP port. This is only necessary if you don't want to use the default port 1812. |

**Default** Disabled by default.

**Mode** Global Configuration

**Example** To configure an AMF master to work as a proxy to the external RADIUS server 192.168.1.10, with shared secret 'mysecurekey', on port 1822, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist server 192.168.1.10
key mysecurekey auth-port 1822
```

To configure an AMF master to work as a proxy to the external RADIUS server 192.168.1.10, with shared secret 'mysecurekey', on the default port (1812), use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist server 192.168.1.10
key mysecurekey
```

To disable the whitelist proxy, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist server
```

**Related commands** [application-proxy whitelist enable](#)  
[service atmf-application-proxy](#)  
[show application-proxy whitelist interface](#)  
[show application-proxy whitelist server](#)

show application-proxy whitelist supplicant

**Command changes**    Version 5.4.9-0.1: command added

# application-proxy whitelist trustpoint (deprecated)

**Overview** This command has been deprecated. It has been replaced by the [application-proxy whitelist protection tls](#) command.

This command sets the trustpoint to use when communicating with the external whitelist RADIUS server. This enables RADIUS over TLS (RadSec) protection.

**Syntax** `application-proxy whitelist trustpoint <name>`  
`no application-proxy whitelist trustpoint`

**Command changes** Version 5.4.9-1.1: command added  
Version 5.5.0-2.1: command deprecated

# area-link

**Overview** Use this command to create an area-link between a Virtual AMF Appliance (VAA) host controller and an AMF container.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove an area-link from a container.

**Syntax** `area-link <area-name>`  
`no area-link`

| Parameter                      | Description                            |
|--------------------------------|----------------------------------------|
| <code>&lt;area-name&gt;</code> | AMF area name of the container's area. |

**Mode** AMF Container Configuration

**Usage notes** The AMF area-link connects the AMF controller on a VAA host to the AMF container. Once a container has been created with the [atmf container](#) command and an area-link configured with the **area-link** command, it can be enabled using the [state](#) command.

You can only configure a single area-link on a container. You will see the following message if you try and configure a second one:

```
% AreaLink already configured for this container
```

Each container has two virtual interfaces:

- Interface eth0, used to connect to the AMF controller on the VAA host via an AMF area-link, configured using this area-link command.
- Interface eth1, used to connect to the outside world using a bridged L2 network link, configured using the [bridge-group \(amf-container\)](#) command.

See the [AMF Feature Overview and Configuration\\_Guide](#) for more information on these virtual interfaces and links.

**Example** To create the area-link to "wlg" on container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# area-link wlg
```

To remove an area-link from container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# no area-link
```

**Related  
commands**

[atmf container](#)  
[show atmf container](#)

**Command  
changes**

Version 5.4.7-0.1: command added

# atmf-arealink

**Overview** This command to enable an Eth interface, on an AR-series device, as an AMF area link. AMF area links are designed to operate between two nodes in different areas in an AMF network. This command is only available if your network is running in AMF secure mode (see [atmf secure-mode](#) for more information on AMF secure mode).

Use the **no** variant of this command to remove any AMF area links that may exist for the selected Eth interface.

**Syntax** `atmf-arealink remote-area <area-name> vlan <2-4094>`  
`no atmf-arealink`

| Parameter   | Description                                                                                                                          |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <area-name> | The name of the remote area that the interface is connecting to.                                                                     |
| <2-4094>    | The VLAN ID for the link. This VLAN cannot be used for any other purpose, and the same VLAN ID must be used at each end of the link. |

**Default** By default, no area links are configured

**Mode** Eth interface on an AR-series device.

**Usage notes** Run this command on the interface at both ends of the link.  
Each area must have the area-name configured, and the same area password must exist on both ends of the link.

Running this command will synchronize the area information stored on the two nodes.

You can configure multiple area links between two area nodes, but only one area link at any time will be in use. All other area links will block information, to prevent network storms.

**NOTE:** See the [switchport atmf-arealink](#) command to configure an AMF area link on an a switch port or link aggregator

**Example** To configure eth1 as an AMF area link to the 'Auckland' area on VLAN 6, use the following commands:

```
master_1# configure terminal
master_1(config)# interface eth1
master_1(config-if)# atmf-arealink remote-area Auckland vlan 6
```

To remove eth1 as an AMF area link, use the following commands:

```
master_1# configure terminal
master_1(config)# interface eth1
master_1(config-if)# no atmf-arealink
```

|                         |                                    |

|                         | <a href="#">show atmf links</a>    |
| <b>Command changes</b>  | Version 5.5.0-1.1: command added   |

# atmf-link

**Overview** Use this command to enable an Eth interface on an AR-series device as an up/down AMF link. This command is only available if your network is running in AMF secure mode (see [atmf secure-mode](#) for more information on AMF secure mode).

Use the **no** variant of this command to remove any AMF link that may exist for the selected Eth interface.

**Syntax** atmf-link  
no atmf-link

**Mode** Eth interface on an AR-series device.

**Usage notes** Up/down links and virtual links interconnect domains in a vertical hierarchy, with the highest domain being the core domain. In effect, they form a tree of interconnected AMF domains. This tree must be loop-free. Therefore you must configure your up/down and virtual links so that no loops are formed.

If you run the command and AMF secure mode is not enabled, you will see the following error message:

```
Node_1(config)#int eth1
Node_1(config-if)#atmf-link
% Cannot configure eth1 because atmf secure-mode is not enabled.
```

**NOTE:** See the [switchport atmf-link](#) command to configure an AMF up/down link on an a switch port or link aggregator

**Example** To configure eth1 as an AMF up/down link, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface eth1
Node_1(config-if)# atmf-link
```

To remove eth1 as an AMF up/down link, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface eth1
Node_1(config-if)# no atmf-link
```

**Command changes** Version 5.5.0-1.1: command added

# atmf amfplus-license-only

**Overview** Use this command if you want to use the AMF Plus features in Vista Manager EX, and you have a mixture of AMF and AMF Plus licenses on your master node. This command sets the AMF network to only count **AMF Plus** licensed nodes.

Use the **no** variant of this command to include both AMF and AMF Plus licenses when calculating the number of licensed nodes in an area count.

**Syntax** `atmf amfplus-license-only`  
`no atmf amfplus-license-only`

**Default** The **no** version is the default. That is, consider both AMF and AMF Plus licenses when calculating the number of licensed nodes.

**Mode** Global Configuration

**Usage notes** From software version 5.5.2-2.3 onwards, AMF licenses are no longer available to purchase. Instead, AMF Plus licenses become available. Existing AMF licenses remain valid. You only need to change to AMF Plus licenses if you want to manage more nodes, or use the new AMF Plus menu in Vista Manager.

**CAUTION:** *If the network has more AMF nodes than are licensed with AMF Plus:*

- AMF Plus will still be enabled in Vista Manager EX (provided there is no AMF license)
- any AMF nodes above the license count won't join the AMF network.

The AMF Plus menu replaces the AOI menu in Vista Manager EX when all the AMF Masters and Controllers have:

- An AMF Plus Controller/Master license on all Masters and Controllers, and
- No AMF Controller/Master licenses applied, or AMF Controller/Master licenses disabled with this command.

**Example** To set the AMF network to only count AMF Plus licensed nodes, use the commands:

```
awplus#configure terminal
awplus(config)#atmf amfplus-license-only
```

**Output** Figure 56-1: Example using **atmf amfplus-license-only**

```
ATMF Summary Information:
ATMF Status : Enabled
Network Name : gtnet
Node Name : node2
Role : Master
Restricted login : Enabled
Secure Mode : Disabled
Current ATMF Guests : 0
Current ATMF Nodes : 10
Total number of licensed nodes available is 22

node2#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
node2(config)#atmf amfplus-license-only
node2(config)#15:41:36 node2 ATMF[1041]: The number of nodes
allowed on this ATMF network is 12

node2(config)#do show atmf
ATMF Summary Information:

ATMF Status : Enabled
Network Name : gtnet
Node Name : node2
Role : Master
Restricted login : Enabled
Secure Mode : Disabled
Current ATMF Guests : 0
Current ATMF Nodes : 10
Master is configured to allow only AMFPLUS Licenses
Total number of licensed nodes available is 12
```

**Related commands** [show atmf](#)

**Command changes** Version 5.5.3-0.1: command added

# atmf area

**Overview** This command creates an AMF area and gives it a name and ID number.

Use the **no** variant of this command to remove the AMF area.

This command is only valid on AMF controllers, master nodes and gateway nodes.

**Syntax** `atmf area <area-name> id <1-4094> [local]`  
`no atmf area <area-name>`

| Parameter   | Description                                                                                                                                                                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-name> | The AMF area name. The area name can be up to 15 characters long. Valid characters are:<br>a..z<br>A..Z<br>0..9<br>-<br>_<br>Names are case sensitive and must be unique within an AMF network. The name cannot be the word "local" or an abbreviation of the word "local" (such as "l", "lo" etc.). |
| <1-4094>    | An ID number that uniquely identifies this area.                                                                                                                                                                                                                                                     |
| local       | Set the area to be the local area. The local area contains the device you are configuring.                                                                                                                                                                                                           |

**Mode** Global Configuration

**Usage notes** This command enables you to divide your AMF network into areas. Each area is managed by at least one AMF master node. Each area can have up to 120 nodes, depending on the license installed on that area's master node.

The whole AMF network is managed by up to 8 AMF controllers. Each AMF controller can communicate with multiple areas. The number of areas supported on a controller depends on the license installed on that controller.

You must give each area in an AMF network a unique name and ID number.

Only one local area can be configured on a device. You must specify a local area on each controller, remote AMF master, and gateway node.

**Example** To create the AMF area named New-Zealand, with an ID of 1, and specify that it is the local area, use the command:

```
controller-1(config)# atmf area New-Zealand id 1 local
```

To configure a remote area named Auckland, with an ID of 100, use the command:

```
controller-1(config)# atmf area Auckland id 100
```

**Related commands**

- atmf area password
- show atmf area
- show atmf area summary
- show atmf area nodes
- switchport atmf-arealink

**Command changes**    Version 5.5.1-2.1: area **id** maximum increased to 4094

# atmf area password

**Overview** This command sets a password on an AMF area.

Use the **no** variant of this command to remove the password.

This command is only valid on AMF controllers, master nodes and gateway nodes. The area name must have been configured first.

**Syntax** `atmf area <area-name> password [8] <password>`  
`no atmf area <area-name> password`

| Parameter   | Description                                                                                                                                                                           |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <area-name> | The AMF area name.                                                                                                                                                                    |
| 8           | This parameter is displayed in <b>show running-config</b> output to indicate that it is displaying the password in encrypted form. You should not enter <b>8</b> on the CLI yourself. |
| <password>  | The password is between 8 and 32 characters long. It can include spaces.                                                                                                              |

**Mode** Global Configuration

**Usage notes** You must configure a password on each area that an AMF controller communicates with, except for the controller's local area. The areas must already have been created using the [atmf area](#) command.

Enter the password identically on both of:

- the area that locally contains the controller, and
- the remote AMF area masters

The command **show running-config atmf** will display the encrypted version of this password. The encryption keys will match between the controller and the remote AMF master.

If multiple controller and masters exist in an area, they must all have the same area configuration.

**Example** To give the AMF area named *Auckland* a password of "secure#1" use the following command on the controller:

```
controller-1(config)# atmf area Auckland password secure#1
```

and also use the following command on the master node for the Auckland area:

```
auck-master(config)# atmf area Auckland password secure#1
```

**Related  
commands**

- atmf area
- show atmf area
- show atmf area summary
- show atmf area nodes
- switchport atmf-arealink

# atmf authorize

**Overview** On an AMF network, with secure mode enabled, use this command on an AMF master to authorize an AMF node to join the network. AMF nodes waiting to be authorized appear in the pending authorization queue, which can be examined using the [show atmf authorization](#) command with the **pending** parameter.

Use the **no** variant of this command to revoke authorization for an AMF node on an AMF master.

**Syntax** `atmf authorize {<node-name> [area <area-name>]|all-pending}`  
`no atmf authorize <node-name> [area <area-name>]`

| Parameter   | Description                                                              |
|-------------|--------------------------------------------------------------------------|
| <node-name> | The name of the node to be authorized or have its authorization revoked. |
| area        | Specify an AMF area.                                                     |
| <area-name> | This is the name of the area the node belongs to.                        |
| all-pending | Authorize all nodes in the pending queue.                                |

**Mode** Privileged Exec

**Usage notes** On an AMF controller, AMF remote-area masters must be authorized by the controller, and the AMF remote-area masters will also need to authorized access from the AMF controller.

**Example** To authorize all AMF nodes in the pending authorization queue on an AMF master, use the command:

```
awplus# atmf authorize all-pending
```

To authorize a node called "node2" in remote AMF area "area3", use the command:

```
awplus# atmf authorize node2 area "area3"
```

To authorize a node called "node4" on an AMF master, use the command:

```
awplus# atmf authorize node4
```

To revoke authorization for a node called "node4" on an AMF master, use the command:

```
awplus# no atmf authorize node4
```

**Command changes**    Version 5.4.7-0.3: command added

# atmf authorize provision

**Overview** Use this command from an AMF controller or AMF master to pre-authorize a node on an AMF network running in secure mode. This allows a node to join the AMF network the moment the [atmf secure-mode](#) command is run on that node.

Use the **no** variant of this command to remove a provisional authorization from and AMF controller or AMF master.

**Syntax**

```
atmf authorize provision [timeout <minutes>] node <node-name>
interface <interface-name> [area <area-name>]

atmf authorize provision [timeout <minutes>] mac <mac-address>

atmf authorize provision [timeout <minutes>] all

no atmf authorize provision node <node-name> interface
<interface-name> [area <area-name>]

no atmf authorize provision mac <mac-address>

no atmf authorize provision all
```

| Parameter        | Description                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------|
| timeout          | Timeout for provisional authorization. Authorization for provisioned nodes expires after the timeout period specified. |
| <minutes>        | Timeout in minutes. A value between 1 and 6000 is permissible with the default being 60 minutes.                       |
| node             | Specify a node to provision by node name.                                                                              |
| <node-name>      | The name of the node to provisionally authorize.                                                                       |
| interface        | Specify the interface the node will connect on.                                                                        |
| <interface-name> | The name of the interface, this can be a switchport, link aggregator, LACP link, or virtual link.                      |
| area             | Specify the AMF area.                                                                                                  |
| <area-name>      | This is the name of the area the node belongs to.                                                                      |
| mac              | Specify a node to provision by MAC address.                                                                            |
| <mac-address>    | Enter a MAC address to provisionally authorize in the format HHHH.HHHH.HHHH.                                           |
| all              | Provision authorization for all secure mode capable nodes.                                                             |

**Default** The default timeout is 60 minutes.

**Mode** Privileged Exec

**Example** To provisionally authorize all non-secure AMF nodes, use the command:

```
awplus# atmf authorize provision all
```

To authorize a node with a MAC address of 0000.cd28.0880 for 2 hours, use the command:

```
awplus# authorize provision timeout 120 mac 0000.cd28.0880
```

To remove all provisional authorization, on an AMF master, use the command:

```
awplus# no atmf authorize provision all
```

**Related commands**

- [show atmf authorization](#)
- [show atmf secure-mode](#)

**Command changes**

- Version 5.4.7-0.3: command added

# atmf backup

**Overview** This command can only be applied to a master node. It manually schedules an AMF backup to start at a specified time and to execute a specified number of times per day.

Use the **no** variant of this command to disable the schedule.

**Syntax** `atmf backup {default|<hh:mm> frequency <1-24>}`

| Parameter        | Description                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------|
| default          | Restore the default backup schedule.                                                                                   |
| <hh:mm>          | Sets the time of day to apply the first backup, in hours and minutes. Note that this parameter uses the 24 hour clock. |
| backup           | Enables AMF backup to external media.                                                                                  |
| frequency <1-24> | Sets the number of times within a 24 hour period that backups will be taken.                                           |

**Default** Backups run daily at 03:00 AM, by default

**Mode** Global Configuration

**Usage notes** Running this command only configures the schedule. To enable the schedule, you should then apply the command [atmf backup enable](#).

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To schedule backup requests to begin at 11 am and execute twice per day (11 am and 11 pm), use the following command:

```
node_1# configure terminal
node_1(config)# atmf backup 11:00 frequency 2
```

**CAUTION:** File names that comprise identical text, but with differing case, such as *Test.txt* and *test.txt*, will not be recognized as being different on FAT32 based backup media such as a USB storage device. However, these filenames will be recognized as being different on your Linux based device. Therefore, for good practice, ensure that you apply a consistent case structure for your back-up file names.

**Related commands** [atmf backup enable](#)  
[atmf backup stop](#)  
[show atmf backup](#)

# atmf backup area-masters delete

**Overview** Use this command to delete from external media, a backup of a specified node in a specified area.

Note that this command can only be run on an AMF controller.

**Syntax** `atmf backup area-masters delete area <area-name> node <node-name>`

| Parameter                      | Description                                                   |
|--------------------------------|---------------------------------------------------------------|
| <code>&lt;area-name&gt;</code> | The area that contains the node whose backup will be deleted. |
| <code>&lt;node-name&gt;</code> | The node whose backup will be deleted.                        |

**Mode** Privileged Exec

**Example** To delete the backup of the remote area-master named “well-gate” in the AMF area named Wellington, use the command:

```
controller-1# atmf backup area-masters delete area Wellington
node well-gate
```

**Related commands** [show atmf backup area](#)

# atmf backup area-masters enable

**Overview** Use this command to enable backup of remote area-masters from the AMF controller. This command is only valid on AMF controllers.

Use the **no** form of the command to stop backups of remote area-masters.

**Syntax** `atmf backup area-masters enable`  
`no atmf backup area-masters enable`

**Mode** Global configuration

**Default** Remote area backups are disabled by default

**Usage notes** Use the following commands to configure the remote area-master backups:

- [atmf backup](#) to configure when the backups begin and how often they run
- [atmf backup server](#) to configure the backup server.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To enable scheduled backups of AMF remote area-masters, use the commands:

```
controller-1# configure terminal
controller-1(config)# atmf backup area-masters enable
```

To disable scheduled backups of AMF remote area-masters, use the commands:

```
controller-1# configure terminal
controller-1(config)# no atmf backup area-masters enable
```

**Related commands** [atmf backup server](#)  
[atmf backup](#)  
[show atmf backup area](#)

# atmf backup area-masters now

**Overview** Use this command to run an AMF backup of one or more remote area-masters from the AMF controller immediately.

This command is only valid on AMF controllers.

**Syntax** `atmf backup area-masters now [area <area-name>|area <area-name>  
node <node-name>]`

| Parameter   | Description                                    |
|-------------|------------------------------------------------|
| <area-name> | The area whose area-masters will be backed up. |
| <node-name> | The node that will be backed up.               |

**Mode** Privileged Exec

**Example** To back up all local master nodes in all areas controlled by controller-1, use the command

```
controller-1# atmf backup area-masters now
```

To back up all local masters in the AMF area named Wellington, use the command

```
controller-1# atmf backup area-masters now area Wellington
```

To back up the local master “well-master” in the Wellington area, use the command

```
controller-1# atmf backup area-masters now area Wellington node
well-master
```

**Related commands** [atmf backup area-masters enable](#)  
[atmf backup area-masters synchronize](#)  
[show atmf backup area](#)

# atmf backup area-masters synchronize

**Overview** Use this command to synchronize backed-up area-master files between the active remote file server and the backup remote file server. Files are copied from the active server to the remote server.

Note that this command is only valid on AMF controllers.

**Syntax** `atmf backup area-masters synchronize`

**Mode** Privileged Exec

**Example** To synchronize backed-up files between the remote file servers for all area-masters, use the command:

```
controller-1# atmf backup area-masters synchronize
```

**Related commands** [atmf backup area-masters enable](#)  
[atmf backup area-masters now](#)  
[show atmf backup area](#)

# atmf backup bandwidth

**Overview** This command sets the maximum bandwidth in kilobytes per second (kBps) available to the AMF backup process. This command enables you to restrict the bandwidth that is utilized for downloading file contents during a backup.

**NOTE:** *This command will only run on an AMF master. An error message will be generated if the command is attempted on node that is not a master.*

*Also note that setting the bandwidth value to zero will allow the transmission of as much bandwidth as is available, which can exceed the maximum configurable speed of 1000 kBps. In effect, zero means unlimited.*

Use the **no** variant of this command to reset (to its default value of zero) the maximum bandwidth in kilobytes per second (kBps) available when initiating an AMF backup. A value of zero tells the backup process to transfer files using unlimited bandwidth.

**Syntax** `atmf backup bandwidth <0-1000>`  
`no atmf backup bandwidth`

| Parameter                   | Description                                       |
|-----------------------------|---------------------------------------------------|
| <code>&lt;0-1000&gt;</code> | Sets the bandwidth in kilobytes per second (kBps) |

**Default** The default value is zero, allowing unlimited bandwidth when executing an AMF backup.

**Mode** Global Configuration

**Examples** To set an atmf backup bandwidth of 750 kBps, use the commands:

```
node2# configure terminal
node2(config)# atmf backup bandwidth 750
```

To set the AMF backup bandwidth to the default value for unlimited bandwidth, use the commands:

```
node2# configure terminal
node2(config)# no atmf backup bandwidth
```

**Related commands** [show atmf backup](#)

# atmf backup delete

**Overview** This command removes the backup file from the external media of a specified AMF node.

Note that this command can only be run from an AMF master node.

**Syntax** `atmf backup delete <node-name>`

| Parameter                      | Description                                         |
|--------------------------------|-----------------------------------------------------|
| <code>&lt;node-name&gt;</code> | The AMF node name of the backup file to be deleted. |

**Mode** Privileged Exec

**Example** To delete the backup file from node2, use the following command:

```
Node_1# atmf backup delete node2
```

**Related commands**

- [show atmf backup](#)
- [atmf backup now](#)
- [atmf backup stop](#)

# atmf backup enable

**Overview** This command enables automatic AMF backups on the AMF master node that you are connected to. By default, automatic backup starts at 3:00 AM. However, this schedule can be changed by the [atmf backup](#) command. Note that backups are initiated and stored only on the master nodes.

Use the **no** variant of this command to disable any AMF backups that have been scheduled and previously enabled.

**Syntax** `atmf backup enable`  
`no atmf backup enable`

**Default** Automatic AMF backup functionality is enabled on the AMF master when it is configured and external media, i.e. an SD card or a USB storage device or remote server, is detected.

**Mode** Global Configuration

**Usage notes** A warning message will appear if you run the [atmf backup enable](#) command with either insufficient or marginal memory availability on your external storage device.

You can use the command [show atmf backup](#) on page 2717 to check the amount of space available on your external storage device.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To turn on automatic AMF backup, use the following command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup enable
```

**Related commands** [show atmf](#)  
[show atmf backup](#)  
[atmf backup](#)  
[atmf backup now](#)  
[atmf enable](#)

# atmf backup guests delete

**Overview** This command removes a guest node's backup files from external media such as a USB drive, SD card, or an external file server.

**Syntax** `atmf backup guests delete <node-name> <guest-port>`

| Parameter                       | Description                          |
|---------------------------------|--------------------------------------|
| <code>&lt;node-name&gt;</code>  | The name of the guest's parent node. |
| <code>&lt;guest-port&gt;</code> | The port number on the parent node.  |

**Mode** User Exec/Privileged Exec

**Example** On a parent node named "node1" (which, in this case, the user has a direct console connection to) use the following command to remove the backup files of the guest node that is directly connected to port1.0.3.

```
node1# atmf backup guests delete node1 port1.0.3
```

**Related Command** [atmf backup delete](#)  
[atmf backup area-masters delete](#)  
[show atmf backup guest](#)

# atmf backup guests enable

**Overview** Use this command to enable backups of remote guest nodes from an AMF master.  
Use the **no** variant of this command to disable the ability of the guest nodes to be backed up.

**Syntax** `atmf backup guests enable`  
`no atmf backup guests enable`

**Default** Guest node backups are enabled by default.

**Mode** Global Config

**Usage notes** We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** On the AMF master node, enable all scheduled guest node backups:

```
atmf-master# configure terminal
atmf-master(config)# atmf backup guests enable
```

**Related commands** [atmf backup area-masters enable](#)  
[show atmf backup guest](#)  
[atmf backup guests synchronize](#)

# atmf backup guests now

**Overview** This command manually triggers an AMF backup of guest nodes on a AMF Master.

**Syntax** `atmf backup guests now [<node-name>] [<guest-port>]`

| Parameter                       | Description                                      |
|---------------------------------|--------------------------------------------------|
| <code>&lt;node-name&gt;</code>  | The name of the guest's parent node.             |
| <code>&lt;guest-port&gt;</code> | The port number that connects to the guest node. |

**Default** n/a

**Mode** Privileged Exec

**Example** Use the following command to manually trigger the backup of all guests in the AMF network

```
awplus# atmf backup guests now
```

**Example** To manually trigger the backup of a guest node connected to port 1.0.23 of node1, use the following command:

```
awplus# atmf backup guests now node1 port1.0.23
```

**Related commands** [show atmf backup guest](#)

# atmf backup guests synchronize

**Overview** This command initiates a manual synchronization of all guest backup file-sets across remote file servers and various redundancy backup media, such as USB storage devices. This facility ensures that each device contains the same backup image files. Note that this backup synchronization process will occur as part of the regular backups scheduled by the [atmf backup](#) command.

**Syntax** `atmf backup guests synchronize`

**Default** n/a

**Mode** User Exec/Privileged Exec

**Example** To synchronize backups across remote file servers and storage devices, use the command:

```
Node1#atmf backup guests synchronize
```

**Related commands**

- [atmf backup redundancy enable](#)
- [show atmf guests](#)
- [atmf backup guests enable](#)

# atmf backup now

**Overview** This command initiates an immediate AMF backup of either all AMF members, or a selected AMF member. Note that this backup information is stored in the external media on the master node of the device on which this command is run, even though the selected AMF member may not be a master node.

Note that this command can only be run on an AMF master node.

**Syntax** `atmf backup now [<nodename>]`

| Parameter                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;nodename&gt;</code><br>or<br><code>&lt;hostname&gt;</code> | The name of the AMF member to be backed up, as set by the command <code>hostname</code> on page 289. Where no name has been assigned to this device, then you must use the default name, which is the word "host", then an underscore, then (without a space) the MAC address of the device to be backed up. For example <code>host_0016_76b1_7a5e</code> . Note that the node-name appears as the command Prompt when in Privileged Exec mode. |

**Default** A backup is initiated for all nodes on the AMF (but stored on the master nodes).

**Mode** Privileged Exec

**Usage notes** Although this command will select the AMF node to be backed-up, it can only be run from any AMF master node.

**NOTE:** The backup produced will be for the selected node but the backed-up config will reside on the external media of the AMF master node on which the command was run. However, this process will result in the information on one master being more up-to-date. To maintain concurrent backups on both masters, you can apply the `backup now` command to the master working-set. This is shown in Example 4 below.

**Example 1** In this example, an AMF member has not been assigned a host name. The following command is run on the `AMF_Master_2` node to immediately backup the device that is identified by its MAC address of `0016.76b1.7a5e`:

```
AMF_Master_2# atmf backup now host_0016_76b1_7a5e
```

**NOTE:** When a host name is derived from its MAC address, the syntax format entered changes from `XXXX.XXXX.XXXX` to `XXXX_XXXX_XXXX`.

**Example 2** In this example, an AMF member has the host name, **office\_annex**. The following command will immediately backup this device:

```
AMF_Master_2# atmf backup now office_annex
```

This command is initiated on the device's master node named **AMF\_Master\_2** and initiates an immediate backup on the device named **office\_annex**.

**Example 3** To initiate from AMF\_master\_1 an immediate backup of all AMF member nodes, use the following command:

```
AMF_Master_1# amf backup now
```

**Example 4** To initiate an immediate backup of the node with the host-name "office\_annex" and store the configuration on both masters, use the following process:

From the AMF\_master\_1, set the working-set to comprise only of the automatic group, master nodes.

```
AMF_Master_1# atmf working-set group master
```

This command returns the following display:

```
=====
AMF_Master_1, AMF_Master_2
=====

Working set join
```

Backup the AMF member with the host name, **office\_annex** on both the master nodes as defined by the working set.

```
AMF_Master[2]# atmf backup now office_annex
```

Note that the [2] shown in the command prompt indicates a 2 node working-set.

**Related commands**

- [atmf backup](#)
- [atmf backup stop](#)
- [hostname](#)
- [show atmf backup](#)

# atmf backup redundancy enable

**Overview** This command is used to enable or disable AMF backup redundancy.

**Syntax** `atmf backup redundancy enable`  
`no atmf backup redundancy enable`

**Default** Disabled

**Mode** Global Configuration

**Usage notes** If the AMF Master or Controller supports any removable media (SD card/USB), it uses the removable media as the redundant backup for the AMF data backup.

This feature is valid only if remote file servers are configured on the AMF Master or Controller.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To enable AMF backup redundancy, use the commands:

```
awplus# configure terminal
awplus(config)# atmf backup redundancy enable
```

To disable AMF backup redundancy, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf backup redundancy enable
```

**Related commands** [atmf backup synchronize](#)  
[show atmf backup](#)  
[show atmf backup area](#)

# atmf backup server

**Overview** This command configures remote file servers as the destination for AMF backups.

Use the **no** variant of this command to remove the destination server(s). When all servers are removed the system will revert to backup from external media.

**Syntax** `atmf backup server id {1|2} <hostlocation> username <username>  
[path <path>|port <1-65535>]  
no atmf backup server id {1|2}`

| Parameter      | Description                                                                                                                                                                                      |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id             | Remote server backup server identifier.                                                                                                                                                          |
| {1 2}          | The backup server identifier number (1 or 2). Note that there can be up to two backup servers, numbered 1 and 2 respectively, and you would need to run this command separately for each server. |
| <hostlocation> | Either the name or the IP address (IPv4 or IPv6) of the selected backup server (1 or 2).                                                                                                         |
| username       | Configure the username to log in with on the selected remote file server.                                                                                                                        |
| <username>     | The selected remote file server's username.                                                                                                                                                      |
| path           | The location of the backup files on the selected remote file server. By default this will be the home directory of the username used to log in with.                                             |
| <path>         | The directory path utilized to store the backup files on the selected remote file server. No spaces are allowed in the path.                                                                     |
| port           | The connection to the selected remote backup file server using SSH. By default SSH connects to a device on TCP port 22 but this can be changed with this command.                                |
| <1-65535>      | A TCP port within the specified range.                                                                                                                                                           |

**Defaults** Remote backup servers are not configured. The default SSH TCP port is 22. The path utilized on the remote file server is the home directory of the username.

**Mode** Global Exec

**Usage notes** The hostname and username parameters must both be configured.

**Examples** To configure server 1 with an IPv4 address and a username of *backup1*, use the commands:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 1 192.168.1.1
username backup1
```

To configure server 1 with an IPv6 address and a username of *backup1*, use the command:

```
AMF_backup1_1# configure terminal
AMF_Master_1(config)# atmf backup server id 1 FFEE::01 username
backup1
```

To configure server 2 with a hostname and username, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 2 www.example.com
username backup2
```

To configure server 2 with a hostname and username in addition to the optional path and port parameters, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 2 www.example.com
username backup2 path tokyo port 1024
```

To unconfigure the AMF remote backup file server 1, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# no atmf backup server id 1
```

**Related  
commands**   [show atmf backup](#)

# atmf backup stop

**Overview** Running this command stops a backup that is currently running on the master node you are logged onto. Note that if you have two masters and want to stop both, then you can either run this command separately on each master node, or add both masters to a working set, and issue this command to the working set.

Note that this command can only be run on a master node.

**Syntax** `atmf backup stop`

**Mode** Privileged Exec

**Usage notes** This command is used to halt an AMF backup that is in progress. In this situation the backup process will finish on its current node and then stop.

**Example** To stop a backup that is currently executing on master node node-1, use the following command:

```
AMF_Master_1# amf backup stop
```

**Related commands**

- [atmf backup](#)
- [atmf backup enable](#)
- [atmf backup now](#)
- [show atmf backup](#)

# atmf backup synchronize

**Overview** For the master node you are connected to, this command initiates a system backup of files from the node's active remote file server to its backup remote file server. Note that this process happens automatically each time the network is backed up.

Note that this command can only be run from a master node.

**Syntax** `atmf backup synchronize`

**Mode** Privileged Exec

**Example** When connected to the master node AMF\_Master\_1, the following command will initiate a backup of all system related files from its active remote file server to its backup remote file server.

```
AMF_Master_1# atmf backup synchronize
```

**Related commands**

- [atmf backup enable](#)
- [atmf backup redundancy enable](#)
- [show atmf](#)
- [show atmf backup](#)

# atmf cleanup

**Overview** This command is an alias to the [erase factory-default](#) command.

# atmf container

**Overview** Use this command to create or update an AMF container on a Virtual AMF Appliance (VAA) virtual machine.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove an AMF container.

**Syntax** `atmf container <container-name>`  
`no atmf container <container-name>`

| Parameter                           | Description                                                 |
|-------------------------------------|-------------------------------------------------------------|
| <code>&lt;container-name&gt;</code> | The name of the AMF container to create, update, or remove. |

**Mode** AMF Container Configuration

**Usage notes** You cannot delete a container while it is still running. First use the **state disable** command to stop the container.

**Examples** To create or update the AMF container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)#
```

To remove the AMF container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# no atmf container vac-wlg-1
```

**Related commands** [area-link](#)  
[atmf container login](#)  
[bridge-group \(amf-container\)](#)  
[description \(amf-container\)](#)  
[show atmf container](#)  
[state](#)

**Command changes** Version 5.4.7-0.1: command added

# atmf container login

**Overview** Use this command to login to an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** `atmf container login <container-name>`

| Parameter                           | Description                                           |
|-------------------------------------|-------------------------------------------------------|
| <code>&lt;container-name&gt;</code> | The name of the AMF container you wish to login into. |

**Mode** Privileged Exec

**Usage notes** If you try to login to a AMF container that has not been created, or is not running, you will see the following message:

```
% Container does not exist or is not running.
```

To exit from a container and return to the host VAA press `<Ctrl+a q>`.

**Example** To login to container “vac-wlg-1”, use the command:

```
awplus# atmf container login vac-wlg-1
```

You will then be presented with a login screen for that container:

```
Connected to tty 1
Type <Ctrl+a q> to exit the console, <Ctrl+a Ctrl+a> to enter Ctrl+a itself

vac-wlg-1 login: manager
Password: friend

AlliedWare Plus (TM) 5.4.7 02/03/17 08:46:12

vac-wlg-1>
```

**Related commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# atmf controller

**Overview** Use this command to configure the device as an AMF controller. This enables you to split a large AMF network into multiple areas.

AMF controller is a licensed feature. The number of areas supported on a controller depends on the license installed on that controller.

Use the **no** variant of this command to remove the AMF controller functionality.

**Syntax** `atmf controller`  
`no atmf controller`

**Mode** Global configuration

**Usage notes** If a valid AMF controller license is not available on the device, the device will accept this command but will not act as a controller until you install a valid license. The following message will warn you of this:

"An AMF Controller license must be installed before this feature will become active"

**NOTE:** *If the AMF controller functionality is removed from a device using the **no atmf controller** command then the device must be rebooted if it is to function properly as an AMF master.*

**Example** To configure the node named *controller-1* as an AMF controller, use the commands:

```
controller-1# configure terminal
controller-1(config)# atmf controller
```

To stop the node named *controller-1* from being an AMF controller, use the commands:

```
controller-1# configure terminal
controller-1(config)# no atmf controller
```

**Related commands** [atmf area](#)  
[show atmf](#)

# atmf distribute firmware

**Overview** This command can be used to upgrade software one AMF node at a time. A URL can be selected from any media location. The latest compatible release for a node will be selected from this location.

Several procedures are performed to ensure the upgrade will succeed. This includes checking the current node release boots from flash. If there is enough space on flash, the software release is copied to flash on the new location.

The new release name is updated using the **boot system** command. The old release will become the backup release file. If a release file exists in a remote device (such as TFTP or HTTP, for example) then the URL should specify the exact release filename without using a wild card character.

The command will continue to upgrade software until all nodes are upgraded. At the end of the upgrade cycle the command should be used on the working-set.

**Syntax** `atmf distribute firmware <filename>`

| Parameter                     | Description                                                                                                                           |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;filename&gt;</code> | The filename and path of the file. See the <a href="#">File Management Feature Overview and Configuration Guide</a> for valid syntax. |

**Mode** Privileged Exec

**Examples** To upgrade nodes in a AMF network with a predefined AMF group called 'teams', use the following command:

```
Team1# atmf working-set group teams
```

```
=====
Team1, Team2, Team3:
=====
Working set join
```

```
ATMF_NETWORK[3]# atmf distribute firmware card:*.rel
```

```
Retrieving data from Team1
Retrieving data from Team2
Retrieving data from Team3
```

ATMF Firmware Upgrade:

| Node Name | New Release File   | Status        |
|-----------|--------------------|---------------|
| Team1     | x510-5.4.7-1.1.rel | Release ready |
| Team2     | x930-5.4.7-1.1.rel | Release ready |
| Team3     | x930-5.4.7-1.1.rel | Release ready |

Continue the rolling reboot ? (y/n):y

```
=====
Copying Release : x510-5.4.7-1.1.rel to Team1
Updating Release : x510-5.4.7-1.1.rel information on Team1
=====
```

```
=====
Copying Release : x930-5.4.7-1.1.rel to Team2

=====
```

```
=====
Copying Release : x930-5.4.7-1.1.rel to Team3
Updating Release : x930-5.4.7-1.1.rel information on Team3
=====
```

```
=====
New firmware will not take effect until nodes are rebooted.
=====
```

ATMF\_NETWORK[3]#

**Related commands** [atmf working-set](#)

# atmf domain vlan

**Overview** The AMF domain VLAN is created when the AMF network is first initiated and is assigned a default VID of 4091. This command enables you to change the VID from this default value on this device.

The AMF domain VLAN is one of AMF's internal VLANs (the management VLAN is the other internal VLAN). AMF uses these internal VLANs to communicate network status information between nodes. These VLANs must be reserved for AMF and not used for other purposes.

An important point conceptually is that although the domain VLAN exists globally across the AMF network, it is assigned separately to each domain. The AMF network therefore can be thought of as comprising a series of domain VLANs each having the same VID and each being applied to a horizontal slice (domain) of the AMF. It follows therefore that the domain VLANs are only applied to ports that form cross-links and not to ports that form uplinks/downlinks.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to reset the VLAN ID to its default value of 4091.

**Syntax** `atmf domain vlan <2-4090>`  
`no atmf domain vlan`

| Parameter                   | Description                             |
|-----------------------------|-----------------------------------------|
| <code>&lt;2-4090&gt;</code> | The VLAN number in the range 2 to 4090. |

**Default** VLAN 4091

**Mode** Global Configuration

**Usage notes** We recommend you only change the domain VLAN when first creating the AMF network, and only if VLAN 4091 is already being used in your network.

However, if you do need to change the VLAN on an existing AMF network, use the following steps:

- 1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the domain VLAN. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

- 2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

- 3) Enter the new VLAN ID, using the commands:

```
test[10]# configure terminal
```

```
test(config)[10]# atmf domain vlan <2-4090>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new VLAN.

- 4) Create the working set again, using the commands:

```
master(config)# exit
```

```
master# atmf working-set group all
```

- 5) Save the configuration, using the command:

```
test[10]# write
```

- 6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the VLAN on missing devices by logging into their consoles directly.

**NOTE:** The domain VLAN will automatically be assigned an IP subnet address based on the value configured by the command *atmf management subnet*.

The default VLAN ID lies outside the user-configurable range. If you need to reset the VLAN to the default VLAN ID, use the **no** variant of this command to do so.

**Examples** To change the AMF domain VLAN to 4090 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
```

```
test[10]# configure terminal
```

```
test(config)[10]# atmf domain vlan 4090
```

```
master(config)# exit
```

```
master# atmf working-set group all
```

```
test[10]# write
```

To reset the AMF domain VLAN to its default of 4091 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf domain vlan
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands**   [atmf management subnet](#)  
[atmf management vlan](#)

# atmf enable

**Overview** This command manually enables (turns on) the AMF feature for the device being configured.

Use the **no** variant of this command to disable (turn off) the AMF feature on the member node.

**Syntax** `atmf enable`  
`no atmf enable`

**Default** Once AMF is configured, the AMF feature starts automatically when the device starts up.

**Mode** Global Configuration

**Usage notes** The device does not auto negotiate AMF domain specific settings such as the Network Name. You should therefore, configure your device with any domain specific (non default) settings before enabling AMF.

**Examples** To turn off AMF, use the command:

```
MyNode# config terminal
MyNode(config)# no atmf enable
```

To turn on AMF, use the command:

```
MyNode(config)# atmf enable
```

This command returns the following display:

```
% Warning: The ATMF network config has been set to enable
% Save the config and restart the system for this change to take
effect.
```

# atmf group (membership)

**Overview** This command configures a device to be a member of one or more AMF groups. Groups exist in three forms: Implicit Groups, Automatic Groups, and User-defined Groups.

- Implicit Groups
  - all: All nodes in the AMF
  - current: The current working-set
  - local: The originating node.

Note that the Implicit Groups do not appear in show group output.

- Automatic Groups - These are defined by hardware architecture, e.g. x510, x230, x8100, AR3050S, AR4050S.
- User-defined Groups - These enable you to define arbitrary groups of AMF members based on your own criteria.

Each node in the AMF is automatically assigned membership to the implicit groups, and the automatic groups that are appropriate to its node type, e.g. x230, PoE. Similarly, nodes that are configured as masters are automatically assigned to the master group.

Use the **no** variant of this command to remove the membership.

**Syntax** `atmf group <group-list>`  
`no atmf group <group-list>`

| Parameter                       | Description                                                                                                                                                  |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;group-list&gt;</code> | A list of group names. These should be entered as a comma delimited list without spaces. Names can contain alphanumeric characters, hyphens and underscores. |

**Mode** Global Configuration

**Usage notes** You can use this command to define your own arbitrary groups of AMF members based on your own network's configuration requirements. Applying a node to a non existing group will result in the group automatically being created.

Note that the master nodes are automatically assigned to be members of the pre-existing master group.

The following example configures the device to be members of three groups; two are company departments, and one comprises all devices located in building\_2. To avoid having to run this command separately on each device that is to be added to these groups, you can remotely assign all of these devices to a working-set, then use the capabilities of the working-set to apply the [atmf group \(membership\)](#) command to all members of the working set.

**Example 1** To specify the device to become a member of AMF groups named *marketing*, *sales*, and *building\_2*, use the following commands:

```
node-1# configure terminal
node-1(config)# atmf group marketing,sales,building_2
```

**Example 2** To add the nodes *member\_node\_1* and *member\_node\_2* to groups *building1* and *sales*, first add the nodes to the working-set:

```
master_node# atmf working-set member_node_1,member_node_2
```

This command returns the following output confirming that the nodes *member\_node\_1* and *member\_node\_2* are now part of the working-set:

```
=====
member_node_1, member_node_2
=====

Working set join
```

Then add the members of the working set to the groups:

```
atmf-net[2]# configure terminal
atmf-net[2](config)# atmf group building1,sales
atmf-net[2](config)# exit
atmf-net[2]# show atmf group
```

This command returns the following output displaying the groups that are members of the working-set.

```
=====
member_node_1
=====

AMF group information

building1, sales
```

**Related commands** [show atmf group](#)  
[show atmf group members](#)

# atmf guest-class

**Overview** This modal command creates a guest-class. Guest-classes are modal templates that can be applied to selected guest types. Once you have created a guest-class, you can select it by entering its mode. From here, you can then configure a further set of operational settings specifically for the new guest-class.

These settings can then all be applied to a guest link by running the [switchport atmf-guestlink](#) command. The following settings can be configured from each guest class mode:

- discovery method
- model type
- http-enable setting
- guest port, user name, and password

The **no** variant of this command removes the guest-class. Note that you cannot remove a guest-class that is assigned to a port.

**Syntax** `atmf guest-class <guest-class-name>`  
`no atmf guest-class <guest-class-name>`

| Parameter                             | Description                                                                                                    |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <code>&lt;guest-class-name&gt;</code> | The name assigned to the guest-class type. This can be chosen from an arbitrary string of up to 15 characters. |

**Mode** Global Configuration

**Example** To create a guest-class named 'camera' use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class camera
node1(config-atmf-guest)#
```

To remove the guest-class named 'camera' use the commands:

```
node1# configure terminal
node1(config)# no atmf guest-class camera
```

[modeltype](#)

switchport atmf-guestlink  
show atmf links guest  
show atmf guests  
login-fallback enable

# atmf log-verbose

**Overview** This command limits the number of log messages displayed on the console or permanently logged.

Use the **no** variant of this command to reset to the default.

**Syntax** `atmf log-verbose <1-3>`  
`no atmf log-verbose`

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| <1-3>     | The verbose limitation (3 = noisiest, 1 = quietest) |

**Default** The default log display is 3.

**Usage** This command is intended for use in large networks where verbose output can make the console unusable for periods of time while nodes are joining and leaving.

**Mode** Global Configuration

**Example** To set the log-verbose to noise level 2, use the command:

```
node-1# configure terminal
node-1(config)# atmf log-verbose 2
```

**Validation Command** `show atmf`

# atmf management subnet

**Overview** This command is used to assign a subnet that will be allocated to the AMF management and domain management VLANs. From the address space defined by this command, two subnets are created, a management subnet component and a domain component, as explained in the Usage section below.

AMF uses these internal IPv4 subnets to communicate network status information between nodes. These subnet addresses must be reserved for AMF and not used for other purposes.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to remove the assigned subnet.

**Syntax** `atmf management subnet <a.b.0.0>`  
`no atmf management subnet`

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;a.b.0.0&gt;</code> | The IP address selected for the management subnet. Because a mask of 255.255.0.0 (i.e. /16) will be applied automatically, an IP address in the format a.b.0.0 must be selected. Usually this subnet address is selected from an appropriate range from within the private address space of 172.16.0.0 to 172.31.255.255, or 192.168.0.0, as defined in RFC1918. |

**Default** 172.31.0.0. A subnet mask of 255.255.0.0 will automatically be applied.

**Mode** Global Configuration

**Usage notes** Running this command will result in the creation of a further two subnets (within the class B address space assigned) and the mask will extend from /16 to /17.

For example, if the management subnet is assigned the address 172.31.0.0/16, this will result in the automatic creation of the following two subnets:

- 172.31.0.0/17 assigned to the [atmf management vlan](#)
- 172.31.128.0/17 assigned to the [atmf domain vlan](#).

We recommend you only change the management subnet when first creating the AMF network, and only if 172.31.0.0 is already being used in your network.

However, if you do need to change the subnet on an existing AMF network, use the following steps:

- 1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the domain VLAN, management VLAN, or management subnet. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

- 2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

- 3) Enter the new subnet address, using the commands:

```
test[10]# configure terminal
```

```
test(config)[10]# atmf management subnet <a.b.0.0>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new subnet.

- 4) Create the working set again, using the commands:

```
master(config)# exit
```

```
master# atmf working-set group all
```

- 5) Save the configuration, using the command:

```
test[10]# write
```

- 6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the subnet on missing devices by logging into their consoles directly.

**Examples** To change the AMF management subnet address to 172.25.0.0 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
```

```
test[10]# configure terminal
```

```
test(config)[10]# atmf management subnet 172.25.0.0
```

```
master(config)# exit
```

```
master# atmf working-set group all
```

```
test[10]# write
```

To reset the AMF management subnet address to its default of 172.31.0.0 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf management subnet
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands**   [atmf domain vlan](#)  
[atmf management vlan](#)

# atmf management vlan

**Overview** The AMF management VLAN is created when the AMF network is first initiated and is assigned a default VID of 4092. This command enables you to change the VID from this default value on this device.

The AMF management VLAN is one of AMF's internal VLANs (the domain VLAN is the other internal VLAN). AMF uses these internal VLANs to communicate network status information between nodes. These VLANs must be reserved for AMF and not used for other purposes.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to restore the VID to the default of 4092.

**Syntax** `atmf management vlan <2-4090>`  
`no atmf management vlan`

| Parameter                   | Description                                  |
|-----------------------------|----------------------------------------------|
| <code>&lt;2-4090&gt;</code> | The VID assigned to the AMF management VLAN. |

**Default** VLAN 4092

**Mode** Global Configuration

**Usage notes** We recommend you only change the management VLAN when first creating the AMF network, and only if VLAN 4092 is already being used in your network.

However, if you do need to change the VLAN on an existing AMF network, use the following steps to ensure you change it on all nodes simultaneously:

- 1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the management VLAN. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

- 2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10] #
```

- 3) Enter the new VLAN ID, using the commands:

```
test[10]# configure terminal
test(config)[10]# atmf management vlan <2-4090>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new VLAN.

- 4) Create the working set again, using the commands:

```
master(config)# exit
master# atmf working-set group all
```

- 5) Save the configuration, using the command:

```
test[10]# write
```

- 6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the VLAN on missing devices by logging into their consoles directly.

**NOTE:** The management VLAN will automatically be assigned an IP subnet address based on the value configured by the command [atmf management subnet](#).

The default VLAN ID lies outside the user-configurable range. If you need to reset the VLAN to the default VLAN ID, use the **no** variant of this command to do so.

**Examples** To change the AMF management VLAN to 4090 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# atmf management vlan 4090
master(config)# exit
master# atmf working-set group all
test[10]# write
```

To reset the AMF management VLAN to its default of 4092 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf management vlan
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands** [atmf domain vlan](#)  
[atmf management subnet](#)

# atmf master

**Overview** This command configures the device to be an AMF master node and automatically creates an AMF master group. The master node is considered to be the core of the AMF network, and must be present for the AMF to form. The AMF master has its node depth set to 0. Note that the node depth vertical distance is determined by the number of uplinks/downlinks that exist between the node and its master.

An AMF master node must be present for an AMF network to form. Up to two AMF master nodes may exist in a network, and they **must** be connected by an AMF crosslink.

**NOTE:** Master nodes are an essential component of an AMF network. In order to run AMF, an AMF License is required for each master node.

If the crosslink between two AMF masters fails, then one of the masters will become isolated from the rest of the AMF network.

Use the **no** variant of this command to remove the device as an AMF master node. The node will retain its node depth of 0 until the network is rebooted.

**NOTE:** Node depth is the vertical distance (or level) from the master node (whose depth value is 0).

**Syntax** `atmf master`  
`no atmf master`

**Default** The device is not configured to be an AMF master node.

**Mode** Global Configuration

**Example** To specify that this node is an AMF master, use the following command:

```
node-1# configure terminal
node-1(config)# atmf master
```

**Related commands** [show atmf](#)  
[show atmf group](#)

## atmf mtu

**Overview** This command configures the AMF network Maximum Transmission Unit (MTU). The MTU value will be applied to the AMF Management VLAN, the AMF Domain VLAN and AMF Area links.

Use the **no** variant of this command to restore the default MTU.

**Syntax** `atmf mtu <1300-1442>`  
`no atmf mtu`

| Parameter                      | Description                                                                                                                               |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;1300-1442&gt;</code> | The value of the maximum transmission unit for the AMF network, which sets the maximum size of all AMF packets generated from the device. |

**Default** 1300

**Mode** Global Configuration

**Usage notes** The default value of 1300 will work for all AMF networks (including those that involve virtual links over IPsec tunnels). If there are virtual links over IPsec tunnels anywhere in the AMF network, we recommend not changing this default. If there are no virtual links over IPsec tunnels, then this AMF MTU value may be increased for network efficiency.

**Example** To change the ATMF network MTU to 1442, use the command:

```
awplus(config)# atmf mtu 1442
```

**Related commands** [show atmf detail](#)

# atmf network-name

**Overview** This command applies an AMF network name to a (prospective) AMF node. In order for an AMF network to be valid, its network-name must be configured on at least two nodes, one of which must be configured as a master and have an AMF License applied. These nodes may be connected using either AMF downlinks or crosslinks.

For more information on configuring an AMF master node, see the command [atmf master](#).

Use the **no** variant of this command to remove the AMF network name.

**Syntax** `atmf network-name <name>`  
`no atmf network-name`

| Parameter                 | Description                                                                              |
|---------------------------|------------------------------------------------------------------------------------------|
| <code>&lt;name&gt;</code> | The AMF network name. Up to 15 printable characters can be entered for the network-name. |

**Mode** Global Configuration

**Usage notes** This is one of the essential commands when configuring AMF and must be entered on each node that is to be part of the AMF.

A switching node (master or member) may be a member of only one AMF network.

**CAUTION:** *Ensure that you enter the correct network name. Entering an incorrect name will cause the AMF network to fragment (at the next reboot).*

**Example** To set the AMF network name to `amf_net` use the command:

```
Node_1(config)# atmf network-name amf_net
```

# atmf provision (interface)

**Overview** This command configures a specified port on an AMF node to accept a provisioned node, via an AMF link, some time in the future.

Use the **no** variant of this command to remove the provisioning on the node.

**Syntax** `atmf provision <nodename>`  
`no atmf provision`

| Parameter                     | Description                                                                         |
|-------------------------------|-------------------------------------------------------------------------------------|
| <code>&lt;nodename&gt;</code> | The name of the provisioned node that will appear on the AMF network in the future. |

**Mode** Interface Configuration for a switchport, a static aggregator, dynamic channel group or an Eth port on an AR-Series device.

**Usage notes** The port should be configured as an AMF link or cross link and should be 'down' to add or remove a provisioned node.

**Example** To provision an AMF node named node1 for port1.0.1, use the commands:

```
host1(config)# interface port1.0.1
host1(config-if)# atmf provision node1
```

# atmf provision node

**Overview** Use this command to provision a replacement node for a specified interface. Node provisioning is effectively the process of creating a backup file-set on a master node that can be loaded onto a provisioned node some time in the future. This file-set is created just as if the provisioned node really existed and was connected to the network. Typically these comprise configuration, operating system, and license files etc.

You can optionally provision a node with multiple device-type backups. When a device is then attached to the network, AMF uses its device-type to find the correct configuration to use. For example you can create an x510 and an x530 provisioning configuration for a node called 'node1' and if either an x510 or an x530 is attached to that node the appropriate configuration will be used.

Use the **no** variant of this command to remove a provisioned node.

**Syntax** `atmf provision node <nodename> [device <device-type>]`  
`no atmf provision node <nodename> [device <device-type>]`

| Parameter     | Description                                                                                                                                                   |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <nodename>    | The name of the provisioned node that will appear on the AMF network.                                                                                         |
| device        | Optionally specify a device type.                                                                                                                             |
| <device-type> | Any valid device type e.g. AR3050s, ie200, x950. For a full list of valid device types use the command <b>atmf provision node &lt;nodename&gt; device ?</b> . |

**Mode** Privileged Exec

**Usage notes** This command creates the directory structure for the provisioned node's file-set. It also switches to the AMF provision node prompt so that the nodes backup file-set can be created or updated. This is typically done with the [create \(amf-provision\)](#) or [clone \(amf-provision\)](#) commands.

For more information on AMF provisioning, see the [AMF Feature Overview and Configuration Guide](#)..

**Example** To configure node named 'node1', use the command:

```
awplus# atmf provision node node1
awplus(atmf-provision) #
```

To configure a node named 'node1' for device type 'x530', use the command:

```
awplus# atmf provision node node1 device x530
awplus(atmf-provision) #
```

**Related commands**

- atmf provision (interface)
- clone (amf-provision)
- configure boot config (amf-provision)
- configure boot system (amf-provision)
- copy (amf-provision)
- create (amf-provision)
- delete (amf-provision)
- identity (amf-provision)
- license-cert (amf-provision)
- locate (amf-provision)
- show atmf provision nodes

**Command changes**    Version 5.4.9-0.1: command added

# atmf reboot-rolling

**Overview** This command enables you to reboot the nodes in an AMF working-set, one at a time, as a rolling sequence in order to minimize downtime. Once a rebooted node has finished running its configuration and its ports are up, it re-joins the AMF network and the next node is rebooted.

By adding the `url` parameter, you can also upgrade your devices' software one AMF node at a time.

The **force** parameter forces the rolling reboot to continue even if a previous node does not rejoin the AMF network. Without the **force** parameter, the unsuitable node will time-out and the rolling reboot process will stop. However, with the **force** parameter applied, the process will ignore the timeout and move on to reboot the next node in the sequence.

This command can take a significant amount of time to complete.

**Syntax** `atmf reboot-rolling [force] [<url>]`

| Parameter                | Description                                                                                                                                          |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>force</code>       | Ignore a failed node and move on to the next node. Where a node fails to reboot a timeout is applied based on the time taken during the last reboot. |
| <code>&lt;url&gt;</code> | The path to the software upgrade file.                                                                                                               |

**Mode** Privileged Exec

**Usage notes** You can load the software from a variety of locations. The latest compatible release for a node will be selected from your selected location, based on the parameters and URL you have entered.

For example `usb:/5.5.2-2/x*-5.5.2-2-*.rel` will select from the folder `usb:/5.5.2-2` the latest file that matches the selection `x(wildcard)-5.5.2-2-(wildcard).rel`. Because `x*` is applied, each device type will be detected and its appropriate release file will be installed.

Other allowable entries are:

| Entry                                 | Used when loading software                              |
|---------------------------------------|---------------------------------------------------------|
| <code>card:*.rel:</code>              | from an SD card                                         |
| <code>tftp:&lt;ip-address&gt;:</code> | from a TFTP server                                      |
| <code>usb:</code>                     | from a USB flash drive                                  |
| <code>flash:</code>                   | from flash memory, e.g. from one x930 switch to another |
| <code>scp:</code>                     | using secure copy                                       |
| <code>http:</code>                    | from an HTTP file server                                |

Several checks are performed to ensure the upgrade will succeed. These include checking the current node release boots from flash. If there is enough space on flash, the software release is copied to flash to a new location on each node as it is processed. The new release name will be updated using the **boot system<release-name>** command, and the old release will become the backup release file.

**NOTE:** *If you are using TFTP or HTTP, for example, to access a file on a remote device then the URL should specify the exact release filename without using wild card characters.*

On bootup the software release is verified. Should an upgrade fail, the upgrading unit will revert back to its previous software version. At the completion of this command, a report is run showing the release upgrade status of each node.

**NOTE:** *Take care when removing external media or rebooting your devices. Removing an external media while files are being written entails a significant risk of causing a file corruption.*

**Example 1** To reboot all x530 nodes in an AMF network, use the commands:

```
Bld2_Floor_1# atmf working-set group x530
```

This command returns the following type of screen output:

```
=====
node1, node2, node3:
=====

Working set join

AMF_NETWORK[3]#
```

```
ATMF_NETWORK[3]# atmf reboot-rolling
```

When the reboot has completed, a number of status screens appear. The selection of these screens will depend on the parameters set.

```

Bld2_Floor_1#atmf working-set group x530

=====
SW_Team1, SW_Team2, SW_Team3:
=====

Working set join

ATMF_NETWORK[3]#atmf reboot-rolling
ATMF Rolling Reboot Nodes:

# atmf recover

**Overview** This command is used to manually initiate the recovery (or replication) of an AMF node, usually when a node is being replaced.

**Syntax** `atmf recover [<node-name> master <node-name>]`  
`atmf recover [<node-name> controller <node-name>]`

| Parameter                           | Description                                                                                                                                                                                                                              |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;node-name&gt;</i>            | The name of the device whose configuration is to be recovered or replicated.                                                                                                                                                             |
| master<br><i>&lt;node-name&gt;</i>  | The name of the master device that holds the required configuration information.<br>Note that although you can omit both the node name and the master name; you cannot specify a master name unless you also specify the node name.      |
| controller <i>&lt;node-name&gt;</i> | The name of the controller that holds the required configuration information.<br>Note that although you can omit both the node name and the controller name; you cannot specify a controller name unless you also specify the node name. |

**Mode** Privileged Exec

**Usage notes** The recovery/replication process involves loading the configuration file for a node that is either about to be replaced or has experienced some problem. You can specify the configuration file of the device being replaced by using the *<node-name>* parameter, and you can specify the name of the master node or controller holding the configuration file.

If the *<node-name>* parameter is not entered then the node will attempt to use one that has been previously configured. If the replacement node has no previous configuration (and has no previously used node-name), then the recovery will fail.

If the master or controller name is not specified then the device will poll all known AMF masters and controllers and execute an election process (based on the last successful backup and its timestamp) to determine which to use. If no valid backup master or controller is found, then this command will fail.

No error checking occurs when this command is run. Regardless of the last backup status, the recovering node will attempt to load its configuration from the specified master node or controller.

If the node has previously been configured, we recommend that you suspend any AMF backup before running this command. This is to prevent corruption of the backup files on the AMF master as it attempts to both backup and recover the node at the same time.

**Example** To recover the AMF node named Node\_10 from the AMF master node named Master\_2, use the following command:

```
Master_2# atmf recover Node_10 master Master_2
```

**Related commands**

- atmf backup stop
- show atmf backup
- show atmf

# atmf recover guest

**Overview** Use this command to initiate a guest node recovery or replacement by reloading its backup file-set that is located within the AMF backup system. Note that this command must be run on the edge node device that connects to the guest node.

**Syntax** `atmf recover guest [<guest-port>]`

| Parameter                       | Description                                      |
|---------------------------------|--------------------------------------------------|
| <code>&lt;guest-port&gt;</code> | The port number that connects to the guest node. |

**Mode** User Exec/Privileged Exec

**Example** To recover a guest on node1 port1.0.1, use the following command

```
node1# atmf recover guest port1.0.1
```

**Related commands** [show atmf backup guest](#)

# atmf recover led-off

**Overview** This command turns off the recovery failure flashing port LEDs. It reverts the LED's function to their normal operational mode, and in doing so assists with resolving the recovery problem. You can repeat this process until the recovery failure has been resolved. For more information, see the [AMF Feature Overview and Configuration Guide](#).

**Syntax** `atmf recover led-off`

**Default** Normal operational mode

**Mode** Privileged Exec

**Example** To revert the LEDs on Node1 from recovery mode display to their normal operational mode, use the command:

```
Node1# atmf recover led-off
```

**Related commands** [atmf recover](#)

# atmf recover over-eth

**Overview** Use this command to enable AMF recovery over an AR-series device's Eth port. This setting persists even after restoring a device to a 'clean' state with the [erase factory-default](#) or [atmf cleanup](#) command.

Use the **no** variant of this command to disable AMF recover over an Eth port.

**Syntax** `atmf recover over-eth`  
`no atmf recover over-eth`

**Default** Eth ports cannot be used for recovery.

**Mode** Privileged Exec

**Usage notes** AMF links over Eth ports are only available if your network is running in AMF secure mode (see [atmf secure-mode](#) for more information on AMF secure mode).

**Example** To enable AMF recovery over an Eth port, use the command:

```
awplus# atmf recover over-eth
```

To disable AMF recovery over an Eth port, use the commands:

```
awplus# no atmf recover over-eth
```

**Related commands** [atmf-link](#)  
[atmf recover](#)  
[atmf secure-mode](#)  
[erase factory-default](#)  
[show atmf detail](#)

**Command changes** Version 5.5.0-1.1: command added

# atmf recovery-server

**Overview** Use this command on an AMF master to process recovery requests from isolated AMF nodes. An isolated node is an AMF member that is only connected to the rest of the AMF network via a virtual-link.

This option allows these nodes, which have no AMF neighbors, to be identified for recovery or provisioning purposes. They are identified using an identity token which is stored on the AMF master.

Use the **no** variant of this command to disable processing of recovery requests from isolated AMF nodes.

**Syntax** `atmf recovery-server`  
`no atmf recovery-server`

**Default** Recovery-server is disabled by default.

**Mode** Global Configuration

**Usage notes** Once **recovery-server** is enabled on an AMF network, the next time an isolated node is backed up its identity token will be stored in the AMF master's database. Should the device fail it can then be replaced and auto-recovery will occur as long as:

- the AMF master is accessible to the isolated node, and
- either, a DHCP server is configured to send the Uniform Resource Identifier (URI) of the AMF master to the recovering node, or
- a DNS server is configured to resolve the default recovery URI (`https://amfrecovery.alliedtelesis.com`) to the IP address of the AMF master.

Provisioning of isolated nodes is achieved by creating an identity token for the new node using the [identity \(amf-provision\)](#) command.

See the [AMF Feature Overview and Configuration Guide](#) for information on preparing your network for recovering or provisioning isolated nodes.

**Example** To enable recovery-server on an AMF master, use the commands:

```
awplus# configure terminal
awplus(config)# atmf recovery-server
```

To disable recovery-server on an AMF master, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf recovery-server
```

**Related commands** [atmf backup](#)  
[atmf cleanup](#)  
[identity \(amf-provision\)](#)  
[atmf virtual-link](#)

**Command changes** Version 5.4.7-2.1: command added

# atmf remote-login

**Overview** Use this command to remotely login to other AMF nodes in order to run commands as if you were a local user of that node.

**Syntax** `atmf remote-login [user <name>] <nodename>`

| Parameter  | Description                                            |
|------------|--------------------------------------------------------|
| <name>     | The name of a user on the remote node.                 |
| <nodename> | The name of the remote AMF node you are connecting to. |

**Mode** Privileged Exec (This command will only run at privilege level 15)

**Usage notes** You do not need a valid login on the local device in order to run this command. The session will take you to the enable prompt on the new device. If the remote login session exits for any reason (e.g. device reboot) you will be returned to the originating node.

You can create additional user accounts on nodes. AMF's goal is to provide a uniform management plane across the whole network, so we recommend you use the same user accounts on all the nodes in the network.

In reality, though, it is not essential to have the same accounts on all the nodes. Users can remote login from one node to a second node even if they are logged into the first node with a user account that does not exist on the second node (provided that [atmf restricted-login](#) is disabled and the user account on the first node has privilege level 15).

Moreover, it is possible to use a RADIUS or TACACS+ server to manage user authentication, so users can log into AMF nodes using user accounts that are present on the RADIUS or TACACS+ server, and not present in the local user databases of the AMF nodes.

The software will not allow you to run multiple remote login sessions. You must exit an existing session before starting a new one.

If you disconnect from the VTY session without first exiting from the AMF remote session, the device will keep the AMF remote session open until the [exec-timeout](#) time expires (10 minutes by default). If the exec-timeout time is set to infinity (**exec-timeout 0 0**), then the device is unable to ever close the remote session. To avoid this, we recommend you use the **exit** command to close AMF remote sessions, instead of closing the associated VTY sessions. We also recommend you avoid setting the exec-timeout to infinity.

**Example** To remotely login from node Node10 to Node20, use the following command:

```
Node10# atmf remote-login node20
Node20>
```

To close the session on Node20 and return to Node10's command line, use the following command:

```
Node20# exit
```

```
Node10#
```

In this example, user User1 is a valid user of node5. They can remotely login from node5 to node3 by using the following commands:

```
node5# atmf remote-login user User1 node3
```

```
node3> enable
```

**Related commands** [atmf restricted-login](#)

**Command changes** Version 5.4.6-2.1: changes to AMF user account requirements

# atmf restricted-login

**Overview** By default, users who are logged into any node on an AMF network are able to manage any other node by using either working-sets or an AMF remote login. If the access provided by this feature is too wide, or contravenes network security restrictions, it can be limited by running this command, which changes the access so that:

- users who are logged into non-master nodes cannot execute any commands that involve working-sets, and
- from non-master nodes, users can use remote-login, but only to login to a user account that is valid on the remote device (via a statically configured account or RADIUS/TACACS+). Users are also required to enter the password for that user account.

Once entered on any AMF master node, this command will propagate across the network.

Use the **no** variant of this command to disable restricted login on the AMF network. This allows access to the **atmf working-set** command from any node in the AMF network.

**Syntax** `atmf restricted-login`  
`no atmf restricted-login`

**Mode** Privileged Exec

**Default** Master nodes operate with **atmf restricted-login** disabled.  
Member nodes operate with **atmf restricted-login** enabled.

**NOTE:** The default conditions of this command vary from those applied by its “no” variant. This is because the restricted-login action is only applied by **master** nodes, and in the absence of a master node, the default is to apply the restricted action to all **member** nodes with AMF configured.

**Usage notes** In the presence of a **master** node, its default of **atmf restricted-login disabled** will propagate to all its member nodes. Similarly, any change in this command’s status that is made on a master node, will also propagate to all its member nodes

Note that once you have run this command, certain other commands that utilize the AMF working-set command, such as the **include**, **atmf reboot-rolling** and **show atmf group members** commands, will operate only on master nodes.

Restricted-login must be enabled on AMF areas with more than 120 nodes.

**Example** To enable restricted login, use the command

```
Node_20(config)# atmf restricted-login node20
```

**Related commands** [atmf remote-login](#)  
[show atmf](#)

**Command changes** Version 5.4.6-2.1: changes to AMF user account requirements

# atmf retry guest-link

**Overview** Use this command to retry an AMF guest-link by restarting AMF guest discovery on a port if it is currently in the failed state.

If no port is specified then all configured AMF guest-link ports that are in the failed state are retried.

If a port is specified then that port will only be retried if it is both:

- configured as an AMF guest-link, and
- it is currently in the failed state.

**Syntax** `atmf retry guest-link [<interface>]`

| Parameter                      | Description                                                              |
|--------------------------------|--------------------------------------------------------------------------|
| <code>&lt;interface&gt;</code> | Name of the interface the guest-link you want to retry is configured on. |

**Mode** Privileged Exec

**Example** To retry all configured AMF guest-link currently in a failed state, use the command:

```
awplus# atmf retry guest-link
```

To retry an AMF guest-link configured on port1.0.2 currently in a failed state, use the command:

```
awplus# atmf retry guest-link port1.0.2
```

**Related commands** [show atmf links guest](#)  
[switchport atmf-guestlink](#)

# atmf secure-mode

**Overview** Use this command to enable AMF secure mode on an AMF node. AMF secure mode makes an AMF network more secure by:

- Adding an authorization mechanism before and AMF member is allowed to join an AMF network.
- The encryption of all AMF packets sent between AMF nodes.
- Adding support for user login authentication by RADIUS or TACACS+, and removing the requirement to have the same privileged user account in the local user database on all devices in the AMF network.
- Adding additional logging which enables network administrators to monitor attempts to gain unauthorized access to the AMF network.

Once the secure mode command is run on all nodes on an AMF network, the AMF masters and AMF controllers manage the addition of AMF nodes and AMF areas to the AMF network.

Use the **no** variant of this command to disable AMF secure mode on an AMF node.

**Syntax** `atmf secure-mode`  
`no atmf secure-mode`

**Default** Secure mode is disabled by default.

**Mode** Global Configuration

**Usage notes** When an AMF network is running in AMF secure mode the [atmf restricted-login](#) feature is automatically enabled. This restricts the [atmf working-set](#) command to users that are logged on to an AMF master. This feature cannot be disabled independently of secure mode.

When AMF secure mode is enabled the AMF controllers and masters in the AMF network form a group of certificate authorities. A node may only join a secure AMF network once it has been authorized by a master or controller. When enabled, all devices in the AMF network must be running in secure mode. Unsecured devices will not be able to join a secure AMF network.

**Example** To enable AMF secure mode on an AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode
```

To disable AMF secure mode on an AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf secure-mode
```

**Related commands** [atmf authorize](#)

Version 5.4.7-0.3: command added

# atmf secure-mode certificate expire

**Overview** Use this command on an AMF master to expire a secure mode certificate. Running this command will force the removal of the AMF node from the network.

**Syntax** `atmf secure-mode certificate expire <node-name> [area <area-name>]`

| Parameter                      | Description                                                            |
|--------------------------------|------------------------------------------------------------------------|
| <code>&lt;node-name&gt;</code> | Name of the AMF node you want to expire the certificate for.           |
| <code>area</code>              | Specify an AMF area.                                                   |
| <code>&lt;area-name&gt;</code> | Name of the AMF area you want to expire the AMF nodes certificate for. |

**Mode** Privileged Exec

**Example** To remove an AMF node named “node3” from an AMF network, use the following command on the AMF master:

```
awplus# atmf secure-mode certificate expire node3
```

To remove an AMF node named “node2” in an area named “area2”, use the following command on the AMF master:

```
awplus# atmf secure-mode certificate expire node2 area area2
```

**Related commands**

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode certificate expiry

**Overview** Use this command to set the expiry time of AMF secure mode certificates. Once an AMF node's certificate expires it must re-authorize and obtain a new certificate from the AMF master.

Use the **no** variant of this command to reset the expiry time to 180 days.

**Syntax** `atmf secure-mode certificate expiry {<days>|infinite}`  
`no atmf secure-mode certificate expiry`

| Parameter                 | Description                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------------------|
| <code>&lt;days&gt;</code> | Length of time, in days, that an AMF secure mode certificate remains valid. A value between 1 and 365. |
| <code>infinite</code>     | The authorization certificate does not expire, in other words AMF nodes stay authorized indefinitely.  |

**Default** The default expiry time is 180 days.

**Mode** Global Configuration

**Example** To set AMF secure mode certificate expiry to 7 days, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# atmf secure-mode certificate expiry 7
```

To set AMF secure mode certificates to never expire, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# atmf secure-mode certificate expiry infinite
```

To reset the certificate expiry to 180 days, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no atmf secure-mode certificate expiry
```

**Related commands** [atmf secure-mode](#)  
[show atmf secure-mode](#)  
[show atmf secure-mode certificates](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode certificate renew

**Overview** Use this command to force all local certificates to expire and be renewed on an AMF secure mode network.

Secure mode certificates renew automatically but this command could be used to renew a certificate in a situation where the automatic renewal may happen while the device is not attached to the AMF network.

**Syntax** `atmf secure-mode certificate renew`

**Mode** Privileged Exec

**Example** To renew a local certificate on a AMF member or AMF master, use the command:

```
awplus# atmf secure-mode certificate renew
```

**Related commands** [show atmf secure-mode certificates](#)  
[show atmf secure-mode statistics](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode enable-all

**Overview** Use this command to enable AMF secure mode on an entire network. AMF secure mode makes an AMF network more secure by:

- Adding an authorization mechanism before an AMF member is allowed to join an AMF network.
- The encryption of all AMF packets sent between AMF nodes.
- Adding support for user login authentication by RADIUS or TACACS+, and removing the requirement to have the same privileged user account in the local user database on all devices in the AMF network.
- Adding additional logging which enables network administrators to monitor attempts to gain unauthorized access to the AMF network.

Once this command is run on an AMF network, the AMF masters and AMF controllers manage the addition of AMF nodes and AMF areas to the AMF network.

This command can only be run on an AMF master.

Use the **no** variant of this command to disable AMF secure mode on an entire network.

**Syntax** `atmf secure-mode enable-all`  
`no atmf secure-mode enable-all`

**Default** Secure mode is disabled by default.

**Mode** Privileged Exec

**Usage notes** When an AMF network is running in AMF secure mode the [atmf restricted-login](#) feature is automatically enabled. This restricts the [atmf working-set](#) command to users that are logged on to an AMF master. This feature cannot be disabled independently of secure mode.

When AMF secure mode is enabled the AMF controllers and masters in the AMF network form a group of certificate authorities. A node may only join a secure AMF network once it has been authorized by a master or controller. When enabled, all devices in the AMF network must be running in secure mode. Unsecured devices will not be able to join a secure AMF network.

Running **atmf secure-mode enable-all**:

- Groups all AMF members in a working set.
- Executes [clear atmf secure-mode certificates](#) on the working set of members, which removes existing secure mode certificates from all the nodes.
- Groups all the AMF masters in a working set.
- Executes [atmf authorize provision all](#) on the working set of masters, so all masters provision all nodes.
- Groups all AMF nodes in a working set.

- Runs a script which executes `atmf secure-mode` and then writes the configuration file on each node.
- Starts a timer that ticks every 10 seconds, for a maximum of 10 times, and checks if all the secure mode capable nodes rejoin the AMF network.

Running **no atmf secure-mode enable-all**:

- Groups all AMF nodes in a working set.
- Runs a script which executes **no atmf secure-mode** and then writes the configuration file on each node.
- Starts a timer that ticks every 10 seconds, for a maximum of 10 times, and checks if all the secure mode capable nodes rejoin the AMF network.

**NOTE:** Enabling or disabling secure mode on the network saves the running-config on every device.

**Example** To enable AMF secure mode on the entire network, use the command:

```
awplus# atmf secure-mode enable-all
```

You will be prompted to confirm the action:

```
Total number of nodes 21
21 nodes support secure-mode

Enable secure-mode across the AMF network ? (y/n): y
```

To disable AMF secure mode on the entire network, use the command:

```
awplus# no atmf secure-mode enable-all
```

You will be prompted to confirm the action:

```
% Warning: All security certificates will be deleted.
Disable secure-mode across the AMF network ? (y/n): y
```

**Related commands** `aaa authentication auth-web`  
`show atmf`

**Command changes** Version 5.4.7-0.3: command added

# atmf select-area

**Overview** Use this command to access devices in an area outside the core area on the controller network. This command will connect you to the remote area-master of the specified area.

This command is only valid on AMF controllers.

The **no** variant of this command disconnects you from the remote area-master.

**Syntax** `atmf select-area {<area-name>|local}`  
`no atmf select-area`

| Parameter                      | Description                                                   |
|--------------------------------|---------------------------------------------------------------|
| <code>&lt;area-name&gt;</code> | Connect to the remote area-master of the area with this name. |
| <code>local</code>             | Return to managing the local controller area.                 |

**Mode** Privileged Exec

**Usage notes** After running this command, use the [atmf working-set](#) command to select the set of nodes you want to access in the remote area.

**Example** To access nodes in the area Canterbury, use the command

```
controller-1# atmf select-area Canterbury
```

This displays the following output:

```
Test_network[3]#atmf select-area Canterbury
=====
Connected to area Canterbury via host Avensis:
=====
```

To return to the local area for controller-1, use the command

```
controller-1# atmf select-area local
```

Alternatively, to return to the local area for controller-1, use the command

```
controller-1# no atmf select-area
```

**Related commands** [atmf working-set](#)

# atmf topology-gui enable

**Overview** Use this command to enable the operation of Vista Manager EX on the Master device.

Vista Manager EX delivers state-of-the-art monitoring and management for your Autonomous Management Framework™ (AMF) network, by automatically creating a complete topology map of switches, firewalls and wireless access points (APs). An expanded view includes third-party devices such as security cameras.

Use the **no** variant of this command to disable operation of Vista Manager EX.

**Syntax** `atmf topology-gui enable`  
`no atmf topology-gui enable`

**Default** Disabled by default on AMF Master and member nodes. Enabled by default on Controllers.

**Mode** Global Configuration mode

**Usage notes** To use Vista Manager EX, you must also enable the HTTP service on all AMF nodes, including all AMF masters and controllers. The HTTP service is enabled by default on AlliedWare Plus switches and disabled by default on AR-Series firewalls. To enable it, use the commands:

```
Node1# configure terminal
Node1(config)# service http
```

On one master in each AMF area in your network, you also need to configure the master to send event notifications to Vista Manager EX. To do this, use the commands:

```
Node1# configure terminal
Node1(config)# log event-host <ip-address> atmf-topology-event
```

**Examples** To enable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# atmf topology-gui enable
```

To disable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# no atmf topology-gui enable
```

**Related commands** [atmf enable](#)  
[log event-host](#)  
[service http](#)

# atmf trustpoint

- Overview** Use this command to set a PKI trustpoint for an AMF network. This command needs to be run on an AMF master or controller.
- The self-signed certificate authority (CA) certificate is distributed to every node on the AMF network. It is used to verify client certificates signed by the trustpoint.
- Use the **no** variant of this command to remove an AMF trustpoint.

**Syntax** `atmf trustpoint <trustpoint-name>`  
`no atmf trustpoint <trustpoint-name>`

| Parameter                            | Description             |
|--------------------------------------|-------------------------|
| <code>&lt;trustpoint-name&gt;</code> | Name of the trustpoint. |

**Default** No trustpoint is configured by default.

**Mode** Global Configuration

**Usage notes** Before using the **atmf trustpoint** command you will need to establish a trustpoint. For example, you can create a local self-signed trustpoint using the procedure outlined below.

Create a self-signed trustpoint called 'our\_trustpoint' with keypair 'our\_key':

```
awplus# configure terminal
awplus(config)# crypto pki trustpoint our_trustpoint
awplus(ca-trustpoint)# enrollment selfsigned
awplus(ca-trustpoint)# rsakeypair our_key
awplus(ca-trustpoint)# exit
awplus(config)# exit
```

Create the root and server certificates for this trustpoint:

```
awplus# crypto pki authenticate our_trustpoint
awplus# crypto pki enroll our_trustpoint
```

For more information about the AlliedWare Plus implementation of Public Key Infrastructure (PKI), see the [Public Key Infrastructure \(PKI\) Feature Overview and Configuration Guide](#)

**Example** To configure an AMF trustpoint for the trustpoint 'our\_trustpoint', use the commands:

```
awplus# configure terminal
awplus(config)# atmf trustpoint our_trustpoint
```

To remove an AMF trustpoint for the trustpoint 'our\_trustpoint', use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no atmf trustpoint our_trustpoint
```

**Related  
commands**

changes**

Version 5.4.7-2.1: command added

# atmf virtual-crosslink

**Overview** Use this command to create a virtual crosslink. A virtual crosslink connects an AMF master or controller on a physical device to a Virtual AMF Appliance (VAA) master or controller.

All AMF master nodes must reside in the same AMF domain and are required to be directly connected using AMF crosslinks. In order to be able to meet this requirement for AMF masters running on VAAs, a virtual crosslink connects the AMF master or controller on the physical device to the master or controller on the VAA.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove a virtual crosslink.

**Syntax**

```
atmf virtual-crosslink id <local-id> ip <local-ip> remote-id
<remote-id> remote-ip <remote-ip>

atmf virtual-crosslink id <local-id> ip <local-ip> remote-id
<remote-id> remote-host <domainname>

no atmf virtual-crosslink id <local-id>
```

| Parameter                   | Description                                               |
|-----------------------------|-----------------------------------------------------------|
| id <local-id>               | ID of the local tunnel port, a value between 1 and 4094.  |
| ip <local-ip>               | IPv4 address of the local tunnel port in a.b.c.d format.  |
| remote-id<br><remote-id>    | ID of the remote tunnel port, a value between 1 and 4094. |
| remote-ip<br><remote-ip>    | IPv4 address of the remote tunnel port in a.b.c.d format. |
| remote-host<br><domainname> | The domain name of the remote node.                       |

**Default** No AMF virtual crosslinks are created by default.

**Mode** Global Configuration

**Usage notes** This command allows a virtual tunnel to be created between two remote sites over a Layer 3 link. The tunnel encapsulates AMF packets and allows them to be sent transparently across a Wide Area Network (WAN) such as the Internet.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID, and a remote IP address or domain name. Each side of the tunnel must be configured with the same, but mirrored parameters.

**NOTE:** Virtual crosslinks are not supported on AMF container masters, therefore if multiple tenants on a single VAA host are configured for secure mode, only a single AMF master is supported per area.

**Example** To setup a virtual link from a local site, 'siteA', to a remote site, 'siteB', (assuming there is already IP connectivity between the sites), run the following commands at the local site:

```
siteA# configure terminal
siteA(config)# atmf virtual-crosslink id 5 ip 192.168.100.1
remote-id 10 remote-ip 192.168.200.1
```

At the remote site, run the commands:

```
siteB# configure terminal
siteB(config)# atmf virtual-crosslink id 10 ip 192.168.200.1
remote-id 5 remote-ip 192.168.100.1
```

To remove this virtual crosslink, run the following commands on the local site:

```
siteA# configure terminal
siteA(config)# no atmf virtual-crosslink id 5
```

On the remote site, run the commands:

```
siteB# configure terminal
siteB(config)# no atmf virtual-crosslink id 10
```

**Related commands**

**Command changes**

- Version 5.5.2-0.1: **remote-host** parameter added
- Version 5.4.7-0.3: command added

# atmf virtual-link

**Overview** This command creates one or more Layer 2 tunnels that enable AMF nodes to transparently communicate across a wide area network using Layer 2 connectivity protocols.

Once connected through the tunnel, the remote member will have the same AMF capabilities as a directly connected AMF member.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove the specified virtual link.

**Syntax**

```
atmf virtual-link id <1-4094> ip <a.b.c.d> remote-id <1-4094>
remote-ip <a.b.c.d> [remote-area <area-name>]

atmf virtual-link id <1-4094> interface <interface-name>
remote-id <1-4094> remote-ip <a.b.c.d> [remote-area
<area-name>]

atmf virtual-link id <1-4094> ip <a.b.c.d> remote-id <1-4094>
remote-host <domainname> [remote-area <area-name>]

atmf virtual-link id <1-4094> interface <interface-name>
remote-id <1-4094> remote-host <domainname> [remote-area
<area-name>]

no atmf virtual-link id <1-4094>
```

| Parameter                     | Description                                                                                                                                                                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id <1-4094>                   | ID of the local tunnel point, in the range 1 to 4094.                                                                                                                                                                                                             |
| ip <a.b.c.d>                  | Specify the local IP address of the local interface for the virtual-link (alternatively you can specify the interface's name, see below).                                                                                                                         |
| interface<br><interface-name> | Specify the local interface name for the virtual-link. This allows you to use a dynamic, rather than a static, local IP address.                                                                                                                                  |
| remote-id<br><1-4094>         | The ID of the (same) tunnel that will be applied by the remote node. Note that this must match the local-id that is defined on the remote node. This means that (for the same tunnel) the local and remote tunnel IDs are reversed on the local and remote nodes. |
| remote-ip<br><a.b.c.d>        | The IP address of the remote node.                                                                                                                                                                                                                                |
| remote-host<br><domainname>   | The domain name of the remote node.                                                                                                                                                                                                                               |
| remote-area<br><area-name>    | The name of the remote area connected to this virtual-link.                                                                                                                                                                                                       |

**Mode** Global Configuration

**Usage notes** The Layer 2 tunnel that this command creates enables a local AMF session to appear to pass transparently across a Wide Area Network (WAN) such as the Internet. The addresses configured as the local and remote tunnel IP addresses must have IP connectivity to each other. If the tunnel is configured to connect a head office and branch office over the Internet, typically this would involve using some type of managed WAN service such as a site-to-site VPN. Tunnels are only supported using IPv4.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID and a remote IP address or domain name. A reciprocal configuration is also required on the corresponding remote device. The local tunnel ID must be unique to the device on which it is configured.

If an interface acquires its IP address dynamically then the local side of the tunnel can be specified by using the interface's name instead of using its IP address. When using a dynamic local address the remote address of the other side of the virtual-link must be configured with either:

- the IP address of the NAT device the dynamically configured interface is behind, or
- 0.0.0.0, if the virtual-link is configured as a secure virtual-link.

For instructions on how to configure dynamic IP addresses on virtual-links, see the [AMF Feature Overview and Configuration Guide](#).

The tunneled link may operate via external (non AlliedWare Plus) routers in order to provide wide area network connectivity. However in this configuration, the routers perform a conventional router to router connection. The protocol tunneling function is accomplished by the AMF nodes.

**NOTE:** *AMF cannot achieve zero touch replacement of the remote device that terminates the tunnel connection, because you must pre-configure the local IP address and tunnel ID on that remote device.*

**Example 1** Use the following commands to create the tunnel shown in the figure below.

Figure 56-2: AMF virtual link example

```
Node_10(config)# atmf virtual-link id 1 ip 192.168.1.1
remote-id 2 remote-ip 192.168.2.1

Node_20(config)# atmf virtual-link id 2 ip 192.168.2.1
remote-id 1 remote-ip 192.168.1.1
```

**Example 2** To set up an area virtual link to a remote site (assuming IP connectivity between the sites already), one site must run the following commands:

```
SiteA# configure terminal

SiteA(config)# atmf virtual-link id 5 ip 192.168.100.1
remote-id 10 remote-ip 192.168.200.1 remote-area SiteB-AREA
```

The second site must run the following commands:

```
SiteB# configure terminal

SiteB(config)# atmf virtual-link id 10 ip 192.168.200.1
remote-id 5 remote-ip 192.168.100.1 remote-area SiteA-AREA
```

Before you can apply the above **atmf virtual-link** command, you must configure the area names *SiteB-AREA* and *SiteA-AREA*.

**Command changes**

- Version 5.5.2-0.1: **remote-host** parameter added
- Version 5.4.9-0.1: **interface** parameter added

# atmf virtual-link description

**Overview** Use this command to add a description to an existing AMF virtual-link.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove a description from an AMF virtual-link.

**Syntax** `atmf virtual-link id <1-4094> description <description>`  
`no atmf virtual-link id <1-4094> description`

| Parameter                        | Description                         |
|----------------------------------|-------------------------------------|
| <code>id &lt;1-4094&gt;</code>   | ID of the local tunnel point.       |
| <code>&lt;description&gt;</code> | A description for the virtual-link. |

**Default** No description is set by default.

**Mode** Global Configuration

**Example** To add a description to the virtual-link with id '5', use the commands:

```
awplus# configure terminal
awplus(config)# atmf virtual-link id 5 description TO SITE B
```

To remove a description from the virtual-link with id '5', use the commands:

```
awplus# configure terminal
awplus(config)# no atmf virtual-link id 5
```

**Related commands** [atmf virtual-link](#)  
[show atmf links](#)  
[show atmf virtual-links](#)

# atmf virtual-link protection

**Overview** Use this command to add protection to an existing AMF virtual-link. Secure AMF virtual-links encapsulate the L2TPv3 frames of the virtual-link with IPsec.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove protection from an AMF virtual-link.

**Syntax**

```
atmf virtual-link id <1-4094> protection ipsec key [8]
<key-string>

no atmf virtual-link id <1-4094> protection
```

| Parameter    | Description                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id           | Specify the link ID.                                                                                                                                                                |
| <1-4094>     | Link ID in the range 1 to 4094                                                                                                                                                      |
| protection   | Protection is on for this link.                                                                                                                                                     |
| ipsec        | Security provided using IPsec.                                                                                                                                                      |
| key          | Set the shared key.                                                                                                                                                                 |
| 8            | Specifies a string in an encrypted format instead of plain text. The running config will display the new password as an encrypted string even if password encryption is turned off. |
| <key-string> | Specify the shared key for the link.                                                                                                                                                |

**Default** Protection is off by default.

**Mode** Global Configuration

**Usage notes** Considered the following limitations when creating a secure virtual-link:

- Switch devices support a maximum of 20 downstream AMF nodes when using a secure virtual-link as an uplink.
- When there are two or more AMF members behind a shared NAT device, only one of the members will be able to use secure virtual-links.
- An AMF multi-tenant environment supports a maximum cumulative total of 1200 secure virtual-links across all AMF containers.

**Example** To create and configure a virtual link with protection, first create the virtual-link:

```
Host-A# configure terminal

Host-A(config)# atmf virtual-link id 1 ip 192.168.1.1 remote-id
2 remote-ip 192.168.2.1
```

The enable protection on the virtual link:

```
Host-A(config)# atmf virtual-link id 1 protection ipsec key
securepassword
```

Repeat these steps on the other side of the link:

```
Host-B(config)# atmf virtual-link id 2 ip 192.168.2.1 remote-id
1 remote-ip 192.168.1.1
```

```
Host-B(config)# atmf virtual-link id 2 protection ipsec key
securepassword
```

Version 5.4.9-0.1: command added

# atmf working-set

**Overview** Use this command to execute commands across an individually listed set of AMF nodes or across a named group of nodes.

Note that this command can only be run on a master node.

Use the **no** variant of this command to remove members or groups from the current working-set.

**Syntax** `atmf working-set {[<node-list>]|group  
{<group-list>|all|local|current}}}`  
`no atmf working-set {[<node-list>]|group <group-list>]}`

| Parameter    | Description                                                                                                                                                                                                                      |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <node-list>  | A comma delimited list (without spaces) of nodes to be included in the working-set.                                                                                                                                              |
| group        | The AMF group.                                                                                                                                                                                                                   |
| <group-list> | A comma delimited list (without spaces) of groups to be included in the working-set. Note that this can include either defined groups, or any of the Automatic, or Implicit Groups shown earlier in the bulleted list of groups. |
| all          | All nodes in the AMF.                                                                                                                                                                                                            |
| local        | Local node<br>Running this command with the parameters <b>group local</b> will return you to the local prompt and local node connectivity.                                                                                       |
| current      | Nodes in current list.                                                                                                                                                                                                           |

**Mode** Privileged Exec

**Usage notes** You can put AMF nodes into groups by using the [atmf group \(membership\)](#) command.

This command opens a session on multiple network devices. When you change the working set to anything other than the local device, the prompt will change to the AMF network name, followed by the size of the working set, shown in square brackets. This command has to be run at privilege level 15.

In addition to the user defined groups, the following system assigned groups are automatically created:

- Implicit Groups
  - local: The originating node.
  - current: All nodes that comprise the current working-set.
  - all: All nodes in the AMF.

- Automatic Groups - These can be defined by hardware architecture, e.g. x510, x610, x8100, AR3050S or AR4050S, or by certain AMF nodal designations such as master.

Note that the Implicit Groups do not appear in `show atmf group` command output.

If a node is an AMF master it will be automatically added to the master group.

**Example 1** To add all nodes in the AMF to the working-set, use the command:

```
node1# atmf working-set group all
```

**NOTE:** This command adds the implicit group "all" to the working set, where "all" comprises all nodes in the AMF.

This command displays an output screen similar to the one shown below:

```
=====
node1, node2, node3, node4, node5, node6:
=====

Working set join

ATMF_NETWORK_Name[6]#
```

**Example 2** To return to the local prompt, and connect to only the local node, use the command:

```
ATMF_Network_Name[6]# atmf working-set group local
node1#
```

The following table describes the meaning of the prompts in this example.

| Parameter         | Description                                                                           |
|-------------------|---------------------------------------------------------------------------------------|
| ATMF_Network_Name | The name of the AMF network, as set by the <a href="#">atmf network-name</a> command. |
| [6]               | The number of nodes in the working-set.                                               |
| node1             | The name of the local node, as set by the <a href="#">hostname</a> command.           |

# bridge-group (amf-container)

**Overview** Use this command to connect an AMF container to a bridge created on a Virtual AMF Appliance (VAA) virtual machine for AMF Cloud. This allows the AMF container to connect to a physical network.

Note that this command is only available on AMF Cloud, not on AlliedWare Plus switches.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove a bridge-group from an AMF container.

**Syntax** `bridge-group <bridge-id>`  
`no bridge-group`

| Parameter                      | Description                                                    |
|--------------------------------|----------------------------------------------------------------|
| <code>&lt;bridge-id&gt;</code> | The ID of the bridge group to join, a number between 1 and 64. |

**Mode** AMF Container Configuration

**Usage notes** Each container has two virtual interfaces:

- 1) Interface eth0, used to connect to the AMF controller on the VAA host via an AMF area-link, and configured using this [area-link](#) command.
- 2) Interface eth1, used to connect to the outside world using a bridged L2 network link, and configured using the **bridge-group** command.

Before using this command, a bridge must be created with the same bridge-id on the VAA host using the **bridge <bridge-id>** command.

See the [AMF Feature Overview and Configuration Guide](#) for more information on configuring the bridge.

**Example** To assign a bridge group to AMF container 'vac-wlg-1', use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# bridge-group 1
```

**Related commands** [atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# clear application-proxy threat-protection

**Overview** Use this command to clear the threat protection for a specified address.

**Syntax** `clear application-proxy threat-protection {<ip-address>|<mac-address>|all}`

| Parameter                        | Description                                                                 |
|----------------------------------|-----------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code>  | The IPv4 address you wish to clear the threat for, in A.B.C.D format.       |
| <code>&lt;mac-address&gt;</code> | The MAC address you wish to clear the threat for, in HHHH.HHHH.HHHH format. |
| <code>all</code>                 | Clear the threat for all IPv4 and MAC addresses.                            |

**Mode** Privileged Exec

**Example** To clear the threat for 10.34.199.117, use the command:

```
awplus# clear application-proxy threat-protection 10.34.199.117
```

**Related commands**

- [show application-proxy threat-protection](#)

**Command changes** Version 5.4.7-2.2: command added

# clear atmf links

**Overview** Use this command with no parameters to manually reset all the AMF links on a device. You can optionally specify an interface or range of interfaces to reset the links on.

Certain events or topology changes can cause AMF links to be incorrect or outdated. Clearing the links forces AMF to relearn the information from neighboring nodes and create a fresh, correct, view of the network.

**Syntax** `clear atmf links [<interface-list>]`

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;interface-list&gt;</code> | <p>The interfaces or ports to perform the reset on. An interface-list can be:</p> <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.1)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a local port (e.g. of0)</li><li>• You can specify a continuous range of interfaces separated by a hyphen, or a comma-separated list (e.g. port1.0.1, port1.0.4-port1.0.18).</li></ul> <p>The specified interfaces must exist.<br/>If this parameter is left out then all links of the specified type will be reset on the device.</p> |

**Mode** Privileged Exec

**Example** To clear all AMF links on a device, use the following command:

```
awplus# clear atmf links
```

To clear all AMF links on port1.0.1 to port1.0.4 and static aggregator sa1, use the following command:

```
awplus# clear atmf links port1.0.1-port1.0.4,sa1
```

**Related commands** [clear atmf links virtual](#)  
[show atmf links](#)

**Command changes** Version 5.4.8-2.1: command added

# clear atmf links virtual

**Overview** Use this command with no parameters to manually reset all the AMF virtual links on a device. You can, optionally, specify a comma separated list of virtual links to reset.

Certain events or topology changes can cause AMF links to be incorrect or outdated. Clearing the links forces AMF to relearn the information from neighboring nodes and create a fresh, correct view of the network.

**Syntax** `clear atmf links virtual [<virtuallink-list>]`

| Parameter          | Description                                                                                                                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <virtuallink-list> | A single, or list, of AMF virtual link identifiers to reset. This must be a comma separated list of links e.g. <i>vlink1, vlink2, vlink3</i> . Specifying a link range e.g <i>vlink1-vlink3</i> is not supported. |

**Mode** Privileged Exec

**Example** To clear all AMF virtual links on a device, use the following command:

```
awplus# clear atmf links virtual
```

To clear AMF virtual links vlink11 and vlink21, use the following command:

```
awplus# clear atmf links virtual vlink11,vlink22
```

**Related commands** [clear atmf links](#)  
[show atmf links](#)

**Command changes** Version 5.4.8-2.1: command added

# clear atmf links statistics

**Overview** This command resets the values of all AMF link, port, and global statistics to zero.

**Syntax** `clear atmf links statistics`

**Mode** Privilege Exec

**Example** To reset the AMF link statistics values, use the command:

```
node_1# clear atmf links statistics
```

**Related commands** [show atmf links statistics](#)

# clear atmf recovery-file

**Overview** Use this command to delete all of a node's recovery files. It deletes the recovery files stored on:

- the local node,
- neighbor nodes, and
- external media (USB or SD card).

**Syntax** `clear atmf recovery-file`

**Mode** Privileged Exec

**Usage notes** AMF recovery files are created for nodes with special links. Special links include:

- virtual links,
- area links terminating on an AMF master, and
- area virtual links terminating on an AMF master.

An AMF node with one of these special links pushes its startup configuration to its neighbors and to any attached external media. It then fetches and applies this configuration at recovery time. This configuration enables it to contact the AMF master and initiate a recovery.

Recovery files can become out of date if:

- a node's neighbor is off line when changes are made to its configuration, or
- when a node no longer contains a special link.

**Example** To clear a node's recovery files, use the command:

```
node1# clear atmf recovery-file
```

**Output** Figure 56-3: If AlliedWare Plus detects that a node contains a special link then the following message is displayed

```
node1#clear atmf recovery-file
% Warning: ATMF recovery files have been removed.
ATMF recovery may fail. Please save running-configuration.
```

**Related commands** [show atmf recovery-file](#)

**Command changes** Version 5.4.8-0.2: command added

# clear atmf secure-mode certificates

**Overview** Use this command to remove all certificates from an AMF member or master. AMF nodes will need to be re-authorized once this command has been run.

**Syntax** `clear atmf secure-mode certificates`

**Mode** Privileged Exec

**Example** To clear all certificates from an AMF node, use the command:

```
awplus# clear atmf secure-mode certificates
```

If this is the only master on the network you will see the following warning:

```
% Warning: This node is the only master in the network!
All the nodes will become isolated and refuse to join any ATMF
network. The certificates on all the isolated nodes must be
cleared before rejoining an ATMF network will be possible.

To clear certificates a reboot of the device is required.
Clear certificates and Reboot ? (y/n):
```

On an AMF member you will see the following message:

```
To clear certificates a reboot of the device is required.
Clear certificates and Reboot ? (y/n):
```

**Related commands**

[show atmf secure-mode statistics](#)

**Command changes** Version 5.4.7-0.3: command added

# clone (amf-provision)

**Overview** This command sets up a space on the backup media for use with a provisioned node and copies into it almost all files and directories from a chosen backup or provisioned node.

Alternatively, you can set up a new, unique provisioned node by using the command [create \(amf-provision\)](#).

**Syntax** `clone <source-nodename>`

| Parameter                            | Description                                                                        |
|--------------------------------------|------------------------------------------------------------------------------------|
| <code>&lt;source-nodename&gt;</code> | The name of the node whose configuration is to be copied for loading to the clone. |

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network.

When using this command it is important to be aware of the following:

- A copy of `<media>:atmf/<atmf_name>/nodes/<source_node>/flash` will be made for the provisioned node and stored in the backup media.
- The directory `<node_backup_dir>/flash/.config/ssh` is excluded from the copy.
- All contents of `<root_backup_dir>/nodes/<nodename>` will be deleted or overwritten.
- Settings for the expected location of other provisioned nodes are excluded from the copy.

The active and backup configuration files are automatically modified in the following ways:

- The **hostname** command is modified to match the name of the provisioned node.
- The **stack virtual-chassis-id** command is removed, if present.

**Example** To copy from the backup of 'device2' to create backup files for the new provisioned node 'device3' use the following command:

```
device1# atmf provision node device3
device1(atmf-provision)# clone device2
```

Figure 56-4: Sample output from the **clone** command

```
device1# atmf provision node device3
device1(atmf-provision)#clone device2
Copying...
Successful operation
```

To confirm that a new provisioned node has been cloned, use the command:

```
device1# show atmf backup
```

The output from this command is shown in the following figure, and shows the details of the new provisioned node 'device3'.

Figure 56-5: Sample output from the **show atmf backup** command

```
device1#show atmf backup

**Command  
changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# configure boot config (amf-provision)

**Overview** This command sets the configuration file to use during the next boot cycle. This command can also set a backup configuration file to use if the main configuration file cannot be accessed for an AMF provisioned node. To unset the boot configuration or the backup boot configuration use the **no boot** command.

**Syntax** `configure boot config [backup] <file-path|URL>`  
`configure no boot config [backup]`

| Parameter       | Description                                         |
|-----------------|-----------------------------------------------------|
| backup          | Specify that this is the backup configuration file. |
| <file-path URL> | The path or URL and name of the configuration file. |

**Default** No boot configuration files or backup configuration files are specified for the provisioned node.

**Mode** AMF Provisioning

**Usage notes** When using this command to set a backup configuration file, the specified AMF provisioned node must exist. The specified file must exist in the flash directory created for the provisioned node in the AMF remote backup media.

**Examples** To set the configuration file 'branch.cfg' on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot config
branch.cfg
```

To set the configuration file 'backup.cfg' as the backup to the main configuration file on the AMF provisioned node 'node1', use the command:

```
MasterNodeName(atmf-provision)# configure boot config backup
usb:/atmf/amf_net/nodes/node1/config/backup.cfg
```

To unset the boot configuration, use the command:

```
MasterNodeName(atmf-provision)# configure no boot config
```

To unset the backup boot configuration, use the command:

```
MasterNodeName(atmf-provision)# configure no boot config backup
```

**Command  
changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# configure boot system (amf-provision)

**Overview** This command sets the release file that will load onto a specified provisioned node during the next boot cycle. This command can also set the backup release file to be loaded for an AMF provisioned node. To unset the boot system release file or the backup boot release file use the **no boot** command.

Use the **no** variant of this command to return to the default.

This command can only be run on AMF master nodes.

**Syntax** `configure boot system [backup] <file-path|URL>`  
`configure no boot system [backup]`

| Parameter       | Description                                   |
|-----------------|-----------------------------------------------|
| <file-path URL> | The path or URL and name of the release file. |

**Default** No boot release file or backup release files are specified for the provisioned node.

**Mode** AMF Provisioning

**Usage notes** When using this command to set a backup release file, the specified AMF provisioned node must exist. The specified file must exist in the flash directory created for the provisioned node in the AMF remote backup media.

**Examples** To set the release file x930-5.4.9-0.1.rel on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
```

```
MasterNodeName(atmf-provision)# configure boot system
x930-5.4.9-0.1.rel
```

To set the backup release file x930-5.4.8-2.5.rel as the backup to the main release file on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
```

```
MasterNodeName(atmf-provision)# configure boot system backup
card:/atmf/amf_net/nodes/node1/flash/x930-5.4.8-2.5.rel
```

To unset the boot release, use the command:

```
MasterNodeName# atmf provision node node1
```

```
MasterNodeName(atmf-provision)# configure no boot system
```

To unset the backup boot release, use the command:

```
MasterNodeName# atmf provision node node1
```

```
MasterNodeName(atmf-provision)# configure no boot system backup
```

**Related commands** [atmf provision \(interface\)](#)

locate (amf-provision)  
show atmf provision nodes

**Command  
changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# copy (amf-provision)

**Overview** Use this command to copy configuration and release files for the node you are provisioning.

For more information about using the copy command see [copy \(filename\)](#) in the File and Configuration Management chapter.

**Syntax** `copy [force] <source-name> <destination-name>`

| Parameter                             | Description                                                                                                                                         |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>force</code>                    | This parameter forces the copy command to overwrite the destination file, if it already exists, without prompting the user for confirmation.        |
| <code>&lt;source-name&gt;</code>      | The filename and path of the source file. See the <a href="#">Introduction</a> of the File and Configuration Management chapter for valid syntax.   |
| <code>&lt;destination-name&gt;</code> | The filename and path for the destination file. See <a href="#">Introduction</a> of the File and Configuration Management chapter for valid syntax. |

**Mode** AMF Provisioning

**Example** To copy a configuration file named `current.cfg` from Node\_4's Flash into the `future_node` directory, and set that configuration file to load onto `future_node`, use the following commands:

```
node_4# atmf provision node future_node
node_4(atmf-provision)# create
node_4(atmf-provision)# locate
node_4(atmf-provision)# copy flash:current.cfg
./future_node.cfg
node_4(atmf-provision)# configure boot config future_node.cfg
```

**Related commands**

- [create \(amf-provision\)](#)
- [delete \(amf-provision\)](#)
- [locate \(amf-provision\)](#)
- [show atmf provision nodes](#)

**Command changes** Version 5.4.9-2.1: command added

# create (amf-provision)

**Overview** This command sets up an empty directory on the backup media for use with a provisioned node. This directory can have configuration and release files copied to it from existing devices. Alternatively, the configuration files can be created by the user.

An alternative way to create a new provisioned node is with the command [clone \(amf-provision\)](#).

This command can only run on AMF master nodes.

**Syntax** `create`

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network.

A date and time is assigned to the new provisioning directory reflecting when this command was executed. If there is a backup or provisioned node with the same name on another AMF master then the most recent one will be used.

**Example** To create a new provisioned node named "device2" use the command:

```
device1# atmf provision node device2
device1(atmf-provision)# create
```

Running this command will create the following directories:

- `<media>:atmf/<atmf_name>/nodes/<node>`
- `<media>:atmf/<atmf_name>/nodes/<node>/flash`

To confirm the new node's settings, use the command:

```
device1# show atmf backup
```

The output for the **show atmf backup** command is shown in the following figure, and shows details for the new provisioned node 'device2'.

Figure 56-6: Sample output from the **show atmf backup** command

```
device1#show atmf backup

**Command  
changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# debug atmf

**Overview** This command enables the AMF debugging facilities, and displays information that is relevant (only) to the current node. The detail of the debugging displayed depends on the parameters specified.

If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

The **no** variant of this command disables either all AMF debugging information, or only the particular information as selected by the command's parameters.

**Syntax**

```
debug atmf
[link|crosslink|arealink|database|neighbor|error|all]

no debug atmf
[link|crosslink|arealink|database|neighbor|error|all]
```

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| link      | Output displays debugging information relating to uplink or downlink information. |
| crosslink | Output displays all crosslink events.                                             |
| arealink  | Output displays all arealink events.                                              |
| database  | Output displays only notable database events.                                     |
| neighbor  | Output displays only notable AMF neighbor events.                                 |
| error     | Output displays AMF error events.                                                 |
| all       | Output displays all AMF events.                                                   |

**Default** All debugging facilities are disabled.

**Mode** User Exec and Global Configuration

**Usage notes** If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

**NOTE:** An alias to the **no** variant of this command is [undebg atmf](#) on page 2798.

**Examples** To enable all AMF debugging, use the command:

```
node_1# debug atmf
```

To enable AMF uplink and downlink debugging, use the command:

```
node_1# debug atmf link
```

To enable AMF error debugging, use the command:

```
node_1# debug atmf error
```

**Related** no debug all  
**commands**

# debug atmf packet

**Overview** This command configures AMF Packet debugging parameters. The debug only displays information relevant to the current node. The command has following parameters:

**Syntax** debug atmf packet [direction {rx|tx|both}] [level {1|2|3}]  
[timeout <seconds>] [num-pkts <quantity>]  
[filter {node <name>|interface <ifname>}]  
[pkt-type [1][2][3][4][5][6][7][8][9][10][11][12][13]]

## Simplified Syntax

|                          |  |                                                           |
|--------------------------|--|-----------------------------------------------------------|
| debug atmf packet        |  | [direction {rx tx both}]                                  |
|                          |  | [level {[1][2 3]}]                                        |
|                          |  | [timeout <seconds>]                                       |
|                          |  | [num-pkts <quantity>]                                     |
| debug atmf packet filter |  | [node <name>]                                             |
|                          |  | [interface <ifname>]                                      |
|                          |  | [pkt-type<br>[1][2][3][4][5][6][7][8][9][10][11][12][13]] |

**NOTE:** You can combine the syntax components shown, but when doing so, you must retain their original order.

**Default** Level 1, both Tx and Rx, a timeout of 60 seconds with no filters applied.

**NOTE:** An alias to the **no** variant of this command - [undebug atmf](#) - can be found elsewhere in this chapter.

**Mode** User Exec and Global Configuration

**Usage notes** If no additional parameters are specified, then the command output will apply a default selection of parameters shown below:

| Parameter | Description                                                                                  |
|-----------|----------------------------------------------------------------------------------------------|
| direction | Sets debug to packet received, transmitted, or both                                          |
| rx        | packets received by this node                                                                |
| tx        | Packets sent from this node                                                                  |
| 1         | AMF Packet Control header Information, Packet Sequence Number. Enter 1 to select this level. |
| 2         | AMF Detailed Packet Information. Enter 2 to select this level.                               |
| 3         | AMF Packet HEX dump. Enter 3 to select this level.                                           |
| timeout   | Sets the execution timeout for packet logging                                                |

| Parameter  | Description                                                                                       |
|------------|---------------------------------------------------------------------------------------------------|
| <seconds>  | Seconds                                                                                           |
| num-pkts   | Sets the number of packets to be dumped                                                           |
| <quantity> | The actual number of packets                                                                      |
| filter     | Sets debug to filter packets                                                                      |
| node       | Sets the filter on packets for a particular Node                                                  |
| <name>     | The name of the remote node                                                                       |
| interface  | Sets the filter to dump packets from an interface (portx.x.x) on the local node                   |
| <ifname>   | Interface port or virtual-link                                                                    |
| pkt-type   | Sets the filter on packets with a particular AMF packet type                                      |
| 1          | Crosslink Hello BPDU packet with crosslink links information. Enter 1 to select this packet type. |
| 2          | Crosslink Hello BPDU packet with downlink domain information. Enter 2 to select this packet type. |
| 3          | Crosslink Hello BPDU packet with uplink information. Enter 3 to select this packet type.          |
| 4          | Downlink and uplink hello BPDU packets. Enter 4 to select this packet type.                       |
| 5          | Non broadcast hello unicast packets. Enter 5 to select this packet type.                          |
| 6          | Stack hello unicast packets. Enter 6 to select this packet type.                                  |
| 7          | Database description. Enter 7 to select this packet type.                                         |
| 8          | DBE request. Enter 8 to select this packet type.                                                  |
| 9          | DBE update. Enter 9 to select this packet type.                                                   |
| 10         | DBE bitmap update. Enter 10 to select this packet type.                                           |
| 11         | DBE acknowledgment. Enter 11 to select this packet type.                                          |
| 12         | Area Hello Packets. Enter 12 to select this packet type.                                          |
| 13         | Gateway Hello Packets. Enter 13 to select this packet type.                                       |

**Examples** To set a packet debug on node 1 with level 1 and no timeout, use the command:

```
node_1# debug atmf packet direction tx timeout 0
```

To set a packet debug with level 3 and filter packets received from AMF node 1:

```
node_1# debug atmf packet direction tx level 3 filter node_1
```

To enable send and receive 500 packets only on vlink1 for packet types 1, 7, and 11, use the command:

```
node_1# debug atmf packet num-pkts 500 filter interface vlink1
pkt-type 1 7 11
```

This example applies the **debug atmf packet** command and combines many of its options:

```
node_1# debug atmf packet direction rx level 1 num-pkts 60
filter node x930 interface port1.0.1 pkt-type 4 7 10
```

# delete (amf-provision)

**Overview** This command deletes files that have been created for loading onto a provisioned node. It can only be run on master nodes.

**Syntax** delete

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network. The command will only work if the provisioned node specified in the command has already been set up (although the device itself is still yet to be installed). Otherwise, an error message is shown when the command is run.

You may want to use the **delete** command to delete a provisioned node that was created in error or that is no longer needed.

This command cannot be used to delete backups created by the AMF backup procedure. In this case, use the command [atmf backup delete](#) to delete the files.

**NOTE:** *This command allows provisioned entries to be deleted even if they have been referenced by the [atmf provision \(interface\)](#) command, so take care to only delete unwanted entries.*

**Example** To delete backup files for a provisioned node named device3 use the command:

```
device1# atmf provision node device3
device1(atmf-provision)# delete
```

To confirm that the backup files for provisioned node device3 have been deleted use the command:

```
device1# show atmf backup
```

The output should show that the provisioned node device3 no longer exists in the backup file, as shown in the figure below:

Figure 56-7: Sample output showing the **show atmf backup** command

```
device1#show atmf backup

Scheduled Backup Enabled
 Schedule 1 per day starting at 03:00
 Next Backup Time 01 Oct 2016 03:00

**Command  
changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# discovery

**Overview** Use this command to specify how AMF learns about guest nodes.

AMF nodes gather information about guest nodes by using one of the internally defined discovery methods: dynamic, static, or agent.

**Dynamic** learning (the default method) means that AMF learns the guest's IP and MAC addresses from LLDP or DHCP snooping. Dynamic learning is only supported when using IPv4. For IPv6, use static learning.

With dynamic learning, ensure that the command [ip dhcp snooping delete-by-linkdown](#) is set.

**Static** learning uses the [switchport atmfguestlink](#) command to specify the guest class name and IP address of the guest node attached to each individual switch port. AMF then learns the MAC addresses of each of the guests of that class from ARP or Neighbor discovery tables.

If you are using the static method, ensure that you have configured the appropriate class type for each of your statically discovered guest nodes.

**Agent** learning uses the AMF agent to retrieve the guest's IP and MAC address. It is only available on guest nodes that support ATMF agent, such as TQ5403 series access points. For step-by-step instructions on using agent discovery for auto-recovery of an TQ5403 series AP, see the [AMF Feature Overview and Configuration Guide](#).

The **no** variant of this command returns the discovery method to **dynamic**.

**Syntax** `discovery [dynamic|static|agent]`  
`no discovery`

| Parameter | Description                          |
|-----------|--------------------------------------|
| dynamic   | Learned from DCHCP Snooping or LLDP. |
| static    | Statically assigned.                 |
| agent     | Learned from the AMF agent.          |

**Default** Dynamic

**Mode** AMF Guest Configuration

**Usage notes** This command is one of several modal commands that are configured and applied for a specific guest-class (mode). Its settings are automatically applied to a guest-node link by the [switchport atmfguestlink](#) command.

**NOTE:** AMF guest nodes are not supported on ports using the OpenFlow protocol.

**Example 1** To configure static discovery for the guest-class 'camera', use the following commands:

```
Node1# configure terminal
Node1(config)# atmf guest-class camera
Node1(config-atmf-guest)# discovery static
```

**Example 2** To return the discovery method for the guest class TQ6602 to its default of **dynamic**, use the following commands:

```
Node1# configure terminal
Node1(config)# atmf guest-class TQ6602
Node1(config-atmf-guest)# no discovery
```

**Related commands**

- [atmf guest-class](#)

**Command changes** Version 5.5.3-0.1: **agent** parameter added

# description (amf-container)

**Overview** Use this command to set the description on an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove the description from an AMF container.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description                                                      |
|----------------------------------|------------------------------------------------------------------|
| <code>&lt;description&gt;</code> | Enter up to 128 characters of text describing the AMF container. |

**Mode** AMF Container Configuration

**Example** To set the description for AMF container “vac-wlg-1” to “Wellington area”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# description Wellington area
```

To remove the description for AMF container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# no description
```

**Related commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# erase factory-default

**Overview** This command erases all data from NVS and all data from flash **except** the following:

- the boot release file (a .rel file) and its release setting file
- all license files
- the latest GUI release file

The device is then rebooted and returned to its factory default condition. The device can then be used for AMF automatic node recovery.

**Syntax** `erase factory-default`

**Mode** Privileged Exec

**Usage notes** This command is an alias to the [atmf cleanup](#) command.  
Note that this command can only be used on standalone switches, not stacked switches.

**Example** To erase data, use the command:

```
Node_1# erase factory-default
```

This command will erase all NVS, all flash contents except for the boot release, a GUI resource file, and any license files, and then reboot the switch. Continue? (y/n):y

**Related commands** [atmf cleanup](#)

# firmware-url

**Overview** Use this command to specify the location of an AP guest node's firmware file when preparing the AP for auto-recovery. AMF cannot back up AP firmware files (only configuration files), so you need to store the firmware file somewhere accessible and use this command to provide the AlliedWare Plus device with the file's location.

For step-by-step instructions for auto-recovery of an TQ5403 series AP, see the [AMF Feature Overview and Configuration Guide](#).

Use the **no** variant of this command to remove the URL.

**Syntax** `firmware-url <name>`  
`no firmware-url`

| Parameter | Description                                                                                                                                                                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <name>    | The file's directory or filename. We recommend specifying a directory because that makes it easier to keep the firmware file up to date. The following protocols are supported: http, https, tftp, usb, and card. Do not change the firmware file's filename. |

**Default** No URL is configured

**Mode** AMF Guest Configuration

**Example** To specify, on a device named node2, that the firmware file for a TQ5403 AP is stored in the top level of a USB stick, use the commands:

```
node2# configure terminal
node2(config)# atmf guest-class TQ5403
node2(config-guest)# firmware-url usb:
```

To specify, on a device named node2, that the firmware file for a TQ5403 AP is stored on a TFTP server with an address of 192.168.2.1, use the commands:

```
node2# configure terminal
node2(config)# atmf guest-class TQ5403
node2(config-guest)# firmware-url tftp://192.168.2.1/
```

**Related commands**

switchport atmf-guestlink

**Command changes** Version 5.5.3-0.1: command added

# http-enable

**Overview** This command is used to enable GUI access to a guest node. When **http-enable** is configured, the port number is set to its default of 80. If the guest node is using a different port for HTTP, you can configure this using the **port** parameter.

This command is used to inform the GUI that this device has an HTTP interface at the specified port number so that a suitable URL can be provided to the user.

Use the **no** variant of this command to disable HTTP.

**Syntax** `http-enable [port <port-number>]`  
`no http-enable`

| Parameter     | Description                       |
|---------------|-----------------------------------|
| port          | TCP port number.                  |
| <port-number> | The port number to be configured. |

**Default** Not set

**Mode** AMF Guest Configuration

**Usage notes** If **http-enable** is selected without a **port** parameter the port number will default to 80.

**Example** To enable HTTP access to a guest node on port 80 (the default), use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# http-enable
```

To enable HTTP access to a guest node on port 400, use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# http-enable port 400
```

To disable HTTP access to a guest node, use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# no http-enable
```

**Related commands** [atmf guest-class](#)  
[switchport atmf-guestlink](#)  
[show atmf links guest](#)

`show atmf nodes`

# identity (amf-provision)

**Overview** Use this command to create an identity token for provisioning an isolated AMF node. An isolated node is an AMF member that is only connected to the rest of the AMF network via a virtual-link.

This command allows these nodes, which have no AMF neighbors, to be identified for provisioning purposes. They are identified using an identity token which is based on either the next-hop MAC address of the provisioned node, or the serial number of the device being provisioned. This identity token is stored on the AMF master.

Use the **no** variant of this command to remove the identity token for a node.

**Syntax**

```
identity mac-address <mac-address> prefix
<ip-address/prefix-length>

identity serial-number <serial-number> prefix
<ip-address/prefix-length>

no identity
```

| Parameter                      | Description                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------------------|
| mac-address                    | Specify the next-hop MAC address of the device being provisioned.                           |
| <mac-address>                  | MAC address of the port the provisioned node is connected to, in the format xxxx.xxxx.xxxx. |
| serial-number                  | Specify the serial number of the device to be provisioned.                                  |
| <serial-number>                | Serial number of the device that is being provisioned.                                      |
| prefix                         | IPv4 address, and prefix length, of the virtual-link interface on the isolated node         |
| <ip-address/<br>prefix-length> | IPv4 address, and prefix length, in A.B.C.D/M format.                                       |

**Mode** AMF Provisioning

**Usage notes** To provision an isolated node, first create a configuration for the node using the [create \(amf-provision\)](#) and/or the [clone \(amf-provision\)](#) commands.

Then create an identity token for the provisioned node by either specifying its next-hop MAC address or by specifying the serial number of the replacement device. The advantage of using the next-hop MAC address is that any device, regardless of its serial number, can be added to the network but using the serial number maybe preferred in situations where the next-hop MAC address is not easy to obtain.

The [atmf recovery-server](#) option must be enabled on the AMF master before attempting to provision the device. This option allows the AMF master to process recovery requests from isolated AMF nodes.

See the [AMF Feature Overview and Configuration Guide](#) for information on preparing your network for recovering or provisioning isolated nodes.

**Example** To create an identity token on your AMF master for a device named “my-x930” with serial number “A10064A172100008”, use the command:

```
awplus# atmf provision node my-x930

awplus(atmf-provision)# identity serial-number
A10064A172100008 prefix 192.168.2.25/24
```

To create an identity token on your AMF master for a device named “my-x930” with next-hop MAC address “0000.cd28.0880”, use the command:

```
awplus# atmf provision node my-x930

awplus(atmf-provision)# identity mac-address 0000.cd28.0880
prefix 192.168.2.25/24
```

To delete the identity token from your AMF master for a device named “my-x930”, use the command:

```
awplus# atmf provision node my-x930

awplus(atmf-provision)# no identity
```

Version 5.4.7-2.1: command added

# license-cert (amf-provision)

**Overview** This command is used to set up the license certificate for a provisioned node.

The certificate file usually has all the license details for the network, and can be stored anywhere in the network. This command makes a hidden copy of the certificate file and stores it in the space set up for the provisioned node on AMF backup media.

For node provisioning, the new device has not yet been part of the AMF network, so the user is unlikely to know its product ID or its MAC address. When such a device joins the network, assuming that this command has been applied successfully, the copy of the certificate file will be applied automatically to the provisioned node.

Once the new device has been resurrected on the network and the certificate file has been downloaded to the provisioned node, the hidden copy of the certificate file is deleted from AMF backup media.

Use the **no** variant of this command to set it back to the default.

This command can only be run on AMF master nodes.

**Syntax** `license-cert <file-path|URL>`  
`no license-cert`

| Parameter                          | Description                                                                   |
|------------------------------------|-------------------------------------------------------------------------------|
| <code>&lt;file-path URL&gt;</code> | The name of the certificate file. This can include the file-path of the file. |

**Default** No license certificate file is specified for the provisioned node.

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network. It will only operate if the provisioned node specified in the command has already been set up, and if the license certification is present in the backup file. Otherwise, an error message is shown when the command is run.

**Example 1** To apply the license certificate 'cert1.txt' stored on a TFTP server for AMF provisioned node "device2", use the command:

```
device1# atmf provision node device2
device1(atmf-provision)# license-cert
tftp://192.168.1.1/cert1.txt
```

**Example 2** To apply the license certificate 'cert2.txt' stored in the AMF master's flash directory for AMF provisioned node 'host2', use the command:

```
device1# atmf provision node host2
device1(atmf-provision)# license-cert /cert2.txt
```

To confirm that the license certificate has been applied to the provisioned node, use the command [show atmf provision nodes](#). The output from this command is shown below, and displays license certification details in the last line.

Figure 56-8: Sample output from the **show atmf provision nodes** command

```
device1#show atmf provision nodes

ATMF Provisioned Node Information:

Backup Media: SD (Total 3827.0MB, Free 3481.1MB)

Node Name : device2
Date & Time : 06-Oct-2016 & 23:25:44
Provision Path : card:/atmf/nodes

Boot configuration :
Current boot image : x510-5.4.6-1.4.rel (file exists)
Backup boot image : x510-5.4.6-1.3.rel (file exists)
Default boot config : flash:/default.cfg (file exists)
Current boot config : flash:/abc.cfg (file exists)
Backup boot config : flash:/xyz.cfg (file exists)

Software Licenses :
Repository file : ../configs/.sw_v2.lic
 : ../configs/.swfeature.lic
Certificate file : card:/atmf/lok/nodes/awplus1/flash/.atmf-lic-cert
```

**Command changes** Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# locate (amf-provision)

**Overview** This command changes the present working directory to the directory of a provisioned node. This makes it easier to edit files and create a unique provisioned node in the backup.

This command can only be run on AMF master nodes.

**NOTE:** We advise that after running this command, you return to a known working directory, typically flash.

**Syntax** locate

**Mode** AMF Provisioning

**Example** To change the working directory that happens to be on device1 to the directory of provisioned node device2, use the following command:

```
device1# atmf provision node device2
device1[atmf-provision]# locate
```

The directory of the node device2 should now be the working directory. You can use the command `pwd` to check this, as shown in the following figure.

Figure 56-9: Sample output from the `pwd` command

```
device2#pwd
card:/atmf/building_2/nodes/device2/flash
```

The output above shows that the working directory is now the flash of device2.

**Command  
changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# log event-host

**Overview** Use this command to set up an external host to log AMF topology events through Vista Manager. This command is run on the Master device.

Use the **no** variant of this command to disable log events through Vista Manager.

**Syntax** `log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event`  
`no log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event`

| Parameter   | Description                    |
|-------------|--------------------------------|
| <ipv4-addr> | ipv4 address of the event host |
| <ipv6-addr> | ipv6 address of the event host |

**Default** Log events are disabled by default.

**Mode** Global Configuration

**Usage notes** Event hosts are set so syslog sends the messages out as they come.  
Note that there is a difference between log event and log host messages:

- Log event messages are sent out as they come by syslog
- Log host messages are set to wait for a number of messages (20) to send them out together for traffic optimization.

**Example** To enable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
```

```
Node1(config)# log event-host 192.0.2.31 atmf-topology-event
```

To disable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
```

```
Node1(config)# no log event-host 192.0.2.31 atmf-topology-event
```

**Related commands** [atmf topology-gui enable](#)

# login-fallback enable

**Overview** Use this command to enable login fallback on TQ model AMF guest nodes. This allows AMF to try the factory default username and password if the guest node's saved username and password fail.

Use the **no** variant of this command to disable login fallback.

**Syntax** login-fallback enable  
no login-fallback enable

**Default** Disabled

**Mode** AMF Guest Configuration

**Usage notes** This feature is only supported on TQ model guest nodes.

Login fallback means: if a guest node's saved username and password fail, AMF will try to connect to the node using the factory default username and password (manager/friend). When a new TQ replaces an existing TQ, this allows the new TQ to be discovered and managed as an AMF guest node. AMF can then start the AMF guest node recovery procedure.

**Example** To use the login fallback feature, first create an AMF guest class for TQ model APs. Then enable the login fall back feature.

For example, to enable login fallback on the guest-class AT-TQ5k, use the commands:

```
node1#configuration terminal
node1(config)#atmf guest-class AT-TQ5k
node1(config-atmf-guest)#login-fallback enable
node1(config-atmf-guest)#end
node1#
```

**Related commands** [atmf guest-class](#)  
[modeltype](#)  
[switchport atmf-guestlink](#)  
[show atmf links guest](#)

**Command changes** Version 5.5.0-1.1: command added

# modeltype

**Overview** This command sets the expected model type of the guest node. The model type will default to **other** if nothing is set.

Use the **no** variant of this command to reset the model type to **other**.

**Syntax** `modeltype {alliedware|aw+|onvif|tq|other}`  
`no modeltype`

| Parameter  | Description                                                  |
|------------|--------------------------------------------------------------|
| alliedware | A legacy Allied Telesis operating system.                    |
| aw+        | The Allied Telesis AlliedWare Plus operating system.         |
| onvif      | ONVIF (Open Network Video Interface Forum) Profile Q devices |
| tq         | An Allied Telesis TQ Series wireless access point.           |
| other      | Used where the model type is outside the above definitions.  |

**Default** Default to **other**

**Mode** AMF Guest Configuration

**Examples** To assign the model type **tq** to the guest-class called 'tq\_device', use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class tq_device
node1(config-vmf-guest)# modeltype tq
```

To remove the model type **tq** from the guest-class called 'tq\_device', and reset it to the default of **other**, use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class tq_device
node1(config-vmf-guest)# no modeltype
```

**Related commands** [atmf guest-class](#)  
[switchport atmf-guestlink](#)  
[show atmf links guest](#)

**Command changes** Version 5.4.9-2.1: **onvif** parameter added

# service atmf-application-proxy

**Overview** Use this command to enable the AMF Application Proxy service. This service distributes messages across all AMF nodes.

Currently this is used for threat protection. When an AMF Security (AMF-Sec) Controller detects a threat, it issues a request to block the address the threat originated from. The AMF Application Proxy service distributes this message to all AMF nodes. An AMF master accepts this block request and instructs the subordinate AMF node to block the relevant device.

Use the **no** variant of this command to disable the AMF Application Proxy service.

**Syntax** `service atmf-application-proxy`  
`no service atmf-application-proxy`

**Default** The AMF Application Proxy service is disabled by default.

**Mode** Global Configuration

**Usage notes** The AMF master maintains a list of all threats and will send this list to any AMF node, or VCS member, when it boots and joins the AMF network.

In order for this to work the follow must be configured:

- the AMF Application Proxy service on all AMF nodes that need to receive the messages.
- the Hypertext Transfer Protocol (HTTP) service on all nodes that are running the AMF Application Proxy service (see [service http](#)).

**Example** To enable the AMF Application Proxy service, use the commands

```
awplus# configure terminal
awplus(config)# service atmf-application-proxy
```

To disable the AMF Application Proxy service, use the commands

```
awplus# configure terminal
awplus(config)# no service atmf-application-proxy
```

**Related commands** [application-proxy threat-protection](#)  
[application-proxy whitelist server](#)  
[clear application-proxy threat-protection](#)  
[show application-proxy threat-protection](#)

**Command changes** Version 5.4.7-2.2: command added

# show application-proxy threat-protection

**Overview** Use this command to list all the IP addresses blocked by the AMF Application Proxy service. It also shows the global threat-detection configuration.

**Syntax** `show application-proxy threat-protection [all]`
