| Parameter     | Description                                                                                                                                                                                                                                                                                                                           |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| external      | Clears all external peers.                                                                                                                                                                                                                                                                                                            |
| ipv4          | Clears all IPv4 address family peers. Configure parameters relating to the BGP exchange of IPv4 prefixes.                                                                                                                                                                                                                             |
| in            | Indicates that incoming advertised routes will be cleared.                                                                                                                                                                                                                                                                            |
| prefix-filter | Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.                         |
| out           | Indicates that outgoing advertised routes will be cleared.                                                                                                                                                                                                                                                                            |
| soft in       | Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory. |
| soft out      | Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.                                                                                                                                                                     |

**Mode** Privileged Exec

**Examples** awplus# clear ip bgp external out

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip bgp peer-group (BGP only)

**Overview** Use this command to reset the BGP connections to all members of a peer group.

**Syntax**

```
clear ip bgp peer-group <peer-name>
clear ip bgp peer-group <peer-name> in [prefix-filter]
clear ip bgp peer-group <peer-name> out
clear ip bgp peer-group <peer-name> soft [in|out]
clear ip bgp peer-group <peer-name> out
clear ip bgp peer-group <peer-name> soft [in|out]
```

| Parameter     | Description                                                                                                                                                                                                                                                                                                                           |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| peer-group    | Clears all members of a peer group.                                                                                                                                                                                                                                                                                                   |
| <peer-name>   | Specifies the name of the peer group for which all members will be cleared.                                                                                                                                                                                                                                                           |
| ipv4          | Clears all IPv4 address family peers. Configure parameters relating to the BGP exchange of IPv4 prefixes.                                                                                                                                                                                                                             |
| in            | Indicates that incoming advertised routes will be cleared.                                                                                                                                                                                                                                                                            |
| prefix-filter | Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.                         |
| out           | Indicates that outgoing advertised routes will be cleared.                                                                                                                                                                                                                                                                            |
| soft in       | Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory. |
| soft out      | Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.                                                                                                                                                                     |

**Mode** Privileged Exec

**Examples** awplus# clear ip bgp peer-group Peer1 out

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip prefix-list

**Overview** Use this command to reset the hit count to zero in the prefix-list entries.

**Syntax** `clear ip prefix-list [<list-name>] [<ip-address>/<mask>]`

| Parameter           | Description                  |
|---------------------|------------------------------|
| <list-name>         | The name of the prefix-list. |
| <ip-address>/<mask> | The IP prefix and length.    |

**Mode** Privileged Exec

**Example** To clear a prefix-list named List1:

```
awplus# clear ip prefix-list List1
```

# debug bgp (BGP only)

**Overview** Use this command to turn on one or more BGP debug options.  
Use the **no** variant of this command to disable one or more BGP debug options.

**Syntax**

```
debug bgp
[all|dampening|events|filters|fsm|keepalives|nht|nsm|updates
[in|out]]

no debug all bgp

no debug bgp
[all|dampening|events|filters|fsm|keepalives|nht|nsm|updates
[in|out]]
```

| Parameter  | Description                                                   |
|------------|---------------------------------------------------------------|
| all        | Turns on all debugging for BGP.                               |
| dampening  | Specifies debugging for BGP dampening.                        |
| events     | Specifies debugging for BGP events.                           |
| filters    | Specifies debugging for BGP filters.                          |
| fsm        | Specifies debugging for BGP Finite State Machine (FSM).       |
| keepalives | Specifies debugging for BGP keepalives.                       |
| nht        | Specifies debugging for BGP NHT (Next Hop Tracking) messages. |
| nsm        | Specifies debugging for NSM messages.                         |
| updates    | [in out]<br>Specifies debugging for BGP updates.              |
| in         | Inbound updates.                                              |
| out        | Outbound updates.                                             |

**Mode** Privileged Exec and Global Configuration

**Usage** If the command is entered with no parameters, then all debug options are enabled.

**Examples**

```
awplus# debug bgp
awplus# debug bgp events
awplus# debug bgp nht
awplus# debug bgp updates in
```

**Related commands** [show debugging bgp \(BGP only\)](#)  
[undebug bgp \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# distance (BGP and BGP4+)

**Overview** This command sets the administrative distance for BGP and BGP4+ routes. The device uses this value to select between two or more routes to the same destination from two different routing protocols. Set the administrative distance for BGP routes in the Router Configuration mode, and for BGP4+ routes in IPv6 Address Family Configuration mode.

The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). For more information, see the [Route Selection Feature Overview and Configuration Guide](#), which is available from the above link at [alliedtelesis.com](#).

The **no** variant of this command sets the administrative distance for the route to the default for the route type.

**Syntax**

```
distance <1-255> <ip-address/m> [<listname>]
distance bgp <ebgp> <ibgp> <local>
no distance <1-255> <ip-address/m> [<listname>]
no distance bgp <ebgp> <ibgp> <local>
```

| Parameter      | Description                                                                                                                                                                                                                    |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-255>        | The administrative distance value you are setting for the route.                                                                                                                                                               |
| <ip-address/m> | The IP source prefix that you are changing the administrative distance for, entered in the form A . B . C . D / M. This is an IPv4 address in dotted decimal notation followed by a forward slash, and then the prefix length. |
| <listname>     | The name of the access list to be applied to the administrative distance to selected routes.                                                                                                                                   |
| <ebgp>         | Specifies the administrative distance of external BGP (eBGP) routes. These are routes learned from a neighbor out of the AS. Specify the distance as a number between 1 and 255.<br>Default: <b>20</b>                         |
| <ibgp>         | Specifies the administrative distance of internal BGP (iBGP) routes. These are routes learned from a neighbor within the same AS. Specify the distance as a number between 1 and 255.<br>Default: <b>200</b>                   |
| <local>        | Specifies the administrative distance of local BGP routes. These are routes redistributed from another protocol within your device. Specify the distance as a number between 1 and 255.<br>Default: <b>200</b>                 |

**Mode [BGP]** Router Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage notes** You can use this command to set the administrative distance:

- for each BGP route type by specifying:

```
awplus(config-router)# distance <ebgp> <igbp> <local>
```

- for a specific route by specifying:

```
awplus(config-router)# distance <1-255> <ip-address/m>
[<listname>]
```

If the administrative distance is changed, it could create inconsistency in the routing table and obstruct routing.

**Examples [BGP]** For BGP IPv4, to set the administrative distance to 34 for the route 10.10.0.0/24 in BGP 100, and use the access list "mylist" to filter the routes, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# distance 34 10.10.0.0/24 mylist
```

For BGP IPv4, to set BGP 100's administrative distances for eBGP routes to 34, iBGP routes to 23, and local BGP routes to 15, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# distance bgp 34 23 15
```

**Example [BGP4+]** For BGP4+ IPv6, to set BGP 100's administrative distances for eBGP routes to 34, iBGP routes to 23, and local BGP routes to 15, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# distance bgp 34 23 15
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# exit-address-family

**Overview** Use this command to exit either the IPv4 or the IPv6 Address Family Configuration mode.

**Syntax** `exit-address-family`

**Mode [BGP]** IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Examples [BGP]** To enter and then exit IPv4 Address Family Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv4
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Example (VRF-lite)** To enter and then exit IPv4 Address Family Configuration mode for VRF instance red, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Example [BGP4+]** To enter and then exit IPv6 Address Family Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Related commands** [address-family](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

## ip as-path access-list

**Overview** This command defines a BGP and BGP4+ Autonomous System (AS) path access list.

The named AS path list is a filter based on regular expressions. If the regular expression matches the AS path in a BGP update message, then the permit or deny condition applies to that update. Use this command to define the BGP access list globally, then use neighbor configuration commands to apply the list to a particular neighbor.

The **no** variant of this command disables the use of the access list. Before deleting an AS path access list, delete references to the access list from any route-maps and BGP filters that use it.

**Syntax** `ip as-path access-list <listname> {deny|permit} <reg-exp>`  
`no ip as-path access-list <listname> {deny|permit} <reg-exp>`

| Parameter  | Description                                               |
|------------|-----------------------------------------------------------|
| <listname> | Specifies the name of the access list.                    |
| deny       | Denies access to matching conditions.                     |
| permit     | Permits access to matching conditions.                    |
| <reg-exp>  | Specifies a regular expression to match the BGP AS paths. |

Regular expressions listed below can be used with the **ip as-path-access-list** command:

| Symbol | Character     | Meaning                                                                                                                            |
|--------|---------------|------------------------------------------------------------------------------------------------------------------------------------|
| ^      | Caret         | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| \$     | Dollar sign   | Used to match the end of the input string.                                                                                         |
| .      | Period        | Used to match a single character (white spaces included).                                                                          |
| *      | Asterisk      | Used to match none or more sequences of a pattern.                                                                                 |
| +      | Plus sign     | Used to match one or more sequences of a pattern.                                                                                  |
| ?      | Question mark | Used to match none or one occurrence of a pattern.                                                                                 |
| _      | Underscore    | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.                                    |
| [ ]    | Brackets      | Specifies a range of single-characters.                                                                                            |
| -      | Hyphen        | Separates the end points of a range.                                                                                               |

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip as-path access-list mylist deny ^65535$`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# ip community-list

**Overview** Use this command to add an entry to a standard or extended BGP community-list filter.

Use the **no** variant of this command to delete a standard or extended community list entry.

**Syntax** `ip community-list <listname> {deny|permit} .<community>`  
`no ip community-list <listname> {deny|permit} .<community>`

| Parameter    | Description                                                                                                                                                                                   |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <listname>   | Specifies the community listname.                                                                                                                                                             |
| deny         | Specifies the community to reject.                                                                                                                                                            |
| permit       | Specifies the community to accept.                                                                                                                                                            |
| .<community> | {<AS:VAL> local-AS no-advertise no-export}                                                                                                                                                    |
| <AS:VAL>     | Specifies the valid value for the community number. This format represents the 32 bit communities value, where AS is the high order 16 bits and VAL is the low order 16 bits in digit format. |
| local-AS     | Specifies routes not to be advertised to external BGP peers.                                                                                                                                  |
| no-advertise | Specifies routes not to be advertised to other BGP peers.                                                                                                                                     |
| no-export    | Specifies routes not to be advertised outside of Autonomous System boundary.                                                                                                                  |

**Mode** Global Configuration

**Usage notes** A community-list can be used as a filter to BGP updates. Use this command to define the community access list globally, then use neighbor configuration commands to apply the list to a particular neighbor.

There are two kinds of community-lists: expanded and standard. A standard community-list defines the community attributes explicitly and not via a regular expression. An expanded community-list defines the communities attributes with regular expressions.

The standard community-list is compiled into binary format and is directly compared with the BGP communities attribute in the BGP updates. The comparison is faster than the expanded community-list. Any community value that does not match the standard community value is automatically treated as expanded.

**Example** `awplus# configure terminal`  
`awplus(config)# ip community-list mylist permit 7675:80 7675:90`

**Related commands** [ip community-list standard](#)  
[ip community-list expanded](#)

Version 5.4.7-2.4: BGP support added for IE300 series

# ip community-list expanded

**Overview** Use this command to add an entry to an expanded BGP community-list filter.

Use the **no** variant of this command to delete the community list entry.

**Syntax**

```
ip community-list <100-199> {deny|permit} .<line>
no ip community-list <100-199> {deny|permit} .<line>
ip community-list expanded <expanded-listname> {deny|permit}
.<line>
no ip community-list expanded <expanded-listname> {deny|permit}
.<line>
```

| Parameter           | Description                                              |
|---------------------|----------------------------------------------------------|
| <100-199>           | Expanded community list number.                          |
| expanded            | Specifies an expanded community list.                    |
| <expanded-listname> | Expanded community list entry.                           |
| deny                | Specifies community to reject.                           |
| permit              | Specifies community to accept.                           |
| .<line>             | Specifies community attributes with regular expressions. |

Regular expressions listed below can be used with the **ip community-list expanded** command:

| Symbo<br>l | Character     | Meaning                                                                                                                            |
|------------|---------------|------------------------------------------------------------------------------------------------------------------------------------|
| ^          | Caret         | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| \$         | Dollar sign   | Used to match the end of the input string.                                                                                         |
| .          | Period        | Used to match a single character (white spaces included).                                                                          |
| *          | Asterisk      | Used to match none or more sequences of a pattern.                                                                                 |
| +          | Plus sign     | Used to match one or more sequences of a pattern.                                                                                  |
| ?          | Question mark | Used to match none or one occurrence of a pattern.                                                                                 |
| _          | Underscore    | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.                                    |
| [ ]        | Brackets      | Specifies a range of single-characters.                                                                                            |
| -          | Hyphen        | Separates the end points of a range.                                                                                               |

**Mode** Global Configuration

**Usage notes** A `community-list` can be used as a filter to BGP updates. Use this command to define the community access list globally, then use **neighbor** configuration commands to apply the list to a particular neighbor.

There are two kinds of community-lists: expanded and standard. A standard community-list defines the community attributes explicitly and not via a regular expression. An expanded community-list defines the communities attributes with regular expressions.

The standard community-list is compiled into binary format and is directly compared with the BGP communities attribute in the BGP updates. The comparison is faster than the expanded community-list. Any community value that does not match the standard community value is automatically treated as expanded.

**Examples**

```
awplus# configure terminal
awplus(config)# ip community-list 125 permit 6789906
awplus(config)# ip community-list expanded CLIST permit .*
```

# ip community-list standard

**Overview** Use this command to add an entry to a standard BGP community-list filter.  
Use the **no** variant of this command to delete the standard community-list entry.

**Syntax**

```
ip community-list <1-99> {deny|permit} [.<community>]
no ip community-list <1-99> {deny|permit} [.<community>]
ip community-list standard <standard-listname> {deny|permit}
[.<community>]
no ip community-list standard <standard-listname> {deny|permit}
[.<community>]
```

| Parameter           | Description                                                                                                                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-99>              | Standard community list number.                                                                                                                                                               |
| standard            | Specifies a standard community list.                                                                                                                                                          |
| <standard-listname> | Standard community list entry.                                                                                                                                                                |
| deny                | Specifies community to reject.                                                                                                                                                                |
| permit              | Specifies community to accept.                                                                                                                                                                |
| <community>         | {<AS:VAL>   local-AS   no-advertise   no-export}                                                                                                                                              |
| <AS:VAL>            | Specifies the valid value for the community number. This format represents the 32 bit communities value, where AS is the high order 16 bits and VAL is the low order 16 bits in digit format. |
| local-AS            | Specifies routes not to be advertised to external BGP peers.                                                                                                                                  |
| no-advertise        | Specifies routes not to be advertised to other BGP peers.                                                                                                                                     |
| no-export           | Specifies routes not to be advertised outside of the Autonomous System boundary.                                                                                                              |

**Mode** Global Configuration

**Usage notes** A community-list can be used as a filter to BGP updates. Use this command to define the community access list globally, then use neighbor configuration commands to apply the list to a particular neighbor.

There are two kinds of community-lists: expanded and standard. The standard community-list defines the community attributes as explicit values, without regular expressions. The expanded community-list defines the communities attributes with regular expressions.

The standard community-list is compiled into binary format and is directly compared with the BGP communities attribute in the BGP updates. The comparison is faster than the expanded community-list. Any community value

that does not match the standard community value is automatically treated as expanded.

**Examples**    `awplus# configure terminal`  
`awplus(config)# ip community-list standard CLIST permit 7675:80`  
`7675:90 no-export`  
`awplus(config)# ip community-list 34 permit 5675:50`  
`no-advertise`

**Related commands**    `ip community-list`  
`ip community-list expanded`  
`show ip community-list`

**Command changes**    Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# ip extcommunity-list expanded

**Overview** Use this command to create or delete an expanded extended community list.

Use the **no** variant of this command to delete the expanded extended community-list entry.

**Syntax**

```
ip extcommunity-list <100-199> {deny|permit}
{.<line>|.<AS:NN>|.<ip-address>}

no ip extcommunity-list <100-199> {deny|permit}
{.<line>|.<AS:NN>|.<ip-address>}

ip extcommunity-list expanded <expanded-listname> {deny|permit}
{.<line>|.<AS:NN>|.<ip-address>}

no ip extcommunity-list expanded <expanded-listname>
{deny|permit} {.<line>|.<AS:NN>|.<ip-address>}

no ip extcommunity-list <100-199>

no ip extcommunity-list expanded <expanded-listname>
```

| Parameter           | Description                                                                                                                                                                                       |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <100-199>           | Expanded extcommunity list number.                                                                                                                                                                |
| expanded            | Specifies an expanded extcommunity list.                                                                                                                                                          |
| <expanded-listname> | Expanded extcommunity list entry.                                                                                                                                                                 |
| deny                | Specifies the extcommunity to reject.                                                                                                                                                             |
| permit              | Specifies the extcommunity to accept.                                                                                                                                                             |
| .<line>             | Specifies extcommunity attributes with regular expression.                                                                                                                                        |
| <AS:NN>             | Specifies the valid value for an extcommunity number. This format represents the 32 bit extcommunities value, where AA is the high order 16 bits and NN is the low order 16 bits in digit format. |
| <ip-address>        | Specifies the IP address to deny or permit.                                                                                                                                                       |

Regular expressions listed below are used with the **ip extcommunity-list expanded** command:

| Symbol | Character   | Meaning                                                                                                                            |
|--------|-------------|------------------------------------------------------------------------------------------------------------------------------------|
| ^      | Caret       | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| \$     | Dollar sign | Used to match the end of the input string.                                                                                         |

| Symbol | Character     | Meaning                                                                                         |
|--------|---------------|-------------------------------------------------------------------------------------------------|
| .      | Period        | Used to match a single character (white spaces included).                                       |
| *      | Asterisk      | Used to match none or more sequences of a pattern.                                              |
| +      | Plus sign     | Used to match one or more sequences of a pattern.                                               |
| ?      | Question mark | Used to match none or one occurrence of a pattern.                                              |
| _      | Underscore    | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string. |
| [ ]    | Brackets      | Specifies a range of single-characters.                                                         |
| -      | Hyphen        | Separates the end points of a range.                                                            |

**Mode** Global Configuration

**Examples** `awplus# configure terminal`  
`awplus(config)# ip extcommunity-list 125 permit 4567335`  
`awplus(config)# ip extcommunity-list expanded CLIST permit .*`

# ip extcommunity-list standard

**Overview** Use this command to create and delete a standard extended community list.

Use the **no** variant of this command to delete a standard extended community-list entry.

**Syntax**

```
ip extcommunity-list <1-99> {deny|permit} {rt|soo}
<community-number>

ip extcommunity-list standard <standard-listname> {deny|permit}
{rt|soo} <community-number>

no ip extcommunity-list <1-99> [{deny|permit} {rt|soo}
<community-number>]

no ip extcommunity-list standard <standard-listname>
[{deny|permit} {rt|soo} <community-number>]
```

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-99>              | Standard extcommunity list number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| standard            | Specifies a standard extended community list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <standard-listname> | Standard extended community list entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| deny                | Specifies the extended community to reject.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| permit              | Specifies the extended community to accept.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| rt                  | Specifies the route target of the extended community.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| soo                 | Specifies the site of origin of the extended community.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <community-number>  | <p>Specifies the valid value for an extended community number.</p> <p>This can be one of two formats:</p> <ul style="list-style-type: none"><li>• &lt;ASN:NN&gt; where <i>ASN</i> is an AS (Autonomous System) number and <i>NN</i> is a value chosen by the ASN administrator</li><li>• &lt;A.B.C.D:NN&gt; where <i>A.B.C.D</i> is an IPv4 address, and <i>NN</i> is a value chosen by the ASN administrator.</li></ul> <p>Note that <i>ASN</i> and <i>NN</i> are both integers from 1 to 4294967295.</p> <p>AS numbers are assigned to the regional registries by IANA (<a href="http://www.iana.org">www.iana.org</a>) and must be obtained in your region.</p> |

- Version 5.4.7-2.4: BGP support added for IE300 series

# ip prefix-list

**Overview** Use this command to create an entry for an IPv4 prefix list.

Use the **no** variant of this command to delete the IPv4 prefix-list entry.

**Syntax**

```
ip prefix-list <list-name> [seq <1-429496725>] {deny|permit}
{any|<ip-prefix>} [ge <0-32>] [le <0-32>]

ip prefix-list <list-name> description <text>

ip prefix-list sequence-number

no ip prefix-list <list-name> [seq <1-429496725>]

no ip prefix-list <list-name> [description <text>]

no ip prefix-list sequence-number
```

| Parameter         | Description                                                                                          |
|-------------------|------------------------------------------------------------------------------------------------------|
| <list-name>       | Specifies the name of a prefix list.                                                                 |
| seq <1-429496725> | Sequence number of the prefix list entry.                                                            |
| deny              | Specifies that the prefixes are excluded from the list.                                              |
| permit            | Specifies that the prefixes are included in the list.                                                |
| <ip-prefix>       | Specifies the IPv4 address and length of the network mask in dotted decimal in the format A.B.C.D/M. |
| any               | Any prefix match. Same as <b>0.0.0.0/0 le 32</b> .                                                   |
| ge<0-32>          | Specifies the minimum prefix length to be matched.                                                   |
| le<0-32>          | Specifies the maximum prefix length to be matched.                                                   |
| <text>            | Text description of the prefix list.                                                                 |
| sequence-number   | Specify sequence numbers included or excluded in prefix list.                                        |

**Mode** Global Configuration

**Usage notes** When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. When setting these parameters, set the **le** value to be less than 32, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

**Example** In the following sample configuration, the last **ip prefix-list** command in the below list matches all, and the first **ip prefix-list** command denies the IP network 76.2.2.0:

```
awplus(config)# router bgp 100
awplus(config-router)# network 172.1.1.0
awplus(config-router)# network 172.1.2.0
awplus(config-router)# neighbor 10.6.5.3 remote-as 300
awplus(config-router)# neighbor 10.6.5.3 prefix-list mylist out
awplus(config-router)# exit
awplus(config)# ip prefix-list mylist seq 5 deny 76.2.2.0/24
awplus(config)# ip prefix-list mylist seq 100 permit any
```

To deny the IP addresses between 10.0.0.0/14 (10.0.0.0 255.252.0.0) and 10.0.0.0/22 (10.0.0.0 255.255.252.0) within the 10.0.0.0/8 (10.0.0.0 255.0.0.0) addressing range, enter the following commands:

```
awplus# configure terminal
awplus(config)# ip prefix-list mylist seq 12345 deny 10.0.0.0/8
ge 14 le 22
```

**Related commands**

- [neighbor prefix-list](#)
- [area filter-list](#)
- [clear ip prefix-list](#)
- [match route-type](#)
- [show ip prefix-list](#)

# ipv6 prefix-list

**Overview** Use this command to create an IPv6 prefix list or an entry in an existing prefix list.

Use the **no** variant of this command to delete a whole prefix list, a prefix list entry, or a description.

**Syntax**

```
ipv6 prefix-list <list-name> [seq <1-429496725>] {deny|permit}
{any|<ipv6-prefix>} [ge <0-128>] [le <0-128>]

ipv6 prefix-list <list-name> description <text>

no ipv6 prefix-list <list-name> [seq <1-429496725>]

no ipv6 prefix-list <list-name> [description <text>]
```

| Parameter         | Description                                                                          |
|-------------------|--------------------------------------------------------------------------------------|
| <list-name>       | Specifies the name of a prefix list.                                                 |
| seq <1-429496725> | Sequence number of the prefix list entry.                                            |
| deny              | Specifies that the prefixes are excluded from the list.                              |
| permit            | Specifies that the prefixes are included in the list.                                |
| <ipv6-prefix>     | Specifies the IPv6 prefix and prefix length in hexadecimal in the format X:X::X:X/M. |
| any               | Any prefix match. Same as ::0/0 le 128.                                              |
| ge <0-128>        | Specifies the minimum prefix length to be matched.                                   |
| le <0-128>        | Specifies the maximum prefix length to be matched.                                   |
| description       | Prefix list specific description.                                                    |
| <text>            | Up to 80 characters of text description of the prefix list.                          |

**Mode** Global Configuration

**Usage notes** When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. The parameters **ge** and **le** are only used if an ip-prefix is stated. When setting these parameters, set the **le** value to be less than 128, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

**Example** To check the first 32 bits of the prefix 2001:db8:: and that the subnet mask must be greater than or equal to 34 and less than or equal to 40, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 prefix-list mylist seq 12345 permit
2001:db8::/32 ge 34 le 40
```

**Related commands**

- match ipv6 address
- show ipv6 prefix-list
- show running-config ipv6 prefix-list

# match as-path

**Overview** Use this command to add an autonomous system (AS) path match clause to a route map entry. Specify the AS path attribute value or values to match by specifying the name of an AS path access list. To create the AS path access list, enter Global Configuration mode and use the [ip as-path access-list](#) command.

A BGP update message matches the route map if its attributes include AS path values that match the AS path access list.

Each entry of a route map can only match against one AS path access list in one AS path match clause. If the route map entry already has an AS path match clause, entering this command replaces that match clause with the new clause.

Note that AS path access lists and route map entries both specify an action of deny or permit. The action in the AS path access list determines whether the route map checks update messages for a given AS path value. The route map action and its **set** clauses determine what the route map does with update messages that contain that AS path value.

Use the **no** variant of this command to remove the AS path match clause from a route map entry.

**Syntax** `match as-path <as-path-listname>`  
`no match as-path [<as-path-listname>]`

| Parameter                             | Description                            |
|---------------------------------------|----------------------------------------|
| <code>&lt;as-path-listname&gt;</code> | Specifies an AS path access list name. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for BGP update messages only.

**Example** To add entry 34 to the route map called `myroute`, which will discard update messages if they contain the AS path values that are included in `myaccesslist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute deny 34
awplus(config-route-map)# match as-path myaccesslist
```

**Related commands** [ip as-path access-list](#)  
[route-map](#)  
[set as-path](#)  
[show route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# match community

**Overview** Use this command to add a community match clause to a route map entry. Specify the community value or values to match by specifying a community list. To create the community list, enter Global Configuration mode and use the [ip community-list](#) command.

A BGP update message matches the route map if its attributes include community values that match the community list.

Each entry of a route map can only match against one community list in one community match clause. If the route map entry already has a community match clause, entering this command replaces that match clause with the new clause.

Note that community lists and route map entries both specify an action of deny or permit. The action in the community list determines whether the route map checks update messages for a given community value. The route map action and its **set** clauses determine what the route map does with update messages that contain that community value.

Use the **no** variant of this command to remove the community match clause from a route map.

**Syntax**

```
match community
{<community-listname>|<1-99>|<100-199>} [exact-match]

no match community
[<community-listname>|<1-99>|<100-199>|exact-match]
```

| Parameter            | Description                             |
|----------------------|-----------------------------------------|
| <community-listname> | The community list name or number.      |
| <1-99>               | Community list number (standard range). |
| <100-199>            | Community list number (expanded range). |
| exact-match          | Exact matching of communities.          |

**Mode** Route-map Configuration

**Usage notes** This command is valid for BGP update messages only.

Communities are used to group and filter routes. They are designed to provide the ability to apply policies to large numbers of routes by using match and set commands. Community lists are used to identify and filter routes by their common attributes.

**Example** To add entry 3 to the route map called `myroute`, which will process update messages if they contain the community values that are included in `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# match community mylist
```

**Related commands**

- `ip community-list`
- `route-map`
- `set comm-list delete`
- `set community`
- `show route-map`

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# max-paths

**Overview** Use this command to set the number of equal-cost multi-path (ECMP) routes for eBGP or iBGP. You can install multiple BGP paths to the same destination to balance the load on the forwarding path.

Use the **no** variant of this command to disable this feature.

**Syntax** `max-paths {ebgp|ibgp} <2-64>`  
`no max-paths ebgp [<2-64>]`  
`no max-paths ibgp [<2-64>]`

| Parameter | Description                     |
|-----------|---------------------------------|
| ebgp      | eBGP ECMP session.              |
| ibgp      | iBGP ECMP session.              |
| <2-64>    | Specifies the number of routes. |

**Mode** Global Configuration

**Usage notes** This command is available for the default BGP instance and for IPV4 and IPV6 unicast addresses.

**Example** `awplus# configure terminal`  
`awplus(config)# router bgp 64501`  
`awplus(config-router)# max-paths ebgp 2`

**Related commands** [show ip route summary](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor activate

**Overview** Use this command to enable the exchange of BGP IPv4 and BGP4+ IPv6 routes with a neighboring router, and also within either an IPv4 or an IPv6 specific address-family.

Use the **no** variant of this command to disable the exchange of information with a BGP or BGP4+ neighbor, in the Router Configuration or the Address Family Configuration mode.

**Syntax** `neighbor <neighborid> activate`  
`no neighbor <neighborid> activate`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | { <ip-address>   <ipv6-addr>   <peer-group> }                                                                                                                                                                                                                                                                              |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage [BGP]** Use this command to enable the exchange of information to a neighbor. To exchange IPv4 or IPv6 prefixes with a BGP or a BGP4+ peer, you must configure this command for the peer or the peer group. This command only enables the exchange of information. You can establish peering without this command, but no prefixes and other information is sent until you apply this command to the neighbor.

This command triggers the device to start a BGP or BGP4+ peering relationship with the specified BGP or BGP4+ neighbor and start exchanging routes with that neighbor.

The command is required for neighbors configured in Address-Family Configuration mode, but it is not required in Router Configuration mode (that is, it does not affect the device's behavior).

**Examples [BGP]** To enable an exchange of routes with a neighboring router with the IPv4 address 10.10.10.1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 activate
```

To disable an exchange of routes with a neighboring router with the IPv4 address 10.10.10.1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 activate
```

To enable an exchange of routes in Address Family Configuration mode with a neighboring router with the IPv4 address 10.10.10.1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 activate
```

To disable an exchange of routes in Address Family Configuration mode with a neighboring router with the IPv4 address 10.10.10.1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 activate
```

To enable an exchange of routes with a neighboring router with the peer-group named group1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.63 remote-as 10
awplus(config-router)# neighbor 10.10.0.63 peer-group group1
awplus(config-router)# neighbor group1 activate
```

To disable an exchange of routes with a neighboring router with the peer-group named group1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 activate
```

**Examples** To enable an exchange of routes in IPv6 Address Family Configuration mode with a neighboring router with the IPv6 address 2001:0db8:010d::1, enter the commands as shown below:

**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 activate
```

To disable an exchange of routes in IPv6 Address Family Configuration mode with a neighboring router with the IPv6 address 2001:0db8:010d::1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
activate
```

To enable an exchange of routes with a neighboring router with the peer-group named group1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 activate
```

To disable an exchange of routes with a neighboring router with the peer-group named group1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 activate
```

**Related commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor advertisement-interval

**Overview** Use this command to set the minimum interval between sending iBGP or eBGP routing updates for a given route. This command reduces the flapping of individual routes.

Use the **no** variant of this command to set the interval time to the default values (30 seconds for eBGP peers and 5 seconds for iBGP peers) for a given route.

**Syntax** `neighbor <neighborid> advertisement-interval <time>`  
`no neighbor <neighborid> advertisement-interval [<time>]`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | {<ip-address>   <ipv6-addr>   <peer-group>}                                                                                                                                                                                                                                                                                                                                                                                                       |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                                                                                                                                                  |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                                                                                                                                                     |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. Note that if you apply an advertisement-interval value to a peer group it will apply to all members in the peer group. |
| <time>       | <0-600> Advertisement -interval value in seconds.                                                                                                                                                                                                                                                                                                                                                                                                 |

**Default** The default interval between sending routing updates for a given route to eBGP peers is 30 seconds, and the default interval for a given route to iBGP peers is 5 seconds.

**Mode** Router Configuration

**Usage notes** Use this command to set the minimum interval between sending iBGP or eBGP routing updates for a given route. To reduce the flapping of routes to the internet, set a minimum advertisement interval, so iBGP or eBGP routing updates are sent per interval seconds.

BGP dampening can also be used to control the effects of flapping routes. See the [bgp dampening](#) command in this chapter, and the [Routing\\_Protocol Guide](#) for more information.

The advertisement-interval time value is the minimum time between the advertisement of Update messages sent from a BGP speaker to report changes to

eBGP or iBGP peers. This is the minimum time between two Update messages sent to iBGP or eBGP peers.

See the [neighbor as-origination-interval](#) command to set the interval time between messages to iBGP peers, which have prefixes within the local AS. Use this command instead of the [neighbor as-origination-interval](#) command for eBGP peers with prefixes not in the same AS and updates not in a local AS.

#### Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.3
advertisement-interval 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.3
advertisement-interval
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.3 remote-as 10
awplus(config-router)# neighbor 10.10.0.3 peer-group group1
awplus(config-router)# neighbor group1 advertisement-interval
45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1
advertisement-interval
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
advertisement-interval 45

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
advertisement-interval

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1
advertisement-interval 45

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1
advertisement-interval
```

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor allowas-in

**Overview** Use this command to accept an AS\_PATH with the specified Autonomous System (AS) number from inbound updates for both BGP and BGP4+ routes.

This command allows BGP and BGP4+ to accept prefixes with the same ASN in the AS\_PATH attribute. This command allows BGP and BGP4+ to accept up to 10 instances, configured by the *<occurrences>* placeholder, of its own AN in the AS\_PATH for a prefix.

Use the **no** variant of this command to revert to default functionality (disabled by default).

**Syntax** `neighbor <neighborid> allowas-in <occurrences>`  
`no neighbor <neighborid> allowas-in`

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;neighborid&gt;</i>  | { <i>&lt;ip-address&gt;</i>   <i>&lt;ipv6-addr&gt;</i>   <i>&lt;peer-group&gt;</i> }                                                                                                                                                                                                                                       |
| <i>&lt;ip-address&gt;</i>  | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <i>&lt;ipv6-addr&gt;</i>   | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <i>&lt;peer-group&gt;</i>  | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <i>&lt;occurrences&gt;</i> | <i>&lt;1-10&gt;</i> Specifies the number of occurrences of the AS number.                                                                                                                                                                                                                                                  |

**Default** Disabled

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** Use this command to configure PE (Provider Edge) routers to allow re-advertisement of all prefixes containing duplicate Autonomous System Numbers (ASNs). In a hub and spoke configuration, a PE router re-advertises all prefixes containing duplicate ASNs. Specify the remote-as or peer-group first using the related commands. The command allows a receiving peer to accept prefixes with its own AN in the AS\_PATH, up the maximum number of instances, as configured by the *<occurrences>* placeholder.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.1 allowas-in 3
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.0.1 allowas-in 3
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.1 allowas-in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.0.1 allowas-in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.1 remote-as 10
awplus(config-router)# neighbor 10.10.0.1 peer-group group1
awplus(config-router)# neighbor group1 allowas-in 3
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor group1 allowas-in 3
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
allowas-in 3
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
allowas-in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 allowas-in 3
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor group1 allowas-in 3
```

# neighbor as-origination-interval

**Overview** Use this command to adjust the sending of AS (Autonomous System) origination routing updates to a specified iBGP peer. This command adjusts the rate at which updates are sent to a specified iBGP peer (15 seconds by default). You must set a rate when you enable it.

The as-origination-interval is the minimum time set between the advertisement of Update messages sent from a BGP speaker to an iBGP peer to report changes within the local AS.

Use the **no** variant of this command to reset the timer to the default value of 15 seconds.

**Syntax [BGP]** `neighbor <neighbor_address> as-origination-interval <time>`  
`no neighbor <neighbor_address> as-origination-interval [<time>]`

**Syntax [BGP4+]** `neighbor <ipv6-addr> as-origination-interval <time>`  
`no neighbor <ipv6-addr> as-origination-interval [<time>]`

| Parameter          | Description                                                                                  |
|--------------------|----------------------------------------------------------------------------------------------|
| <neighbor_address> | Specify a neighbor IPv4 address, in dotted decimal in the format A.B.C.D.                    |
| <ipv6-addr>        | Specify an address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| <time>             | <1-600> Time in seconds.                                                                     |

**Default** The default interval between sending routing updates to iBGP peers, which include a prefix that originates from the local AS, is 15 seconds by default.

**Mode** Router Configuration

**Usage** This command is used to change the minimum interval between sending AS-origination routing updates. The update interval for iBGP peers can be set from 1 to 600 seconds.

For interoperability with other vendors' devices, we recommend using the default value. The AS origination interval timer may not be available to adjust on other vendors' devices. Applying the default of 15 seconds across the AS maintains a common timer policy.

AlliedWare Plus devices use the default 15 second AS Origination Interval timer as per RFC 4271, a 30 second keepalive timer, a 90 second hold timer, a 120 second connect timer, a 5 second iBGP peer route advertisement interval, and a 30 second eBGP peer route advertisement interval.

Cisco devices use a 60 second keepalive timer, a 180 second hold timer, and no iBGP peer route interval timer (0). Juniper devices use a 10 second AS Origination Interval timer.

The as-origination-interval time value is the minimum amount of time between the advertisement of Update messages sent from a BGP speaker to report changes within the local AS. This is the minimum time between two Update messages to iBGP peers, which contain a prefix that originates from the same AS. See the [neighbor advertisement-interval](#) command to set time between messages to eBGP peers.

Use this command instead of the [neighbor advertisement-interval](#) command for iBGP peers with prefixes in the same AS for updates only within a local AS.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# neighbor 10.10.0.1
as-origination-interval 10
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 10.10.0.1
as-origination-interval
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# neighbor 2001:0db8:010d::1
as-origination-interval 10
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 2001:0db8:010d::1
as-origination-interval
```

# neighbor attribute-unchanged

**Overview** Use this command to advertise unchanged BGP or BGP4+ attributes to the specified BGP or BGP4+ neighbor.

Use the **no** variant of this command to disable this function.

**Syntax** `neighbor <neighborid> attribute-unchanged  
{as-path|next-hop|med}`  
`no neighbor <neighborid> attribute-unchanged  
{as-path|next-hop|med}`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | {<ip-address>   ipv6-addr>   <peer-group>}                                                                                                                                                                                                                                                                                 |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| as-path      | AS path attribute.                                                                                                                                                                                                                                                                                                         |
| next-hop     | Next hop attribute.                                                                                                                                                                                                                                                                                                        |
| med          | Multi Exit Discriminator.                                                                                                                                                                                                                                                                                                  |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage notes** Note that specifying this command with the optional **as-path** parameter has the same effect as invoking the [neighbor transparent-as](#) command.

Note this specifying this command with the optional **next-hop** parameter has the same effect as invoking the [neighbor transparent-next-hop](#) command.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.75 attribute-unchanged
as-path med

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.75
attribute-unchanged as-path med

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.0.75
attribute-unchanged as-path med

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.0.75
attribute-unchanged as-path med

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.75 remote-as 10
awplus(config-router)# neighbor 10.10.0.75 peer-group group1
awplus(config-router)# neighbor group1 attribute-unchanged
as-path med

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 attribute-unchanged
as-path med
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
attribute-unchanged as-path med
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
attribute-unchanged as-path med
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 attribute-unchanged
as-path med
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1
attribute-unchanged as-path med
```

# neighbor capability graceful-restart

**Overview** Use this command to configure the device to advertise the Graceful Restart Capability to BGP and BGP4+ neighbors.

Use the **no** variant of this command to configure the device so it does not advertise the Graceful Restart Capability to its neighbor.

**Syntax** `neighbor <neighborid> capability graceful-restart`  
`no neighbor <neighborid> capability graceful-restart`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | { <ip-address>   <ipv6-addr>   <peer-group> }                                                                                                                                                                                                                                                                              |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Default** Disabled

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** Use the **neighbor capability graceful-restart** command to advertise to the BGP or BGP4+ neighbor routers the capability of graceful restart. First specify the BGP or BGP4+ neighbor's **remote-as** identification number as assigned by the neighbor router.

The graceful restart capability is advertised only when the graceful restart capability has been enabled using the [bgp graceful-restart](#) command.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.50 capability
graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.50 capability
graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.50 capability
graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.50 capability
graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.50 remote-as 10
awplus(config-router)# neighbor 10.10.10.50 peer-group group1
awplus(config-router)# neighbor group1 capability
graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 capability
graceful-restart
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
capability graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
capability graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 capability
graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 capability
graceful-restart
```

# neighbor capability orf prefix-list

**Overview** Use this command to advertise ORF (Outbound Route Filters) capability to neighbors. Use this command to dynamically filter updates. The BGP speaker can advertise a prefix list with prefixes it wishes the peer to prune or filter from outgoing updates.

Use the **no** variant of this command to disable this function.

**Syntax** `neighbor <neighborid> capability orf prefix-list  
{both|receive|send}`

`no neighbor <neighborid> capability orf prefix-list  
{both|receive|send}`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | {<ip-address>   <ipv6-addr>   <peer-group>}                                                                                                                                                                                                                                                                                |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| orf          | Advertises ORF capability to its neighbors.                                                                                                                                                                                                                                                                                |
| both         | Indicates that the local router can send ORF entries to its peer as well as receive ORF entries from its peer.                                                                                                                                                                                                             |
| receive      | Indicates that the local router is willing to receive ORF entries from its peer.                                                                                                                                                                                                                                           |
| send         | Indicates that the local router is willing to send ORF entries to its peer.                                                                                                                                                                                                                                                |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Default** Disabled

**Usage notes** Outbound Route Filters (ORFs) send and receive capabilities to lessen the number of updates exchanged between neighbors. By filtering updates, this option minimizes generating and processing of updates. The local router advertises the ORF capability in `send` mode and the remote router receives the ORF capability in

**receive** mode applying the filter as outbound policy. The two routers exchange updates to maintain the ORF for each router. Only an individual router or a peer-group can be configured to be in **receive** or **send** mode. A peer-group member cannot be configured in **receive** or **send** mode.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.5 capability orf
prefix-list both

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.5 capability orf
prefix-list both

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# neighbor 10.10.0.5 capability orf
prefix-list both

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# no neighbor 10.10.0.5 capability orf
prefix-list both

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.5 remote-as 10
awplus(config-router)# neighbor 10.10.0.5 peer-group group1
awplus(config-router)# neighbor group1 capability orf
prefix-list both

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 capability orf
prefix-list both
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router)# neighbor 2001:0db8:010d::1 capability
orf prefix-list both

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router)# no neighbor 2001:0db8:010d::1 capability
orf prefix-list both

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 capability orf
prefix-list both

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 capability orf
prefix-list both
```

**changes**

Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor capability route-refresh

**Overview** Use this command to advertise route-refresh capability to the specified BGP and BGP4+ neighbors.

Use the **no** variant of this command to disable this function

**Syntax** `neighbor <neighborid> capability route-refresh`  
`no neighbor <neighborid> capability route-refresh`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | { <ip-address>   ipv6-addr>   <peer-group> }                                                                                                                                                                                                                                                                               |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| ipv6-addr>   | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode** Router Configuration

**Default** Enabled

**Usage** Use this command to advertise to peer about route refresh capability support. If route refresh capability is supported, then router can dynamically request that the peer readvertises its Adj-RIB-Out.

### Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 capability
route-refresh
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 capability
route-refresh
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.1.1 remote-as 10
awplus(config-router)# neighbor 10.10.1.1 peer-group group1
awplus(config-router)# neighbor group1 capability route-refresh
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 capability
route-refresh
```

### Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 capability
route-refresh
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 capability
route-refresh
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 capability route-refresh
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 capability
route-refresh
```

**Command changes**    Added to AlliedWare Plus prior to 5.4.6-1  
                              Version 5.4.7-2.1: BGP support added for x510 and x550 series  
                              Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor collide-established

**Overview** Use this command to specify including a BGP or BGP4+ neighbor, already in an 'established' state, for conflict resolution when a TCP connection collision is detected.

Use the **no** variant of this command to remove a BGP or BGP4+ neighbor, already in an 'established' state, for conflict resolution when a TCP connection collision is detected.

**Syntax** `neighbor <neighborid> collide-established`  
`no neighbor <neighborid> collide-established`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | {<ip-address> <ipv6-addr> <peer-group>}                                                                                                                                                                                                                                                                                    |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode** Router Configuration

**Usage notes** This command must be used only when specially required. It is not required in most network deployments.

The associated functionality of including an 'established' neighbor into TCP connection collision conflict resolution is automatically enabled when neighbor is configured for BGP graceful-restart.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 collide-established
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1
collide-established
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 collide-established
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 collide-established
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
collide-established
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
collide-established
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 collide-established
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 collide-established
```

# neighbor default-originate

**Overview** Use this command to allow a BGP or BGP4+ local router to send the default route to a neighbor.

Use the **no** variant of this command to send no route as a default route.

**Syntax** `neighbor {<neighborid>} default-originate [route-map <routemap-name>]`  
`no neighbor {<neighborid>} default-originate [route-map <routemap-name>]`

| Parameter       | Description                                                                                                                                                                                                                                                                                                                             |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid>    | { <ip-address>   <ipv6-addr>   <peer-group> }                                                                                                                                                                                                                                                                                           |
|                 | <ip-address> Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
|                 | <ipv6-addr> Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                               |
|                 | <peer-group> Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| route-map       | If a route-map is specified, then the route table must contain at least one route that matches the permit criteria of the route map before the default route will be advertised to the specified neighbor.                                                                                                                              |
| <routemap-name> | Enter the route-map name.                                                                                                                                                                                                                                                                                                               |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Examples [BGP]** To allow a device to originate default route to neighbor 10.10.10.1, when the device's route table contains at least one route matching the route map 'myroute', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 default-originate
route-map myroute
```

To stop a device from originating default route to neighbor 10.10.10.1, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 default-originate
route-map myroute
```

To allow a device to originate the IPv4 default route to neighbor 10.10.10.1, when the device's route table contains at least one route matching the route map 'myroute', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1
default-originate route-map myroute
```

To stop a device from originating IPv4 default route to neighbor 10.10.10.1, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1
default-originate route-map myroute
```

To allow a device to originate default route to peer group 'group1', when the device's route table contains at least one route matching the route map 'myroute', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 default-originate
route-map myroute
```

To stop a device originating default route to peer group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 default-originate
route-map myroute
```

**Examples** To allow a device to originate default route to neighbor 2001:0db8:010d::1, when  
**[BGP4+]** the device's route table contains at least one route matching the route map 'myroute', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
default-originate route-map myroute
```

To stop a device originating default route to neighbor 2001:0db8:010d::1, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
default-originate route-map myroute
```

To allow a device to originate default route to peer group 'group1', when the device's route table contains at least one route matching the route map 'myroute', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 default-originate
route-map myroute
```

To stop a device originating default route to peer group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 default-originate
route-map myroute
```

**Related commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor description

**Overview** Use this command to associate a description with a BGP or a BGP4+ neighbor. We recommend adding descriptions to defined neighbors, so any network administrators or network engineers can see a description of connected BGP or BGP4+ peers on the device.

Use the **no** variant of this command to remove the description from a BGP or a BGP4+ neighbor.

**Syntax** `neighbor <neighborid> description <description>`  
`no neighbor <neighborid> description [<description>]`

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;neighborid&gt;</code>  | { <code>&lt;ip-address&gt;</code>   <code>&lt;ipv6-addr&gt;</code>   <code>&lt;peer-group&gt;</code> }                                                                                                                                                                                                                     |
| <code>&lt;ip-address&gt;</code>  | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <code>&lt;ipv6-addr&gt;</code>   | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <code>&lt;peer-group&gt;</code>  | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <code>&lt;description&gt;</code> | Enter up to 80 characters of text describing the neighbor.                                                                                                                                                                                                                                                                 |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 description Backup
router for sales

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 description

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 description Backup
router for sales

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 description Backup
router for sales.
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 description
Backup router for sales

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
description

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 description Backup
router for sales

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 description Backup
router for sales
```

**Related commands**    [neighbor peer-group \(add a neighbor\)](#)

**Command changes**    Added to AlliedWare Plus prior to 5.4.6-1  
                              Version 5.4.7-2.1: BGP support added for x510 and x550 series  
                              Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor disallow-infinite-holdtime

**Overview** Use this command to disallow the configuration of infinite holdtime for BGP and BGP4+.

Use the **no** variant of this command to allow the configuration of infinite holdtime for BGP or BGP4+.

**Syntax [BGP]** neighbor {<ip-address>} disallow-infinite-holdtime  
no neighbor {<ip-address>} disallow-infinite-holdtime

**Syntax [BGP4+]** neighbor {<ipv6-addr>} disallow-infinite-holdtime  
no neighbor {<ipv6-addr>} disallow-infinite-holdtime

| Parameter    | Description                                                                                   |
|--------------|-----------------------------------------------------------------------------------------------|
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.              |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |

**Mode** Router Configuration

**Usage** This command enables the local BGP or BGP4+ speaker to reject holdtime "0" seconds from the peer during exchange of open messages or the user during configuration.

The **no** variant of this command allows the BGP speaker to accept "0" holdtime from the peer or during configuration.

**Examples [BGP]** To enable the **disallow-infinite-holdtime** feature on the BGP speaker with the IP address of 10.10.10.1, enter the command:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1
disallow-infinite-holdtime
```

To disable the **disallow-infinite-holdtime** feature on the BGP speaker with the IP address of 10.10.10.10, enter the command:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1
disallow-infinite-holdtime
```

**Examples** To enable the **disallow-infinite-holdtime** feature on the BGP4+ speaker with the  
**[BGP4+]** IPv6 address of 2001:0db8:010d::1, enter the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor
disallow-infinite-holdtime2001:0db8:010d::1
```

To disable the **disallow-infinite-holdtime** feature on the BGP4+ speaker with the IPv6 address of 2001:0db8:010d::1, enter the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor
disallow-infinite-holdtime2001:0db8:010d::1
```

# neighbor distribute-list

**Overview** This command filters route updates from a particular BGP or BGP4+ neighbor using an access control list.

You can add one incoming and one outgoing distribute-list for each BGP or BGP4+ neighbor.

The **no** variant of this command removes a previously configured BGP or BGP4+ distribute-list.

**Syntax** `neighbor <neighborid> distribute-list <access-list> {in|out}`  
`no neighbor <neighborid> distribute-list <access-list> {in|out}`

| Parameter     | Description                                                                                                                                                                                                                                                                                                                     |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid>  | Specify an identification method for the BGP or BGP4+ peer. Use one of the following formats:                                                                                                                                                                                                                                   |
|               | <ip-address> Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                   |
|               | <ipv6-addr> Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                       |
|               | <peer-group> Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> and <a href="#">neighbor route-map</a> commands. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <access-list> | The specific software access-list used to filter routes. Specify one of the following types of access-lists:                                                                                                                                                                                                                    |
|               | <name> The name of an IP software access-list.                                                                                                                                                                                                                                                                                  |
|               | <1-199> The ID number of an IP software access-list.                                                                                                                                                                                                                                                                            |
|               | <1300-2699> The ID number of an IP software access-list (expanded range).                                                                                                                                                                                                                                                       |
| in            | Indicates that incoming advertised routes will be filtered.                                                                                                                                                                                                                                                                     |
| out           | Indicates that outgoing advertised routes will be filtered.                                                                                                                                                                                                                                                                     |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

### **Examples [BGP]** Example 1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 distribute-list
mylist out
```

### Example 2:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 distribute-list
mylist out
```

### Example 3:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 distribute-list
mylist out
```

### Example 4:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1
distribute-list mylist out
```

### Example 5:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor 10.10.10.1 distribute-list
mylist out
```

### Example 6:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 distribute-list
mylist out
```

**Examples**  
**[BGP4+]**

**Example 1:**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
distribute-list mylist out
```

**Example 2:**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
distribute-list mylist out
```

**Example 3:**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor 2001:0db8:010d::1
distribute-list mylist out
```

**Example 4:**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
distribute-list mylist out
```

# neighbor dont-capability-negotiate

**Overview** Use this command to disable capability negotiation for BGP and BGP4+.

The capability negotiation is performed by default. This command is used to allow compatibility with older BGP versions that have no capability parameters used in open messages between peers.

Use the **no** variant of this command to enable capability negotiation.

**Syntax** `neighbor <neighborid> dont-capability-negotiate`  
`no neighbor <neighborid> dont-capability-negotiate`

| Parameter    | Description                                                                                                                                                                                                                                                                                                        |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | { <ip-address>   <ipv6-addr>   <peer-group> }                                                                                                                                                                                                                                                                      |
| <ip-address> | Specify the IPv4 address of the BGP neighbor in dotted decimal, in the format A.B.C.D.                                                                                                                                                                                                                             |
| <ipv6-addr>  | Specify the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                     |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> and <a href="#">neighbor route-map</a> commands. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.34
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.34
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 100
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1
dont-capability-negotiate
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
dont-capability-negotiate

# neighbor ebgp-multihop

**Overview** Use this command to accept and attempt BGP or BGP4+ connections to external peers on indirectly connected networks.

Effectively, this command sets the TTL value in the BGP or BGP4+ packets that the router sends to the neighbor, so that the packets may traverse the network route to the neighbor.

The device will not establish a connection to a multihop neighbor, if the only route to the multihop peer is a default route.

Use the **no** variant of this command to return to the default.

**Syntax** `neighbor <neighborid> ebgp-multihop [<count>]`  
`no neighbor <neighborid> ebgp-multihop [<count>]`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                             |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

# neighbor filter-list

**Overview** This command creates a BGP or BGP4+ filter using an AS (Autonomous System) path list. This command specifies an AS path list, which it then applies to filter updates to and from a BGP or a BGP4+ neighbor

The **no** variant of this command removes the previously specified BGP or BGP4+ filter using access control lists.

**Syntax** `neighbor <neighborid> filter-list <listname> {in|out}`  
`no neighbor <neighborid> filter-list <listname> {in|out}`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                             |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | Specify the identification method for the BGP or BGP4+ peer. Use one of the following formats:                                                                                                                                                                                                                                          |
|              | <ip-address> Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
|              | <ipv6-addr> Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                               |
|              | <peer-group> Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <listname>   | Specify the name of an AS (Autonomous System) path list.                                                                                                                                                                                                                                                                                |
| in           | Indicates that incoming advertised routes will be filtered.                                                                                                                                                                                                                                                                             |
| out          | Indicates that outgoing advertised routes will be filtered.                                                                                                                                                                                                                                                                             |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** This command specifies a filter for updates based on a BGP AS (Autonomous System) path list.

### Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.34 filter-list list1
out

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.34 filter-list list1
out

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.0.34 filter-list list1
out

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.0.34 filter-list
list1 out

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 10
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1 filter-list list1 out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 filter-list list1 out
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
filter-list list1 out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
filter-list list1 out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 filter-list list1 out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 filter-list list1
out
```

[neighbor route-map](#)

**Command**  
**changes**

Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor interface

**Overview** Use this command to configure the interface name of a BGP4+ speaking neighbor. Use the **no** variant of this command to disable this function.

**Syntax [BGP4+]** neighbor {<ipv6-addr>|<ipaddress>} interface <interface>  
no neighbor {<ipv6-addr>|<ipaddress>} interface <interface>

| Parameter   | Description                                                                                                |
|-------------|------------------------------------------------------------------------------------------------------------|
| <ipaddress> | Specifies the IPv4 address of the BGP neighbor - entered in dotted decimal notation in the format A.B.C.D. |
| <ipv6-addr> | Specifies the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.           |
| <interface> | Specifies the name of the interface to reach the BGP neighbor over.                                        |

**Mode [BGP4+]** Router Configuration

**Usage [BGP4+]** This command is for use with BGP4+ peering. Use this command for BGP peering with IPv6 link local addresses.

**Examples [BGP4+]** To specify a neighbor of 10.10.0.72 over the interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 interface vlan2
```

To remove the neighbor of 10.10.0.72 over the interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 interface vlan2
```

To specify a neighbor of 2001:0db8:010d::1 over the interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 interface
vlan2
```

To remove the neighbor of 2001:0db8:010d::1 over the interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 interface
vlan2
```

**Command  
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

# neighbor local-as

**Overview** Use this command to configure a local AS number for the specified BGP or BGP4+ neighbor. This overrides the local AS number specified by the [router bgp](#) command.

Use the **no** variant of this command to remove the local AS number for the specified BGP or BGP4+ neighbor.

**Syntax** `neighbor <neighborid> local-as <as-number>`  
`no neighbor <neighborid> local-as <as-number>`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                     |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | { <ip-address>   <ipv6-addr>   <peer-group> }                                                                                                                                                                                                                                                                                   |
|              | <ip-address> The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
|              | <ipv6-addr> The address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                               |
|              | <peer-group> Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> and <a href="#">neighbor route-map</a> commands. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <as-number>  | <1-4294967295> Neighbor's Autonomous System (AS) number.                                                                                                                                                                                                                                                                        |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

When VRF-lite is configured, this command allows internal BGP loopback connections between named VRFs and the default global routing instance to be configured to act as eBGP connections, instead of only iBGP.

**Usage [BGP4+]** When BGP4+ is configured, this command prepends the ASN as defined by the [router bgp](#) command, and adds the ASN as defined by the [neighbor local-as](#) command in front of the actual ASN as defined by the [router bgp](#) command. This makes the peer believe it is peering with the ASN as defined by the [neighbor local-as](#) command.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.34 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.34 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 10
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 local-as 1
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 local-as 1
```

# neighbor maximum-prefix

**Overview** Use this command to control the number of prefixes that can be received from a BGP or a BGP4+ neighbor.

Use the **no** variant of this command to disable this function. Do not specify threshold to apply the default threshold of 75% for the maximum number of prefixes before this is applied.

**Syntax** `neighbor <neighborid> maximum-prefix <maximum>`  
`no neighbor <neighborid> maximum-prefix [<maximum>]`

| Parameter                       | Description                                                                                                                                                                                                                                                                                                      |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;neighborid&gt;</code> | <code>{&lt;ip-address&gt;   &lt;ipv6-addr&gt;   &lt;peer-group&gt;}</code>                                                                                                                                                                                                                                       |
| <code>&lt;ip-address&gt;</code> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                 |
| <code>&lt;ipv6-addr&gt;</code>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                    |
| <code>&lt;peer-group&gt;</code> | Name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <code>&lt;maximum&gt;</code>    | <code>&lt;maxprefix&gt; [&lt;threshold&gt;] [warning-only]</code>                                                                                                                                                                                                                                                |
| <code>&lt;maxprefix&gt;</code>  | <code>&lt;1-4294967295&gt;</code><br>Specifies the maximum number of prefixes permitted.                                                                                                                                                                                                                         |
| <code>&lt;threshold&gt;</code>  | <code>&lt;1-100&gt;</code> Specifies the threshold value, 1 to 100 percent. 75% by default.                                                                                                                                                                                                                      |
| <code>warning-only</code>       | Only gives a warning message when the limit is exceeded.                                                                                                                                                                                                                                                         |

**Default** The default threshold value is 75%. If the threshold value is not specified this default is applied.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** The **neighbor maximum-prefix** command allows the configuration of a specified number of prefixes that a BGP or a BGP4+ router is allowed to receive from a neighbor. When the `warning-only` option is not used, if any extra prefixes are received, the router ends the peering. A terminated peer, stays down until the **clear ip bgp** command is used.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 maximum-prefix 1244
warning-only

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 maximum-prefix
1244 warning-only

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 maximum-prefix 1244
warning-only

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 maximum-prefix 1244
warning-only
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
maximum-prefix 1244 warning-only
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6

# neighbor next-hop-self

**Overview** Use this command to configure the BGP or BGP4+ router as the next hop for a BGP or BGP4+ speaking neighbor or peer group.

Use the **no** variant of this command to disable this feature.

**Syntax** `neighbor <neighborid> next-hop-self`  
`no neighbor <neighborid> next-hop-self`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | { <ip-address>   <ipv6-addr>   <peer-group> }                                                                                                                                                                                                                                                                              |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage notes** This command allows a BGP or BGP4+ router to change the next hop information that is sent to the iBGP peer. The next hop information is set to the IP address of the interface used to communicate with the neighbor.

This command can be run for a specific VRF instance.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# no neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 next-hop-self
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 next-hop-self
```

# neighbor passive

**Overview** Use this command to configure the local BGP or BGP4+ router to be passive with regard to the specified BGP or BGP4+ neighbor. This has the effect that the BGP or BGP4+ router will not attempt to initiate connections to this BGP or BGP4+ neighbor, but will accept incoming connection attempts from the BGP or BGP4+ neighbor.

Use the **no** variant of this command to disable this function.

**Syntax** `neighbor <neighborid> passive`  
`no neighbor <neighborid> passive`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor password

**Overview** Use this command to enable MD5 authentication on a TCP connection between BGP and BGP4+ neighbors. No authentication is applied by default. To setup authentication for the session, you must first apply authentication on each connected peer for the session.

Use the **no** variant of this command to disable this function.

**Syntax [BGP]** `neighbor {<ip-address>|<peer-group-name>} password <password>`  
`no neighbor {<ip-address>|<peer-group-name>} password`  
`[<password>]`

**Syntax [BGP4+]** `neighbor {<ipv6-addr>|<peer-group-name>} password <password>`  
`no neighbor {<ipv6-addr>|<peer-group-name>} password`  
`[<password>]`

| Parameter         | Description                                                                                                                             |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address>      | Specifies the IP address of the BGP neighbor, in A.B.C.D format.                                                                        |
| <ipv6-addr>       | Specifies the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                        |
| <peer-group-name> | Name of an existing peer-group. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <password>        | An alphanumeric string of characters to be used as password.                                                                            |

**Default** No authentication is applied by default.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage notes** When using the <peer-group-name> parameter with this command (to apply this command to all peers in the group), see the related commands [neighbor peer-group \(add a neighbor\)](#) and [neighbor route-map](#) for information about how to create peer groups first.

**Examples [BGP]** This example specifies the encryption type and the password 'manager' for the neighbor 10.10.10.1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 password manager
```

This example removes the password set for the neighbor 10.10.10.1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 password
```

This example specifies the encryption type and the password 'manager' for the neighbor peer group named 'group1':

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 password manager
```

This example removes the password set for the neighbor peer group named group1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 password
```

#### **Examples (VRF-lite)**

This example specifies the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# neighbor 10.10.10.1 password manager
```

This example removes the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family, VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# no neighbor 10.10.10.1 password
manager
```

This example specifies the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family, VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# neighbor group1 password manager
```

**Examples [BGP4+]** This example specifies the encryption type and the password 'manager' for the neighbor 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor password manager
2001:0db8:010d::1
```

This example removes the password set for the neighbor 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor password 2001:0db8:010d::1
```

This example specifies the encryption type and the password 'manager' for the neighbor peer group named group1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor remote-as 102001:0db8:010d::1
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor peer-group group1
2001:0db8:010d::1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 password manager
```

This example removes the password set for the neighbor peer group named 'group1':

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 password
```

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor peer-group (add a neighbor)

**Overview** Use this command to add a BGP or a BGP4+ neighbor to an existing peer-group.  
Use the **no** variant of this command to disable this function.

**Syntax [BGP]** `neighbor <ip-address> peer-group <peer-group>`  
`no neighbor <ip-address> peer-group <peer-group>`

**Syntax [BGP4+]** `neighbor <ipv6-addr> peer-group <peer-group>`  
`no neighbor <ipv6-addr> peer-group <peer-group>`

| Parameter    | Description                                                                                                                               |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address> | Specify the IPv4 address of the BGP neighbor, entered in the format A.B.C.D.                                                              |
| <ipv6-addr>  | Specify the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                            |
| <peer-group> | Enter the name of the peer-group. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** Use this command to add neighbors with the same update policies to a peer group. This facilitates the updates of various policies, such as, distribute and filter lists. The peer-group is then configured easily with many of the neighbor commands. Any changes made to the peer group affect all members.

To create a peer-group use the [neighbor port](#) command and then use this command to add neighbors to the group.

**Examples [BGP]** This example shows a new peer-group `group1` and the addition of a neighbor `10.10.0.63` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.63 peer-group group1
```

This example shows a new peer-group `group1` and the removal of a neighbor `10.10.0.63` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# no neighbor 10.10.0.63 peer-group group1
```

**Examples [BGP4+]** This example shows a new peer-group `group1` and the addition of a neighbor `2001:0db8:010d::1` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor peer-group
group1 2001:0db8:010d::1
```

This example shows a new peer-group `group1` and the removal of a neighbor `2001:0db8:010d::1` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor peer-group
group1 2001:0db8:010d::1
```

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor port

**Overview** Use this command to specify the TCP port to which packets are sent to on a BGP or a BGP4+ neighbor. TCP port 179 is the default port used to connect BGP and BGP4+ peers. You can specify a different destination port for the TCP session with this command.

Use the **no** variant of this command to reset the port number back to the default value (TCP port 179).

**Syntax [BGP]** `neighbor <neighborid> port <portnum>`  
`no neighbor <neighborid> port [<portnum>]`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | { <ip-address>   ipv6-addr>   <peer-group> }                                                                                                                                                                                                                                                                               |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <portnum>    | <0-65535> Specifies the TCP port number.                                                                                                                                                                                                                                                                                   |

**Default** TCP port 179 is the default port used to connect BGP and BGP4+ peers.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor 10.10.10.10 port 643
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor 10.10.10.10 port 643
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 port 643
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 port 643
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor port 643 2001:0db8:010d::1
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor port 643 2001:0db8:010d::1
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(awplus-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 port 643
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 port 643
```

# neighbor prefix-list

**Overview** Use this command to distribute BGP and BGP4+ neighbor information as specified in a prefix list.

Use the **no** variant of this command to remove an entry.

**Syntax** `neighbor <neighborid> prefix-list <listname> {in|out}`  
`no neighbor <neighborid> prefix-list <listname> {in|out}`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                             |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | <ip-address> <ipv6-addr> <peer-group>                                                                                                                                                                                                                                                                                                   |
|              | <ip-address> Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
|              | <ipv6-addr> Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                               |
|              | <peer-group> Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <listname>   | The name of an IP prefix list.                                                                                                                                                                                                                                                                                                          |
| in           | Specifies that the IP prefix list applies to incoming advertisements.                                                                                                                                                                                                                                                                   |
| out          | Specifies that the IP prefix list applies to outgoing advertisements.                                                                                                                                                                                                                                                                   |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage notes** Use this command to specify a prefix list for filtering BGP or BGP4+ advertisements. Filtering by prefix list matches the prefixes of routes with those listed in the prefix list. If there is a match, the route is used. An empty prefix list permits all prefixes. If a given prefix does not match any entries of a prefix list, the route is denied access.

The router begins the search at the top of the prefix list, with the sequence number 1. Once a match or deny occurs, the router does not need to go through the rest of the prefix list. For efficiency the most common matches or denies are listed at the top.

The **neighbor distribute-list** command is an alternative to the **neighbor prefix-list** command and only one of them can be used for filtering to the same neighbor in any direction.

### Examples [BGP]

```
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 prefix-list list1 in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 prefix-list list1
in
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 prefix-list list1
in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 prefix-list
list1 in
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 prefix-list list1 in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 prefix-list list1 in
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# ipv6 prefix-list list1 deny
2001:0db8:010d::1/128

awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:: prefix-list
list1 in

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:: prefix-list
list1 in

awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 2001:0db8:010d::1/128
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 prefix-list list1 in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 prefix-list list1
in
```

**Command**  
**changes**

Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor remote-as

**Overview** Use this command to configure an internal or external BGP or BGP4+ (iBGP or eBGP) peering relationship with another router.

Use the **no** variant of this command to remove a previously configured BGP or BGP4+ peering relationship.

**Syntax** `neighbor <neighborid> remote-as <as-number>`  
`no neighbor <neighborid> remote-as <as-number>`

**Syntax (VRF- lite)** `neighbor <neighborid> remote-as <as-number> [global|vrf <vrf-name>]`  
`no neighbor <neighborid> remote-as <as-number>`

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;neighborid&gt;</code> | <code>{ &lt;ip-address&gt;   ipv6-addr   &lt;peer-group&gt; }</code>                                                                                                                                                                                                                                                       |
| <code>&lt;ip-address&gt;</code> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <code>&lt;ipv6-addr&gt;</code>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <code>&lt;peer-group&gt;</code> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <code>&lt;as-number&gt;</code>  | <code>&lt;1-4294967295&gt;</code> Neighbor's Autonomous System (AS) number.                                                                                                                                                                                                                                                |
| <code>global</code>             | Specify that the remote neighbor exists locally within the device, in the global routing domain                                                                                                                                                                                                                            |
| <code>vrf</code>                | Specify that the remote neighbor exists locally within the device, in the specified VRF instance.                                                                                                                                                                                                                          |
| <code>&lt;vrf-name&gt;</code>   | The name of the VRF instance.                                                                                                                                                                                                                                                                                              |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage notes** This command is used to configure iBGP and eBGP peering relationships with other BGP or BGP4+ neighbors. A peer-group support of this command is configured only after creating a specific peer-group. Use the **no** variant of this command to remove a previously configured BGP peering relationship.

The **vrf** and **global** parameters are used to create internal 'loopback' BGP connections within the device between two VRF instances. This is used to leak BGP routes between a named VRF instance and the global routing instance. This requires BGP neighbors to be configured in both the global routing instance and in the named VRF instance.

**Examples [BGP]** To configure a BGP peering relationship from the neighbor with the IPv4 address 10.10.0.73 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.73 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the IPv4 address 10.10.0.73 from another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.73 remote-as 10
```

To configure a BGP peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

**Examples [BGP4+]** To configure a BGP4+ peering relationship with another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 345
```

To remove a configured BGP4+ peering relationship from another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# no neighbor 2001:0db8:010d::1 remote-as 345
```

To configure a BGP4+ peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP4+ peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

**Command  
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor remove-private-AS (BGP only)

**Overview** Use this command to remove the private Autonomous System (AS) number from external outbound updates. Use the **no** variant of this command to revert to the default (disabled).

**Syntax** `neighbor <neighborid> remove-private-AS`  
`no neighbor <neighborid> remove-private-AS`

| Parameter    | Description                                                                                                                                                                                                                                                                                                   |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | { <ip-address>   <tag> }                                                                                                                                                                                                                                                                                      |
| <ip-address> | The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                      |
| <tag>        | Name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor remote-as</a> command. When this parameter is used with a command, the command applies on all peers in the specified group. |

**Default** This command is disabled by default.

**Mode** Router Configuration or IPv4 Address Family Configuration

**Usage notes** The private AS numbers range from <64512-65535>. Private AS numbers are not advertised to the Internet. This command is used with external BGP peers only. The router removes the AS numbers only if the update includes private AS numbers. If the update includes both private and public AS numbers, the system treats it as an error.

This command removes private AS numbers for BGP in Router Configuration mode. This command is not supported for BGP4+ in IPv6 Address Family Configuration mode. This command removes a private AS number and makes an update packet with a public AS number as the AS path attribute. So only public AS numbers are entered in Internet BGP routing tables, and private AS numbers are not entered in Internet BGP tables.

For the filtering to apply, both peering devices must be set to use either 2-byte or extended 4- byte ASN (with the same ASN type set on both peers). For example, if a device (which defaults to use a 4-byte ASN), is peered with a device that defaults to a 2-byte ASN, then the device using a 2-byte ASN device also needs to be configured with the command **bgp extended-asn-cap** for the filtering to apply.

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.63 remove-private-AS
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.63 remove-private-AS
```

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor restart-time

**Overview** Use this command to set a different restart-time other than the global restart-time configured using the **bgp graceful-restart** command for BGP and BGP4+.

Use the **no** variant of this command to restore the device to its default state (see the default value of the **bgp graceful-restart** command).

**Syntax** `neighbor <neighborid> restart-time <delay-value>`  
`no neighbor <neighborid> restart-time <delay-value>`

| Parameter     | Description                                                                                                                                                                                                                                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid>  | { <ip-address>   <ipv6-addr>   <peer-group> }                                                                                                                                                                                                                                                                              |
| <ip-address>  | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <ipv6-addr>   | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <peer-group>  | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <delay-value> | <1-3600> Delay value in seconds.                                                                                                                                                                                                                                                                                           |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** This command takes precedence over the restart-time value specified using the **bgp graceful-restart** command.

The restart-time value is the maximum time that a graceful-restart neighbor waits to come back up after a restart. The default is 120 seconds.

Make sure that the restart time specified using this command does not exceed the stalepath-time specified in the Router Configuration mode.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 restart-time 45
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 restart-time 45
```

# neighbor route-map

**Overview** Use this command to apply a route map to incoming or outgoing routes for BGP or BGP4+.

Use the **no** variant of this command to remove a route map from a BGP or BGP4+ route.

**Syntax** `neighbor <neighborid> route-map <mapname> {in|out}`  
`no neighbor <neighborid> route-map <mapname> {in|out}`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | {<ip-address>   ipv6-addr>   <peer-group>}                                                                                                                                                                                                                                                                                 |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <mapname>    | Specifies name of the route-map.                                                                                                                                                                                                                                                                                           |
| in           | Specifies that the access list applies to incoming advertisements.                                                                                                                                                                                                                                                         |
| out          | Specifies that the access list applies to outgoing advertisements.                                                                                                                                                                                                                                                         |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage notes** Use the **neighbor route-map** command to filter updates and modify attributes. A route map is applied to inbound or outbound updates. Only the routes that pass the route map are sent or accepted in updates.

**Examples [BGP]** The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 route-map rmap2 in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 route-map rmap2 in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the IPv4 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 route-map rmap2 in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the IPv4 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 route-map rmap2 in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the peer group named group1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 route-map rmap2 in
```

The following example shows the removal the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the peer group named group1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 route-map rmap2 in
```

#### Examples [BGP4+]

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv6 address 2001:0db8:010d::1 in the IPv6 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 route-map rmap2 in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv6 address 2001:0db8:010d::1 in the IPv6 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1 route-map rmap2 in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the peer group named group1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 route-map rmap2 in
```

The following example shows the removal the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the peer group named group1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 route-map rmap2 in
```

**Command  
changes**

Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor route-reflector-client (BGP only)

**Overview** Use this command to configure the router as a BGP route reflector and configure the specified neighbor as its client.

Use the **no** variant of this command to indicate that the neighbor is not a client.

**Syntax** `neighbor <neighborid> route-reflector-client`  
`no neighbor <neighborid> route-reflector-client`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | {<ip-address>   <peer-group>}                                                                                                                                                                                                                                                                                              |
| <ip-address> | The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                                   |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode** Router Configuration or IPv4 Address Family Configuration

**Usage notes** Route reflectors are a solution for the explosion of iBGP peering within an autonomous system. By route reflection the number of iBGP peers within an AS is reduced. Use the **neighbor route-reflector-client** command to configure the local router as the route reflector and specify neighbors as its client.

An AS can have more than one route reflector. One route reflector treats the other route reflector as another iBGP speaker.

In the following configuration, Router1 is the route reflector for clients 3.3.3.3 and 2.2.2.2; it also has a non-client peer 6.6.6.6:

```
Router1#
router bgp 200
neighbor 3.3.3.3 remote-as 200
neighbor 3.3.3.3 route-reflector-client
neighbor 2.2.2.2 remote-as 200
neighbor 2.2.2.2 route-reflector-client
neighbor 6.6.6.6 remote-as 200
```

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72
route-reflector-client

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72
route-reflector-client
```

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor route-server-client (BGP only)

**Overview** Use this command to specify the peer as route server client.  
Use the **no** variant of this command to disable this function.

**Syntax** `neighbor <neighborid> route-server-client`  
`no neighbor <neighborid> route-server-client`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | {<ip-address> <peer-group>}                                                                                                                                                                                                                                                                                                |
| <ip-address> | The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                                   |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode** Router Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 route-server-client
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72
route-server-client
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor send-community

**Overview** Use this command to specify that a community attribute should be sent to a BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove the entry for the community attribute.

**Syntax** `neighbor <neighborid> send-community {both|extended|standard}`  
`no neighbor <neighborid> send-community`  
`{both|extended|standard}`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | { <ip-address>   <ipv6-addr>   <peer-group> }                                                                                                                                                                                                                                                                                                                                 |
|              | <div><div>&lt;ip-address&gt;</div><div>Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.</div></div>                                                                                                                                                                                                                                           |

When this parameter is used with this command, the command applies on all peers in the specified group.</div></div> |
| both         | Sends Standard and Extended Community attributes. Specifying this parameter with the <b>no</b> variant of this command results in no standard or extended community attributes being sent.                                                                                                                                                                                    |
| extended     | Sends Extended Community attributes. Specifying this parameter with the <b>no</b> variant of this command results in no extended community attributes being sent.                                                                                                                                                                                                             |
| standard     | Sends Standard Community attributes. Specifying this parameter with the <b>no</b> variant of this command results in no standard community attributes being sent.                                                                                                                                                                                                             |

**Default** Both **standard** and **extended** community attributes are sent to a neighbor.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration and IPv6 Address Family Configuration

**Usage notes** This command is used to specify a community attribute to be sent to a neighbor. The community attribute groups destinations in a certain community and applies routing decisions according to those communities. On receiving community attributes the router reannounces them to the neighbor. Only when the **no**

parameter is used with this command the community attributes are not reannounced to the neighbor.

By default, both **standard** and **extended** community attributes are sent to a neighbor.

### Examples [BGP]

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.0.72 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.0.72 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 send-community extended
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 send-community
extended
```

# neighbor shutdown

**Overview** Use this command to disable a peering relationship with a BGP or BGP4+ neighbor. Use the **no** variant of this command to re-enable the BGP or BGP4+ neighbor.

**Syntax** neighbor <neighborid> shutdown  
no neighbor <neighborid> shutdown

| Parameter    | Description                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | { <ip-address>   <peer-group> }                                                                                                                                                                                                                                                                                            |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage notes** This command shuts down any active session for the specified BGP or BGP4+ neighbor and clears all related routing data.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 shutdown
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 shutdown
```

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor soft-reconfiguration inbound

**Overview** Use this command to configure the device to start storing all updates from the BGP or BGP4+ neighbor, without any consideration of any inward route filtering policy that might be applied to the connection with this BGP or BGP4+ neighbor. This is so that the full set of the neighbor's updates are available locally to be used in a soft-reconfiguration event.

You may need to apply this older method of clearing routes if the peer does not support route refresh.

Use the **no** variant of this command to disable this function for a BGP or BGP4+ neighbor.

**Syntax** `neighbor <neighborid> soft-reconfiguration inbound`  
`no neighbor <neighborid> soft-reconfiguration inbound`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | { <ip-address>   <ipv6-addr>   <peer-group> }                                                                                                                                                                                                                                                                              |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** Use this command to store updates for inbound soft reconfiguration. Soft-reconfiguration may be used in lieu of BGP route refresh capability. Using this command enables local storage of all the received routes and their attributes. This requires additional memory. When a soft reset (inbound) is done on this neighbor, the locally stored routes are re-processed according to the inbound policy. The BGP neighbor connection is not affected.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor 10.10.10.10
soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor 10.10.10.10
soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.10 soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.10 soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 soft-reconfiguration
inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 soft-reconfiguration
inbound
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 soft-reconfiguration
inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router-
af)# no neighbor group1 soft-reconfiguration inbound
```

| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |              |                                                                                  |             |                                                                                               |              |                                                                                                                                                                                                                                                                                                                            |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group.                                                                                                                                                                                                                                                                                                                                   |              |                                                                                  |             |                                                                                               |              |                                                                                                                                                                                                                                                                                                                            |
| <keepalive>  | <0-65535> Frequency (in seconds) at which a router sends keepalive messages to its neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |              |                                                                                  |             |                                                                                               |              |                                                                                                                                                                                                                                                                                                                            |
| <holdtime>   | <0-65535> Interval (in seconds) after which, on not receiving a keepalive message, the router declares a neighbor dead.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |              |                                                                                  |             |                                                                                               |              |                                                                                                                                                                                                                                                                                                                            |
| <connect>    | <code>connect &lt;1-65535&gt;</code> Specifies the connect timer in seconds. The default connect timer value is 120 seconds as per RFC 4271. Modify this value as needed for interoperability.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |              |                                                                                  |             |                                                                                               |              |                                                                                                                                                                                                                                                                                                                            |

**Default** The keepalive timer default is 60 seconds, the holdtime timer default is 90 seconds, and the connect timer default is 120 seconds as per RFC 4271. Holdtime is keepalive \* 3.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** Keepalive messages are sent by a router to inform another router that the BGP connection between the two is still active. The keepalive interval is the period of time between each keepalive message sent by the router. The holdtime interval is the time the router waits to receive a keepalive message and if it does not receive

a message for this period it declares the neighbor dead. The holdtime value must be 3 times the value of the keepalive value.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 timers 60 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 timers
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 timers 60 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 timers
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 timers 60 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 timers
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 timers 60 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 timers
```

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor transparent-as

**Overview** Use this command to specify not to append your AS path number even if the BGP or BGP4+ peer is an eBGP peer.

Note this command has the same effect as invoking [neighbor attribute-unchanged](#) and specifying the optional **as-path** parameter.

**Syntax** neighbor <neighborid> transparent-as

| Parameter    | Description                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | { <ip-address>   <ipv6-addr>   <peer-group> }                                                                                                                                                                                                                                                                              |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 transparent-as
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 transparent-as
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
transparent-as
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 transparent-as
```

# neighbor unsuppress-map

**Overview** Use this command to selectively leak more specific routes to a particular BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove selectively leaked specific routes to a particular BGP or BGP4+ neighbor.

**Syntax** `neighbor <neighborid> unsuppress-map <route-map-name>`  
`no neighbor <neighborid> unsuppress-map <route-map-name>`

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;neighborid&gt;</code>     | { <code>&lt;ip-address&gt;</code>   <code>&lt;ipv6-addr&gt;</code>   <code>&lt;peer-group&gt;</code> }                                                                                                                                                                                                                     |
| <code>&lt;ip-address&gt;</code>     | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <code>&lt;ipv6-addr&gt;</code>      | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <code>&lt;peer-group&gt;</code>     | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <code>&lt;route-map-name&gt;</code> | The name of the route-map used to select routes to be unsuppressed.                                                                                                                                                                                                                                                        |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** When the [aggregate-address](#) command is used with the **summary-only** option, the more-specific routes of the aggregate are suppressed to all neighbors. Use this command instead to selectively leak more-specific routes to a particular neighbor.

**Examples [BGP]** To allow the device to advertise specific routes in the routemap 'mymap', which would have otherwise been aggregated to neighbor 10.10.0.73, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.73 unsuppress-map mymap
```

To stop the device from advertising specific routes in the routemap, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.73 unsuppress-map mymap
```

To allow the device to advertise specific IPv4 routes in the routemap 'mymap', which would have otherwise been aggregated to neighbor 10.10.0.73, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# neighbor 10.10.0.70 unsuppress-map mymap
```

To stop the device from advertising specific IPv4 routes in the routemap, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# no neighbor 10.10.0.70 unsuppress-map mymap
```

To allow the device to advertise specific routes in the routemap 'mymap', which would have otherwise been aggregated to peer group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 unsuppress-map mymap
```

To stop the device from advertising specific routes in the routemap to peer group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 unsuppress-map mymap
```

**Examples**  
**[BGP4+]** To allow the device to advertise specific IPv6 routes in the routemap 'mymap', which would have otherwise been aggregated to neighbor 2001:0db8:010d::1, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# neighbor 2001:0db8:010d::1
unsuppress-map mymap
```

To stop the device from advertising specific IPv6 routes in the routemap, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
unsuppress-map mymap
```

To allow the device to advertise specific IPv6 routes in the routemap 'mymap', which would have otherwise been aggregated to peer group 'group1', use the commands

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 unsuppress-map mymap
```

To stop the device from advertising specific IPv6 routes in the routemap to peer group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 unsuppress-map
mymap
```

- Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor update-source

**Overview** Use this command to specify the source IPv4 or IPv6 address of BGP or BGP4+ packets, which are sent to the neighbor for routing updates, as the IPv4 or IPv6 address configured on the specified interface. The specified interface is usually the local loopback (lo) interface to allow internal BGP or BGP4+ connections to stay up regardless of which interface is used to reach a neighbor.

Use the **no** variant of this command to remove the IPv4 or IPv6 address from the interface as the source IPv4 or IPv6 address of BGP or BGP4+ packets sent to the neighbor, and restores the interface assignment to the closest interface, which is also called the best local address.

**Syntax** `neighbor <neighborid> update-source <interface>`  
`no neighbor <neighborid> update-source`

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;neighborid&gt;</code> | { <code>&lt;ip-address&gt;</code>   <code>&lt;ipv6-addr&gt;</code>   <code>&lt;peer-group&gt;</code> }                                                                                                                                                                                                                     |
| <code>&lt;ip-address&gt;</code> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <code>&lt;ipv6-addr&gt;</code>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <code>&lt;peer-group&gt;</code> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <code>&lt;interface&gt;</code>  | Specifies the local loopback interface (lo).                                                                                                                                                                                                                                                                               |

**Default** Use of this command sets a default value of 2 for the maximum hop count.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** Use this command in conjunction with any specified interface on the router. The local loopback interface is the interface that is most commonly used with this command. The use of local loopback interface eliminates a dependency and BGP or BGP4+ does not have to rely on the availability of a particular interface for making BGP or BGP4+ peer relationships.

**Examples [BGP]** To source BGP connections for neighbor 10.10.0.72 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.0.73/24
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# network 10.10.0.0
awplus(config-router)# neighbor 10.10.0.72 remote-as 110
awplus(config-router)# neighbor 10.10.0.72 update-source lo
```

To remove BGP connections for neighbor 10.10.0.72 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 10.10.0.72 update-source
```

To source BGP connections for neighbor group1 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.0.73/24
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# network 10.10.0.0
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.72 remote-as 100
awplus(config-router)# neighbor 10.10.0.72 peer-group group1
awplus(config-router)# neighbor group1 update-source lo
```

To remove BGP connections for neighbor group1 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 update-source lo
```

**Examples** To source BGP connections for neighbor 2001:0db8:010d::1 with the IPv6 address  
**[BGP4+]** of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ipv6 address 2001:0db8:010d::1/128
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 110
awplus(config-router)# neighbor 2001:0db8:010d::1
update-source lo
```

To remove BGP connections for neighbor 2001:0db8:010d::1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 2001:0db8:010d::1
update-source
```

To source BGP connections for neighbor group1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ipv6 address 2001:0db8:010d::1/128
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 update-source lo
```

To remove BGP connections for neighbor group1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 update-source lo
```

**Related commands** [neighbor peer-group \(add a neighbor\)](#)  
[neighbor route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series

## Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor version (BGP only)

**Overview** Use this command to configure the device to accept only a particular BGP version.  
Use the **no** variant of this command to use the default BGP version (version 4).

**Syntax** `neighbor <neighborid> version <version>`  
`no neighbor <neighborid> version`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                             |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | { <ip-address>   <peer-group> }                                                                                                                                                                                                                                                                                                         |
|              | <ip-address> The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                                   |
|              | <peer-group> Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <version>    | {4} Specifies the BGP version number.                                                                                                                                                                                                                                                                                                   |

**Mode** Router Configuration or IPv4 Address Family Configuration

**Usage notes** By default, the system uses BGP version 4 and on request dynamically negotiates down to version 2. Using this command disables the router's version-negotiation capability and forces the router to use only a specified version with the neighbor.

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 version 4
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 version 4
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 version
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 version
```

**Related commands** [neighbor peer-group \(add a neighbor\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor weight

**Overview** Use this command to set default weights for routes from this BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove a weight assignment.

**Syntax** `neighbor <neighborid> weight <weight>`  
`no neighbor <neighborid> weight [<weight>]`

| Parameter     | Description                                                                                                                                                                                                                                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid>  | {<ip-address> <ipv6-addr> <peer-group>}                                                                                                                                                                                                                                                                                    |
| <ip-address>  | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <ipv6-addr>   | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <peer- group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <weight>      | <0-65535> Specifies the weight this command assigns to the route.                                                                                                                                                                                                                                                          |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage notes** Use this command to specify a weight value to all routes learned from a BGP or BGP4+ neighbor. The route with the highest weight gets preference when there are other routes on the network.

Unlike the local-preference attribute, the weight attribute is relevant only to the local router.

The weights assigned using the **set weight** command overrides the weights assigned using this command.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 weight
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 weight
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 weight
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1 weight
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 weight
```

**changes**

Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# network (BGP and BGP4+)

**Overview** Use this command to specify particular routes to be advertised into the BGP or BGP4+ routing process. A unicast network address without a mask is accepted if it falls into the natural boundary of its class. A class-boundary mask is derived if the address matches its natural class-boundary.

Note that you can specify a prefix length for the prefix being added, and you can also specify a classful network without a prefix length and an appropriate prefix length is added. Note that specifying a non-classful prefix without a prefix length results in a /32 prefix length on an IPv4 route.

Use the **no** variant of this command to remove a network route entry.

**Syntax [BGP]** `network {<ip-prefix/length>|<ip-network-addr>} [mask <network-mask>] [route-map <route-map-name>] [backdoor]`  
`no network {<ip-prefix/length>|<ip-network-addr>} [mask <network-mask>] [route-map <route-map-name>] [backdoor]`

**Syntax [BGP4+]** `network {<ipv6-prefix/length>|<ipv6-network-addr>} [route-map <route-map-name>]`  
`no network {<ipv6-prefix/length>|<ipv6-network-addr>} [route-map <route-map-name>]`

| Parameter            | Description                                                                                                                                                                                     |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-prefix/length>   | IP network prefix and prefix length entered in dotted decimal format for the IP network prefix, then slash notation for the prefix length in the format A.B.C.D/M, e.g. 192.168.1.224/27        |
| <ip-network-addr>    | IP network prefix entered in dotted decimal format A.B.C.D, e.g. 192.168.1.224                                                                                                                  |
| <network-mask>       | Specify a network mask in the format A.B.C.D, e.g. 255.255.255.224.                                                                                                                             |
| <ipv6-prefix/length> | IPv6 network prefix and prefix length entered in dotted decimal format for the IPv6 network prefix, then slash notation for the IPv6 prefix length in the format X:X::X:X/M, e.g. 2001:db8::/64 |
| <ipv6-network-addr>  | IP network prefix entered in dotted decimal format A.B.C.D, e.g. 192.168.1.224                                                                                                                  |
| <route-map-name>     | Specify the name of the route map.                                                                                                                                                              |
| backdoor             | Specify a BGP backdoor route that is not advertised.                                                                                                                                            |

**Mode [BGP]** Router Configuration and IPv4 Address Family [ipv4 unicast] mode

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage notes** It does not matter how the route is arranged in the IP or IPv6 routing table. The route can arrive in the IP routing table by a static route, or the route can be learned from OSPF or OSPFv3 or RIP or RIPng routing.

If you configure a route-map, then that route-map will be used in filtering the network, or the route-map will be used to modify the attributes that are advertised with the route.

**Example [BGP]** The following example illustrates a Class-A address configured as a network route. The natural Class-A network prefix mask length of 8 will be internally derived, that is, 2.0.0.0/8.

```
awplus(config)# router bgp 100
awplus(config-router)# network 2.0.0.0
```

**Output [BGP]** Figure 30-1: Example output from the **show running-config** command after entering **network 2.0.0.0**

```
awplus#show running-config

router bgp 100
network 2.0.0.0/8
```

**Example [BGP]** The following example illustrates a network address which does not fall into its natural class boundary, and hence, is perceived as a host route, that is, 192.0.2.224/27.

```
awplus(config)# router bgp 100
awplus(config-router)# network 192.0.2.224 mask 255.255.255.224
```

**Output [BGP]** Figure 30-2: Example output from the **show running-config** command after entering **network 192.0.2.224 mask 255.255.255.224**

```
awplus#show running-config

router bgp 100
network 192.0.2.224/27
```

**Example [BGP]** The following example is the same as the previous example for host route 192.0.2.224/27, but is entered in prefix/length format using slash notation (instead of prefix plus mask in dotted decimal format using the **mask** keyword before the network mask in dotted decimal format):

```
awplus(config)# router bgp 100
awplus(config-router)# network 192.0.2.224/27
```

**Example [BGP4+]** The following example is the same as the previous example for host route 2001:db8::/32:

```
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# network 2001:db8::/32
```

**Output [BGP4+]** Figure 30-3: Example output from the **show running-config** command after entering **network 2001:db8::/32**

```
awplus#show running-config

router bgp 100
 network 2001:db8::/32
```

**Command  
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# network synchronization

**Overview** Use this command to ensure the exact same static network prefix, specified through any of the **network** commands, is local or has IGP reachability before introduction to BGP or BGP4+.

Use the **no** variant of this command to disable this function.

**Syntax** `network synchronization`  
`no network synchronization`

**Default** Network synchronization is disabled by default.

**Mode [BGP]** Router Configuration and IPv4 Address Family [ipv4 unicast] Configuration

**Mode [BGP4+]** IPv6 Address Family [ipv6 unicast] Configuration

**Examples [BGP]** The following example enables IGP synchronization of BGP static network routes in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# network synchronization
```

The following example enables IGP synchronization of BGP static network routes in the IPv4-Unicast address family.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# network synchronization
```

**Example [BGP4+]** The following example enables IGP synchronization of BGP4+ static network routes in the IPv6-Unicast address family.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# network synchronization
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# redistribute (into BGP or BGP4+)

**Overview** Use this command to inject routes from one routing process into a BGP or BGP4+ routing table.

Use the **no** variant of this command to disable this function.

**Syntax** `redistribute {ospf|rip|connected|static} [route-map  
<route-map-entry-pointer>]`  
`no redistribute {ospf|rip|connected|static} [route-map  
<route-map-entry-pointer>]`

| Parameter                 | Description                                                                               |
|---------------------------|-------------------------------------------------------------------------------------------|
| connected                 | Specifies the redistribution of connected routes for both BGP and BGP4+.                  |
| ospf                      | Specifies the redistribution of OSPF information for BGP or OSPFv3 information for BGP4+. |
| rip                       | Specifies the redistribution of RIP information for BGP or RIPng information for BGP4+.   |
| static                    | Specifies the redistribution of Static routes for both BGP and BGP4+.                     |
| route-map                 | Route map reference for both BGP and BGP4+.                                               |
| <route-map-entry-pointer> | Pointer to route-map entries.                                                             |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration or IPv6 Address Family Configuration

**Usage notes** Redistribution is used by routing protocols to advertise routes that are learned by some other means, such as by another routing protocol or by static routes. Since all internal routes are dumped into BGP, careful filtering is applied to make sure that only routes to be advertised reach the internet, not everything. This command allows redistribution by injecting prefixes from one routing protocol into another routing protocol.

**Examples [BGP/ BGP+]** The following example shows the configuration of a route-map named `rmap1`, which is then applied using the **redistribute route-map** command.

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 1
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 12
awplus(config-router)# redistribute ospf route-map rmap1
```

To apply the above example to a specific VRF instance named `blue`, use the following commands:

```
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# redistribute ospf route-map rmap1
```

The following example shows the configuration of a route-map named `rmap2`, which is then applied using the **redistribute route-map** command.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 3
awplus(config-route-map)# match interface vlan1
awplus(config-route-map)# set metric-type 1
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# redistribute bgp route-map rmap2
```

Note that configuring a route-map and applying it with the **redistribute route-map** command allows you to filter which routes are distributed from another routing protocol (such as OSPF with BGP). A route-map can also set the metric, tag, and metric-type of the redistributed routes.

**Command  
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# restart bgp graceful (BGP only)

**Overview** Use this command to force the device to perform a graceful BGP restart.

**Syntax** `restart bgp graceful`

**Mode** Privileged Exec

**Usage** Before using this command, BGP graceful-restart capabilities must be enabled within the router BGP ([bgp graceful-restart](#) command), and each neighbor configured on the device should be set to advertise its graceful-restart capability ([bgp graceful-restart graceful-reset](#) command). The neighbor devices also need to have BGP graceful-restart capabilities enabled ([bgp graceful-restart](#) command).

This command stops the whole BGP process and makes the device retain the BGP routes and mark them as stale. Receiving BGP speakers, retain and mark as stale all BGP routes received from the restarting speaker for all the address families received in the Graceful Restart Capability exchange.

When a **restart bgp graceful** command is issued, the BGP configuration is reloaded from the last saved configuration. Ensure you first issue a **copy running-config startup-config**.

**Example** `awplus# restart bgp graceful`

**Related commands** [bgp graceful-restart](#)  
[bgp graceful-restart graceful-reset](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# router bgp

**Overview** Use this command to configure a BGP routing process, specifying the 32-bit Autonomous System (AS) number.

Use the **no** variant of this command to disable a BGP routing process, specifying the 32-bit AS number.

**Syntax** router bgp <asn>  
no router bgp <asn>

| Parameter | Description                                                        |
|-----------|--------------------------------------------------------------------|
| <asn>     | <1-4294967295> Specifies the 32-bit Autonomous System (AS) number. |

**Mode** Global Configuration

**Usage** The **router bgp** command enables a BGP routing process:

```
router bgp 1
 neighbor 10.0.0.1 remote-as 1
 neighbor 10.0.0.2 remote-as 1
 !
router bgp 2
 neighbor 10.0.0.3 remote-as 2
 neighbor 10.0.0.4 remote-as 2
```

**Examples** awplus# configure terminal  
awplus(config)# router bgp 12  
awplus(config-router)#  
awplus# configure terminal  
awplus(config)# no router bgp 12  
awplus(config)#

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# route-map

**Overview** Use this command to configure a route map entry, and to specify whether the device will process or discard matching routes and BGP update messages.

The device uses a name to identify the route map, and a sequence number to identify each entry in the route map.

The **route-map** command puts you into route-map configuration mode. In this mode, you can use the following:

- one or more of the **match** commands to create match clauses. These specify what routes or update messages match the entry.
- one or more of the **set** commands to create set clauses. These change the attributes of matching routes or update messages.

Use the **no** variant of this command to delete a route map or to delete an entry from a route map.

**Syntax** `route-map <mapname> {deny|permit} <seq>`  
`no route-map <mapname>`  
`no route-map <mapname> {deny|permit} <seq>`

| Parameter | Description                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------|
| <mapname> | A name to identify the route map.                                                                                         |
| deny      | The route map causes a routing process to discard matching routes or BGP update messages.                                 |
| permit    | The route map causes a routing process to use matching routes or BGP update messages.                                     |
| <seq>     | <1-65535> The sequence number of the entry. You can use this parameter to control the order of entries in this route map. |

**Mode** Global Configuration

**Usage notes** Route maps allow you to control and modify routing information by filtering routes and setting route attributes. You can apply route maps when the device:

- processes BGP update messages that it has received from a peer
- prepares BGP update messages to send to peers
- redistributes routes from one routing protocol into another
- redistributes static routes into routing protocols
- uses BGP route flap dampening

When a routing protocol passes a route or update message through a route map, it checks the entries in order of their sequence numbers, starting with the lowest numbered entry.

If it finds a match on a route map with an action of permit, then it applies any set clauses and accepts the route. Having found a match, the route is not compared against any further entries of the route map.

If it finds a match on a route map with an action of deny, it will discard the matching route.

If it does not find a match, it discards the route or update message. This means that route maps end with an implicit deny entry. To permit all non-matching routes or update messages, end your route map with an entry that has an action of **permit** and no match clause.

**Examples** To enter route-map mode for entry 1 of the route map called "route1", and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 1
awplus(config-route-map)# match as-path 60
awplus(config-route-map)# set weight 70
```

To enter route-map mode for entry 2 of the route map called "route1", and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 2
awplus(config-route-map)# match interface vlan2
awplus(config-route-map)# set metric 20
```

Note how the prompt changes when you go into route map configuration mode.

To make the device process non-matching routes instead of discarding them, add a command like the following one:

```
awplus(config)# route-map route1 permit 100
```

- [default-information originate](#)
- [redistribute \(OSPF\)](#)

For RIP:

`redistribute (RIP)`

# set as-path

- Overview** Use this command to add an AS path set clause to a route map entry.
- When a BGP update message matches the route map entry, the device prepends the specified Autonomous System Number (ASN) or ASNs to the update's AS path attribute.
- The AS path attribute is a list of the autonomous systems through which the announcement for the prefix has passed. As prefixes pass between autonomous systems, each autonomous system adds its ASN to the beginning of the list. This means that the AS path attribute can be used to make routing decisions.
- Use the **no** variant of this command to remove the set clause.

**Syntax** `set as-path prepend <1-65535> [<1-65535>]...`  
`no set as-path prepend [<1-65535> [<1-65535>]...]`

| Parameter                    | Description                                                                                    |
|------------------------------|------------------------------------------------------------------------------------------------|
| <code>prepend</code>         | Prepends the autonomous system path.                                                           |
| <code>&lt;1-65535&gt;</code> | The number to prepend to the AS path. If you specify multiple ASNs, separate them with spaces. |

**Mode** Route-map mode

**Usage notes** Use the **set as-path** command to specify an autonomous system path. By specifying the length of the AS-Path, the device influences the best path selection by a neighbor. Use the `prepend` parameter with this command to prepend an AS path string to routes increasing the AS path length.

This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `myroute` to prepend ASN 8 and 24 to the AS path of matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set as-path prepend 8 24
```

**Related commands** [match as-path](#)  
[route-map](#)  
[show route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# set community

**Overview** Use this command to add a community set clause to a route map entry.

When a BGP update message matches the route map entry, the device takes one of the following actions:

- changes the update's community attribute to the specified value or values, or
- adds the specified community value or values to the update's community attribute, if you specify the **additive** parameter after specifying another parameter. or
- removes the community attribute from the update, if you specify the **none** parameter

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set community {[<1-65535>][AA:NN] [internet] [local-AS]
[no-advertise] [no-export] [additive]}

no set community {[AA:NN] [internet] [local-AS] [no-advertise]
[no-export] [additive]}

set community none

no set community none
```

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                         |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-65535>    | The AS number of the community as an integer not in AA:NN format.                                                                                                                                                                                                                                                                                                   |
| AA:NN        | The Autonomous System (AS) number of the community, in AA:NN format. AS numbers are assigned to the regional registries by the IANA ( <a href="http://www.iana.org">www.iana.org</a> ) and can be obtained from the registry in your region.<br>AA and NN are both integers from 1 to 65535.<br>AA is the AS number; NN is a value chosen by the ASN administrator. |
| local-AS     | The community of routes that must not be advertised to external BGP peers (this includes peers in other members' Autonomous Systems inside a BGP confederation).                                                                                                                                                                                                    |
| internet     | The community of routes that can be advertised to all BGP peers.                                                                                                                                                                                                                                                                                                    |
| no-advertise | The community of routes that must not be advertised to other BGP peers.                                                                                                                                                                                                                                                                                             |
| no-export    | The community of routes that must not be advertised outside a BGP confederation boundary (a standalone Autonomous System that is not part of a confederation should be considered a confederation itself).                                                                                                                                                          |

| Parameter | Description                                                                                                                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| none      | The device removes the community attribute from matching update messages.                                                                                                                                                         |
| additive  | The device adds the specified community value to the update message's community attribute, instead of replacing the existing attribute. By default this parameter is not included, so the device replaces the existing attribute. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for BGP update messages only.

**Examples** To use entry 3 of the route map called `rmap1` to put matching routes into the no-advertise community, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community no-advertise
```

To use entry 3 of the route map called `rmap1` to put matching routes into several communities, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 10:01 23:34 12:14
no-export
```

To use entry 3 of the route map called `rmap1` to put matching routes into a single AS community numbered 16384, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 16384 no-export
```

## show bgp ipv6 (BGP4+ only)

**Overview** Use this command to display BGP4+ network information for a specified IPv6 address.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 <ipv6-addr>`

| Parameter                      | Description                                                                |
|--------------------------------|----------------------------------------------------------------------------|
| <code>&lt;ipv6-addr&gt;</code> | Specifies the IPv6 address, entered in hexadecimal in the format X:X::X:X. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 2001:0db8:010d::1`

**Related commands** [show bgp ipv6 longer-prefixes \(BGP4+ only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 community (BGP4+ only)

**Overview** Use this command to display routes that match specified communities within an IPv6 environment. Use the [show ip bgp community \(BGP only\)](#) command within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

You may use any combination and repetition of parameters listed in the *<type>* placeholder.

**Syntax** `show bgp ipv6 community [<type>] [exact-match]`

| Parameter           | Description                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------|
| <i>&lt;type&gt;</i> | {[ <i>AA:NN</i> ] [ <i>local-AS</i> ] [ <i>no-advertise</i> ] [ <i>no-export</i> ] }                        |
| <i>AA:NN</i>        | Specifies the Autonomous System (AS) community number, in AA:NN format.                                     |
| <i>local-AS</i>     | Do not send outside local Autonomous Systems (well-known community).                                        |
| <i>no-advertise</i> | Do not advertise to any peer (well-known community).                                                        |
| <i>no-export</i>    | Do not export to next AS (well-known community).                                                            |
| <i>exact-match</i>  | Specifies that the exact match of the communities is displayed. This optional parameter cannot be repeated. |

**Mode** User Exec and Privileged Exec

**Examples** Note that the AS numbers shown are examples only.

```
awplus# show bgp ipv6 community 64497:64499 exact-match
awplus# show bgp ipv6 community 64497:64499 64500:64501
exact-match
awplus# show bgp ipv6 community 64497:64499 64500:64501
64510:64511no-advertise
awplus# show bgp ipv6 community no-advertise
no-advertiseno-advertise exact-match
awplus# show bgp ipv6 community no-export 64510:64511
no-advertise local-AS no-export
awplus# show bgp ipv6 community no-export 64510:64511
no-advertise 64497:64499 64500:64501 no-export
awplus# show bgp ipv6 community no-export 64497:64499
no-advertise local-AS no-export
```

**Related commands** [show ip bgp community \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 community-list (BGP4+ only)

**Overview** Use this command to display routes that match the given community-list within an IPv6 environment. Use the [show ip bgp community-list \(BGP only\)](#) command within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 community-list <listname> [exact-match]`

| Parameter   | Description                                                            |
|-------------|------------------------------------------------------------------------|
| <listname>  | Specifies the community list name.                                     |
| exact-match | Displays only routes that have exactly the same specified communities. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 community-list mylist exact-match`

**Related commands** [show ip bgp community-list \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 dampening (BGP4+ only)

**Overview** Use this command to show dampened routes from a BGP4+ instance within an IPv6 environment. Use the [show ip bgp dampening \(BGP only\)](#) command to show dampened routes from a BGP instance within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 dampening  
{dampened-paths|flap-statistics|parameters}`

| Parameter       | Description                                         |
|-----------------|-----------------------------------------------------|
| dampened-paths  | Display paths suppressed due to dampening.          |
| flap-statistics | Display flap statistics of routes.                  |
| parameters      | Display details of configured dampening parameters. |

**Mode** User Exec and Privileged Exec

**Usage notes** Enable BGP4+ dampening to maintain dampened-path information in memory.

**Examples**

```
awplus# show bgp ipv6 dampening dampened-path
awplus# show bgp ipv6 dampening flap-statistics
awplus# show bgp ipv6 dampening parameter
```

**Related commands** [show ip bgp dampening \(BGP only\)](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 filter-list (BGP4+ only)

**Overview** Use this command to display routes conforming to the filter-list within an IPv6 environment. Use the [show ip bgp filter-list \(BGP only\)](#) command to display routes conforming to the filter-list within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 filter-list <listname>`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| <listname> | Specifies the regular-expression access list name. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 filter-list mylist`

**Related commands** [show ip bgp filter-list \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 inconsistent-as (BGP4+ only)

**Overview** Use this command to display routes with inconsistent AS Paths within an IPv6 environment. Use the [show ip bgp inconsistent-as \(BGP only\)](#) command to display routes with inconsistent AS paths within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 inconsistent-as`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 inconsistent-as`

**Related commands** [show ip bgp inconsistent-as \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 longer-prefixes (BGP4+ only)

**Overview** Use this command to display the route of the local BGP4+ routing table for a specific prefix with a specific mask or for any prefix having a longer mask than the one specified.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 <ipv6-addr/prefix-length> longer-prefixes`

| Parameter                                    | Description                                                                                                                                                |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-addr/prefix-length&gt;</code> | Specifies the IPv6 address with prefix length. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 2001:0db8::/64 longer-prefixes`

**Related commands** [show bgp ipv6 \(BGP4+ only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 neighbors (BGP4+ only)

**Overview** Use this command to display detailed information on peering connections to all BGP4+ neighbors within an IPv6 environment.

Use the [show ip bgp neighbors \(BGP only\)](#) command to display detailed information on peering connections to all BGP neighbors within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 neighbors [<ipv6-addr> [advertised-routes|received prefix-filter|received-routes|routes]]`

| Parameter              | Description                                                                                                                                       |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipv6-addr>            | Specifies the IPv6 address, entered in hexadecimal in the format X:X::X:X.                                                                        |
| advertised-routes      | Displays the routes advertised to a BGP4+ neighbor.                                                                                               |
| received prefix-filter | Displays received prefix-list filters.                                                                                                            |
| received-routes        | Displays the received routes from the neighbor. To display all the received routes from the neighbor, configure the BGP4+ soft reconfigure first. |
| routes                 | Displays all accepted routes learned from neighbors.                                                                                              |

**Mode** User Exec and Privileged Exec

**Examples** **[BGP4+]**

```
awplus# show bgp ipv6 neighbors 2001:0db8:010d::1
advertised-routes

awplus# show bgp ipv6 neighbors 2001:0db8:010d::1 received
prefix-filter

awplus# show bgp ipv6 neighbors 2001:0db8:010d::1
received-routes

awplus# show bgp ipv6 neighbors 2001:0db8:010d::1 routes
```

**Output** Figure 30-4: Example output from **show bgp ipv6 neighbors 2001:db8:b::1**

```
awplus#show bgp ipv6 neighbors 2001:db8:b::1
BGP neighbor is 2001:db8:b::1, remote AS 200, local AS 100, external link
 BGP version 4, remote router ID 2.2.2.1
 BGP state = Established, up for 01:03:26
 Last read 01:03:26, hold time is 90, keepalive interval is 30 seconds
 Neighbor capabilities:
 Route refresh: advertised and received (old and new)
 4-Octet ASN Capability: advertised and received
 Address family IPv4 Unicast: advertised and received
 Address family IPv6 Unicast: advertised and received
 Received 157 messages, 0 notifications, 0 in queue
 Sent 228 messages, 0 notifications, 0 in queue
 Route refresh request: received 0, sent 0
 Minimum time between advertisement runs is 30 seconds
 Update source is lo
For address family: IPv4 Unicast
 BGP table version 1, neighbor version 1
 Index 2, Offset 0, Mask 0x4
 Community attribute sent to this neighbor (both)
 0 accepted prefixes
 0 announced prefixes

For address family: IPv6 Unicast
 BGP table version 66, neighbor version 66
 Index 2, Offset 0, Mask 0x4
 AF-dependant capabilities:
 Graceful restart: advertised, received

 Community attribute sent to this neighbor (both)
 Default information originate, default sent
 Inbound path policy configured
 Incoming update prefix filter list is *BGP_FILTER_LIST
 Route map for incoming advertisements is *BGP_LOCAL_PREF_MAP
 8 accepted prefixes
 8 announced prefixes

Connections established 1; dropped 0
Graceful-restart Status:
 Remote restart-time is 90 sec

 External BGP neighbor may be up to 2 hops away.
Local host: 2001:db8:a::1, Local port: 179
Foreign host: 2001:db8:b::1, Foreign port: 50672
Nexthop: 1.1.1.1
Nexthop global: 2001:db8:a::1
Nexthop local: ::
BGP connection: non shared network
```

If available the following is shown:

- Session information
  - Neighbor address, ASN information and if the link is external or internal
  - BGP version and status
  - Neighbor capabilities for the BGP session
  - Number of messages transmitted and received
- IPv6 unicast address family information
  - BGP4+ table version
  - IPv6 Address Family dependent capabilities
  - IPv6 Communities
  - IPv6 Route filters for ingress and egress updates
  - Number of announced and accepted IPv6 prefixes
- Connection information
  - Connection counters
  - Graceful restart timer
  - Hop count to the peer
  - Next hop information
  - Local and external port numbers

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

## show bgp ipv6 paths (BGP4+ only)

**Overview** Use this command to display BGP4+ path information within an IPv6 environment. Use the [show ip bgp paths \(BGP only\)](#) command to display BGP path information within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 paths`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 paths`

**Related commands** [show ip bgp paths \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 prefix-list (BGP4+ only)

**Overview** Use this command to display routes matching the prefix-list within an IPv6 environment. Use the [show ip bgp prefix-list \(BGP only\)](#) command to display routes matching the prefix-list within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 prefix-list <list>`

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| <list>    | Specifies the name of the IPv6 prefix list. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 prefix-list mylist`

**Related commands** [show ip bgp prefix-list \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 quote-regexp (BGP4+ only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv6 environment. Use the [show ip bgp quote-regexp \(BGP only\)](#) command to display routes matching the AS path regular expression within an IPv4 environment.

Note that you must use quotes to enclose the regular expression with this command. Use the regular expressions listed below with the *<expression>* parameter:

| Symbol | Character     | Meaning                                                                                                                            |
|--------|---------------|------------------------------------------------------------------------------------------------------------------------------------|
| ^      | Caret         | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| \$     | Dollar sign   | Used to match the end of the input string.                                                                                         |
| .      | Period        | Used to match a single character (white spaces included).                                                                          |
| *      | Asterisk      | Used to match none or more sequences of a pattern.                                                                                 |
| +      | Plus sign     | Used to match one or more sequences of a pattern.                                                                                  |
| ?      | Question mark | Used to match none or one occurrence of a pattern.                                                                                 |
| _      | Underscore    | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.                                    |
| [ ]    | Brackets      | Specifies a range of single-characters.                                                                                            |
| -      | Hyphen        | Separates the end points of a range.                                                                                               |

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 quote-regexp <expression>`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 quote-regexp myexpression`

**Related commands** [show ip bgp quote-regexp \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

## show bgp ipv6 regexp (BGP4+ only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv6 environment. Use the [show ip bgp regexp \(BGP only\)](#) command to display routes matching the AS path regular expression within an IPv4 environment.

Use the regular expressions listed below with the *<expression>* parameter:

| Symbol | Character     | Meaning                                                                                                                            |
|--------|---------------|------------------------------------------------------------------------------------------------------------------------------------|
| ^      | Caret         | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| \$     | Dollar sign   | Used to match the end of the input string.                                                                                         |
| .      | Period        | Used to match a single character (white spaces included).                                                                          |
| *      | Asterisk      | Used to match none or more sequences of a pattern.                                                                                 |
| +      | Plus sign     | Used to match one or more sequences of a pattern.                                                                                  |
| ?      | Question mark | Used to match none or one occurrence of a pattern.                                                                                 |
| _      | Underscore    | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.                                    |
| [ ]    | Brackets      | Specifies a range of single-characters.                                                                                            |
| -      | Hyphen        | Separates the end points of a range.                                                                                               |

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 regexp <expression>`

| Parameter                 | Description                                                 |
|---------------------------|-------------------------------------------------------------|
| <i>&lt;expression&gt;</i> | Specifies a regular-expression to match the BGP4+ AS paths. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show bgp ipv6 regexp myexpression`

**Related commands** [show ip bgp regexp \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series

## Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 route-map (BGP4+ only)

**Overview** Use this command to display BGP4+ routes that match the specified route-map within an IPv6 environment. Use the [show ip bgp route-map \(BGP only\)](#) command to display BGP routes that match the specified route-map within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show bgp ipv6 route-map <route-map>`

| Parameter                      | Description                            |
|--------------------------------|----------------------------------------|
| <code>&lt;route-map&gt;</code> | Specifies a route-map that is matched. |

**Mode** User Exec and Privileged Exec

**Example** To show routes that match the route-map `myRouteMap`, use the command:

```
awplus# show bgp ipv6 route-map myRouteMap
```

**Related commands** [show ip bgp route-map \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 summary (BGP4+ only)

**Overview** Use this command to display a summary of a BGP4+ neighbor status within an IPv6 environment. Use the [show ip bgp summary \(BGP only\)](#) command to display a summary of a BGP neighbor status within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show bgp ipv6 summary

**Mode** User Exec and Privileged Exec

**Example** awplus# show bgp ipv6 summary

**Output** Figure 30-5: Example output from the **show ip bgp summary** command

```
awplus>show ip bgp summary

BGP router identifier 1.0.0.1, local AS number 65541
BGP table version is 12
4 BGP AS-PATH entries
0 BGP community entries

Neighbor V AS MsgRc MsgSnt TblVer InOutQ Up/Down State/PfxRcd
2001:0db8:cccc::1 4 65544 20 24 11 0/0 00:07:19 1
2001:0db8:dddd::1 4 65545 0 0 0 0/0 never Active
2001:0db8:eeee::1 4 65542 34 40 0 0/0 00:00:04 Active
2001:0db8:ffff::1 4 65543 29 32 11 0/0 00:07:03 13

Number of neighbors 4
```

The Up/Down column in this output is a timer that shows:

- "never" if the peer session has never been established
- The up time, if the peer session is currently up
- The down time, if the peer session is currently down.

In the example above, the session with 2001:0db8:eeee::1 has been down for 4 seconds, and the session with 2001:0db8:dddd::1 has never been established.

**Related commands** [show ip bgp summary \(BGP only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 vrf

**Overview** Use this command to display BGP4+ network information, either the global routing instance or a named VRF.

Use the **summary** parameter to show a summary of the BGP peers configured for the specific routing instance.

**Syntax** `show bgp ipv6 [vrf <vrf-name>|global] [inconsistent-as|summary]`

| Parameter       | Description                                        |
|-----------------|----------------------------------------------------|
| vrf             | Applies the command to the specified VRF instance. |
| <vrf-name>      | The VRF instance name.                             |
| global          | Global Routing/Forwarding table                    |
| inconsistent-as | Display routes with inconsistent AS Paths          |
| summary         | Summary of BGP neighbor status                     |

**Mode** Privileged Exec

**Example** To display all BGP routes for the VRF red, use the command:

```
awplus# show bgp ipv6 vrf red
```

To display the BGP routes with inconsistent-as from the global instance, use the command:

```
awplus# show bgp ipv6 global inconsistent-as
```

To display a summary of the BGP peers for VRF red, use the command:

```
awplus# show bgp ipv6 vrf red summary
```

**Output** Figure 30-6: Example output from **show bgp ipv6 vrf mid**

```
R2#show bgp ipv6 vrf mid
[VRF: mid]
BGP table version is 1, local router ID is 2.2.2.3

```

**Related commands** [show ip bgp cidr-only \(BGP only\)](#)

**Command changes** Version 5.5.3-1.1: command added

# show bgp ipv6 vrf community

**Overview** Use this command to show routes that match the specified communities from a BGP instance, either the global routing instance or a named VRF.

**Syntax** `show bgp ipv6 [vrf <vrf-name>|global] community [{[AA:NN]  
[local-AS] [no-advertise] [no-export]]} [exact-match]`

| Parameter    | Description                                                                                                 |
|--------------|-------------------------------------------------------------------------------------------------------------|
| vrf          | Applies the command to the specified VRF instance.                                                          |
| <vrf-name>   | The VRF instance name.                                                                                      |
| global       | Global routing/forwarding table                                                                             |
| AA:NN        | Specifies the Autonomous System (AS) community number, in AA:NN format.                                     |
| local-AS     | Do not send outside local Autonomous Systems (well-known community).                                        |
| no-advertise | Do not advertise to any peer (well-known community).                                                        |
| no-export    | Do not export to next AS (well-known community).                                                            |
| exact-match  | Specifies that the exact match of the communities is displayed. This optional parameter cannot be repeated. |

**Mode** Privileged Exec

**Example** To show routes that match the community 'no-export' for VRF red, use the command:

```
awplus# show bgp ipv6 vrf red community no-export
```

To show routes that exactly match the communities 65500:2 and 65500:3 for the global routing instance, use the command:

```
awplus# show bgp ipv6 global community 65500:2 65500:3
exact-match
```

**Output** Figure 30-8: Example output from **show bgp ipv6 vrf community**

```
awplus# show bgp ipv6 vrf red community no-export

[VRF: red]

# show bgp ipv6 vrf community-list

**Overview** Use this command to show routes that match the given community-list from a BGP instance in either the global routing instance or a named VRF.

**Syntax** `show bgp ipv6 [vrf <vrf-name>| global] community-list <listname> [exact-match]`

| Parameter   | Description                                                            |
|-------------|------------------------------------------------------------------------|
| vrf         | Applies the command to the specified VRF instance.                     |
| <vrf-name>  | The VRF instance name.                                                 |
| global      | Global routing/forwarding table                                        |
| <listname>  | The community list name                                                |
| exact-match | Displays only routes that have exactly the same specified communities. |

**Mode** Privileged Exec

**Example** To show routes that match the community-list 'myCommunity' for VRF red, use the command:

```
awplus# show bgp ipv6 vrf red community-list myCommunity
```

To show routes that exactly match the community-list 'myExactCommunity' for the global routing instance, use the command:

```
awplus# show bgp ipv6 global community-list myExactCommunity exact-match
```

**Output** Figure 30-9: Example output from **show bgp ipv6 vrf community-list**

```
awplus#show bgp ipv6 vrf red community-list myCommunity

# show bgp ipv6 vrf dampening

**Overview** Use this command to display detailed information about dampening on either the global routing instance or a named VRF.

**Syntax** `show bgp ipv6 [vrf <vrf-name>|global] dampening {dampened-paths|flap-statistics}`

| Parameter       | Description                                        |
|-----------------|----------------------------------------------------|
| vrf             | Applies the command to the specified VRF instance. |
| <vrf-name>      | The VRF instance name.                             |
| global          | Global routing/forwarding table.                   |
| dampened-paths  | Display paths suppressed due to dampening.         |
| flap-statistics | Display flap statistics of routes.                 |

**Mode** Privileged Exec

**Usage notes** Route dampening is a mechanism used in routing protocols, particularly in Border Gateway Protocol (BGP), to mitigate the impact of flapping routes. Route flapping occurs when a route, typically due to network instability, alternates rapidly between being reachable and unreachable. This can happen due to factors like link failures, route oscillations, or network instabilities.

Route dampening aims to reduce the disruptive effects of route flapping by penalizing unstable routes. When a route flaps, it is assigned a penalty, and if the penalty exceeds a certain threshold, the route is suppressed. This means that the router will stop advertising or considering the unstable route for a specified period, allowing the network to stabilize.

**Example** To show routes that are suppressed due to dampening for VRF red, use the command:

```
awplus# show bgp ipv6 vrf red dampening dampened-paths
```

To show routes that are suppressed due to dampening for VRF red, with the flap-statistics use the command:

```
awplus# show bgp ipv6 global dampening flap-statistics
```

**Output** Figure 30-10: Example output from **show bgp ipv6 vrf dampening dampened-paths**

```
awplus#show bgp ipv6 vrf red dampening dampened-paths

# show bgp ipv6 vrf filter-list

**Overview** Use this command to show routes that match the given prefix-list, filter-list, or route-map from a BGP instance in either the global routing instance or a named VRF.

**Syntax** `show bgp ipv6 [vrf <vrf-name>|global]  
[prefix-list|filter-list|route-map]<listname>`

| Parameter   | Description                                        |
|-------------|----------------------------------------------------|
| vrf         | Applies the command to the specified VRF instance. |
| <vrf-name>  | The VRF instance name.                             |
| global      | Global routing/forwarding table.                   |
| prefix-list | Display routes matching the prefix-list.           |
| filter-list | Display routes matching the filter-list.           |
| route-map   | Display routes matching the route-map.             |
| <listname>  | Specify the regular-expression access list name.   |

**Mode** Privileged Exec

**Example** To show routes that match the prefix-list 'myPrefixes' for VRF red, use the command:

```
awplus# show bgp ipv6 vrf red prefix-list myPrefixes
```

To show routes that match the route-map 'myRouteMap' for the global routing instance, use the command:

```
awplus# show bgp ipv6 global route-map myRouteMap
```

**Output** Figure 30-12: Example output from **show bgp ipv6 vrf filter-list**

```
awplus# show bgp ipv6 vrf red filter-list mylist

```

**Related commands** [show ip bgp neighbors \(BGP only\)](#)

**Command changes** Version 5.5.3-1.1: command added

# show bgp ipv6 vrf regexp

**Overview** Use this command to display routes matching the AS path regular expression in either the global routing instance or a named VRF.

**Syntax** `show bgp ipv6 [vrf <vrf-name> |global] {regexp <expression>|quote-regexp <quoted-expression>}`

| Parameter           | Description                                                         |
|---------------------|---------------------------------------------------------------------|
| vrf                 | Applies the command to the specified VRF instance.                  |
| <vrf-name>          | The VRF instance name.                                              |
| global              | Global routing/forwarding table                                     |
| regexp              | Displays routes matching the AS path regular expression.            |
| <expression>        | Specifies a regular-expression to match the BGP AS paths.           |
| quote-regexp        | Displays routes matching the AS path regular expression in quotes.  |
| <quoted-expression> | Specifies a regular-expression in quotes to match the BGP AS paths. |

**Mode** Privileged Exec

**Usage notes** In the BGP protocol, routers exchange routing information in the form of route announcements, which include various attributes about the routes. One such attribute is the AS Path, which is a sequence of autonomous system numbers that a route announcement has traversed to reach the advertising router. The AS Path provides information about the path that the route has taken through different ASes on its way to the current network.

**Example** To show routes that match the AS path in 'myexpression' for VRF red, use the command:

```
awplus# show bgp ipv6 vrf red regexp myexpression
```

To show routes that match the AS path in 'myexpression' for the global VRF, use the command:

```
awplus# show bgp ipv6 global quote-regexp 'myexpression'
```

**Output** Figure 30-16: Example output from **show bgp ipv6 vrf regexp**

```
awplus# show bgp ipv6 vrf red quote-regexp "^6500_"
[VRF: red]
BGP table version is 1, local router ID is 1.1.1.1

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp community (BGP only)

**Overview** Use this command to display routes that match specified communities from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 community \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

You may use any combination and repetition of parameters listed in the *<type>* placeholder.

**Syntax** `show ip bgp community [<type>] [exact-match]`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] community [<type>] [exact-match]`

| Parameter               | Description                                                                                                 |
|-------------------------|-------------------------------------------------------------------------------------------------------------|
| global                  | When VRF-lite is configured, apply the command to the global routing and forwarding table.                  |
| vrf                     | Apply the command to the specified VRF instance.                                                            |
| <i>&lt;vrf-name&gt;</i> | The name of the VRF instance.                                                                               |
| <i>&lt;type&gt;</i>     | {[ <i>AA:NN</i> ] [ <i>local-AS</i> ] [ <i>no-advertise</i> ] [ <i>no-export</i> ] }                        |
|                         | <i>AA:NN</i> Specifies the Autonomous System (AS) community number, in AA:NN format.                        |
|                         | <i>local-AS</i> Do not send outside local Autonomous Systems (well-known community).                        |
|                         | <i>no-advertise</i> Do not advertise to any peer (well-known community).                                    |
|                         | <i>no-export</i> Do not export to next AS (well-known community).                                           |
| exact-match             | Specifies that the exact match of the communities is displayed. This optional parameter cannot be repeated. |

**Mode** User Exec and Privileged Exec

**Examples** Note that the AS numbers shown are examples only.

```
awplus# show ip bgp community 64497:64499 exact-match
awplus# show ip bgp community 64497:64499 64500:64501
exact-match
awplus# show ip bgp community 64497:64499 64500:64501
64510:64511no-advertise
awplus# show ip bgp community no-advertise
no-advertiseno-advertise exact-match
awplus# show ip bgp community no-export 64510:64511
no-advertise local-AS no-export
awplus# show ip bgp community no-export 64510:64511
no-advertise 64497:64499 64500:64501 no-export
awplus# show ip bgp community no-export 64497:64499
no-advertise local-AS no-export
awplus# show ip bgp vrf red no-export
awplus# show ip bgp global 65500:2 65500:3 exact-match
```

# show ip bgp community-list (BGP only)

**Overview** Use this command to display routes that match the given community-list from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 community-list \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp community-list <listname> [exact-match]`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] community-list <listname> [exact-match]`

| Parameter   | Description                                                                                |
|-------------|--------------------------------------------------------------------------------------------|
| global      | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf         | Apply the command to the specified VRF instance.                                           |
| <vrf-name>  | The name of the VRF instance.                                                              |
| <listname>  | Specifies the community list name.                                                         |
| exact-match | Displays only routes that have exactly the same specified communities.                     |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip bgp community-list mylist exact-match
awplus# show ip bgp vrf red community-list myCommunity
awplus# show ip bgp global community-list myExactCommunity exact-match
```

**Related commands** [show bgp ipv6 community-list \(BGP4+ only\)](#)

# show ip bgp dampening (BGP only)

**Overview** Use this command to show dampened routes from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 dampening \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp dampening  
{dampened-paths|flap-statistics|parameters}`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] dampening  
{dampened-paths|flap-statistics|parameters}`

| Parameter       | Description                                                                                |
|-----------------|--------------------------------------------------------------------------------------------|
| global          | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf             | Apply the command to the specified VRF instance.                                           |
| <vrf-name>      | The name of the VRF instance.                                                              |
| dampened-paths  | Display paths suppressed due to dampening.                                                 |
| flap-statistics | Display flap statistics of routes.                                                         |
| parameters      | Display details of configured dampening parameters.                                        |

**Mode** User Exec and Privileged Exec

**Usage notes** Enable BGP dampening to maintain dampened-path information in memory.

**Examples** `awplus# show ip bgp dampening dampened-paths  
awplus# show ip bgp vrf red dampening dampened-paths  
awplus# show ip bgp global dampening flap-statistics`

**Output** Figure 30-22: Example output from the **show ip bgp dampening** command

|                                |          |
|--------------------------------|----------|
| dampening 15 750 2000 60 15    |          |
| Reachability Half-Life time    | : 15 min |
| Reuse penalty                  | : 750    |
| Suppress penalty               | : 2000   |
| Max suppress time              | : 60 min |
| Un-reachability Half-Life time | : 15 min |
| Max penalty (ceil)             | : 11999  |
| Min penalty (floor)            | : 375    |

The following example output shows that the internal route (i), has flapped 3 times and is now categorized as history (h).

Figure 30-23: Example output from the **show ip bgp dampening flap-statistics** command

```
awplus# show ip bgp dampening flap-statistics
BGP table version is 1, local router ID is 30.30.30.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, S
Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
 Network From Flaps Duration Reuse Path

hi1.1.1.0/24 10.100.0.62 3 00:01:20 i
```

The following example output shows a dampened route in the 1.1.1.0/24 network.

Figure 30-24: Example output from the **show ip bgp dampening dampened-path** command

```
awplus# show ip bgp dampening dampened-paths
BGP table version is 1, local router ID is 30.30.30.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, S
Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
 Network From Reuse Path

di 1.1.1.0/24 10.100.0.62 00:35:10 i

Total number of prefixes 1
```

**Related commands** [show bgp ipv6 dampening \(BGP4+ only\)](#)

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp longer-prefixes (BGP only)

**Overview** Use this command to display the route of the local BGP routing table for a specific prefix with a specific mask, or for any prefix having a longer mask than the one specified.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp <ip-address/m> longer-prefixes`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] <ip-address/m> longer-prefixes`

| Parameter      | Description                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------|
| global         | When VRF-lite is configured, apply the command to the global routing and forwarding table.               |
| vrf            | Apply the command to the specified VRF instance.                                                         |
| <vrf-name>     | The name of the VRF instance.                                                                            |
| <ip-address/m> | Neighbor's IP address and subnet mask, entered in the form A.B.C.D/M, where M is the subnet mask length. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip bgp 10.10.0.10/24 longer-prefixes
awplus# show ip bgp vrf red 172.16.4.0/24
awplus# show ip bgp global 172.16.0.0/16 longer-prefixes
```

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors (BGP only)

**Overview** Use this command to display detailed information on peering connections to all BGP neighbors within an IPv4 environment.

Use the [show bgp ipv6 neighbors \(BGP4+ only\)](#) command to display detailed information on peering connections to all BGP4+ neighbors within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax [BGP]** `show ip bgp neighbors [<ipv4-addr> [advertised-routes|received prefix-filter|received-routes|routes]]`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] neighbors [<ipv4-addr> routes]`

| Parameter              | Description                                                                                                                                     |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipv4-addr>            | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                   |
| advertised-routes      | Displays the routes advertised to a BGP neighbor.                                                                                               |
| received prefix-filter | Displays the received prefix-list filters.                                                                                                      |
| received-routes        | Displays the received routes from the neighbor. To display all the received routes from the neighbor, configure the BGP soft reconfigure first. |
| routes                 | Displays all accepted routes learned from neighbors.                                                                                            |
| global                 | When VRF-lite is configured, apply the command to the global routing and forwarding table.                                                      |
| vrf                    | Apply the command to the specified VRF instance.                                                                                                |
| <vrf-name>             | The name of the VRF instance.                                                                                                                   |

**Mode [BGP]** User Exec and Privileged Exec

**Examples [BGP]**

```
awplus# show ip bgp neighbors 10.10.10.72 advertised-routes
awplus# show ip bgp neighbors 10.10.10.72 received
prefix-filter
awplus# show ip bgp neighbors 10.10.10.72 received-routes
awplus# show ip bgp neighbors 10.10.10.72 routes
```

**Output** Figure 30-25: Example output from **show ip bgp neighbors 10.10.10.72**

```
awplus#show ip bgp neighbors 10.10.10.72
BGP neighbor is 10.10.10.72, remote AS 100, local AS 100, internal
link
Member of peer-group group1 for session parameters
 BGP version 4, remote router ID 0.0.0.0
 BGP state = Active
 Last read , hold time is 90, keepalive interval is 30 seconds
 Received 0 messages, 0 notifications, 0 in queue
 Sent 0 messages, 0 notifications, 0 in queue
 Route refresh request: received 0, sent 0
 Minimum time between advertisement runs is 5 seconds
For address family: IPv4 Unicast
 BGP table version 1, neighbor version 0
 Index 1, Offset 0, Mask 0x2
 group1 peer-group member
 NEXT_HOP is always this router
 0 accepted prefixes
 0 announced prefixes

Connections established 0; dropped 0
Next connect timer due in 33 seconds
```

If available the following is shown:

- Session information
  - Neighbor address, ASN information and if the link is external or internal
  - BGP version and status
  - Neighbor capabilities for the BGP session
  - Number of messages transmitted and received
- IPv4 unicast address family information
  - BGP table version
  - IPv4 Address Family dependent capabilities
  - IPv4 Communities
  - IPv4 Route filters for ingress and egress updates
  - Number of announced and accepted IPv4 prefixes
- Connection information
  - Connection counters
  - Graceful restart timer
  - Hop count to the peer
  - Next hop information
  - Local and external port numbers

**Related commands** [show bgp ipv6 neighbors \(BGP4+ only\)](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors connection-retrytime (BGP only)

**Overview** Use this command to display the configured connection-retrytime value of the peer at the session establishment time with the neighbor.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> connection-retrytime`

| Parameter                      | Description                                                                   |
|--------------------------------|-------------------------------------------------------------------------------|
| <code>&lt;ipv4-addr&gt;</code> | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp neighbors 10.11.4.26 connection-retrytime`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors hold-time (BGP only)

**Overview** Use this command to display the configured holdtime value of the peer at the session establishment time with the neighbor.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> hold-time`

| Parameter   | Description                                                                   |
|-------------|-------------------------------------------------------------------------------|
| <ipv4-addr> | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Default** The holdtime timer default is 90 seconds as per RFC 4271. Holdtime is keepalive \* 3.

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip bgp neighbors 10.11.4.26 hold-time`

**Related commands** [neighbor timers](#)  
[show ip bgp neighbors keepalive-interval \(BGP only\)](#)  
[timers \(BGP\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors keepalive (BGP only)

**Overview** Use this command to display the number of keepalive messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> keepalive`

| Parameter   | Description                                                                   |
|-------------|-------------------------------------------------------------------------------|
| <ipv4-addr> | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip bgp neighbors 10.11.4.26 keepalive`

**Related commands** [show ip bgp neighbors keepalive-interval \(BGP only\)](#)

Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors open (BGP only)

**Overview** Use this command to display the number of open messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> open`

| Parameter                      | Description                                                                   |
|--------------------------------|-------------------------------------------------------------------------------|
| <code>&lt;ipv4-addr&gt;</code> | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp neighbors 10.11.4.26 open`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors rcvd-msgs (BGP only)

**Overview** Use this command to display the number of messages received by the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> rcvd-msgs`

| Parameter   | Description                                                                   |
|-------------|-------------------------------------------------------------------------------|
| <ipv4-addr> | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp neighbors 10.11.4.26 rcvd-msgs`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors sent-msgs (BGP only)

**Overview** Use this command to display the number of messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> sent-msgs`

| Parameter                      | Description                                                                   |
|--------------------------------|-------------------------------------------------------------------------------|
| <code>&lt;ipv4-addr&gt;</code> | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp neighbors 10.11.4.26 sent-msgs`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors update (BGP only)

**Overview** Use this command to display the number of update messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp neighbors <ipv4-addr> update`

| Parameter   | Description                                                                   |
|-------------|-------------------------------------------------------------------------------|
| <ipv4-addr> | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp neighbors 10.11.4.26 update`

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp paths (BGP only)

**Overview** Use this command to display BGP4 path information within an IPv4 environment. Use the [show bgp ipv6 paths \(BGP4+ only\)](#) command to display BGP4+ path information within an IPv4 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp paths`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp paths`

**Related commands** [show bgp ipv6 paths \(BGP4+ only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp prefix-list (BGP only)

**Overview** Use this command to display routes matching the prefix-list within an IPv4 environment. Use the [show bgp ipv6 prefix-list \(BGP4+ only\)](#) command to display routes matching the prefix-list within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp prefix-list <list>`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] prefix-list <list>`

| Parameter  | Description                                                                                |
|------------|--------------------------------------------------------------------------------------------|
| global     | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf        | Apply the command to the specified VRF instance.                                           |
| <vrf-name> | The name of the VRF instance.                                                              |
| <list>     | Specifies the name of the IP prefix list.                                                  |

**Mode** User Exec and Privileged Exec

**Examples**  
`awplus# show ip bgp prefix-list mylist`  
`awplus# show ip bgp vrf red prefix-list myPrefixes`

**Related commands** [show bgp ipv6 prefix-list \(BGP4+ only\)](#)

**Command changes**  
Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp quote-regexp (BGP only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the [show bgp ipv6 quote-regexp \(BGP4+ only\)](#) command to display routes matching the AS path regular expression within an IPv6 environment.

Note that you must use quotes to enclose the regular expression with this command. Use the regular expressions listed below with the *<expression>* parameter:

| Symbol | Character     | Meaning                                                                                                                            |
|--------|---------------|------------------------------------------------------------------------------------------------------------------------------------|
| ^      | Caret         | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| \$     | Dollar sign   | Used to match the end of the input string.                                                                                         |
| .      | Period        | Used to match a single character (white spaces included).                                                                          |
| *      | Asterisk      | Used to match none or more sequences of a pattern.                                                                                 |
| +      | Plus sign     | Used to match one or more sequences of a pattern.                                                                                  |
| ?      | Question mark | Used to match none or one occurrence of a pattern.                                                                                 |
| _      | Underscore    | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.                                    |
| [ ]    | Brackets      | Specifies a range of single-characters.                                                                                            |
| -      | Hyphen        | Separates the end points of a range.                                                                                               |

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp quote-regexp <expression>`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] quote-regexp <expression>`

| Parameter    | Description                                                                                |
|--------------|--------------------------------------------------------------------------------------------|
| global       | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf          | Apply the command to the specified VRF instance.                                           |
| <vrf-name>   | The name of the VRF instance.                                                              |
| <expression> | Specifies a regular-expression to match the BGP AS paths.                                  |

**Mode** User Exec and Privileged Exec

**Examples**    `awplus# show ip bgp quote-regexp myexpression`  
              `awplus# show ip bgp global quote-regexp 65550 65555`

**Related commands**    [show bgp ipv6 quote-regexp \(BGP4+ only\)](#)

**Command changes**    Added to AlliedWare Plus prior to 5.4.6-1  
                          Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
                          Version 5.4.7-2.1: BGP support added for x510 and x550 series  
                          Version 5.4.7-2.4: BGP support added for IE300 series

## show ip bgp regexp (BGP only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the [show bgp ipv6 regexp \(BGP4+ only\)](#) command to display routes matching the AS path regular expression within an IPv6 environment.

Use the regular expressions listed below with the *<expression>* parameter:

| Symbol | Character     | Meaning                                                                                                                            |
|--------|---------------|------------------------------------------------------------------------------------------------------------------------------------|
| ^      | Caret         | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| \$     | Dollar sign   | Used to match the end of the input string.                                                                                         |
| .      | Period        | Used to match a single character (white spaces included).                                                                          |
| *      | Asterisk      | Used to match none or more sequences of a pattern.                                                                                 |
| +      | Plus sign     | Used to match one or more sequences of a pattern.                                                                                  |
| ?      | Question mark | Used to match none or one occurrence of a pattern.                                                                                 |
| _      | Underscore    | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.                                    |
| [ ]    | Brackets      | Specifies a range of single-characters.                                                                                            |
| -      | Hyphen        | Separates the end points of a range.                                                                                               |

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp regexp <expression>`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] regexp <expression>`

| Parameter    | Description                                                                                |
|--------------|--------------------------------------------------------------------------------------------|
| global       | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf          | Apply the command to the specified VRF instance.                                           |
| <vrf-name>   | The name of the VRF instance.                                                              |
| <expression> | Specifies a regular-expression to match the BGP AS paths.                                  |

**Mode** User Exec and Privileged Exec

**Examples**    `awplus# show ip bgp regexp myexpression`  
              `awplus# show ip bgp vrf red regexp 65550 65555`

**Related commands**    `show bgp ipv6 regexp (BGP4+ only)`

**Command changes**    Added to AlliedWare Plus prior to 5.4.6-1  
                          Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
                          Version 5.4.7-2.1: BGP support added for x510 and x550 series  
                          Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp route-map (BGP only)

**Overview** Use this command to display BGP routes that match the specified route-map within an IPv4 environment. Use the [show bgp ipv6 route-map \(BGP4+ only\)](#) command to display BGP4+ routes that match the specified route-map within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp route-map <route-map>`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] route-map <route-map>`

| Parameter   | Description                                                                                |
|-------------|--------------------------------------------------------------------------------------------|
| global      | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf         | Apply the command to the specified VRF instance.                                           |
| <vrf-name>  | The name of the VRF instance.                                                              |
| <route-map> | Specifies a route-map that is matched.                                                     |

**Mode** User Exec and Privileged Exec

**Examples** To show routes that match the route-map `myRouteMap` for the global routing instance, use the command:

```
awplus# show ip bgp global route-map myRouteMap
```

To show routes that match the route-map `myRouteMap`, use the command:

```
awplus# show ip bgp route-map myRouteMap
```

**Related commands** [show bgp ipv6 route-map \(BGP4+ only\)](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp scan (BGP only)

**Overview** Use this command to display BGP scan status.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp scan`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp scan`

**Output** Figure 30-26: Example output from the **show ip bgp scan** command

```
BGP scan is running
BGP scan interval is 60
BGP instance : AS is 11,DEFAULT
Current BGP nexthop cache:
BGP connected route:
 10.10.10.0/24
 10.10.11.0/24
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp summary (BGP only)

**Overview** Use this command to display a summary of a BGP neighbor status within an IPv4 environment. Use the [show bgp ipv6 summary \(BGP4+ only\)](#) command to display a summary of BGP4+ neighbors.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp summary`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] summary`

| Parameter  | Description                                                                                |
|------------|--------------------------------------------------------------------------------------------|
| global     | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf        | Apply the command to the specified VRF instance.                                           |
| <vrf-name> | The name of the VRF instance.                                                              |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip bgp summary`  
`awplus# show ip bgp vrf red summary`

**Output** Figure 30-27: Example output from the **show ip bgp summary** command

```
awplus>show ip bgp summary

BGP router identifier 1.0.0.1, local AS number 65541
BGP table version is 12
4 BGP AS-PATH entries
0 BGP community entries

Neighbor V AS MsgRc MsgSnt TblVer InOutQ Up/Down State/PfxRcd
192.168.3.2 4 65544 20 24 11 0/0 00:07:19 1
192.168.4.2 4 65545 0 0 0 0/0 never Active
192.168.11.2 4 65542 34 40 0 0/0 00:00:04 Active
192.168.21.2 4 65543 29 32 11 0/0 00:07:03 13

Number of neighbors 4
```

The Up/Down column in this output is a timer that shows:

- "never" if the peer session has never been established
- The up time, if the peer session is currently up
- The down time, if the peer session is currently down.

In the example above, the session with 192.168.11.2 has been down for 4 seconds, and the session with 192.168.4.2 has never been established.

**Related commands** [show bgp ipv6 summary \(BGP4+ only\)](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip community-list

**Overview** Use this command to display routes that match a specified community-list name or number.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip community-list [<listnumber>|<listname>]`

| Parameter                       | Description                                                                                                                    |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;listnumber&gt;</code> | Specifies the community list number in the range <1-199> as specified by a previously issued <b>ip community-list</b> command. |
| <code>&lt;listname&gt;</code>   | Specifies the community list name as specified by a previously issued <a href="#">ip community-list</a> command.               |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip community-list mylist`  
`awplus# show ip community-list 99`

**Related commands** [ip community-list](#)  
[ip community-list expanded](#)  
[ip community-list standard](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip extcommunity-list

**Overview** Use this command to display a configured extcommunity-list.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip extcommunity-list [<1-199>|<extcommunity-listname>]`

| Parameter               | Description              |
|-------------------------|--------------------------|
| <1-199>                 | Extcommunity-list number |
| <extcommunity-listname> | Extcommunity-list name   |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip extcommunity-list 33`

**Related commands** [ip extcommunity-list expanded](#)  
[ip extcommunity-list standard](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip prefix-list

**Overview** Use this command to display the IPv4 prefix-list entries.  
Note that this command is valid for RIP and BGP routing protocols only.

**Syntax** `show ip prefix-list [<name>|detail|summary]`

| Parameter | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| <name>    | Specify the name of a prefix list in this placeholder.                    |
| detail    | Specify this parameter to show detailed output for all IPv4 prefix lists. |
| summary   | Specify this parameter to show summary output for all IPv4 prefix lists.  |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip prefix-list`  
`awplus# show ip prefix-list 10.10.0.98/8`  
`awplus# show ip prefix-list detail`

**Related commands** [ip prefix-list](#)

# show ipv6 prefix-list

**Overview** Use this command to display the prefix-list entries.  
Note that this command is valid for RIPv6 and BGP4+ routing protocols only.

**Syntax** `show ipv6 prefix-list [<name>|detail|summary]`

| Parameter | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| <name>    | Specify the name of an individual IPv6 prefix list.                       |
| detail    | Specify this parameter to show detailed output for all IPv6 prefix lists. |
| summary   | Specify this parameter to show summary output for all IPv6 prefix lists.  |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ipv6 prefix-list
awplus# show ipv6 prefix-list 10.10.0.98/8
awplus# show ipv6 prefix-list detail
```

**Related commands** [ipv6 prefix-list](#)

# show ip protocols bgp (BGP only)

**Overview** Use this command to display BGP process parameters and statistics.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip protocols bgp`

**Mode** User Exec and Privileged Exec

**Example** To display BGP process parameters and statistics, use the command:

```
awplus# show ip protocols bgp
```

**Output** Figure 30-28: Example output from the **show ip protocols bgp** command

```
Routing Protocol is "bgp 100"
 IGP synchronization is disabled
 Automatic route summarization is disabled
 Default local-preference applied to incoming route is 100
 Redistributing:
 Neighbor(s):
 Address AddressFamily FiltIn FiltOut DistIn DistOut RouteMapIn RouteMapOut
Weight
10.10.10.1 unicast
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show route-map

**Overview** Use this command to display information about one or all route maps.

**Syntax** `show route-map <map-name>`

| Parameter                     | Description                       |
|-------------------------------|-----------------------------------|
| <code>&lt;map-name&gt;</code> | A name to identify the route map. |

**Mode** User Exec and Privileged Exec

**Example** To display information about the route-map named `example-map`, use the command:

```
awplus# show route-map example-map
```

**Output** Figure 30-29: Example output from the **show route-map** command

```
route-map example-map, permit, sequence 1
 Match clauses:
 ip address prefix-list example-pref
 Set clauses:
 metric 100
route-map example-map, permit, sequence 200
 Match clauses:
 Set clauses:
```

**Related commands** [route-map](#)

# synchronization

**Overview** Use this command in Router Configuration mode or in Address Family Configuration mode to ensure BGP does not advertise router learned from iBGP peers until they are learned locally, or are propagated throughout the AS via an IGP.

Use the **no** variant of this command to disable this function.

**Syntax** `synchronization`  
`no synchronization`

**Default** Disabled.

**Mode** Router Configuration and Address Family Configuration mode

**Usage notes** Synchronization is used when a BGP router should not advertise routes learned from iBGP neighbors, unless those routes are also present in an IGP (for example, OSPF). These routes must be in the RIB (Routing Information Base) learned locally or via an IGP.

Synchronization may be enabled when all the routers in an autonomous system do not speak BGP, and the autonomous system is a transit for other autonomous systems.

Use the **no synchronization** command when BGP router can advertise routes learned from iBGP neighbors, without waiting for IGP reachability, when routes are in the RIB.

**Example** The following example enables IGP synchronization of iBGP routes in Router Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# synchronization
```

The following example enables IGP synchronization of iBGP routes in IPv4 unicast Address Family Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config)# address-family ipv4 unicast
awplus(config-af)# synchronization
```

The following example enables IGP synchronization of iBGP routes in the IPv6 unicast Address Family Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config)# address-family ipv6 unicast
awplus(config-af)# synchronization
```

**Command  
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# timers (BGP)

**Overview** Use this command sets the BGP keepalive timer and holdtime timer values.  
Use the **no** variant of this command to reset timers to the default.

**Syntax** `timers bgp <keepalive> <holdtime>`  
`no timers bgp [<keepalive> <holdtime>]`

| Parameter                      | Description                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;keepalive&gt;</code> | <code>&lt;0-65535&gt;</code> The frequency with which the keepalive messages are sent to the neighbors. The default is 30 seconds as per RFC 4271. Cisco IOS uses a 60 second keepalive timer default value. Adjust keepalive timers for interoperability as required. Maintain the keepalive value at the holdtime value / 3.                                     |
| <code>&lt;holdtime&gt;</code>  | <code>&lt;0-65535&gt;</code> The interval after which the neighbor is considered dead if keepalive messages are not received. The default holdtime value is 90 seconds as per RFC 4271. Cisco IOS uses a 180 second holdtime timer default value. Adjust holdtime timers for interoperability as required. Maintain the holdtime value at the keepalive value * 3. |

**Default** The keepalive timer default is 60 seconds, the holdtime timer default is 90 seconds, and the connect timer default is 120 seconds as per RFC 4271. Holdtime is keepalive \* 3.

**Mode** Router Configuration

**Usage notes** This command is used globally to set or unset the keepalive and holdtime values for all the neighbors.

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# timers bgp 40 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no timers bgp 30 90
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no timers bgp
```

**Related commands** [neighbor timers](#)  
[show ip bgp neighbors hold-time \(BGP only\)](#)  
[show ip bgp neighbors keepalive-interval \(BGP only\)](#)

changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# undebg bgp (BGP only)

**Overview** Use this command to disable BGP debugging functions.

**Syntax** undebg bgp  
[all|dampening|events|filters|fsm|keepalives|nht|nsm|updates]  
undebg all bgp

| Parameter  | Description                                                 |
|------------|-------------------------------------------------------------|
| all        | Disable all debugging for BGP.                              |
| dampening  | Disable debugging for BGP dampening.                        |
| events     | Disable debugging for BGP events.                           |
| filters    | Disable debugging for BGP filters.                          |
| fsm        | Disable debugging for BGP Finite State Machine (FSM).       |
| keepalives | Disable debugging for BGP keepalives.                       |
| nht        | Disable debugging for BGP NHT (Next Hop Tracking) messages. |
| nsm        | Disable debugging for NSM messages.                         |
| updates    | Disable debugging for BGP updates.                          |

**Mode** Privileged Exec and Global Configuration

**Example** awplus# undebg bgp events  
awplus# undebg bgp nht  
awplus# undebg bgp updates

# 31

# Route Map Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for route map commands. For more information, see the [Routemaps Feature Overview and Configuration Guide](#). These commands can be divided into the following categories:

- the [route-map](#) command, which is used to create a route map and/or route map entry, and to put you into route map mode
- **match** commands, used to determine which routes or BGP update messages the route map applies to
- **set** commands, used to modify matching routes or BGP update messages

- Command List**
- ["match as-path"](#) on page 1768
  - ["match community"](#) on page 1770
  - ["match interface"](#) on page 1772
  - ["match ip address"](#) on page 1773
  - ["match ip next-hop"](#) on page 1775
  - ["match ipv6 address"](#) on page 1777
  - ["match ipv6 next-hop"](#) on page 1779
  - ["match metric"](#) on page 1780
  - ["match origin"](#) on page 1781
  - ["match route-type"](#) on page 1783
  - ["match tag"](#) on page 1784
  - ["route-map"](#) on page 1785
  - ["set aggregator"](#) on page 1788
  - ["set as-path"](#) on page 1789

# match as-path

**Overview** Use this command to add an autonomous system (AS) path match clause to a route map entry. Specify the AS path attribute value or values to match by specifying the name of an AS path access list. To create the AS path access list, enter Global Configuration mode and use the [ip as-path access-list](#) command.

A BGP update message matches the route map if its attributes include AS path values that match the AS path access list.

Each entry of a route map can only match against one AS path access list in one AS path match clause. If the route map entry already has an AS path match clause, entering this command replaces that match clause with the new clause.

Note that AS path access lists and route map entries both specify an action of deny or permit. The action in the AS path access list determines whether the route map checks update messages for a given AS path value. The route map action and its **set** clauses determine what the route map does with update messages that contain that AS path value.

Use the **no** variant of this command to remove the AS path match clause from a route map entry.

**Syntax** `match as-path <as-path-listname>`  
`no match as-path [<as-path-listname>]`

| Parameter                             | Description                            |
|---------------------------------------|----------------------------------------|
| <code>&lt;as-path-listname&gt;</code> | Specifies an AS path access list name. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for BGP update messages only.

**Example** To add entry 34 to the route map called `myroute`, which will discard update messages if they contain the AS path values that are included in `myaccesslist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute deny 34
awplus(config-route-map)# match as-path myaccesslist
```

**Related commands** [ip as-path access-list](#)  
[route-map](#)  
[set as-path](#)  
[show route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# match community

**Overview** Use this command to add a community match clause to a route map entry. Specify the community value or values to match by specifying a community list. To create the community list, enter Global Configuration mode and use the [ip community-list](#) command.

A BGP update message matches the route map if its attributes include community values that match the community list.

Each entry of a route map can only match against one community list in one community match clause. If the route map entry already has a community match clause, entering this command replaces that match clause with the new clause.

Note that community lists and route map entries both specify an action of deny or permit. The action in the community list determines whether the route map checks update messages for a given community value. The route map action and its **set** clauses determine what the route map does with update messages that contain that community value.

Use the **no** variant of this command to remove the community match clause from a route map.

**Syntax**

```
match community
{<community-listname>|<1-99>|<100-199>} [exact-match]

no match community
[<community-listname>|<1-99>|<100-199>|exact-match]
```

| Parameter            | Description                             |
|----------------------|-----------------------------------------|
| <community-listname> | The community list name or number.      |
| <1-99>               | Community list number (standard range). |
| <100-199>            | Community list number (expanded range). |
| exact-match          | Exact matching of communities.          |

**Mode** Route-map Configuration

**Usage notes** This command is valid for BGP update messages only.

Communities are used to group and filter routes. They are designed to provide the ability to apply policies to large numbers of routes by using match and set commands. Community lists are used to identify and filter routes by their common attributes.

**Example** To add entry 3 to the route map called `myroute`, which will process update messages if they contain the community values that are included in `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# match community mylist
```

**Related commands**

- `ip community-list`
- `route-map`
- `set comm-list delete`
- `set community`
- `show route-map`

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# match interface

**Overview** Use this command to add an interface match clause to a route map entry. Specify the interface name to match.

A route matches the route map if its interface matches the interface name.

Each entry of a route map can only match against one interface in one interface match clause. If the route map entry already has an interface match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the interface match clause from the route map entry. Use the **no** variant of this command without a specified interface to remove all interfaces.

**Syntax** `match interface <interface>`  
`no match interface [<interface>]`

| Parameter                      | Description             |
|--------------------------------|-------------------------|
| <code>&lt;interface&gt;</code> | The interface to match. |

**Mode** Route-map Configuration

**Usage** This command is valid for RIP and OSPF routes only.

**Example** To add entry 10 to the route map called 'mymap1', which will process routes if they use the interface vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match interface vlan1
```

To remove all interfaces from the route map called 'mymap1', use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# no match interface
```

**Related commands**

- [match ip address](#)
- [match ip next-hop](#)
- [match route-type](#)
- [match tag](#)
- [route-map](#)
- [show route-map](#)

# match ip address

**Overview** Use this command to add an IP address prefix match clause to a route map entry. You can specify the prefix or prefixes to match by either:

- specifying the name of an access list. To create the access list, enter Global Configuration mode and use the **access-list** command.
- specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ip prefix-list** command.

A route matches the route map entry if the route's prefix matches the access list or prefix list.

Use the **no** variant of this command to remove the IP address match clause from a route map entry. To remove a prefix list-based match clause you must also specify the **prefix-list** parameter.

**Syntax**

```
match ip address <access-list-id>
match ip address prefix-list <prefix-listname>
no match ip address
no match ip address <access-list-id>
no match ip address prefix-list <prefix-listname>
```

| Parameter        | Description                                               |
|------------------|-----------------------------------------------------------|
| <access-list-id> | Use an ACL to specify which prefixes to match.            |
|                  | <access-list-name> The IP access list name.               |
|                  | <1-199> The IP access list number.                        |
|                  | <1300-2699> The IP access list number (expanded range).   |
| prefix-list      | Use an IP prefix list to specify which prefixes to match. |
|                  | <prefix-listname> The prefix list name.                   |

**Mode** Route-map Configuration

**Usage notes** Each entry of a route map can have at most one access list-based IP address match clause and one prefix list-based IP address match clause. If the route map entry already has one of these match clauses, entering this command replaces that match clause with the new clause.

Note that access lists, prefix lists and route map entries all specify an action of deny or permit. The action in the access list or prefix list determines whether the route map checks update messages and routes for a given prefix. The action in the route map, and the map's **set** clauses, determine what the device does with update messages or routes that contain that prefix.

If the **match ip address** command results in a match against the specified IP address, then the outcome is:

- If **permit** is specified, then the route is redistributed or controlled, as specified by the set action.
- If **deny** is specified, then the route is not redistributed or controlled.

If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of **permit** or **deny** specifications.

This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

**Examples** To add entry 3 to the route map called 'myroute', which will process routes that match the ACL called 'List1', use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# match ip address List1
```

To add entry 3 to the route map called 'rmap1', which will process routes that match the prefix list called 'mylist', use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ip address prefix-list mylist
```

**Related  
commands**

[access-list \(extended numbered\)](#)

[access-list \(standard numbered\)](#)

[ip prefix-list](#)

[route-map](#)

[show ip access-list](#)

[show route-map](#)

# match ip next-hop

**Overview** Use this command to add a next-hop match clause to a route map entry. You can specify the next hop to match by either:

- specifying the name of an access list. To create the access list, enter Global Configuration mode and use the **access-list** command.
- specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ip prefix-list** command.

A route matches the route map if the route's next hop matches the access list or prefix list.

Each entry of a route map can have at most one access list-based next-hop match clause and one prefix list-based next-hop match clause. If the route map entry already has one of these match clauses, entering this command replaces that match clause with the new clause.

Note that the lists and route map entries specify an action of deny or permit. The action in the list determines whether the route map checks update messages and routes for a given next-hop value. The route map action and its **set** clauses determine what the route map does with update messages and routes that contain that next hop.

Use the **no** variant of this command to remove the next-hop match clause from a route map entry. To remove a prefix list-based match clause you must also specify the prefix-list parameter.

**Syntax** `match ip next-hop <access-list-id>`  
`match ip next-hop prefix-list <prefix-listname>`  
`no match ip next-hop [<access-list-id>]`  
`no match ip next-hop prefix-list [<prefix-listname>]`

| Parameter        | Description                                                |
|------------------|------------------------------------------------------------|
| <access-list-id> | Use an ACL to specify which next hops to match.            |
|                  | <access-list-name> The IP access list name.                |
|                  | <1-199> The IP access list number.                         |
|                  | <1300-2699> The IP access list number (expanded range).    |
| prefix-list      | Use an IP prefix list to specify which next hops to match. |
|                  | <prefix-listname> The prefix list name.                    |

**Mode** Route-map Configuration

**Usage notes** This command is valid for:

- OSPF routes

- routes in BGP update messages
- RIP routes.

**Examples** To add entry 3 to the route map called 'rmap1', which will process routes whose next hop matches the ACL called 'mylist', use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ip next-hop mylist
```

To add entry 3 to the route map called 'mymap', which will process routes whose next hop matches the prefix list called 'list1', use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap permit 3
awplus(config-route-map)# match ip next-hop prefix-list list1
```

**Related commands**

- [access-list \(extended numbered\)](#)

# match ipv6 address

**Overview** Use this command to add an IPv6 address prefix match clause to a route map entry. You can specify the prefix or prefixes to match by either:

- specifying the name of an access list. To create the access list, enter Global Configuration mode and use the **access-list** command.
- specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ipv6 prefix-list** command.

A route matches the route map entry if the route's prefix matches the access list or prefix list.

Use the **no** variant of this command to remove the IPv6 address match clause from a route map entry.

**Syntax**

```
match ipv6 address <access-list-id>
match ipv6 address prefix-list <prefix-listname>
no match ipv6 address
no match ipv6 address <access-list-id>
no match ipv6 address prefix-list <prefix-listname>
```

| Parameter          | Description                                                                    |
|--------------------|--------------------------------------------------------------------------------|
| <access-list-id>   | {<access-list-name> <1-199> <1300-2699>}<br>The IP access list name or number. |
| <access-list-name> | The IP access list name.                                                       |
| <1-199>            | The IP access list number.                                                     |
| <1300-2699>        | The IP access list number (expanded range).                                    |
| prefix-list        | Use an IP prefix list to specify which prefixes to match.                      |
| <prefix-listname>  | The prefix list name.                                                          |

**Mode** Route-map Configuration

**Usage notes** Each entry of a route map can have at most one access list-based IPv6 address match clause and one prefix list-based IPv6 address match clause. If the route map entry already has one of these match clauses, entering this command replaces that match clause with the new clause.

Note that access lists, prefix lists and route map entries all specify an action of deny or permit. The action in the access list or prefix list determines whether the route map checks update messages and routes for a given prefix. The action in the route map, and the map's **set** clauses, determine what the device does with update messages or routes that contain that prefix.

If the **match ipv6 address** command results in a match against the specified IPv6 address, then the outcome is:

- If **permit** is specified, then the route is redistributed or controlled, as specified by the set action.
- If **deny** is specified, then the route is not redistributed or controlled.

If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of **permit** or **deny** specifications.

This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

**Examples** To avoid processing the routes specified by the ACL named "acl1", use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 deny 1
awplus(config-route-map)# match ipv6 address acl1
```

To match traffic according to the prefix list named "mylist", use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ipv6 address prefix-list mylist
```

# match ipv6 next-hop

**Overview** Use this command to specify a next-hop address to be matched by the route-map. Use the **no** variant of this command to disable this function.

**Syntax**

```
match ipv6 next-hop <access-list-name>
match ipv6 next-hop <ipv6-addr>
match ipv6 next-hop prefix-list <prefix-listname>
no match ipv6 next-hop [<access-list-name>]
match ipv6 next-hop [<ipv6-addr>]
match ipv6 next-hop [prefix-list <prefix-listname>]
```

| Parameter          | Description                                                                               |
|--------------------|-------------------------------------------------------------------------------------------|
| <access-list-name> | The name of the IPv6 access list that specifies criteria for the addresses to match.      |
| <ipv6-addr>        | The IPv6 address of the next hop. The IPv6 address uses the format X:X::X:X.              |
| <prefix-listname>  | The name of the IPv6 prefix list that specifies criteria for the addresses to be matched. |

**Mode** Route-map Configuration

**Usage notes** The **match ipv6 next-hop** command specifies the next-hop address to be matched. If there is a match for the specified next-hop address, and permit is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and deny is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of permit or deny specifications.

**NOTE:** This command is valid only for BGP.

**Example**

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ipv6 next-hop 2001:0db8::/32
```

# match metric

**Overview** Use this command to add a metric match clause to a route map entry. Specify the metric value to match.

A route matches the route map if its metric matches the route map's metric.

A BGP update message matches the route map if its MED attribute value matches the route map's metric.

Each entry of a route map can only match against one metric value in one metric match clause. If the route map entry already has a metric match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the metric match clause from the route map entry.

**Syntax** `match metric <metric>`  
`no match metric [<metric>]`

| Parameter | Description                                |
|-----------|--------------------------------------------|
| <metric>  | <0-4294967295> Specifies the metric value. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

**Example** To stop entry 3 of the route map called "myroute" from processing routes with a metric of 888999, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# no match metric 888999
```

**Related commands** [route-map](#)  
[set metric](#)  
[show route-map](#)

# match origin

**Overview** Use this command to add an origin match clause to a route map entry. Specify the origin attribute value to match.

A BGP update message matches the route map if its origin attribute value matches the route map's origin value.

Each entry of a route map can only match against one origin in one origin match clause. If the route map entry already has an origin match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the origin match clause from the route map entry.

**Syntax** `match origin {egp|igp|incomplete}`  
`no match origin [egp|igp|incomplete]`

| Parameter  | Description                                      |
|------------|--------------------------------------------------|
| egp        | Learned from an exterior gateway protocol.       |
| igp        | Learned from a local interior gateway protocol.  |
| incomplete | Of unknown heritage, for example a static route. |

**Mode** Route-map Configuration

**Usage** The origin attribute defines the origin of the path information. The **egp** parameter is indicated as an **e** in the routing table, and it indicates that the origin of the information is learned via Exterior Gateway Protocol. The **igp** parameter is indicated as an **i** in the routing table, and it indicates the origin of the path information is interior to the originating AS. The **incomplete** parameter is indicated as a **?** in the routing table, and indicates that the origin of the path information is unknown or learned through other means. If a static route is redistributed into BGP, the origin of the route is incomplete.

The **match origin** command specifies the origin to be matched. If there is a match for the specified origin, and **permit** is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and **deny** is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of **permit** or **deny** specifications.

This command is valid for BGP update messages only.

**Example** To add entry 34 to the route map called "rmap1", which will drop externally-originated routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute deny 34
awplus(config-route-map)# match origin egp
```

**Related  
commands**   route-map  
                  set origin  
                  show route-map

# match route-type

**Overview** Use this command to add an external route-type match clause to a route map entry. Specify whether to match OSPF type-1 external routes or OSPF type-2 external routes.

An OSPF route matches the route map if its route type matches the route map's route type.

Each entry of a route map can only match against one route type in one match clause. If the route map entry already has a route type match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the route type match clause from the route map entry.

**Syntax** `match route-type external {type-1|type-2}`  
`no match route-type external [type-1|type-2]`

| Parameter | Description                  |
|-----------|------------------------------|
| type-1    | OSPF type-1 external routes. |
| type-2    | OSPF type-2 external routes. |

**Mode** Route-map Configuration

**Usage** Use the **match route-type external** command to match specific external route types. AS- external LSA is either Type-1 or Type-2. **external type-1** matches only Type 1 external routes, and **external type-2** matches only Type 2 external routes. This command is valid for OSPF routes only.

**Example** To add entry 10 to the route map called `mymap1`, which will process type-1 external routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match route-type external type-1
```

**Related commands**

- [match interface](#)
- [match ip address](#)
- [match ip next-hop](#)
- [match tag](#)
- [route-map](#)
- [set metric-type](#)
- [show route-map](#)

# match tag

**Overview** Use this command to add a tag match clause to a route map entry. Specify the route tag value to match.

An OSPF route matches the route map if it has been tagged with the route map's tag value. Routes can be tagged through OSPF commands or through another route map's set clause.

Each entry of a route map can only match against one tag in one match clause. If the route map entry already has a tag match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the tag match clause from the route map entry.

**Syntax** `match tag <0-4294967295>`  
`no match tag [<0-4294967295>]`

**Mode** Route-map Configuration

**Usage** This command is valid for OSPF routes only.

**Example** To add entry 10 to the route map called `mymap1`, which will process routes that are tagged 100, use the following commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match tag 100
```

**Related commands**

- [show route-map](#)

# route-map

**Overview** Use this command to configure a route map entry, and to specify whether the device will process or discard matching routes and BGP update messages.

The device uses a name to identify the route map, and a sequence number to identify each entry in the route map.

The **route-map** command puts you into route-map configuration mode. In this mode, you can use the following:

- one or more of the **match** commands to create match clauses. These specify what routes or update messages match the entry.
- one or more of the **set** commands to create set clauses. These change the attributes of matching routes or update messages.

Use the **no** variant of this command to delete a route map or to delete an entry from a route map.

**Syntax**

```
route-map <mapname> {deny|permit} <seq>
no route-map <mapname>
no route-map <mapname> {deny|permit} <seq>
```

| Parameter | Description                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------|
| <mapname> | A name to identify the route map.                                                                                         |
| deny      | The route map causes a routing process to discard matching routes or BGP update messages.                                 |
| permit    | The route map causes a routing process to use matching routes or BGP update messages.                                     |
| <seq>     | <1-65535> The sequence number of the entry. You can use this parameter to control the order of entries in this route map. |

**Mode** Global Configuration

**Usage notes** Route maps allow you to control and modify routing information by filtering routes and setting route attributes. You can apply route maps when the device:

- processes BGP update messages that it has received from a peer
- prepares BGP update messages to send to peers
- redistributes routes from one routing protocol into another
- redistributes static routes into routing protocols
- uses BGP route flap dampening

When a routing protocol passes a route or update message through a route map, it checks the entries in order of their sequence numbers, starting with the lowest numbered entry.

If it finds a match on a route map with an action of permit, then it applies any set clauses and accepts the route. Having found a match, the route is not compared against any further entries of the route map.

If it finds a match on a route map with an action of deny, it will discard the matching route.

If it does not find a match, it discards the route or update message. This means that route maps end with an implicit deny entry. To permit all non-matching routes or update messages, end your route map with an entry that has an action of **permit** and no match clause.

**Examples** To enter route-map mode for entry 1 of the route map called "route1", and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 1
awplus(config-route-map)# match as-path 60
awplus(config-route-map)# set weight 70
```

To enter route-map mode for entry 2 of the route map called "route1", and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 2
awplus(config-route-map)# match interface vlan2
awplus(config-route-map)# set metric 20
```

Note how the prompt changes when you go into route map configuration mode.

To make the device process non-matching routes instead of discarding them, add a command like the following one:

```
awplus(config)# route-map route1 permit 100
```

- [default-information originate](#)
- [redistribute \(OSPF\)](#)

For RIP:

`redistribute (RIP)`

# set aggregator

**Overview** Use this command to add an aggregator set clause to a route map entry.

When a BGP update message matches the route map entry, the device sets the update's aggregator attribute. The aggregator attribute specifies the AS and IP address of the device that performed the aggregation.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set aggregator as <asnum> <ip-address>`  
`no set aggregator as`

| Parameter    | Description                       |
|--------------|-----------------------------------|
| <asnum>      | The AS number of the aggregator.  |
| <ip-address> | The IP address of the aggregator. |

**Mode** Route-map Configuration

**Usage** An Autonomous System (AS) is a collection of networks under a common administration sharing a common routing strategy. It is subdivided by areas, and is assigned a unique 16-bit number. Use the **set aggregator** command to assign an AS number for the aggregator.

This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `myroute` to set the aggregator attribute to 43 10.10.0.3 in matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set aggregator as 43 10.10.0.3
```

To remove all aggregator attributes for entry 3 of the route map called `myroute`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# no set aggregator as
```

**Related commands** [route-map](#)  
[show route-map](#)

# set as-path

**Overview** Use this command to add an AS path set clause to a route map entry.

When a BGP update message matches the route map entry, the device prepends the specified Autonomous System Number (ASN) or ASNs to the update's AS path attribute.

The AS path attribute is a list of the autonomous systems through which the announcement for the prefix has passed. As prefixes pass between autonomous systems, each autonomous system adds its ASN to the beginning of the list. This means that the AS path attribute can be used to make routing decisions.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set as-path prepend <1-65535> [<1-65535>]...`  
`no set as-path prepend [<1-65535> [<1-65535>]...]`

| Parameter                    | Description                                                                                    |
|------------------------------|------------------------------------------------------------------------------------------------|
| <code>prepend</code>         | Prepends the autonomous system path.                                                           |
| <code>&lt;1-65535&gt;</code> | The number to prepend to the AS path. If you specify multiple ASNs, separate them with spaces. |

**Mode** Route-map mode

**Usage notes** Use the **set as-path** command to specify an autonomous system path. By specifying the length of the AS-Path, the device influences the best path selection by a neighbor. Use the `prepend` parameter with this command to prepend an AS path string to routes increasing the AS path length.

This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `myroute` to prepend ASN 8 and 24 to the AS path of matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set as-path prepend 8 24
```

**Related commands** [match as-path](#)  
[route-map](#)  
[show route-map](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series

# set atomic-aggregate

**Overview** Use this command to add an atomic aggregate set clause to a route map entry.

When a BGP update message matches the route map entry, the device adds the atomic aggregate attribute to the update.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set atomic-aggregate`  
`no set atomic-aggregate`

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `rmap1` to add the atomic aggregator attribute to matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set atomic-aggregate
```

**Related commands** [route-map](#)  
[show route-map](#)

# set comm-list delete

**Overview** Use this command to delete one or more communities from the community attribute of a BGP update message. Specify the communities to delete by specifying a community list. To create the community list, enter Global Configuration mode and use the [ip community-list](#) command.

When a BGP update message matches the route map entry, the device deletes the specified communities from the update's community attribute.

Use the **no** variant of this command to stop deleting the communities.

**Syntax** `set comm-list {<1-199>|<100-199>|<word>} delete`  
`no set comm-list {<1-199>|<100-199>|<word>} delete`

| Parameter | Description                     |
|-----------|---------------------------------|
| <1-99>    | Standard community-list number. |
| <100-199> | Expanded community-list number. |
| <word>    | Name of the Community-list.     |

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `myroute` to delete the communities in community list 34 from matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set comm-list 34 delete
```

**Related commands** [ip community-list](#)  
[match community](#)  
[route-map](#)  
[set community](#)  
[show route-map](#)

# set community

**Overview** Use this command to add a community set clause to a route map entry.

When a BGP update message matches the route map entry, the device takes one of the following actions:

- changes the update's community attribute to the specified value or values, or
- adds the specified community value or values to the update's community attribute, if you specify the **additive** parameter after specifying another parameter. or
- removes the community attribute from the update, if you specify the **none** parameter

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set community {[<1-65535>][AA:NN] [internet] [local-AS]
[no-advertise] [no-export] [additive]}

no set community {[AA:NN] [internet] [local-AS] [no-advertise]
[no-export] [additive]}

set community none

no set community none
```

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                         |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <1-65535>    | The AS number of the community as an integer not in AA:NN format.                                                                                                                                                                                                                                                                                                   |
| AA:NN        | The Autonomous System (AS) number of the community, in AA:NN format. AS numbers are assigned to the regional registries by the IANA ( <a href="http://www.iana.org">www.iana.org</a> ) and can be obtained from the registry in your region.<br>AA and NN are both integers from 1 to 65535.<br>AA is the AS number; NN is a value chosen by the ASN administrator. |
| local-AS     | The community of routes that must not be advertised to external BGP peers (this includes peers in other members' Autonomous Systems inside a BGP confederation).                                                                                                                                                                                                    |
| internet     | The community of routes that can be advertised to all BGP peers.                                                                                                                                                                                                                                                                                                    |
| no-advertise | The community of routes that must not be advertised to other BGP peers.                                                                                                                                                                                                                                                                                             |
| no-export    | The community of routes that must not be advertised outside a BGP confederation boundary (a standalone Autonomous System that is not part of a confederation should be considered a confederation itself).                                                                                                                                                          |

| Parameter | Description                                                                                                                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| none      | The device removes the community attribute from matching update messages.                                                                                                                                                         |
| additive  | The device adds the specified community value to the update message's community attribute, instead of replacing the existing attribute. By default this parameter is not included, so the device replaces the existing attribute. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for BGP update messages only.

**Examples** To use entry 3 of the route map called `rmap1` to put matching routes into the no-advertise community, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community no-advertise
```

To use entry 3 of the route map called `rmap1` to put matching routes into several communities, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 10:01 23:34 12:14
no-export
```

To use entry 3 of the route map called `rmap1` to put matching routes into a single AS community numbered 16384, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 16384 no-export
```

# set dampening

**Overview** Use this command to add a route flap dampening set clause to a route map entry.

Also use the route map by specifying it in the command [bgp dampening route-map](#).

When a route matches the route map entry, the device enables route flap dampening for that route. If the set clause includes dampening parameter values, the device uses those values when dampening the matching route.

Use the **no** variant of this command to remove the set clause. This disables dampening on matching routes.

**Syntax**

```
set dampening
set dampening [<reachtime>]
set dampening <reachtime> [<reuse> <suppress> <maxsuppress>]
[<unreachtime>]
no set dampening
no set dampening [<reachtime>]
no set dampening <reachtime> [<reuse> <suppress> <maxsuppress>]
[<unreachtime>]
```

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <reachtime> | <1-45><br>The time it takes, in minutes, for the route's instability penalty to halve if the route remains stable. The instability penalty is called the Figure of Merit (FoM). For example, if reachtime is 15, the FoM of a stable route halves over a 15 minute period, quarters over a 30 minute period, and so on. The default is 15 minutes. |
| <reuse>     | <1-20000><br>The value that the instability penalty (FoM) must reach for the device to use a suppressed route again. Once a route is suppressed, it remains suppressed until its FoM falls below this threshold. Reuse must not exceed suppress. The default is 750.                                                                               |
| <suppress>  | <1-20000><br>The instability penalty (FoM) at which the route is suppressed. Suppress must be greater than or equal to reuse. If suppress is less than 1000, a route is suppressed when it becomes unreachable for the first time. The default is 2000.                                                                                            |

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;maxsuppress&gt;</code> | <code>&lt;1-255&gt;</code><br>A number that is multiplied by reachtime to give the maximum time in minutes for which a suppressed route must remain stable in order to become unsuppressed. The lowest maxsuppress value of 1 gives a maximum suppression time of 1 x reachtime, and the highest maxsuppress value of 255 gives a maximum suppression time of 255 x reachtime.<br>For example, if reachtime is 15 and maxsuppress is 4, the route is unsuppressed after 60 minutes of stability even if its FoM still exceeds reuse. The default is 4. |
| <code>&lt;unreachtime&gt;</code> | <code>&lt;1-45&gt;</code><br>The time it takes, in minutes, for the route's instability penalty to halve if the route remains unstable. The default is 15 minutes.                                                                                                                                                                                                                                                                                                                                                                                     |

**Mode** Route-map Configuration

**Usage** The **suppress** value must be greater than or equal to the **reuse** value.  
Set the unreachability half-life time to be equal to, or greater than, reachability half-life time. The suppress-limit value must be greater than or equal to the reuse limit value.  
This command is valid for BGP routes only.

**Example** To use entry 24 of the route map called R1 to enable dampening of matching routes and set the dampening parameters, use the commands:

```
configure terminal
route-map R1 permit 24
set dampening 20 333 534 30
```

### Related commands

# set extcommunity

**Overview** Use this command to add an extended community set clause to a route map entry. A route map entry can have a route target extended community set clause, a site-of-origin extended community set clause, or both.

When a BGP update message matches the route map entry, the device sets the update's extended community attribute to the specified value or values.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set extcommunity {rt|soo} <extcomm-number>`  
`no set extcommunity {rt|soo} [<extcomm-number>]`

| Parameter        | Description                                                                                                        |
|------------------|--------------------------------------------------------------------------------------------------------------------|
| rt               | Configure a route target extended community. This consists of routers that will receive matching routes.           |
| soo              | Configure a site-of-origin extended community. This consists of routers that will inject matching routes into BGP. |
| <extcomm-number> | The extended community number, in the format AA:NN or IPADD:N.                                                     |

**Mode** Route-map Configuration

**Usage notes** This command is valid for BGP update messages only.

**Examples** To use entry 3 of the route map called `rmap1` to set the route target extended community attribute to 06:01, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity rt 06:01
```

To instead specify the extended community number in dotted decimal notation, use the command:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity rt 0.0.0.6:01
```

To use entry 3 of the route map called `rmap1` to set the site-of-origin extended community attribute to 06:01, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity soo 06:01
```

To instead specify the extended community number in dotted decimal notation, use the command:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity soo 0.0.0.6:01
```

**Related  
commands**

[match community](#)  
[route-map](#)  
[set comm-list delete](#)  
[set community](#)  
[show route-map](#)

# set ip next-hop (route map)

**Overview** Use this command to add a next-hop set clause to a route map entry.

When a route or BGP update message matches the route map entry, the device sets the route's next hop to the specified IP address.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set ip next-hop <ip-address>`  
`no set ip next-hop [<ip-address>]`

| Parameter                       | Description                                                  |
|---------------------------------|--------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | The IP address of the next hop, entered in the form A.B.C.D. |

**Mode** Route-map Configuration

**Usage notes** Use this command to set the next-hop IP address to the routes.

This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

**Example** To use entry 3 of the route map called `mymap` to give matching routes a next hop of 10.10.0.67, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap permit 3
awplus(config-route-map)# set ip next-hop 10.10.0.67
```

**Related commands** [match ip next-hop](#)  
[route-map](#)  
[show route-map](#)

# set ipv6 next-hop

**Overview** Use this command to set a next hop-address.

Use the **no** variant of this command to delete an entry.

**Syntax** `set ipv6 next-hop {<ipv6-addr-global>|local <ipv6-addr>}`  
`no set ipv6 next-hop [<ipv6-addr-global>|local [<ipv6-addr>]]`

| Parameter                             | Description                                                                     |
|---------------------------------------|---------------------------------------------------------------------------------|
| <code>&lt;ipv6-addr-global&gt;</code> | The IPv6 global address of next hop. The IPv6 address uses the format X:X::X:X. |
| <code>local</code>                    | Specifies that the address is local.                                            |
| <code>&lt;ipv6-addr&gt;</code>        | The IPv6 local address of next hop. The IPv6 address uses the format X:X::X:X.  |

**Mode** Route-map Configuration

**Usage notes** Use this command to set the next-hop IPv6 address to the routes.  
This command is valid only for BGP.

**Examples** `awplus# configure terminal`  
`awplus(config)# route-map rmap1 permit 3`  
`awplus(config-route-map)# set ipv6 next-hop local`  
`fe80::203:47ff:fe97:66dc`  
`awplus(config-route-map)# no set ipv6 next-hop`

# set local-preference

**Overview** This command changes the default local preference value.

The local preference indicates the BGP local preference path attribute when there are multiple paths to the same destination. The path with the higher preference is chosen.

Use this command to define the preference of a particular path. The preference is sent to all routers and access servers in the local autonomous system.

The **no** variant of this command reverts to the default setting.

**Syntax** `set local-preference <pref-value>`  
`no set local-preference [<pref-value>]`

| Parameter                       | Description                                                                                 |
|---------------------------------|---------------------------------------------------------------------------------------------|
| <code>&lt;pref-value&gt;</code> | <0-4294967295> Configure local preference value. The default local preference value is 100. |

**Mode** Route-map Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set local-preference 2345555
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-route-map)# no set local-preference
```

**Related commands** For related Route Map commands:

[route-map](#)

[show route-map](#)

For related BGP commands:

[bgp default local-preference \(BGP only\)](#)

[neighbor route-map](#)

# set metric

**Overview** Use this command to add a metric set clause to a route map entry.

When a route or BGP update message matches the route map entry, the device takes one of the following actions:

- changes the metric (or for BGP, the MED attribute value) to the specified value, or
- adds or subtracts the specified value from the metric or MED attribute, if you specify + or - before the value (for example, to increase the metric by 2, enter +2)

Use the **no** variant of this command to remove the set clause.

**Syntax** `set metric {+<metric-value>|-<metric-value>|<metric-value>}`  
`no set metric [+<metric-value>|-<metric-value>|<metric-value>]`

| Parameter      | Description                                                                                                                 |
|----------------|-----------------------------------------------------------------------------------------------------------------------------|
| +              | Increase the metric or MED attribute by the specified amount.                                                               |
| -              | Decrease the metric or MED attribute by the specified amount.                                                               |
| <metric-value> | <0-4294967295><br>The new metric or MED attribute value, or the amount by which to increase or decrease the existing value. |

**Default** The default metric value for routes redistributed into OSPF and OSPFv3 is 20.

**Mode** Route-map Configuration

**Usage notes** For BGP, if you want the device to compare MED values in update messages from peers in different ASes, also enter the command [bgp always-compare-med](#). You do not need to enter this command if you only want the device to compare MED values in update messages from peers in the same AS, because it always does.

This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

Note that defining the OSPF metric in a route map supersedes the metric defined using a [redistribute \(OSPF\)](#) or a [redistribute \(IPv6 OSPF\)](#) command. For more information, see the [OSPFv3 Feature Overview and Configuration Guide](#) and the [OSPF Feature Overview and Configuration Guide](#).

**Examples** To use entry 3 of the route map called "rmap1" to give matching routes a metric of 600, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric 600
```

To use entry 3 of the route map called "rmap1" to increase the metric of matching routes by 2, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric +2
```

**Related commands**

- [match metric](#)
- [route-map](#)
- [show route-map](#)

# set metric-type

**Overview** Use this command to add a metric-type set clause to a route map entry.

When a route matches the route map entry, the device sets its route type to the specified value.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set metric-type {type-1|type-2}`  
`no set metric-type [type-1|type-2]`

| Parameter | Description                                                       |
|-----------|-------------------------------------------------------------------|
| type-1    | Redistribute matching routes into OSPF as type-1 external routes. |
| type-2    | Redistribute matching routes into OSPF as type-2 external routes. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for OSPF routes only.

**Example** To use entry 3 of the route map called `rmap1` to redistribute matching routes into OSPF as type-1 external routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric-type 1
```

**Related commands**

- [default-information originate](#)
- [redistribute \(OSPF\)](#)
- [match route-type](#)
- [route-map](#)
- [show route-map](#)

# set origin

**Overview** Use this command to add an origin set clause to a route map entry.

When a BGP update message matches the route map entry, the device sets its origin attribute to the specified value.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set origin {egp|igp|incomplete}`  
`no set origin [egp|igp|incomplete]`

| Parameter  | Description                                      |
|------------|--------------------------------------------------|
| egp        | Learned from an exterior gateway protocol.       |
| igp        | Learned from a local interior gateway protocol.  |
| incomplete | Of unknown heritage, for example a static route. |

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `rmap1` to give matching update messages an origin of `egp`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set origin egp
```

**Related commands** [match origin](#)  
[route-map](#)  
[show route-map](#)

# set originator-id

- Overview** Use this command to add an originator ID set clause to a route map entry.
- The originator ID is the router ID of the IBGP peer that first learned this route, either via an EBGP peer or by some other means such as importing it.
- When a BGP update message matches the route map entry, the device sets its originator ID attribute to the specified value.
- Use the **no** variant of this command to remove the set clause.

**Syntax** `set originator-id <ip-address>`  
`no set originator-id [<ip-address>]`

| Parameter                       | Description                                                    |
|---------------------------------|----------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | The IP address of the originator, entered in the form A.B.C.D. |

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Example** To use entry 3 of the route map called `rmap1` to give matching update messages an originator ID of `1.1.1.1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set originator-id 1.1.1.1
```

**Related commands** [route-map](#)  
[show route-map](#)

# set tag

- Overview** Use this command to add a tag set clause to a route map entry.
- When a route matches the route map entry, the device sets its tag to the specified value when it redistributes the route into OSPF.
- Use the **no** variant of this command to remove the set clause.

**Syntax** `set tag <tag-value>`  
`no set tag [<tag-value>]`

| Parameter                      | Description                                                             |
|--------------------------------|-------------------------------------------------------------------------|
| <code>&lt;tag-value&gt;</code> | <code>&lt;0-4294967295&gt;</code><br>Value to tag matching routes with. |

**Mode** Route-map Configuration

**Usage notes** This command is valid only when redistributing routes into OSPF.

**Example** To use entry 3 of the route map called `rmap1` to tag matching routes with the number 6, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set tag 6
```

**Related commands**

- [default-information originate](#)
- [redistribute \(OSPF\)](#)
- [match tag](#)
- [route-map](#)
- [show route-map](#)

# set weight

**Overview** Use this command to add a weight set clause to a route map entry.

The weight value assists in best path selection of BGP routes. It is stored with the route in the BGP routing table, but is not advertised to peers. When there are multiple routes with a common destination, the device uses the route with the highest weight value.

When a route matches the route map entry, the device sets its weight to the specified value.

Use the **no** variant of this command to remove the set clause.

**Syntax** `set weight <weight>`  
`no set weight [<weight>]`

| Parameter | Description                         |
|-----------|-------------------------------------|
| <weight>  | <0-4294967295><br>The weight value. |

**Mode** Route-map Configuration

**Usage** This command is valid for BGP routes only.

**Example** To use entry 3 of the route map called `rmap1` to give matching routes a weight of 60, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set weight 60
```

**Related commands** [route-map](#)  
[show route-map](#)

# show route-map

**Overview** Use this command to display information about one or all route maps.

**Syntax** `show route-map <map-name>`

| Parameter  | Description                       |
|------------|-----------------------------------|
| <map-name> | A name to identify the route map. |

**Mode** User Exec and Privileged Exec

**Example** To display information about the route-map named `example-map`, use the command:

```
awplus# show route-map example-map
```

**Output** Figure 31-1: Example output from the **show route-map** command

```
route-map example-map, permit, sequence 1
 Match clauses:
 ip address prefix-list example-pref
 Set clauses:
 metric 100

# address-family

**Overview** This command enters the IPv4 or IPv6 Address-Family Configuration command mode. In this mode you can configure address-family specific parameters.

When using VRF-lite, you can enter IPv4 Address Family Configuration mode for a specified VRF instance before configuring that instance.

**Syntax [BGP]** address-family ipv4 [unicast]  
no address-family ipv4 [unicast]

**Syntax (VRF-lite)** address-family ipv4 [unicast|vrf <vrf-name>]  
no address-family ipv4 [unicast|vrf <vrf-name>]

**Syntax [BGP4+]** address-family ipv6 [unicast]  
no address-family ipv6 [unicast]

| Parameter  | Description                                                                      |
|------------|----------------------------------------------------------------------------------|
| ipv4       | Configure parameters relating to the exchange of IPv4 prefixes.                  |
| ipv6       | Configure parameters relating to the exchange of IPv6 prefixes.                  |
| unicast    | Configure parameters relating to the exchange of routes to unicast destinations. |
| vrf        | Applies the command to the specified VRF instance.                               |
| <vrf-name> | The name of the VRF instance to enter IPv4 Address-Family mode for.              |

**Mode [BGP]** Router Configuration

**Mode [BGP4+]** Router Configuration

**Usage notes** To leave the IPv4 or IPv6 Address Family Configuration mode, and return to the Router Configuration mode, use the [exit-address-family](#) command.

**Example [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# neighbor 192.168.0.1 remote-as 100
awplus(config-router)# address-family ipv4 vrf green
awplus(config-router-af)# neighbor 192.168.0.1 activate
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Example [BGP4+]**    `awplus# configure terminal`  
                  `awplus(config)# router bgp 100`  
                  `awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 100`  
                  `awplus(config-router)# address-family ipv6`  
                  `awplus(config-router-af)# neighbor 2001:0db8:010d::1 activate`  
                  `awplus(config-router-af)# exit-address-family`  
                  `awplus(config-router)#`

**Related commands**    [exit-address-family](#)

**Command changes**    Added to AlliedWare Plus prior to 5.4.6-1  
                          Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
                          Version 5.4.7-2.1: BGP support added for x510 and x550 series  
                          Version 5.4.7-2.4: BGP support added for IE300 series

# address-family ipv6 vrf (RIP)

**Overview** Use this command to enter IPv6 Address Family configuration mode. In this mode you can configure address-family specific parameters associated with a VRF instance specified by its name.

Use the **no** variant of this command to remove the IPv6 address-family configuration from the device configuration for a specific VRF instance in RIPng.

**Syntax** `address-family ipv6 vrf <vrf-name>`  
`no address-family ipv6 vrf <vrf-name>`

| Parameter  | Description                            |
|------------|----------------------------------------|
| <vrf-name> | The name of the specific VRF instance. |

**Mode** Router Address Family Configuration

**Example** To enter RIPng mode, then IPv6 address-family mode, and configure parameters associated with VRF instance 'blue', use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# address-family ipv6 vrf blue
awplus(config-router-af)# redistribute connected
awplus(config-router-af)# exit-address-family
```

To remove the IPv6 address-family configuration from the device configuration mode for VRF instance 'blue' in RIPng, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no address-family ipv6 vrf blue
```

**Related commands** [exit-address-family](#)

**Command changes** Version 5.5.4-1.1: command added

# address-family ipv4 (RIP)

**Overview** This command enters the IPv4 address-family command mode. In this mode you can configure address-family specific parameters for a specific VRF (RIP) instance.

**Syntax** `address-family ipv4 vrf <vrf-name>`  
`no address-family ipv4 vrf <vrf-name>`

| Parameter                     | Description                                                         |
|-------------------------------|---------------------------------------------------------------------|
| <code>ipv4</code>             | Configure parameters relating to the RIP exchange of IPv4 prefixes. |
| <code>vrf</code>              | Apply this command to a VRF instance.                               |
| <code>&lt;vrf-name&gt;</code> | The name of the VRF instance.                                       |

**Mode** Router Configuration

**Usage** To leave Address Family mode and return to Router Configuration mode, use the [exit-address-family](#) command.

**Example** In this example the address family “green” is entered, and then exited by using the `exit-address-family` command.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf green
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Related commands** [exit-address-family](#)

# arp

**Overview** This command adds a static ARP entry to the ARP cache. This is typically used to add entries for hosts that do not support ARP or to speed up the address resolution function for a host. The ARP entry must not already exist. Use the **alias** parameter to allow your device to respond to ARP requests for this IP address.

If VRF-lite is configured, you can add ARP entries to either the global cache or for a specific VRF instance.

The **no** variant of this command removes the static ARP entry. Use the [clear arp-cache](#) command to remove the dynamic ARP entries in the ARP cache.

**Syntax**

```
arp <ip-addr> <mac-address> [<port-number>] [alias]
arp <ip-addr> <multicast-mac-address> [<port-list>]
no arp <ip-addr>
```

**Syntax (VRF-lite)**

```
arp [vrf <vrf-name>] <ip-addr> <mac-address> [<port-number>]
[alias]
arp [vrf <vrf-name>] <ip-addr> <multicast-mac-address>
[<port-list>]
no arp [vrf <vrf-name>] <ip-addr>
```

| Parameter               | Description                                                                                                                                          |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-addr>               | The IPv4 address of the device you are adding as a static ARP entry.                                                                                 |
| <mac-address>           | The MAC address of the device you are adding as a static ARP entry, in hexadecimal notation with the format HHHH.HHHH.HHHH.                          |
| <port-number>           | The port number associated with the IP address. Specify this when the IP address is part of a VLAN.                                                  |
| <multicast-mac-address> | The multicast MAC address for which you are adding a static ARP entry, in hexadecimal notation with the format HHHH.HHHH.HHHH.                       |
| <port-list>             | The list of port numbers associated with the IP address. You can only specify multiple egress ports when the MAC address is a multicast MAC address. |
| alias                   | Allows your device to respond to ARP requests for the IP address. Proxy ARP must be enabled on the interface before using this parameter.            |
| vrf                     | Apply this command to a VRF instance.                                                                                                                |
| <vrf-name>              | The name of the VRF instance.                                                                                                                        |

**Mode** Global Configuration

**Usage notes** One use of this command is to limit packet flooding when using services like Microsoft Network Load Balancing (MS-NLB). With such services, packets destined for server cluster virtual address must be sent to all servers in the cluster. The server cluster can operate in multicast mode, in which it uses a multicast MAC address. To support this, this command allows you to create a static ARP entry with a multicast MAC address, and specify which ports the packets will be forwarded out.

Creating a static ARP entry enables the switch to correctly forward server cluster traffic. If you want the switch to also respond to pings from the server cluster, you need to also enable server cluster support, using the [arp-mac-disparity](#) command.

**Examples** To add the IP address 10.10.10.9 with the MAC address 0010.2533.4566 into the ARP cache, and have your device respond to ARP requests for this address, use the commands:

```
awplus# configure terminal
awplus(config)# arp 10.10.10.9 0010.2533.4566 alias
```

**Example (VRF-lite)** To apply the above example within a VRF instance called `red` use the following commands:

```
awplus# configure terminal
awplus(config)# arp vrf red 10.10.10.9 0010.2533.4566 alias
```

**Related commands**

- [arp-mac-disparity](#)
- [clear arp-cache](#)
- [ip proxy-arp](#)
- [show arp](#)

# arp opportunistic-nd

**Overview** Use this command to enable opportunistic neighbor discovery for the global ARP cache. This command changes the behavior for unsolicited ARP packet forwarding on the device.

**CAUTION:** *Opportunistic neighbor discovery can make your device more vulnerable to ARP/ND cache poisoning attacks. We recommend disabling it unless necessary.*

When using VRF-lite, you can use this command to enable opportunistic neighbor discovery for a named VRF instance.

Use the **no** variant of this command to disable opportunistic neighbor discovery for the global ARP cache.

**Syntax** `arp opportunistic-nd`  
`no arp opportunistic-nd`

**Syntax (VRF-lite)** `arp opportunistic-nd [vrf <vrf-name>]`  
`no arp opportunistic-nd [vrf <vrf-name>]`

| Parameter                     | Description                           |
|-------------------------------|---------------------------------------|
| <code>vrf</code>              | Apply this command to a VRF instance. |
| <code>&lt;vrf-name&gt;</code> | The name of the VRF instance.         |

**Default** Opportunistic neighbor discovery is disabled by default.

**Mode** Global Configuration

**Usage notes** When opportunistic neighbor discovery is enabled, the device will reply to any received unsolicited ARP packets (but not gratuitous ARP packets). The source MAC address for the unsolicited ARP packet is added to the ARP cache, so the device forwards the ARP packet. When opportunistic neighbor discovery is disabled, the source MAC address for the ARP packet is not added to the ARP cache, so the ARP packet is not forwarded by the device.

Note this command enables or disables opportunistic neighbor discovery for a VRF instance if the **vrf** parameter and an instance name are applied. If a VRF instance is not specified, then opportunistic neighbor discovery is enabled or disabled for device ports configured for IPv4.

**Examples** To enable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# arp opportunistic-nd
```

To disable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# no arp opportunistic-nd
```

**Example (VRF-lite)** To enable opportunistic neighbor discovery for the VRF instance 'blue', enter:

```
awplus# configure terminal
awplus(config)# arp opportunistic-nd vrf blue
```

To disable opportunistic neighbor discovery for the VRF instance 'blue', enter:

```
awplus# configure terminal
awplus(config)# no arp opportunistic-nd vrf blue
```

- [show running-config interface](#)

# clear arp-cache

**Overview** This command deletes dynamic ARP entries from the ARP cache. You can optionally specify the IPv4 address of an ARP entry to be cleared from the ARP cache.

When running VRF-lite, this command deletes dynamic ARP entries either from the ARP cache of a specific VRF instance, or from the ARP cache of the Global VRF instance. To delete all ARP entries from both the Global VRF instance and all VRF instances, use the command with no parameters. You can optionally specify the IPv4 address for the VRF instance to clear an ARP entry from the ARP cache.

**Syntax** `clear arp-cache [<ip-address>]`

**Syntax (VRF-lite)** `clear arp-cache [vrf <vrf-name>|global] [<ip-address>]`

| Parameter    | Description                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------|
| <ip-address> | Specifies a specific IPv4 address for a VRF instance whose entries are to be cleared from the ARP cache. |
| global       | When VRF-lite is configured, apply this command to the global routing and forwarding table.              |
| vrf          | Apply this command to the specified VRF instance.                                                        |
| <vrf-name>   | The VRF instance name.                                                                                   |

**Mode** Privileged Exec

**Usage notes** To display the entries in the ARP cache, use the [show arp](#) command. To remove static ARP entries, use the no variant of the [arp](#) command.

**Example** To clear all dynamic ARP entries, use the command:

```
awplus# clear arp-cache
```

To clear all dynamic ARP entries associated with the IPv4 address 192.168.1.1, use the command:

```
awplus# clear arp-cache 192.168.1.1
```

**Example (VRF-lite)** To clear the dynamic ARP entries from the VRF instance named blue, use the commands:

```
awplus# clear arp-cache vrf blue
```

To clear the dynamic ARP entries from the VRF instance named blue with the IPv4 address 192.168.1.1, use the commands:

```
awplus# clear arp-cache vrf blue 192.168.1.1
```

When running VRF-lite, to clear the dynamic ARP entries from the global VRF-lite and all VRF instances, use the command:

```
awplus# clear arp-cache
```

[show arp](#)

## clear ip bgp \* (BGP only)

**Overview** Use this command to reset all BGP connections, either by fully resetting sessions or by performing soft resets.

If VRF-lite is configured, you can reset BGP connections for all VRF instances or for a specified VRF instance.

**Syntax**

```
clear ip bgp *
clear ip bgp * in
clear ip bgp * out
clear ip bgp * soft [in|out]
clear ip bgp * in [prefix-filter]
```

**Syntax (VRF-lite)**

```
clear ip bgp * [vrf <vrf-name>]
clear ip bgp * [vrf <vrf-name>] in
clear ip bgp * [vrf <vrf-name>] out
clear ip bgp * [vrf <vrf-name>] soft [in|out]
clear ip bgp * in [prefix-filter]
```

| Parameter     | Description                                                                                                                                                                                                                                                                                                                           |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| *             | Clears all BGP peers.                                                                                                                                                                                                                                                                                                                 |
| in            | Indicates that incoming advertised routes will be cleared.                                                                                                                                                                                                                                                                            |
| prefix-filter | Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.                         |
| out           | Indicates that outgoing advertised routes will be cleared.                                                                                                                                                                                                                                                                            |
| soft in       | Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory. |
| soft out      | Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.                                                                                                                                                                     |
| vrf           | Applies the command to the specified VRF instance.                                                                                                                                                                                                                                                                                    |
| <vrf-name>    | The name of the VRF instance.                                                                                                                                                                                                                                                                                                         |

**Mode** Privileged Exec

**Examples** To clear all BGP peers, use the command:

```
awplus# clear ip bgp *
```

**Example (VRF-lite)** To clear all BGP peers in VRF instance red, use the command:

```
awplus# clear ip bgp * vrf red
```

To clear all outbound BGP peers in VRF instance red, use the command:

```
awplus# clear ip bgp * out vrf red
```

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip bgp (IPv4) (BGP only)

**Overview** Use this command to reset the IPv4 BGP connection to the peer specified by the IP address. When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax [BGP]** `clear ip bgp <ipv4-addr> [in [prefix-filter]|out|soft [in|out]]`

**Syntax (VRF-lite)** `clear ip bgp <ipv4-address> [vrf <vrf-name>] [in|out|soft [in|out]]`

| Parameter     | Description                                                                                                                                                                                                                                                                                                                           |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipv4-addr>   | Specifies the IPv4 address of the neighbor whose connection is to be reset, entered in the form A.B.C.D.                                                                                                                                                                                                                              |
| in            | Indicates that incoming advertised routes will be cleared.                                                                                                                                                                                                                                                                            |
| prefix-filter | Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration.                         |
| out           | Indicates that outgoing advertised routes will be cleared.                                                                                                                                                                                                                                                                            |
| soft in       | Soft inbound reset causes the neighbors to resend all their updates to the local switch, without resetting the connection or clearing the entries in the local switch. So, the local switch stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory. |
| soft out      | Soft outbound reset causes the switch to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries.                                                                                                                                                                     |
| vrf           | Applies the command to the specified VRF instance.                                                                                                                                                                                                                                                                                    |
| <vrf-name>    | The name of the VRF instance.                                                                                                                                                                                                                                                                                                         |

**Mode [BGP]** Privileged Exec

**Examples [BGP]** To clear the BGP connection to the peer at IPv4 address 192.168.1.1 and clear all incoming routes, use the following command:

```
awplus# clear ip bgp 192.168.1.1 in
```

To apply the above example to clear the BGP connection to the peer at IP address 192.0.2.11 for the VRF instance blue, use the following commands:

```
awplus# clear ip bgp 192.0.2.11 vrf blue in
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip rip route

**Overview** Use this command to clear specific data from the RIP routing table.

**Syntax** `clear ip rip route <ip-dest-network/prefix-length>`  
`clear ip rip route`  
`{static|connected|rip|ospf|bgp|invalid-routes|all}`

**Syntax (VRF-lite)** `clear ip rip [vrf <vrf-name>] route`  
`<ip-dest-network/prefix-length>`  
`clear ip rip [vrf <vrf-name>] route`  
`{static|connected|rip|ospf|bgp|invalid-routes|all}`

| Parameter                       | Description                                                                                                                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| vrf                             | Apply this command to a VRF instance.                                                                                                                   |
| <vrf-name>                      | The name of the VRF instance.                                                                                                                           |
| <ip-dest-network/prefix-length> | Removes entries which exactly match this destination address from RIP routing table. Enter the IP address and prefix length of the destination network. |
| static                          | Removes static entries from the RIP routing table.                                                                                                      |
| connected                       | Removes entries for connected routes from the RIP routing table.                                                                                        |
| rip                             | Removes only RIP routes from the RIP routing table.                                                                                                     |
| ospf                            | Removes only OSPF routes from the RIP routing table.                                                                                                    |
| bgp                             | Removes only BGP routes from the RIP routing table.                                                                                                     |
| invalid-routes                  | Removes routes with metric 16 immediately. Otherwise, these routes are not removed until RIP times out the route after 2 minutes.                       |
| all                             | Clears the entire RIP routing table.                                                                                                                    |

**Mode** Privileged Exec

**Usage notes** Using this command with the **all** parameter clears the RIP table of all the routes.

**Examples** To clear the route 10.0.0.0/8 from the RIP routing table, use the following command:

```
awplus# clear ip rip route 10.0.0.0/8
```

**Examples (VRF-lite)** To clear RIP routes associated with the VRF instance 'red' for OSPF routes, use the following command:

```
awplus# clear ip rip vrf red route ospf
```

To clear the route 10.0.0.0/8 from the RIP routing table for the VRF instance 'red', use the following command:

```
awplus# clear ip rip vrf red route 10.0.0.0/8
```

# crypto key pubkey-chain knownhosts

**Overview** This command adds a public key of the specified SSH server to the known host database on your device. The SSH client on your device uses this public key to verify the remote SSH server.

The key is retrieved from the server. Before adding a key to this database, check that the key sent to you is correct.

If the server's key changes, or if your SSH client does not have the public key of the remote SSH server, then your SSH client will inform you that the public key of the server is unknown or altered.

The **no** variant of this command deletes the public key of the specified SSH server from the known host database on your device.

**Syntax** `crypto key pubkey-chain knownhosts [ip|ipv6] <hostname> [ecdsa|rsa]`  
`no crypto key pubkey-chain knownhosts <1-65535>`

**Syntax (VRF-lite)** `crypto key pubkey-chain knownhosts [vrf <vrf-name>] [ip|ipv6] <hostname> [ecdsa|rsa]`  
`no crypto key pubkey-chain knownhosts [vrf <vrf-name>] <1-65535>`

| Parameter                     | Description                                                                                                                                                         |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>vrf</code>              | Apply this command to the specified VRF instance.                                                                                                                   |
| <code>&lt;vrf-name&gt;</code> | The VRF instance name                                                                                                                                               |
| <code>ip</code>               | Keyword used prior to specifying an IPv4 address                                                                                                                    |
| <code>ipv6</code>             | Keyword used prior to specifying an IPv6 address                                                                                                                    |
| <code>&lt;hostname&gt;</code> | IPv4/IPv6 address or hostname of a remote server in the format <code>a.b.c.d</code> for an IPv4 address, or in the format <code>x:x:x:x</code> for an IPv6 address. |
| <code>ecdsa</code>            | Specify the ECDSA public key of the server to be added to the known host database.                                                                                  |
| <code>rsa</code>              | Specify the RSA public key of the server to be added to the known host database.                                                                                    |
| <code>&lt;1-65535&gt;</code>  | Specify a key identifier when removing a key using the <b>no</b> parameter.                                                                                         |

**Default** If no cryptography algorithm is specified, then **rsa** is used as the default cryptography algorithm.

**Mode** Privilege Exec

**Usage notes** This command adds a public key of the specified SSH server to the known host database on the device. The key is retrieved from the server. The remote SSH server is verified by using this public key. The user is requested to check the key is correct before adding it to the database.

If the remote server's host key is changed, or if the device does not have the public key of the remote server, then SSH clients will inform the user that the public key of the server is altered or unknown.

**Examples** To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts 192.0.2.11
```

To delete the second entry in the known host database, use the command:

```
awplus# no crypto key pubkey-chain knownhosts 2
```

**Examples (VRF-lite)** To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 in VRF 'red' to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts vrf red 192.0.2.11
```

To delete the second entry in the known host database in VRF 'red', use the command:

```
awplus# no crypto key pubkey-chain knownhosts vrf red 2
```

**Validation Commands** [show crypto key pubkey-chain knownhosts](#)

# default-metric (RIP)

**Overview** Use this command to specify the metrics to be assigned to redistributed RIP routes. Use the **no** variant of this command to reset the RIP metric back to its default (1).

**Syntax** `default-metric <metric>`  
`no default-metric [<metric>]`

| Parameter | Description                                       |
|-----------|---------------------------------------------------|
| <metric>  | <1-16> Specifies the value of the default metric. |

**Default** By default, the RIP metric value is set to 1.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** This command is used with the [redistribute \(RIP\)](#) command to make the routing protocol use the specified metric value for all redistributed routes, regardless of the original protocol that the route has been redistributed from.

**Examples** This example assigns the cost of 10 to the routes that are redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# default-metric 10
awplus(config-router)# redistribute ospf
awplus(config-router)# redistribute connected
```

**Example (VRF-lite)** This example assigns the cost of 10 to the routes which are redistributed into RIP for the VRF instance blue.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address family ipv4 vrf blue
awplus(config-router-af)# default-metric 10
awplus(config-router-af)# redistribute ospf
awplus(config-router-af)# redistribute connected
```

**Related commands** [redistribute \(RIP\)](#)

# description (VRF)

**Overview** Use this command to add text that describes a specific VRF instance. Descriptions can be up to 80 characters long.

The **no** variant of this command removes the description of the selected VRF instance.

**Syntax** `description <descriptive-text>`  
`no description`

| Parameter                             | Description                                                      |
|---------------------------------------|------------------------------------------------------------------|
| <code>&lt;descriptive-text&gt;</code> | A string of up to 80 characters that describes the VRF instance. |

**Mode** VRF Configuration

**Example** To add the description for a VRF instance named blue, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# description the text description of vrf
blue
```

**Related commands** [show ip vrf](#)

# distance (RIP)

**Overview** This command sets the administrative distance for RIP routes. Your device uses this value to select between two or more routes to the same destination obtained from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). For more information, see the [Route Selection Feature Overview and Configuration Guide](#).

The **no** variant of this command sets the administrative distance for the RIP route to the default of 120.

**Syntax** `distance <1-255> [<ip-addr/prefix-length> [<access-list>]]`  
`no distance [<1-255>] [<ip-addr/prefix-length> [<access-list>]]`

| Parameter               | Description                                                                                                                   |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <1-255>                 | The administrative distance value you are setting for this RIP route.                                                         |
| <ip-addr/prefix-length> | The network IP address and prefix-length that you are changing the administrative distance for.                               |
| <access-list>           | Specifies the access-list name. This access list specifies which routes within the specified network this command applies to. |

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Examples** To set the administrative distance to 8 for the RIP routes within the 10.0.0.0/8 network that match the access-list "mylist", use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distance 8 10.0.0.0/8 mylist
```

To set the administrative distance to the default of 120 for the RIP routes within the 10.0.0.0/8 network that match the access-list "mylist", use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no distance 8 10.0.0.0/8 mylist
```

**Example (VRF-lite)** This example assigns a cost of 10 to the routes for the VRF instance blue, when redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address family ipv4 blue
awplus(config-router-af)# distance 10
```

# distribute-list (RIP)

**Overview** Use this command to filter incoming or outgoing route updates using the access-list or the prefix-list.

When running VRF-lite, this command can be applied to a specific VRF instance.

Use the **no** variant of this command to disable this feature.

**Syntax** `distribute-list {<access-list> | prefix <prefix-list>} {in|out} [<interface>]`  
`no distribute-list {<access-list> | prefix <prefix-list>} {in|out} [<interface>]`

| Parameter     | Description                                           |
|---------------|-------------------------------------------------------|
| <access-list> | Specifies the IPv4 access-list number or name to use. |
| prefix        | Filter prefixes in routing updates.                   |
| <prefix-list> | Specifies the name of the IPv4 prefix-list to use.    |
| in            | Filter incoming routing updates.                      |
| out           | Filter outgoing routing updates.                      |
| <interface>   | The interface on which the filtering applies.         |

**Default** Disabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** Filter out incoming or outgoing route updates using an access-list or a prefix-list. If you do not specify the name of the interface, the filter will be applied to all interfaces.

**Examples** To apply an ACL called 'myfilter' to filter incoming routing updates on VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distribute-list myfilter in vlan2
```

To apply a prefix list called 'myfilter' to filter incoming routing updates on VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distribute-list prefix myfilter in vlan2
```

**Example (VRF-lite)** This example applies the commands of the previous prefix-list example, but to a specific VRF named blue:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# distribute-list prefix myfilter in
vlan2
```

**Related commands** [access-list extended \(named\)](#)  
[ip prefix-list](#)

# export map

**Overview** This command associates a route map with a specific VRF instance. It provides a finer control over the routes that are exported out of a VRF instance by the **route-target** command. Note, however, that this command does not replace the need for a route-target export in the VRF configuration.

The **no** variant of this command disables the capability to export route map entries for a specified VRF instance.

**Syntax** `export map <route-map>`  
`no export map`

| Parameter                      | Description         |
|--------------------------------|---------------------|
| <code>&lt;route-map&gt;</code> | The route-map name. |

**Mode** VRF Configuration

**Usage notes** Use this command to export route-map entries in VRF configuration mode.

**Example** To export the route map named routemap2 for the VRF instance named blue, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# export map routemap2
```

**Related commands** [import map](#)

# fullupdate (RIP)

**Overview** Use this command to specify which routes RIP should advertise when performing a triggered update. By default, when a triggered update is sent, RIP will only advertise those routes that have changed since the last update. When **fullupdate** is configured, the device advertises the full RIP route table in outgoing triggered updates, including routes that have not changed. This enables faster convergence times, or allows inter-operation with legacy network equipment, but at the expense of larger update messages.

Use the **no** variant of this command to disable this feature.

**Syntax** fullupdate  
no fullupdate

**Default** By default this feature is disabled.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage (VRF-lite)** If VRF-lite is configured, you can apply this command for either the global routing environment, or to a specific VRF instance.

**Example** To enable the fullupdate (RIP) function, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# fullupdate
```

**Example (VRF-lite)** To enable the full update (RIP) function on the VRF instance named 'blue', use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# fullupdate
```

# http client vrf

**Overview** Use this command to enable the use of a specific VRF for the command **copy http**.  
Use the **no** variant of this command to disable the configured VRF.

**Syntax** `http client vrf <vrf-name>`  
`no http client vrf`

| Parameter                                         | Description                                            |
|---------------------------------------------------|--------------------------------------------------------|
| <code>vrf</code><br><code>&lt;vrf-name&gt;</code> | Specify the VRF to use when copying a file using HTTP. |

**Default** Global VRF.

**Mode** Privileged Exec

**Examples** To enable the use of VRF 'MyVRF', use the commands:

```
awplus# configure terminal
awplus(config)# http client vrf MyVRF
```

To remove a specified VRF and revert to the global VRF, use the commands:

```
awplus# configure terminal
awplus(config)# no http client vrf
```

**Output** Figure 32-1: Example output if the specified VRF does not exist:

```
"Invalid VRF instance MyVRF"
```

**Related commands** [copy \(filename\)](#)  
[show http client](#)

**Command changes** Version 5.5.2-1.1: command added

# http vrf

**Overview** Use this command to configure an HTTP server to be run within a specified VRF. Use the **no** variant of this command to remove a VRF configuration from the HTTP server.

**Syntax** `http vrf <vrf-name>`  
`no http vrf`

| Parameter                                         | Description                                                                           |
|---------------------------------------------------|---------------------------------------------------------------------------------------|
| <code>vrf</code><br><code>&lt;vrf-name&gt;</code> | Specify the VRF to use when running the HTTP server.<br>The name of the VRF instance. |

**Default** By default the HTTP server uses the global VRF.

**Mode** Global Configuration

**Examples** To configure VRF 'MyVRF', use the commands:

```
awplus# configure terminal
awplus(config)# http vrf MyVRF
```

To return the HTTP server to the global VRF, use the commands:

```
awplus# configure terminal
awplus(config)# no http vrf
```

**Related commands** [service http](#)  
[show http](#)

**Command changes** Version 5.5.2-1.1: command added

# import map

**Overview** The import map command associates a route map with a specific VRF instance. The import map command does not replace the need for a route-target import in the VRF configuration. It provides a finer control over the routes imported into a VRF instance by the **route-target** command.

The **no** variant of this command disables the capability to import route map entries for a specified VRF instance.

**Syntax** `import map <route-map>`  
`no import map`

| Parameter                      | Description         |
|--------------------------------|---------------------|
| <code>&lt;route-map&gt;</code> | The route-map name. |

**Mode** VRF Configuration

**Usage notes** Use this command to import route-map entries into the specified VRF instance.

**Example** To import the route map named `routemap2` for the VRF instance named `blue`, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# import map routemap2
```

**Related commands** [export map](#)

# ip route static inter-vrf

**Overview** Applying this command enables static inter-VRF routing. Note that static inter-VRF routing must be enabled before you can use the **ip route** command to create a static inter-VRF route.

The **no** variant of this command disables static inter-VRF routing.

**Syntax** `ip route static inter-vrf`  
`no ip route static inter-vrf`

**Mode** VRF Configuration

**Default** Static inter-VRF routing is enabled.

**Example** To enable static inter-VRF routing, use the following commands:

```
awplus# config terminal
awplus(config)# ip route static inter-vrf
```

**Related commands** [ip route](#)  
[show ip route](#)

# ip route vrf

**Overview** This command adds a static route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to advertise routes to neighbors and forward packets.

When using VRF (Virtual Routing and Forwarding), you can use this command to configure a static inter-VRF route to a destination network that is reachable by a remote gateway located in a different VRF instance. Note that to apply the command in this way, the [ip route static inter-vrf](#) command must be in enabled (its default condition). For more information about VRF, see the [VRF Feature Overview and Configuration Guide](#) and the [VRF-lite Commands](#) chapter.

The **no** variant of this command removes the static route from the RIB and FIB.

**Syntax**

```
ip route [vrf <vrf-name>] <subnet&mask>
{<gateway-ip>|<interface>} [<distance>] [description
<description>]

ip route [vrf <vrf-name>] <subnet&mask> fall-over bfd [disable]

ip route [vrf <vrf-name>] <subnet&mask> fall-over bfd [profile
<profile-name>]

no ip route [vrf <vrf-name>] <subnet&mask>
{<gateway-ip>|<interface>} [<distance>]

no ip route [vrf <vrf-name>] <subnet&mask> fall-over bfd
[disable]

no ip route [vrf <vrf-name>] <subnet&mask> fall-over bfd
[profile <profile-name>]
```

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <subnet&mask> | The IPv4 address of the destination subnet defined using either a prefix length or a separate mask specified in one of the following formats: <ul style="list-style-type: none"><li>The IPv4 subnet address in dotted decimal notation followed by the subnet mask, also in dotted decimal notation.</li><li>The IPv4 subnet address in dotted decimal notation, followed by a forward slash, then the prefix length.</li></ul>                                                                                                                       |
| <gateway-ip>  | The IPv4 address of the gateway device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <interface>   | The interface that connects your device to the network. Enter the name of the VLAN or its VID. You can also enter 'null' as an interface. Specify a 'null' interface to add a null or blackhole route to the switch.<br>The gateway IP address or the interface is required if VRF-lite is not configured.<br>If VRF-lite is configured: When adding a static intra-VRF route, you must specify either the gateway IP address or the interface. When adding a static inter-VRF route, you must specify both the gateway IP address and the interface. |

| Parameter                                                    | Description                                                                                                                                                                                                                                                                        |
|--------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;distance&gt;</code>                                | The administrative distance for the static route in the range 1 to 255. Static routes by default have an administrative distance of 1, which gives them the highest priority possible.                                                                                             |
| <code>vrf</code>                                             | Applies the command to the specified VRF instance.                                                                                                                                                                                                                                 |
| <code>&lt;vrf-name&gt;</code>                                | The name of the VRF instance to enter IPv4 Address-Family mode for.                                                                                                                                                                                                                |
| <code>description</code><br><code>&lt;description&gt;</code> | A description to record the route's purpose. It can be up to 80 printable ASCII characters long, including spaces. The description does not affect routing or forwarding decisions made by the device. To see the description, use the command <b>show running-configuration</b> . |
| <code>fall-over bfd</code>                                   | Enable BFD fall-over detection on the static route.                                                                                                                                                                                                                                |
| <code>disable</code>                                         | Disable BFD fall-over detection on the static route.                                                                                                                                                                                                                               |
| <code>profile</code><br><code>&lt;profile-name&gt;</code>    | Apply the settings from a BFD profile when enabling BFD fall-over detection.                                                                                                                                                                                                       |

**Mode** Global Configuration

**Default** The default administrative distance for a static route is 1.

**Usage notes** You can use administrative distance to determine which routes take priority over other routes.

Specify a 'Null' interface to add a null or blackhole route to the switch. A null or blackhole route is a routing table entry that does not forward packets, so any packets sent to it are dropped.

Versions of AlliedWare Plus earlier than 5.5.1-2.1 do not support descriptions on static routes, so a start-up configuration that contains descriptions will be rejected by these older versions. If you add descriptions, be careful if you downgrade to an older AlliedWare Plus version.

The **fall-over bfd** parameter is used to enable or disable BFD fall-over detection on an IP route under the specified VRF.

Use the command:

- **ip route vrf fall-over bfd** to enable BFD fall-over detection on the specified static route.
- **no ip route vrf fall-over bfd disable** to re-enable BFD fall-over detection on the specified static route.
- **no ip route vrf fall-over bfd** to disable BFD fall-over detection on the specified static route.
- **ip route vrf fall-over bfd disable** to disable BFD fall-over detection on the specified static route, if you have used the command [bfd all-interfaces](#) and want to override it for this particular route.

You can also use the **profile** parameter with this command to apply or remove a BFD profile's settings.

Use the command:

- **ip route vrf fall-over bfd profile <name>** to enable BFD fall-over detection and apply the profile's settings to the specified static route.
- **no ip route vrf fall-over bfd profile** to revert back to using default profile settings.

**Examples** To create a static route from source VRF instance red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6, use the following commands:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
```

To remove a static route from source VRF red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip route vrf red 192.168.50.0/24
192.168.20.6
```

To create a static route from source VRF red, to the subnet 192.168.50.0/24 with a next hop of 192.168.20.6 via vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
vlan10
```

To give a route a description of 'test' when creating it, use the commands:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
description test
```

To remove the description from a route, re-enter the route without specifying the **description** parameter:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
```

To enable BFD fall-over detection for an IP route under VRF red, use the commands:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
fall-over bfd
```

To disable BFD fall-over detection for an IP route under VRF red, use the commands:

```
awplus# configure terminal
awplus(config)# no ip route vrf red 192.168.50.0/24
192.168.20.6 fall-over bfd
```

To enable BFD fall-over detection for IP routes on all interfaces except under VRF red, use the commands:

```
awplus# configure terminal
awplus(config)# ip route bfd all-interfaces
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
fall-over bfd disable
```

To re-enable BFD fall-over detection for an IP route under VRF red, use the commands:

```
awplus# configure terminal
awplus(config)# no ip route vrf red 192.168.50.0/24
192.168.20.6 fall-over bfd disable
```

To enable BFD fall-over detection and add the settings from BFD profile 'bfdProfile' to the BFD session for an IP route under VRF red, use the commands:

```
awplus# configure terminal
awplus(config)# ip route vrf red 192.168.50.0/24 192.168.20.6
fall-over bfd profile bfdProfile
```

To revert back to using default profile settings for an IP route under VRF red, use the commands:

```
awplus# configure terminal
awplus(config)# no ip route vrf red 192.168.50.0/24
192.168.20.6 fall-over bfd profile bfdProfile
```

**Command  
changes**

Version 5.5.2-1.1: **fall-over bfd** and **profile** parameters added for the SBx81CFC960, SBx908 GEN2, x950, x930, and x530 series.

Version 5.5.1-2.1: **weight** and **description** parameters added.

Version 5.5.2-2.1: **weight** parameter added for 10GbE UTM firewall.

# ip tftp vrf

**Overview** Use this command to specify a VRF to use when copying a file via TFTP.

Use the **no** variant of this command to remove the VRF from the configuration and set it back to the default VRF.

**Syntax** `ip tftp vrf <vrf-name>`  
`no ip tftp vrf`

| Parameter                                         | Description                                            |
|---------------------------------------------------|--------------------------------------------------------|
| <code>vrf</code><br><code>&lt;vrf-name&gt;</code> | Specify the VRF to use when copying a file using TFTP. |

**Default** Global VRF

**Mode** Global Configuration

**Example** To configure a VRF called 'red' to use when copying a file via TFTP, use the commands:

```
awplus# configure terminal
awplus(config)# ip tftp vrf red
```

**Related commands** [copy \(filename\)](#)

**Command changes** Version 5.5.2-1.1: command added

# ip vrf

**Overview** This command creates a VRF instance and specifies its unique name. You can also optionally specify a VRF ID. If you do not specify the VRF ID, a unique ID will automatically be created and assigned to the VRF instance.

The **no** variant of this command removes a selected VRF instance. All interfaces previously belonging to the removed instance are then returned to the global routing and forwarding environment.

**Syntax** `ip vrf <vrf-name> [<vrf-inst-id>]`  
`no ip vrf <vrf-name> [<vrf-inst-id>]`

| Parameter     | Description                                                 |
|---------------|-------------------------------------------------------------|
| <vrf-name>    | The name of the VRF instance.                               |
| <vrf-inst-id> | The ID of the VRF instance, a number in the range 1 to 600. |

**Mode** Global Configuration

**Default** Static inter-VRF routing is enabled

**Example** To create a VRF instance named `vrf blue` and assign it the ID number `2`, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue 2
```

**Command changes** Version 5.4.6-2.1: On AR Series devices: VRF-lite support added  
Version 5.5.0-0.1: On SBx908 GEN2 and x950 Series devices: **vrf-inst-id** parameter range increased to 600.

# ip vrf forwarding

**Overview** This command associates a VRF instance with an interface.  
The **no** variant of this command disassociates the VRF instance from its interface.

**Syntax** `ip vrf forwarding <vrf-name>`  
`no ip vrf <vrf-name>`

| Parameter  | Description                   |
|------------|-------------------------------|
| <vrf-name> | The name of the VRF instance. |

**Mode** Interface Configuration

**Default** The default for an interface is the global routing table.

**Examples** For LAN interfaces, to associate the VRF instance named `blue` with the VLAN interface `vlan-admin`, use the following commands:

```
awplus# config terminal
awplus(config)# interface vlan-admin
awplus(config-if)# ip vrf forwarding blue
```

# log host

**Overview** This command configures the device to send log messages to a remote syslog server via UDP port 514. The IP address of the remote server must be specified. By default no filters are defined for remote syslog servers. Filters must be defined before messages will be sent.

Use the **no** variant of this command to stop sending log messages to the remote syslog server.

**Syntax** `log host <ipv4-addr> [secure]`  
`log host <ipv6-addr>`  
`no log host <ipv4-addr>|<ipv6-addr>`

**Syntax (VRF-lite)** `log host <ipv4-addr>|<ipv6-addr> [vrf <vrf-name>] [secure]`  
`no log host <ipv4-addr>|<ipv6-addr> [vrf <vrf-name>]`

| Parameter         | Description                                                                                                                                                                                                                                                                        |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipv4-addr>       | Specify the source IPv4 address, in dotted decimal notation (A.B.C.D).                                                                                                                                                                                                             |
| <ipv6-addr>       | Specify the source IPv6 address, in X:X::X:X notation.                                                                                                                                                                                                                             |
| vrf<br><vrf-name> | The name of a VRF instance. Use this to specify the VRF that the remote syslog server (host) is accessible by. Hosts are uniquely identified by their address and VRF, so multiple hosts can have the same address as long as the VRF is different. The default is the global VRF. |
| secure            | Optional value to create a secure log destination. This option is only valid for IPv4 hosts.                                                                                                                                                                                       |

**Mode** Global Configuration

**Usage notes** Use the optional **secure** parameter to configure a secure IPv4 syslog host. For secure hosts, syslog over TLS is used to encrypt the logs. The certificate received from the remote log server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

The remote server may also request that a certificate is transmitted from the local device. In this situation the first trustpoint added to the syslog application will be transmitted to the remote server.

For detailed information about securing syslog, see the [PKI Feature Overview\\_and Configuration\\_Guide](#).

**Examples** To configure the device to send log messages to a remote secure syslog server with IP address 10.32.16.99, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.99 secure
```

To stop the device from sending log messages to the remote syslog server with IP address 10.32.16.99, use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.99
```

**Example (VRF-lite)** To configure the device to send log messages to a remote syslog server that is accessible via VRF 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.99 vrf red
```

**Command changes** Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

# log host exclude

**Overview** Use this command to prevent specified log messages from being sent to the remote syslog server, when **log host** is enabled. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log host {<hostname>|<ipv4-addr>|<ipv6-addr>} exclude [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log host {<hostname>|<ipv4-addr>|<ipv6-addr>} exclude [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

**Syntax (VRF-lite)** `log host {<hostname>|<ipv4-addr>|<ipv6-addr>} [vrf <vrf-name>] exclude [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log host {<hostname>|<ipv4-addr>|<ipv6-addr>} [vrf <vrf-name>] exclude [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]`

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |               |                    |          |                                  |            |                     |          |                  |            |                    |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|--------------------|----------|----------------------------------|------------|---------------------|----------|------------------|------------|--------------------|
| <hostname>        | The host name of a remote syslog server.                                                                                                                                                                                                                                                                                                                                                                                                                                               |               |                    |          |                                  |            |                     |          |                  |            |                    |
| <ipv4-addr>       | The IPv4 address of a remote syslog server, in A.B.C.D format.                                                                                                                                                                                                                                                                                                                                                                                                                         |               |                    |          |                                  |            |                     |          |                  |            |                    |
| <ipv6-addr>       | The IPv6 address of a remote syslog server, in X:X::X:X format.                                                                                                                                                                                                                                                                                                                                                                                                                        |               |                    |          |                                  |            |                     |          |                  |            |                    |
| vrf<br><vrf-name> | The name of a VRF instance. Use this if the syslog server is inside a VRF. The default is the global VRF.                                                                                                                                                                                                                                                                                                                                                                              |               |                    |          |                                  |            |                     |          |                  |            |                    |
| level             | Exclude messages of the specified severity level.                                                                                                                                                                                                                                                                                                                                                                                                                                      |               |                    |          |                                  |            |                     |          |                  |            |                    |
| <level>           | The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: <table><tr><td>0 emergencies</td><td>System is unusable</td></tr><tr><td>1 alerts</td><td>Action must be taken immediately</td></tr><tr><td>2 critical</td><td>Critical conditions</td></tr><tr><td>3 errors</td><td>Error conditions</td></tr><tr><td>4 warnings</td><td>Warning conditions</td></tr></table> | 0 emergencies | System is unusable | 1 alerts | Action must be taken immediately | 2 critical | Critical conditions | 3 errors | Error conditions | 4 warnings | Warning conditions |
| 0 emergencies     | System is unusable                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |               |                    |          |                                  |            |                     |          |                  |            |                    |
| 1 alerts          | Action must be taken immediately                                                                                                                                                                                                                                                                                                                                                                                                                                                       |               |                    |          |                                  |            |                     |          |                  |            |                    |

| syslog        | Messages generated internally by syslogd                                                                                |
| lpr           | Line printer subsystem                                                                                                  |
| news          | Network news subsystem                                                                                                  |
| uucp          | UUCP subsystem                                                                                                          |
| cron          | Clock daemon                                                                                                            |
| authpriv      | Security/authorization messages (private)                                                                               |
| ftp           | FTP daemon                                                                                                              |
| msgtext       | Exclude messages containing a certain text string.                                                                      |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To exclude messages that contain the string 'example of irrelevant message' being sent to the remote syslog server 10.10.10.100, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.10.10.100 exclude msgtext example
of irrelevant message
```

**Example (VRF-lite)** To exclude messages that contain the string 'example of irrelevant message' being sent to the remote syslog server 10.10.10.100, within VRF 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.10.10.100 vrf red exclude msgtext
example of irrelevant message
```

- [log host source](#)
- [log host time](#)
- [show log config](#)

**Command changes** Version 5.2.2-1.1: **vrf** parameter added for products that support VRF

# log host (filter)

**Overview** This command creates a filter to select messages to be sent to a remote syslog server. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a substring within the message or a combination of some or all of these.

The **no** variant of this command configures the device to no longer send log messages to a remote syslog server. The IP address of the syslog server must be specified. All configuration relating to this log target will be removed.

**Syntax** `log host <ip-addr> [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`  
`no log host <ip-addr> [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`

**Syntax (VRF-lite)** `log host <ip-addr> [vrf <vrf-name>] [level <level>] [program  
<program-name>] [facility <facility>] [msgtext <text-string>]`  
`no log host <ip-addr> [vrf <vrf-name>] [level <level>] [program  
<program-name>] [facility <facility>] [msgtext <text-string>]`

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |               |                                    |          |                                  |            |                     |          |                  |            |                    |           |                                     |                 |                        |             |                      |

| <program-name>    | The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. <table><tr><td>rip</td><td>Routing Information Protocol (RIP)</td></tr></table>                                                                                                                                                                                                                                                                                                           | rip           | Routing Information Protocol (RIP) |          |                                  |            |                     |          |                  |            |                    |           |                                     |                 |                        |             |                      |
| rip               | Routing Information Protocol (RIP)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |               |                                    |          |                                  |            |                     |          |                  |            |                    |           |                                     |                 |                        |             |                      |

| Parameter  | Description                                                              |

| dhcpsn     | DHCP snooping (DHCP SN)                                                  |
| facility   | Filter messages by syslog facility.                                      |
| <facility> | Specify one of the following syslog facilities to include messages from: |
| kern       | Kernel messages                                                          |
| user       | Random user-level messages                                               |
| mail       | Mail system                                                              |
| daemon     | System daemons                                                           |
| auth       | Security/authorization messages                                          |
| syslog     | Messages generated internally by syslogd                                 |
| lpr        | Line printer subsystem                                                   |
| news       | Network news subsystem                                                   |
| uucp       | UUCP subsystem                                                           |
| cron       | Clock daemon                                                             |
| authpriv   | Security/authorization messages (private)                                |

| Parameter     | Description                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------|
|               | ftp FTP daemon                                                                                                          |
| msgtext       | Select messages containing a certain text string.                                                                       |
| <text-string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Mode** Global Configuration

**Examples** To create a filter to send all messages generated by EPSR that have a severity of **notices** or higher to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 level notices program epsr
```

To create a filter to send all messages containing the text "Bridging initialization", to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 msgtext "Bridging
initialization"
```

To create a filter to send messages with a severity level of **informational** and above to the syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 level informational
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.21 level notices program
epsr
```

To remove a filter that sends all messages containing the text "Bridging initialization", to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.21 msgtext "Bridging
initialization"
```

To remove a filter that sends messages with a severity level of **informational** and above to the syslog server with IP address 10.32.16.21, use the following commands:

```
awplusawplus# configure terminal
awplus(config)# no log host 10.32.16.21 level informational
```

**Example (VRF-lite)** To create a filter to send messages with a severity level of **informational** and above to the syslog server with IP address 10.32.16.21, when that server is in VRF 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 vrf red level
informational
```

**Command changes** Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

# log host time

**Overview** This command configures the time used in messages sent to a remote syslog server. If the syslog server is in a different time zone to your device then the time offset can be configured using either the **utc-offset** parameter option keyword or the **local-offset** parameter option keyword, where **utc-offset** is the time difference from UTC (Universal Time, Coordinated) and **local-offset** is the difference from local time.

**Syntax** `log host {<hostname>|<ipv4-addr>|<ipv6-addr>} time {local|local-offset|utc-offset {plus|minus} <0-24>}`

**Syntax (VRF-lite)** `log host {<ipv4-addr>|<ipv6-addr>} [vrf <vrf-name>] time {local|local-offset|utc-offset {plus|minus} <0-24>}`

| Parameter       | Description                                                                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <hostname>      | The host name of a remote syslog server.                                                                                                                                                                       |
| <ipv4-addr>     | The IPv4 address of a remote syslog server, in A.B.C.D format.                                                                                                                                                 |
| <ipv6-addr>     | The IPv6 address of a remote syslog server, in X:X::X:X format.                                                                                                                                                |
| <email-address> | The email address to send log messages to                                                                                                                                                                      |
| vrf <vrf-name>  | The name of a VRF instance. Use this if the syslog server is inside a VRF. The default is the global VRF.                                                                                                      |
| time            | Specify the time difference between the email recipient and the device you are configuring.                                                                                                                    |
| local           | The device is in the same time zone as the email recipient                                                                                                                                                     |
| local-offset    | The device is in a different time zone to the email recipient. Use the <b>plus</b> or <b>minus</b> keywords and specify the difference (offset) from local time of the device to the email recipient in hours. |
| utc-offset      | The device is in a different time zone to the email recipient. Use the <b>plus</b> or <b>minus</b> keywords and specify the difference (offset) from UTC time of the device to the email recipient in hours.   |
| plus            | Negative offset (difference) from the device to the syslog server.                                                                                                                                             |
| minus           | Positive offset (difference) from the device to the syslog server.                                                                                                                                             |
| <0-24>          | World Time zone offset in hours                                                                                                                                                                                |

**Default** The default is **local** time.

**Mode** Global Configuration

**Usage notes** Use the **local** option if the remote syslog server is in the same time zone as the device. Messages will display the time as on the local device when the message was generated.

Use the **offset** option if the email recipient is in a different time zone to this device. Specify the time offset of the remote syslog server in hours. Messages will display the time they were generated on this device but converted to the time zone of the remote syslog server.

**Examples** To send messages to the remote syslog server with the IP address 10.32.16.21 in the same time zone as the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 time local 0
```

To send messages to the remote syslog server with the IP address 10.32.16.12 with the time information converted to the time zone of the remote syslog server, which is 3 hours ahead of the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.12 time local-offset plus 3
```

To send messages to the remote syslog server with the IP address 10.32.16.02 with the time information converted to the time zone of the email recipient, which is 3 hours behind the device's UTC time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.02 time utc-offset minus 3
```

**Example (VRF-lite)** To send messages to the remote syslog server with the IP address 10.32.16.02 within the VRF 'red', in the same time zone as the switch's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.02 vrf red time utc-offset minus 3
```

**Command changes** Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

# max-fib-routes (VRF)

**Overview** This command now enables you to control the maximum number of FIB routes configured for a VRF instance. It operates by providing parameters that enable you to configure preset maximums and warning message thresholds.

**NOTE:** This command applies to a user-defined VRF instance; to set the max-fib-routes for the Global VRF instance use the [max-fib-routes](#) command. For static routes use the [max-static-routes](#) command for the Global VRF instance and the [max-static-routes \(VRF\)](#) command for a user-defined VRF instance.

Use the **no** variant of this command to set the maximum number of FIB routes to the default of 4294967294 FIB routes.

**Syntax** max-fib-routes <1-4294967294> [<1-100>|warning-only]  
no max-fib-routes

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| max-fib-routes | The maximum number of routes that can be stored in Forwarding Information dataBase for either the Global VRF or a VRF instance.                                                                                                                                                                                                              |
| <1-4294967294> | The allowable configurable range for setting the maximum number of FIB-routes.                                                                                                                                                                                                                                                               |
| <1-100>        | This parameter enables you to optionally apply a percentage value. This percentage will be based on the maximum number of FIB routes you have specified. This will cause a warning message to appear when your routes reach your specified percentage value. Routes can continue to be added until your configured maximum value is reached. |
| warning-only   | This parameter enables you to optionally apply a warning message. If you set this option a warning message will appear if your maximum configured value configured. Routes can continue to be added until your switch reaches either the maximum capacity value of 4294967294, or a practical system limit.                                  |

**Mode** VRF Configuration

**Default** Sets the maximum number of dynamic routes to 4294967294 and no warning threshold.

**Examples** To set the maximum number of dynamic routes to 2000 and warning threshold of 75% on VRF instance blue, use the commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# max-fib-routes 2000 75
```

**Related  
commands**    `max-fib-routes`  
                  `show ip route`

# max-static-routes (VRF)

**Overview** Use this command to set the maximum number of static routes (excluding FIB—Forwarding Information Base routes) for VRF instances. A limit of 1000 static routes can be assigned to each individual VRF instance. For example you can assign 800 static routes to the Global VRF, then also assign 600 static routes to VRF instance Blue, and a further 600 routes to VRF instance Green.

**NOTE:** This command applies to a user-defined VRF instance; to set the max-static-routes for the Global VRF instance use the [max-static-routes](#) command. For FIB routes use the [max-fib-routes](#) command for the Global VRF instance and the [max-fib-routes \(VRF\)](#) command for a user-defined VRF instance.

Use the **no** variant of this command to reset the maximum number of static routes to the default value of 1000.

**Syntax** max-static-routes <1-1000>  
no max-static-routes

**Default** The default number of static routes is the maximum number of static routes (1000).

**Mode** VRF Configuration

**Example** To assign 200 static routes to VRF instance Blue, use the following commands:

```
awplus# configure terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# max-static-routes 200
```

**NOTE:** Static routes are applied before adding routes to the RIB (Routing Information Base). Therefore, rejected static routes will not appear in the running config.

**Related commands** [max-fib-routes \(VRF\)](#)

# neighbor next-hop-self

**Overview** Use this command to configure the BGP or BGP4+ router as the next hop for a BGP or BGP4+ speaking neighbor or peer group.

Use the **no** variant of this command to disable this feature.

**Syntax** `neighbor <neighborid> next-hop-self`  
`no neighbor <neighborid> next-hop-self`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | { <ip-address>   <ipv6-addr>   <peer-group> }                                                                                                                                                                                                                                                                              |
| <ip-address> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
| <ipv6-addr>  | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                              |
| <peer-group> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage notes** This command allows a BGP or BGP4+ router to change the next hop information that is sent to the iBGP peer. The next hop information is set to the IP address of the interface used to communicate with the neighbor.

This command can be run for a specific VRF instance.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# no neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 next-hop-self
```

**Examples**  
**[BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
next-hop-self

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
next-hop-self

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 next-hop-self

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 next-hop-self
```

[neighbor route-map](#)

**Command**  
**changes**

Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor password

**Overview** Use this command to enable MD5 authentication on a TCP connection between BGP and BGP4+ neighbors. No authentication is applied by default. To setup authentication for the session, you must first apply authentication on each connected peer for the session.

Use the **no** variant of this command to disable this function.

**Syntax [BGP]** `neighbor {<ip-address>|<peer-group-name>} password <password>`  
`no neighbor {<ip-address>|<peer-group-name>} password`  
`[<password>]`

**Syntax [BGP4+]** `neighbor {<ipv6-addr>|<peer-group-name>} password <password>`  
`no neighbor {<ipv6-addr>|<peer-group-name>} password`  
`[<password>]`

| Parameter         | Description                                                                                                                             |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address>      | Specifies the IP address of the BGP neighbor, in A.B.C.D format.                                                                        |
| <ipv6-addr>       | Specifies the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                        |
| <peer-group-name> | Name of an existing peer-group. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <password>        | An alphanumeric string of characters to be used as password.                                                                            |

**Default** No authentication is applied by default.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage notes** When using the <peer-group-name> parameter with this command (to apply this command to all peers in the group), see the related commands [neighbor peer-group \(add a neighbor\)](#) and [neighbor route-map](#) for information about how to create peer groups first.

**Examples [BGP]** This example specifies the encryption type and the password 'manager' for the neighbor 10.10.10.1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 password manager
```

This example removes the password set for the neighbor 10.10.10.1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 password
```

This example specifies the encryption type and the password 'manager' for the neighbor peer group named 'group1':

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 password manager
```

This example removes the password set for the neighbor peer group named group1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 password
```

#### **Examples (VRF-lite)**

This example specifies the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# neighbor 10.10.10.1 password manager
```

This example removes the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family, VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# no neighbor 10.10.10.1 password
manager
```

This example specifies the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family, VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# neighbor group1 password manager
```

**Examples [BGP4+]** This example specifies the encryption type and the password 'manager' for the neighbor 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor password manager
2001:0db8:010d::1
```

This example removes the password set for the neighbor 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor password 2001:0db8:010d::1
```

This example specifies the encryption type and the password 'manager' for the neighbor peer group named group1:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor remote-as 102001:0db8:010d::1
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor peer-group group1
2001:0db8:010d::1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 password manager
```

This example removes the password set for the neighbor peer group named 'group1':

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 password
```

# neighbor remote-as

**Overview** Use this command to configure an internal BGP or BGP4+ (iBGP or eBGP) peering relationship with another router.

Use the **no** variant of this command to remove a previously configured BGP or BGP4+ peering relationship.

**Syntax** `neighbor <neighborid> remote-as <as-number>`  
`no neighbor <neighborid> remote-as <as-number>`

**Syntax (VRF- lite)** `neighbor <neighborid> remote-as <as-number> [global|vrf <vrf-name>]`  
`no neighbor <neighborid> remote-as <as-number>`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                             |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <neighborid> | { <ip-address>   ipv6-addr   <peer-group> }                                                                                                                                                                                                                                                                                             |
|              | <ip-address> Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                           |
|              | ipv6-addr Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.                                                                                                                                                                                                                                 |
|              | <peer-group> Enter the name of an existing peer-group. For information on how to create peer groups, refer to the <a href="#">neighbor peer-group (add a neighbor)</a> command, and <a href="#">neighbor route-map</a> command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <as-number>  | <1-4294967295> Neighbor's Autonomous System (AS) number.                                                                                                                                                                                                                                                                                |
| global       | Specify that the remote neighbor exists locally within the device, in the global routing domain                                                                                                                                                                                                                                         |
| vrf          | Specify that the remote neighbor exists locally within the device, in the specified VRF instance.                                                                                                                                                                                                                                       |
| <vrf-name>   | The name of the VRF instance.                                                                                                                                                                                                                                                                                                           |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage notes** This command is used to configure iBGP and eBGP peering relationships with other BGP or BGP4+ neighbors. A peer-group support of this command is configured only after creating a specific peer-group. Use the **no** variant of this command to remove a previously configured BGP peering relationship.

The **vrf** and **global** parameters are used to create internal 'loopback' BGP connections within the device between two VRF instances. This is used to leak BGP routes between a named VRF instance and the global routing instance. This requires BGP neighbors to be configured in both the global routing instance and in the named VRF instance.

**Examples [BGP]** To configure a BGP peering relationship from the neighbor with the IPv4 address 10.10.0.73 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.73 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the IPv4 address 10.10.0.73 from another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.73 remote-as 10
```

To configure a BGP peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

**Examples [BGP4+]** To configure a BGP4+ peering relationship with another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 345
```

To remove a configured BGP4+ peering relationship from another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# no neighbor 2001:0db8:010d::1 remote-as 345
```

To configure a BGP4+ peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP4+ peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

**Command  
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# network (RIP)

**Overview** Use this command to activate the transmission of RIP routing information on the defined network.

Use the **no** variant of this command to remove the specified network or interface as one that runs RIP.

**Syntax** `network {<network-address>[/<subnet-mask>]|<interface>}`  
`no network {<network-address>[/<subnet-mask>]|<interface>}`

| Parameter                                                                   | Description                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;network-address&gt;</code><br><code>[/&lt;subnet-mask&gt;]</code> | Specifies the network address to run RIP. Entering a subnet mask (or prefix length) for the network address is optional. Where no mask is entered, the device will attempt to apply a mask that is appropriate to the class (A, B, or C) of the address entered, e.g. an IP address of 10.0.0.0 will have a prefix length of 8 applied to it. |
| <code>&lt;interface&gt;</code>                                              | Specify an interface to run RIP.                                                                                                                                                                                                                                                                                                              |

**Default** Disabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** Use this command to specify networks, by IP address or interface, to which routing updates will be sent and received. The connected routes corresponding to the specified network will be automatically advertised in RIP updates. RIP updates will be sent and received within the specified network.

When running VRF-lite, this command can be applied to a VRF instance.

**Example** Use the following commands to activate RIP routing updates on network 172.16.20.0/24:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# network 172.16.20.0/24
```

**Example (VRF-lite)** To activate RIP routing updates on vlan3 for VRF instance 'blue'.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# network vlan3
```

**Related  
commands**    `show ip rip`  
                  `show running-config`  
                  `clear ip rip route`

# offset-list (RIP)

**Overview** Use this command to add an offset to the **in** and **out** metrics of routes learned through RIP.

Use the **no** variant of this command to remove the offset list.

**Syntax** `offset-list <access-list> {in|out} <offset> [<interface>]`  
`no offset-list <access-list> {in|out} <offset> [<interface>]`

| Parameter     | Description                                                                                                      |
|---------------|------------------------------------------------------------------------------------------------------------------|
| <access-list> | Specifies the access-list number or names to apply. Note that you can only use standard ACLs, not extended ACLs. |
| in            | Indicates the access list will be used for metrics of incoming advertised routes.                                |
| out           | Indicates the access list will be used for metrics of outgoing advertised routes.                                |
| <offset>      | <0-16> Specifies that the offset is used for metrics of networks matching the access list.                       |
| <interface>   | An alphanumeric string that specifies the interface to match.                                                    |

**Default** The default offset value is the metric value of the interface over which the updates are being exchanged.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage** Use this command to specify the offset value that is added to the routing metric. When the networks match the access list the offset is applied to the metrics. No change occurs if the offset value is zero.

**Examples** In this example the router examines the RIP updates being sent out from interface vlan2 and adds 5 hops to the routes matching the IP addresses specified in the access list 8. To do this, use these commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# offset-list 8 in 5 vlan2
```

To apply this same command within the specific VRF instance named 'blue', use these commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# offset-list 8 in 5 vlan2
```

**Related  
commands** [access-list \(extended numbered\)](#)

# passive-interface (RIP)

**Overview** Use this command to block RIP broadcasts on the interface.  
Use the **no** variant of this command to disable this function.

**Syntax** `passive-interface <interface>`  
`no passive-interface <interface>`

| Parameter                      | Description                   |
|--------------------------------|-------------------------------|
| <code>&lt;interface&gt;</code> | Specifies the interface name. |

**Default** Disabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Example** Use the following commands to block RIP broadcasts on vlan2:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# passive-interface vlan2
```

**Example (VRF-lite)** To apply the example above to a specific VRF instance named 'green', use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf green
awplus(config-router-af)# passive-interface vlan2
```

**Related commands** [show ip rip](#)

# ping

**Overview** This command sends a query to another IPv4 host (send Echo Request messages).

**Syntax** ping [ip] <host> [broadcast] [df-bit {yes|no}] [interval <0-128>] [pattern <hex-data-pattern>] [repeat {<1-2147483647>|continuous}] [size <36-18024>] [source <ip-addr>] [timeout <1-65535>] [tos <0-255>]

**Syntax (VRF-lite)** ping [vrf <vrf-name>] [ip] <host> [broadcast] [df-bit {yes|no}] [interval <0-128>] [pattern <hex-data-pattern>] [repeat {<1-2147483647>|continuous}] [size <36-18024>] [source <ip-addr>] [timeout <1-65535>] [tos <0-255>]

| Parameter                  | Description                                                                                                                                                                                                          |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <host>                     | The destination IP address or hostname.                                                                                                                                                                              |
| broadcast                  | Allow pinging of a broadcast address.                                                                                                                                                                                |
| df-bit                     | Enable or disable the do-not-fragment bit in the IP header.                                                                                                                                                          |
| interval <0-128>           | Specify the time interval in seconds between sending ping packets. The default is 1. You can use decimal places to specify fractions of a second. For example, to ping every millisecond, set the interval to 0.001. |
| pattern <hex-data-pattern> | Specify the hex data pattern.                                                                                                                                                                                        |
| repeat                     | Specify the number of ping packets to send.                                                                                                                                                                          |
| <1-2147483647>             | Specify repeat count. The default is 5.                                                                                                                                                                              |
| continuous                 | Continuous ping                                                                                                                                                                                                      |
| size <36-18024>            | The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes).                                                                                                          |
| source <ip-addr>           | The IP address of a configured IP interface to use as the source in the IP header of the ping packet.                                                                                                                |
| timeout <1-65535>          | The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait.                                                 |
| tos <0-255>                | The value of the type of service in the IP header.                                                                                                                                                                   |
| vrf                        | Apply the command to the specified VRF instance.                                                                                                                                                                     |
| <vrf-name>                 | The name of the VRF instance.                                                                                                                                                                                        |

**Mode** User Exec and Privileged Exec

**Example** To ping the IP address 10.10.0.5 use the following command:

```
awplus# ping 10.10.0.5
```

**Example (VRF-lite)** To ping the IP address 10.10.0.5 from VRF instance 'red', use the following command:

```
awplus# ping vrf red 10.10.0.5
```

**NOTE:** Unless a cross-domain static or leaked route exists to the destination IP address, you must run this command from within the same routing domain as the address being pinged.

# radius-server host

**Overview** Use this command to specify a remote RADIUS server host for authentication or accounting, and to set server-specific parameters. The parameters specified with this command override the corresponding global parameters for RADIUS servers. This command specifies the IP address or host name of the remote RADIUS server host and assigns authentication and accounting destination UDP port numbers.

This command adds the RADIUS server address and sets parameters to the RADIUS server. The RADIUS server is added to the running configuration after you issue this command. If parameters are not set using this command then common system settings are applied.

Use the **no** variant of this command to remove the specified server host as a RADIUS authentication and/or accounting server and set the destination port to the default RADIUS server port number (1812).

**Syntax**

```
radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [key <key-string>] [retransmit <0-100>] [timeout <1-1000>]

radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [key-encrypted <encrypted-key-string>] [retransmit <0-100>] [timeout <1-1000>]

no radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>]
```

**Syntax (VRF-lite)**

```
radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [key <key-string>] [retransmit <0-100>] [timeout <1-1000>] [vrf <vrf-name>]

radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [key-encrypted <encrypted-key-string>] [retransmit <0-100>] [timeout <1-1000>] [vrf <vrf-name>]

no radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>] [auth-port <0-65535>] [vrf <vrf-name>]
```

| Parameter    | Description                                                                                                                                                                                                                      |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <host-name>  | Server host name. The DNS name of the RADIUS server host.                                                                                                                                                                        |
| <ip-address> | The IP address of the RADIUS server host.                                                                                                                                                                                        |
| acct-port    | Accounting port. Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the server is not used for accounting. The default UDP port for accounting is 1813.                                       |
| <0-65535>    | UDP port number. (Accounting port number is set to (accounting port number is set to 1813 by default) Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the host is not used for accounting. |

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| auth-port     | Authentication port. Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the server is not used for authentication. The default UDP port for authentication is 1812.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <0-65535>     | UDP port number (authentication port number is set to 1812 by default). Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the host is not used for authentication.                                                                                                                                                                                                                                                                                                                                                                                                          |
| timeout       | Specifies the amount of time to wait for a response from the server. If this parameter is not specified the global value configured by the <b>radius-server timeout</b> command is used.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <1-1000>      | Time in seconds to wait for a server reply (timeout is set to 5 seconds by default). The time interval (in seconds to wait for the RADIUS server to reply before retransmitting a request or considering the server dead. This setting overrides the global value set by the <b>radius-server timeout</b> command. If no timeout value is specified for this server, the global value is used.                                                                                                                                                                                                                      |
| retransmit    | Specifies the number of retries before skip to the next server. If this parameter is not specified the global value configured by the <b>radius-server retransmit</b> command is used.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <0-100>       | Maximum number of retries (maximum number of retries is set to 3 by default). The maximum number of times to resend a RADIUS request to the server, if it does not respond within the timeout interval, before considering it dead and skipping to the next RADIUS server. This setting overrides the global setting of the <b>radius-server retransmit</b> command. If no retransmit value is specified, the global value is used.                                                                                                                                                                                 |
| key           | Set shared secret key with RADIUS servers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <key-string>  | Shared key string applied. Specifies the shared secret authentication or encryption key for all RADIUS communications between this device and the RADIUS server. This key must match the encryption used on the RADIUS daemon. All leading spaces are ignored, but spaces within and at the end of the string are used.<br><br>If spaces are used in the string, do not enclose the string in quotation marks unless the quotation marks themselves are part of the key. This setting overrides the global setting of the <b>radius-server key</b> command. If no key value is specified, the global value is used. |
| key-encrypted | Set an encrypted shared secret key. When secure mode is enabled, the running configuration contains this parameter instead of the key parameter. It indicates that the device stores keys in the running configuration in encrypted form instead of in plain text.                                                                                                                                                                                                                                                                                                                                                  |

| Parameter                                      | Description                                                                                                                                                                                                                                                                           |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;encrypted-key<br/>-string&gt;</code> | Encrypted shared key string.                                                                                                                                                                                                                                                          |
| <code>vrf &lt;vrf-name&gt;</code>              | The name of a VRF instance. Use this to specify the VRF that the RADIUS server is accessible by. Servers are uniquely identified by their address and VRF, so multiple servers can have the same address or host-name as long as the VRF is different. The default is the global VRF. |

**Default** The RADIUS client address is not configured (null) by default. No RADIUS server is configured.

**Mode** Global Configuration

**Usage** Multiple **radius-server host** commands can be used to specify multiple hosts. The software searches for hosts in the order they are specified. If no host-specific timeout, retransmit, or key values are specified, the global values apply to that host. If there are multiple RADIUS servers for this client, use this command multiple times—once to specify each server.

If you specify a host without specifying the auth port or the acct port, it will by default be configured for both authentication and accounting, using the default UDP ports. To set a host to be a RADIUS server for authentication requests only, set the **acct-port** parameter to 0; to set the host to be a RADIUS server for accounting requests only, set the **auth-port** parameter to 0.

A RADIUS server is identified by IP address, authentication port and accounting port. A single host can be configured multiple times with different authentication or accounting ports. All the RADIUS servers configured with this command are included in the predefined RADIUS server group **radius**, which may be used by AAA authentication, authorization and accounting commands. The client transmits (and retransmits, according to the **retransmit** and **timeout** parameters) RADIUS authentication or accounting requests to the servers in the order you specify them, until it gets a response.

**Examples** To add the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20
```

To set the secret key to 'mySecret' on the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20 key mySecret
```

To delete the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host 10.0.0.20
```

To configure rad1.company.com for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad1.company.com acct-port 0
```

To remove the RADIUS server rad1.company.com configured for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host rad1.company.com
acct-port 0
```

To configure rad2.company.com for accounting only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad2.company.com auth-port 0
```

To configure 192.168.1.1 with authentication port 1000, accounting port 1001 and retransmit count 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 192.168.1.1 auth-port 1000
acct-port 1001 retransmit 5
```

#### Examples (VRF-lite)

To add the RADIUS server 10.0.0.20 in the VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20 vrf red
```

To set the secret key to 'mySecret' on the RADIUS server 10.0.0.20 in the VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20 key mySecret vrf
red
```

#### Command changes

Version 5.5.2-1.1: **vrf** parameter added for products that support VRF  
Version 5.4.9-2.1: **key-encrypted** parameter added

# rd (route distinguisher)

**Overview** This command creates a Route Distinguisher (RD). The RD forms part of the route table creation process for a VRF instance and is implemented only when using BGP routing.

**Syntax** `rd {<ASN:n>|<ip-address:n>}`

**CAUTION:** This command does not have a “no” variant. To remove the RD requires deleting the VRF instance to which it is assigned. Therefore, it is important that you carefully enter the correct value for the RD.

| Parameter      | Description                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ASN:n>        | The RD reference number. This is based on the formal RD format structure of ASN number:Ref number.<br>The ASN value can be any number between 1 and 4294967295, and the value n can be any number between 1 and 65535. |
| <ip-address:n> | The RD reference number. This is based on the formal RD format structure of IP-address:Ref number.<br>The IP-address must be in IPv4 format. The value n can be any number between 1 and 65535.                        |

**NOTE:** The above table refers to an ASN or Autonomous System Number. If you have a formal ASN number assigned to your BGP network, you should enter this value. Alternatively; because the Route Distinguisher has limited functionality in VRF-lite, you can use an unofficial value for your ASN when configuring this particular command.

**Mode** VRF Configuration

**Usage notes** For the implementation of VRF-lite installed on your switch, this command has little practical functionality. However, the switch does check certain components of the RD that you enter. For this reason, the RD syntax must comply with the structural formats defined above, and each value that you assign to a VRF instance must be unique on the switch. Good networking practice is to use common values for the RD and RT within a VRF instance.

**Default** No default RD is configured.

**Example** To create an RD 100:2 that is associated with VRF “red” use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf red
awplus(config-vrf)# rd 100:2
```

**Related commands** [show ip vrf](#)

# redistribute (into BGP or BGP4+)

**Overview** Use this command to inject routes from one routing process into a BGP or BGP4+ routing table.

Use the **no** variant of this command to disable this function.

**Syntax** `redistribute {ospf|rip|connected|static} [route-map  
<route-map-entry-pointer>]`  
`no redistribute {ospf|rip|connected|static} [route-map  
<route-map-entry-pointer>]`

| Parameter                 | Description                                                                               |
|---------------------------|-------------------------------------------------------------------------------------------|
| connected                 | Specifies the redistribution of connected routes for both BGP and BGP4+.                  |
| ospf                      | Specifies the redistribution of OSPF information for BGP or OSPFv3 information for BGP4+. |
| rip                       | Specifies the redistribution of RIP information for BGP or RIPng information for BGP4+.   |
| static                    | Specifies the redistribution of Static routes for both BGP and BGP4+.                     |
| route-map                 | Route map reference for both BGP and BGP4+.                                               |
| <route-map-entry-pointer> | Pointer to route-map entries.                                                             |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration or IPv6 Address Family Configuration

**Usage notes** Redistribution is used by routing protocols to advertise routes that are learned by some other means, such as by another routing protocol or by static routes. Since all internal routes are dumped into BGP, careful filtering is applied to make sure that only routes to be advertised reach the internet, not everything. This command allows redistribution by injecting prefixes from one routing protocol into another routing protocol.

**Examples [BGP/ BGP+]** The following example shows the configuration of a route-map named `rmap1`, which is then applied using the **redistribute route-map** command.

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 1
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 12
awplus(config-router)# redistribute ospf route-map rmap1
```

To apply the above example to a specific VRF instance named `blue`, use the following commands:

```
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# redistribute ospf route-map rmap1
```

The following example shows the configuration of a route-map named `rmap2`, which is then applied using the **redistribute route-map** command.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 3
awplus(config-route-map)# match interface vlan1
awplus(config-route-map)# set metric-type 1
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# redistribute bgp route-map rmap2
```

Note that configuring a route-map and applying it with the **redistribute route-map** command allows you to filter which routes are distributed from another routing protocol (such as OSPF with BGP). A route-map can also set the metric, tag, and metric-type of the redistributed routes.

**Command  
changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# redistribute (OSPF)

**Overview** Use this command to redistribute routes from other routing protocols, static routes and connected routes into an OSPF routing table.

Use the **no** variant of this command to disable this function.

**Syntax**

```
redistribute {bgp|connected|rip|static} {metric
<0-16777214>|metric-type {1|2}|route-map <name>|tag
<0-4294967295>}

no redistribute {bgp|connected|rip|static} {metric
<0-16777214>|metric-type {1|2}|route-map <name>|tag
<0-4294967295>}
```

| Parameter   | Description                                                            |
|-------------|------------------------------------------------------------------------|
| bgp         | Specifies that this applies to the redistribution of BGP routes.       |
| connected   | Specifies that this applies to the redistribution of connected routes. |
| rip         | Specifies that this applies to the redistribution of RIP routes.       |
| static      | Specifies that this applies to the redistribution of static routes.    |
| metric      | Specifies the external metric.                                         |
| metric-type | Specifies the external metric-type.                                    |
| route-map   | Specifies name of the route-map.                                       |
| tag         | Specifies the external route tag.                                      |

**Default** The default metric value for routes redistributed into OSPF is 20. The metric can also be defined using the [set metric](#) command for a route map. Note that a metric defined using the [set metric](#) command for a route map overrides a metric defined with this command.

**Mode** Router Configuration

**Usage notes** You use this command to inject routes, learned from other routing protocols, into the OSPF domain to generate AS-external-LSAs. If a route-map is configured by this command, then that route-map is used to control which routes are redistributed and can set metric and tag values on particular routes.

The metric, metric-type, and tag values specified on this command are applied to any redistributed routes that are not explicitly given a different metric, metric-type, or tag value by the route map.

See the [OSPF Feature Overview and Configuration Guide](#) for more information about metrics, and about behavior when configured in route maps.

Note that this command does not redistribute the default route. To redistribute the default route, use the [default-information originate](#) command.

**Example** The following example shows redistribution of BGP routes into OSPF routing table 100, with metric 12.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# redistribute bgp metric 12
```

The following example shows the configuration of a route-map named 'rmap2', which is then applied using the **redistribute route-map** command, so routes learned via a specified interface can be redistributed as type-1 external LSAs:

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 3
awplus(config-route-map)# match interface vlan1
awplus(config-route-map)# set metric-type 1
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# redistribute rip route-map rmap2
```

Note that configuring a route-map and applying it with the **redistribute route-map** command allows you to filter which routes are distributed from another routing protocol (such as RIP). A route-map can also set the metric, tag, and metric-type of the redistributed routes.

**Related commands**

- [distribute-list \(OSPF\)](#)
- [match interface](#)
- [route-map](#)
- [show ip ospf database external](#)

# redistribute (RIP)

**Overview** Use this command to redistribute information from other routing protocols into RIP.

When using VRF-lite, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to disable the specified redistribution. The parameters **metric** and **route-map** may be used with the **no** variant, but have no effect.

**Syntax** `redistribute {connected|static|ospf|bgp} [metric <0-16>]  
[route-map <route-map>]`  
`no redistribute {connected|static|ospf|bgp} [metric] [route-map]`

| Parameter     | Description                                                                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| route-map     | Optional. Specifies route-map that controls how routes are redistributed.                                                                                                                                                                             |
| <route-map>   | Optional. The name of the route map.                                                                                                                                                                                                                  |
| connected     | Redistribute from connected routes.                                                                                                                                                                                                                   |
| static        | Redistribute from static routes.                                                                                                                                                                                                                      |
| ospf          | Redistribute from Open Shortest Path First (OSPF).                                                                                                                                                                                                    |
| bgp           | Redistribute from Border Gateway Protocol (BGP).                                                                                                                                                                                                      |
| metric <0-16> | Optional. Sets the value of the metric that will be applied to routes redistributed into RIP from other protocols. If a value is not specified, and no value is specified using the <a href="#">default-metric (RIP)</a> command, the default is one. |

**Default** By default, the RIP metric value is set to 1.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Example** To apply the metric value 15 to static routes being redistributed into RIP, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# redistribute static metric 15
```

**Example (VRF-lite)** To apply the metric value 15 to static routes in address-family ipv4 VRF instance blue being redistributed into RIP, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# redistribute static metric 15
```

**Related commands** [default-metric \(RIP\)](#)

# route (RIP)

**Overview** Use this command to add a static RIP route.  
Use the **no** variant of this command to remove a static RIP route.

**Syntax** `route <ip-addr/prefix-length>`  
`no route <ip-addr/prefix-length>`

| Parameter                                  | Description                         |
|--------------------------------------------|-------------------------------------|
| <code>&lt;ip-addr/prefix-length&gt;</code> | The IPv4 address and prefix length. |

**Default** No static RIP route is added by default.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** Use this command to add a static RIP route. After adding the RIP route, the route can be checked in the RIP routing table.

**Example** To create a static RIP route to IP subnet 192.168.1.0/24, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# route 192.168.1.0/24
```

**Example (VRF-lite)** To create a static RIP route to IP subnet 192.168.1.0/24, for the VRF instance red, use the following commands

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# route 192.168.1.0/24
```

**Related commands** [show ip rip](#)  
[clear ip rip route](#)

# route-target

**Overview** Use this command within a specific VRF instance, to create a route-target within the BGP extended communities path attribute field. This value can then be included in a list of import and export route target extended communities for the specified VRF instance. Learned routes that carry a specific route-target extended community are then imported into all VRFs configured with that extended community as an imported route-target.

The **no** variant of this command removes a route-target extended community for the VRF instance specified.

**Syntax** `route-target {import|export|both} {ASN:n|ip-address:n}`  
`no route-target {import|export|both} {ASN:n|ip-address:n}`

| Parameter                         | Description                                                                                                                                                                                                                                                                                                          |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>route-target</code>         | Specifies a BGP extended community as a route-target.                                                                                                                                                                                                                                                                |
| <code>import</code>               | Adds the route target to its import list.                                                                                                                                                                                                                                                                            |
| <code>export</code>               | Adds the route target to its export list.                                                                                                                                                                                                                                                                            |
| <code>both</code>                 | Adds the route target to both the import and export lists.                                                                                                                                                                                                                                                           |
| <code>&lt;ASN:n&gt;</code>        | The route target reference number. This uses the same structure that is defined for the RD. This being, ASN number:Ref number. The ASN value can be any number between 1 and 65535, and the value n can be any number between 1 and 4294967295.                                                                      |
| <code>&lt;ip-address:n&gt;</code> | The route target reference number. This uses the same structure that is defined for the RD (Route Distinguisher). This being IP-address:Ref number.<br>In practice, the IP-address can be an entry in IPv4 format, or an integer number between 1 and 4294967295. The value n can be any number between 1 and 65535. |

**Mode** VRF Configuration

**Default** No route-target community attributes are associated with a VRF instance.

**Usage notes** In VRF systems that use MPLS, there is an close relationship between the Route Target (RT) and the Route Distinguisher (RD) values. For VRF-lite however, this relationship is only implicit in that they share the same format structure.

**Example** Use the following commands to create a route-target extended community for ASN value 200, and a Reference number of 3, within the VRF instance blue:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# route-target import 200:1
```

**Related  
commands**   `ip vrf`  
`show ip vrf`

# router ospf

**Overview** Use this command to enter Router Configuration mode to configure an OSPF routing process. You must specify the process ID with this command for multiple OSPF routing processes on the device.

Use the **no** variant of this command to terminate an OSPF routing process.

Use the **no** parameter with the **process-id** parameter, to terminate and delete a specific OSPF routing process. If no **process-id** is specified on the **no** variant of this command, then all OSPF routing processes are terminated, and all OSPF configuration is removed.

**Syntax** `router ospf [<process-id>]`  
`no router ospf [<process-id>]`

**Syntax (VRF-lite)** `router ospf [<process-id>] [<vrf-instance>]`  
`no router ospf [<process-id>]`

| Parameter                         | Description                                                                  |
|-----------------------------------|------------------------------------------------------------------------------|
| <code>&lt;process-id&gt;</code>   | A positive number from 1 to 65535, that is used to define a routing process. |
| <code>&lt;vrf-instance&gt;</code> | The VRF instance to be associated with the OSPF routing process.             |

**Default** No routing process is defined by default.

**Mode** Global Configuration

**Usage notes** The process ID of OSPF is an optional parameter for the **no** variant of this command only. When removing all instances of OSPF, you do not need to specify each Process ID, but when removing particular instances of OSPF you must specify each Process ID to be removed.

When using VRF-lite, this command can be used to associate a process-id with a VRF instance that has been created using the [ip vrf](#) command.

**Example** To enter Router Configuration mode to configure an existing OSPF routing process 100, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)#
```

**Example (VRF-lite)** To enter Router Configuration mode to configure an existing OSPF routing process 100 for VRF instance `red`, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100 red
awplus(config-router)#
```

## router-id (VRF)

**Overview** Use this command to specify a router identifier (in IP address format). When using VRF-Lite, the router-id is configured for the specified VRF instance.

Use the **no** variant of this command to force OSPF to use the previous OSPF router-id behavior.

**Syntax** `router-id <ip-address>`  
`no router-id`

| Parameter                       | Description                                     |
|---------------------------------|-------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | Specifies the router ID in IPv4 address format. |

**Mode** Router Configuration

**Usage notes** Configure each router with a unique router-id. In an OSPF router process that has active neighbors, a new router-id is used at the next reload or when you restart OSPF manually.

**Example** The following example shows a fixed router ID 10.10.10.60 for the VRF instance red:

```
awplus# configure terminal
awplus(config)# ip vrf red
awplus(config-router)# router-id 10.10.10.60
```

**Related commands** [show ip ospf](#)  
[show ip vrf](#)

# router ipv6 vrf ospf

**Overview** Use this command to enter Router Configuration mode to configure an IPv6 OSPF routing process for a named VRF. You must specify the VRF name that this routing process is to be used on.

Use the **no** variant of this command to terminate an IPv6 OSPF routing process.

**Syntax** `router ipv6 vrf ospf <vrf-name>`  
`no router ipv6 vrf ospf <vrf-name>`

| Parameter                     | Description                                                                                                                                                                                                   |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;vrf-name&gt;</code> | The VRF name that the router process is to be used on. This is also the process tag for the routing process, and is used in the interface command <b>ipv6 router ospf area</b> to link to the router process. |

**Mode** Global Configuration

**Example** To enter Router Configuration mode for VRF red, use the commands:

```
awplus# configure terminal
awplus(config)# ip vrf red
awplus(config)# router ipv6 vrf ospf red
```

**Related commands** [ipv6 router ospf area](#)  
[router ipv6 ospf](#)

**Command changes** Version 5.5.3-2.1: command added

# show arp

**Overview** Use this command to display entries in the ARP routing and forwarding table—the ARP cache contains mappings of IP addresses to physical addresses for hosts. To have a dynamic entry in the ARP cache, a host must have used the ARP protocol to access another host.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show arp`

**Syntax (VRF-lite)** `show arp [global|vrf <vrf-name>]`

| Parameter  | Description                                                                                 |
|------------|---------------------------------------------------------------------------------------------|
| global     | When VRF-lite is configured, apply this command to the global routing and forwarding table. |
| vrf        | Apply this command to the specified VRF instance.                                           |
| <vrf-name> | The VRF instance name.                                                                      |

**Mode** User Exec and Privileged Exec

**Usage notes** Running this command with no additional parameters will display all entries in the ARP routing and forwarding table.

With VRF-lite configured, and no additional parameters entered, the command output displays all entries, listed by their VRF instance. By adding either a specific VRF instance or global parameter entry, you can selectively list ARP entries by their membership of a specific VRF instance.

**Example** To display all ARP entries in the ARP cache, use the following command:

```
awplus# show arp
```

**Output** Figure 32-2: Example output from the **show arp** command

|                 |                |           |           |         |
|-----------------|----------------|-----------|-----------|---------|
| awplus#show arp |                |           |           |         |
| IP Address      | LL Address     | Interface | Port      | Type    |
| 192.168.27.10   | 192.168.4.1    | vlan1     | port1.0.1 | dynamic |
| 192.168.27.100  | 0000.daaf.cd24 | vlan1     | port1.0.2 | dynamic |
| ...             |                |           |           |         |

**Example (VRF-lite)** To display the dynamic ARP entries in the global routing instance, use the command:

```
awplus# show arp global
```

**Output** Figure 32-3: Example output from the **show arp global** command

```
awplus#show arp global
```

| IP Address    | LL Address     | Interface | Port      | Type    |
|---------------|----------------|-----------|-----------|---------|
| 192.168.10.2  | 0015.77ad.fad8 | vlan1     | port1.0.1 | dynamic |
| 192.168.20.2  | 0015.77ad.fa48 | vlan2     | port1.0.2 | dynamic |
| 192.168.1.100 | 00d0.6b04.2a42 | vlan2     | port1.0.3 | static  |

**Example (VRF-lite)** To display the dynamic ARP entries for a VRF instance 'red', use the command:

```
awplus# show arp vrf red
```

**Output** Figure 32-4: Example output from the **show arp vrf red** command

```
awplus# show arp vrf red
```

[VRF: red]

| IP Address   | LL Address     | Interface | Port      | Type    |
|--------------|----------------|-----------|-----------|---------|
| 192.168.10.2 | 0015.77ad.fad8 | vlan1     | port1.0.1 | dynamic |

**Table 1:** Parameters in the output of the **show arp** command

| Parameter  | Meaning                                                                                                                                                                               |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address | IP address of the network device this entry maps to.                                                                                                                                  |
| LL Address | Hardware address of the network device.                                                                                                                                               |
| Interface  | Interface over which the network device is accessed.                                                                                                                                  |
| Port       | Physical port that the network device is attached to.                                                                                                                                 |
| Type       | Whether the entry is a static or dynamic entry. Static entries are added using the <a href="#">arp</a> command. Dynamic entries are learned from ARP request/reply message exchanges. |
| VRF        | The name of the VRF instance. The VRF-lite components only display when VRF-lite is configured.                                                                                       |

**Related commands**

**Command changes** Version 5.4.9-0.1: Link layer addresses now shown as the hardware address (MAC Address output parameter has been renamed to LL Address).

# show crypto key pubkey-chain knownhosts

**Overview** This command displays the list of public keys maintained in the known host database on the device.

**Syntax** `show crypto key pubkey-chain knownhosts [<1-65535>]`

**Syntax (VRF-lite)** `show crypto key pubkey-chain knownhosts [vrf <vrf-name>|global] [<1-65535>]`

| Parameter  | Description                                                                                |
|------------|--------------------------------------------------------------------------------------------|
| global     | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf        | Apply the command to the specified VRF instance.                                           |
| <vrf-name> | The name of the VRF instance.                                                              |
| <1-65535>  | Key identifier for a specific key. Displays the public key of the entry if specified.      |

**Default** Display all keys.

**Mode** User Exec, Privileged Exec and Global Configuration

**Usage** When VRF-lite is configured:

- If **vrf** is specified, this command displays the known host database from the specified VRF instance.
- If **global** is specified, this command displays the known host database from the global routing environment.
- If neither **vrf** nor **global** is specified, this command displays the known host database from the global routing environment and each configured VRF.

For more information about VRF, see the [VRF Lite Feature Overview and Configuration Guide](#).

**Examples** To display public keys of known SSH servers, use the command:

```
awplus# show crypto key pubkey-chain knownhosts
```

To display the key data of the first entry in the known host data, use the command:

```
awplus# show crypto key pubkey-chain knownhosts 1
```

**Output** Figure 32-5: Example output from the **show crypto key public-chain knownhosts** command

| No | Hostname                                 | Type | Fingerprint                                     |

**Table 2:** Parameters in the output of the **show crypto key public-chain knownhosts** command

| Parameter   | Description                             |
|-------------|-----------------------------------------|
| No          | Number ID of the key.                   |
| Hostname    | Host name of the known SSH server.      |
| Type        | The algorithm used to generate the key. |
| Fingerprint | Checksum value for the public key.      |

**Related commands** [crypto key pubkey-chain knownhosts](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for x510 and x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp community (BGP only)

**Overview** Use this command to display routes that match specified communities from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 community \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

You may use any combination and repetition of parameters listed in the *<type>* placeholder.

**Syntax** `show ip bgp community [<type>] [exact-match]`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] community [<type>] [exact-match]`

| Parameter               | Description                                                                                                 |
|-------------------------|-------------------------------------------------------------------------------------------------------------|
| global                  | When VRF-lite is configured, apply the command to the global routing and forwarding table.                  |
| vrf                     | Apply the command to the specified VRF instance.                                                            |
| <i>&lt;vrf-name&gt;</i> | The name of the VRF instance.                                                                               |
| <i>&lt;type&gt;</i>     | {[ <i>AA:NN</i> ] [ <i>local-AS</i> ] [ <i>no-advertise</i> ] [ <i>no-export</i> ] }                        |
|                         | <i>AA:NN</i> Specifies the Autonomous System (AS) community number, in AA:NN format.                        |
|                         | <i>local-AS</i> Do not send outside local Autonomous Systems (well-known community).                        |
|                         | <i>no-advertise</i> Do not advertise to any peer (well-known community).                                    |
|                         | <i>no-export</i> Do not export to next AS (well-known community).                                           |
| exact-match             | Specifies that the exact match of the communities is displayed. This optional parameter cannot be repeated. |

**Mode** User Exec and Privileged Exec

**Examples** Note that the AS numbers shown are examples only.

```
awplus# show ip bgp community 64497:64499 exact-match
awplus# show ip bgp community 64497:64499 64500:64501
exact-match

awplus# show ip bgp community 64497:64499 64500:64501
64510:64511no-advertise

awplus# show ip bgp community no-advertise
no-advertiseno-advertise exact-match

# show ip bgp dampening (BGP only)

**Overview** Use this command to show dampened routes from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 dampening \(BGP4+ only\)](#) command within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp dampening  
{dampened-paths|flap-statistics|parameters}`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] dampening  
{dampened-paths|flap-statistics|parameters}`

| Parameter       | Description                                                                                |
|-----------------|--------------------------------------------------------------------------------------------|
| global          | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf             | Apply the command to the specified VRF instance.                                           |
| <vrf-name>      | The name of the VRF instance.                                                              |
| dampened-paths  | Display paths suppressed due to dampening.                                                 |
| flap-statistics | Display flap statistics of routes.                                                         |
| parameters      | Display details of configured dampening parameters.                                        |

**Mode** User Exec and Privileged Exec

**Usage notes** Enable BGP dampening to maintain dampened-path information in memory.

**Examples** `awplus# show ip bgp dampening dampened-paths  
awplus# show ip bgp vrf red dampening dampened-paths  
awplus# show ip bgp global dampening flap-statistics`

**Output** Figure 32-8: Example output from the **show ip bgp dampening** command

|                                |          |
|--------------------------------|----------|
| dampening 15 750 2000 60 15    |          |
| Reachability Half-Life time    | : 15 min |
| Reuse penalty                  | : 750    |
| Suppress penalty               | : 2000   |
| Max suppress time              | : 60 min |
| Un-reachability Half-Life time | : 15 min |
| Max penalty (ceil)             | : 11999  |
| Min penalty (floor)            | : 375    |

The following example output shows that the internal route (i), has flapped 3 times and is now categorized as history (h).

Figure 32-9: Example output from the **show ip bgp dampening flap-statistics** command

```
awplus# show ip bgp dampening flap-statistics
BGP table version is 1, local router ID is 30.30.30.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, S
Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
 Network From Flaps Duration Reuse Path

hi1.1.1.0/24 10.100.0.62 3 00:01:20 i
```

The following example output shows a dampened route in the 1.1.1.0/24 network.

Figure 32-10: Example output from the **show ip bgp dampening dampened-path** command

```
awplus# show ip bgp dampening dampened-paths
BGP table version is 1, local router ID is 30.30.30.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, S
Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
 Network From Reuse Path

di 1.1.1.0/24 10.100.0.62 00:35:10 i

Total number of prefixes 1
```

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp inconsistent-as (BGP only)

**Overview** Use this command to display routes with inconsistent AS Paths within an IPv4 environment. Use the [show bgp ipv6 inconsistent-as \(BGP4+ only\)](#) command to display routes with inconsistent AS paths within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp inconsistent-as`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] inconsistent-as`

| Parameter  | Description                                                                                |
|------------|--------------------------------------------------------------------------------------------|
| global     | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf        | Apply the command to the specified VRF instance.                                           |
| <vrf-name> | The name of the VRF instance.                                                              |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp inconsistent-as`  
`awplus# show ip bgp global inconsistent-as`

**Related commands** [show bgp ipv6 inconsistent-as \(BGP4+ only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp filter-list (BGP only)

**Overview** Use this command to display routes conforming to the filter-list within an IPv4 environment. Use the [show bgp ipv6 filter-list \(BGP4+ only\)](#) command to display routes conforming to the filter-list within an IPv6 environment

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp filter-list <listname>`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] filter-list <listname>`

| Parameter  | Description                                                                                |
|------------|--------------------------------------------------------------------------------------------|
| global     | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf        | Apply the command to the specified VRF instance.                                           |
| <vrf-name> | The name of the VRF instance.                                                              |
| <listname> | Specifies the regular-expression access list name.                                         |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip bgp filter-list mylist`  
`awplus# show ip bgp vrf red filter-list mylist`

**Related commands** [show bgp ipv6 filter-list \(BGP4+ only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp longer-prefixes (BGP only)

**Overview** Use this command to display the route of the local BGP routing table for a specific prefix with a specific mask, or for any prefix having a longer mask than the one specified.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp <ip-address/m> longer-prefixes`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] <ip-address/m> longer-prefixes`

| Parameter      | Description                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------|
| global         | When VRF-lite is configured, apply the command to the global routing and forwarding table.               |
| vrf            | Apply the command to the specified VRF instance.                                                         |
| <vrf-name>     | The name of the VRF instance.                                                                            |
| <ip-address/m> | Neighbor's IP address and subnet mask, entered in the form A.B.C.D/M, where M is the subnet mask length. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip bgp 10.10.0.10/24 longer-prefixes
awplus# show ip bgp vrf red 172.16.4.0/24
awplus# show ip bgp global 172.16.0.0/16 longer-prefixes
```

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp prefix-list (BGP only)

**Overview** Use this command to display routes matching the prefix-list within an IPv4 environment. Use the [show bgp ipv6 prefix-list \(BGP4+ only\)](#) command to display routes matching the prefix-list within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp prefix-list <list>`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] prefix-list <list>`

| Parameter  | Description                                                                                |
|------------|--------------------------------------------------------------------------------------------|
| global     | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf        | Apply the command to the specified VRF instance.                                           |
| <vrf-name> | The name of the VRF instance.                                                              |
| <list>     | Specifies the name of the IP prefix list.                                                  |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip bgp prefix-list mylist`  
`awplus# show ip bgp vrf red prefix-list myPrefixes`

**Related commands** [show bgp ipv6 prefix-list \(BGP4+ only\)](#)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1  
Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
Version 5.4.7-2.1: BGP support added for x510 and x550 series  
Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp quote-regexp (BGP only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the [show bgp ipv6 quote-regexp \(BGP4+ only\)](#) command to display routes matching the AS path regular expression within an IPv6 environment.

Note that you must use quotes to enclose the regular expression with this command. Use the regular expressions listed below with the *<expression>* parameter:

| Symbol | Character     | Meaning                                                                                                                            |
|--------|---------------|------------------------------------------------------------------------------------------------------------------------------------|
| ^      | Caret         | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| \$     | Dollar sign   | Used to match the end of the input string.                                                                                         |
| .      | Period        | Used to match a single character (white spaces included).                                                                          |
| *      | Asterisk      | Used to match none or more sequences of a pattern.                                                                                 |
| +      | Plus sign     | Used to match one or more sequences of a pattern.                                                                                  |
| ?      | Question mark | Used to match none or one occurrence of a pattern.                                                                                 |
| _      | Underscore    | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.                                    |
| [ ]    | Brackets      | Specifies a range of single-characters.                                                                                            |
| -      | Hyphen        | Separates the end points of a range.                                                                                               |

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp quote-regexp <expression>`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] quote-regexp <expression>`

| Parameter    | Description                                                                                |
|--------------|--------------------------------------------------------------------------------------------|
| global       | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf          | Apply the command to the specified VRF instance.                                           |
| <vrf-name>   | The name of the VRF instance.                                                              |
| <expression> | Specifies a regular-expression to match the BGP AS paths.                                  |

**Mode** User Exec and Privileged Exec

**Examples**    `awplus# show ip bgp quote-regexp myexpression`  
              `awplus# show ip bgp global quote-regexp 65550 65555`

**Related commands**    [show bgp ipv6 quote-regexp \(BGP4+ only\)](#)

                          Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
                          Version 5.4.7-2.1: BGP support added for x510 and x550 series  
                          Version 5.4.7-2.4: BGP support added for IE300 series

## show ip bgp regexp (BGP only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the [show bgp ipv6 regexp \(BGP4+ only\)](#) command to display routes matching the AS path regular expression within an IPv6 environment.

Use the regular expressions listed below with the *<expression>* parameter:

| Symbol | Character     | Meaning                                                                                                                            |
|--------|---------------|------------------------------------------------------------------------------------------------------------------------------------|
| ^      | Caret         | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| \$     | Dollar sign   | Used to match the end of the input string.                                                                                         |
| .      | Period        | Used to match a single character (white spaces included).                                                                          |
| *      | Asterisk      | Used to match none or more sequences of a pattern.                                                                                 |
| +      | Plus sign     | Used to match one or more sequences of a pattern.                                                                                  |
| ?      | Question mark | Used to match none or one occurrence of a pattern.                                                                                 |
| _      | Underscore    | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.                                    |
| [ ]    | Brackets      | Specifies a range of single-characters.                                                                                            |
| -      | Hyphen        | Separates the end points of a range.                                                                                               |

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp regexp <expression>`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] regexp <expression>`

| Parameter    | Description                                                                                |
|--------------|--------------------------------------------------------------------------------------------|
| global       | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf          | Apply the command to the specified VRF instance.                                           |
| <vrf-name>   | The name of the VRF instance.                                                              |
| <expression> | Specifies a regular-expression to match the BGP AS paths.                                  |

**Mode** User Exec and Privileged Exec

**Examples**    `awplus# show ip bgp regexp myexpression`  
              `awplus# show ip bgp vrf red regexp 65550 65555`

**Related commands**    `show bgp ipv6 regexp (BGP4+ only)`

**Command changes**    Added to AlliedWare Plus prior to 5.4.6-1  
                          Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products  
                          Version 5.4.7-2.1: BGP support added for x510 and x550 series  
                          Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp route-map (BGP only)

**Overview** Use this command to display BGP routes that match the specified route-map within an IPv4 environment. Use the [show bgp ipv6 route-map \(BGP4+ only\)](#) command to display BGP4+ routes that match the specified route-map within an IPv6 environment.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp route-map <route-map>`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] route-map <route-map>`

| Parameter   | Description                                                                                |
|-------------|--------------------------------------------------------------------------------------------|
| global      | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf         | Apply the command to the specified VRF instance.                                           |
| <vrf-name>  | The name of the VRF instance.                                                              |
| <route-map> | Specifies a route-map that is matched.                                                     |

**Mode** User Exec and Privileged Exec

**Examples** To show routes that match the route-map `myRouteMap` for the global routing instance, use the command:

```
awplus# show ip bgp global route-map myRouteMap
```

To show routes that match the route-map `myRouteMap`, use the command:

```
awplus# show ip bgp route-map myRouteMap
```

**Related commands** [show bgp ipv6 route-map \(BGP4+ only\)](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp summary (BGP only)

**Overview** Use this command to display a summary of a BGP neighbor status within an IPv4 environment. Use the [show bgp ipv6 summary \(BGP4+ only\)](#) command to display a summary of BGP4+ neighbors.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip bgp summary`

**Syntax (VRF-lite)** `show ip bgp [global|vrf <vrf-name>] summary`

| Parameter  | Description                                                                                |
|------------|--------------------------------------------------------------------------------------------|
| global     | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf        | Apply the command to the specified VRF instance.                                           |
| <vrf-name> | The name of the VRF instance.                                                              |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ip bgp summary`  
`awplus# show ip bgp vrf red summary`

**Output** Figure 32-11: Example output from the **show ip bgp summary** command

```
awplus>show ip bgp summary

BGP router identifier 1.0.0.1, local AS number 65541
BGP table version is 12
4 BGP AS-PATH entries
0 BGP community entries

Neighbor V AS MsgRc MsgSnt TblVer InOutQ Up/Down State/PfxRcd
192.168.3.2 4 65544 20 24 11 0/0 00:07:19 1
192.168.4.2 4 65545 0 0 0 0/0 never Active
192.168.11.2 4 65542 34 40 0 0/0 00:00:04 Active
192.168.21.2 4 65543 29 32 11 0/0 00:07:03 13

Number of neighbors 4
```

The Up/Down column in this output is a timer that shows:

- "never" if the peer session has never been established
- The up time, if the peer session is currently up
- The down time, if the peer session is currently down.

In the example above, the session with 192.168.11.2 has been down for 4 seconds, and the session with 192.168.4.2 has never been established.

**Related commands** [show bgp ipv6 summary \(BGP4+ only\)](#)

**Command changes**

- Added to AlliedWare Plus prior to 5.4.6-1
- Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products
- Version 5.4.7-2.1: BGP support added for x510 and x550 series
- Version 5.4.7-2.4: BGP support added for IE300 series

# show ip interface vrf

**Overview** Use this command to display protocol and status information about configured interfaces and their assigned IP addresses in VRF instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip interface [vrf <vrf-name>|global]`

| Parameter  | Description                              |
|------------|------------------------------------------|
| vrf        | A VRF instance.                          |
| <vrf-name> | The name of a specific VRF instance.     |
| global     | The global routing and forwarding table. |

**Mode** User Exec and Privileged Exec

**Examples** To display all interfaces and IP addresses associated with a VRF instance ‘red’, use the command:

```
awplus# show ip interface vrf red
```

**Output** Figure 32-12: Example output from **show ip interface vrf red**

|            |                 |          |          |
|------------|-----------------|----------|----------|
| [VRF: red] |                 |          |          |
| Interface  | IP-Address      | Status   | Protocol |
| lo1        | unassigned      | admin up | running  |
| vlan1      | 192.168.10.1/24 | admin up | running  |

**Example** To display all interfaces and IP addresses associated with all VRF instances, use the command:

```
awplus# show ip interface
```

**Output** Figure 32-13: Example output from the **show ip interface** with VRF-lite configured

|             |                |          |          |

# show ip rip vrf database

**Overview** Use this command to display information about the RIP database that is associated with a specific VRF instance.

Entering this command with the **full** option included, will display information about the full RIP database (including sub-optimal routes) associated with a specific VRF instance.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip rip {vrf <vrf-name>|global} database [full]`

| Parameter  | Description                                                     |
|------------|-----------------------------------------------------------------|
| vrf        | Specific VRF instance.                                          |
| <vrf-name> | The name of the VRF instance.                                   |
| global     | The global routing and forwarding table.                        |
| full       | Specify the full RIP database including sub-optimal RIP routes. |

**Mode** User Exec and Privileged Exec

**Example** To display information about the RIP database associated with a VRF instance 'blue', use the command:

```
awplus# show ip rip vrf blue database
```

**Output** Figure 32-14: Example output from the **show ip rip vrf blue database** command

|                                                                                                     |              |        |              |       |       |
|-----------------------------------------------------------------------------------------------------|--------------|--------|--------------|-------|-------|
| Codes: R - RIP, Rc - RIP connected, Rs - RIP static<br>C - Connected, S - Static, O - OSPF, B - BGP |              |        |              |       |       |
| Network                                                                                             | Next Hop     | Metric | From         | If    | Time  |
| Rc 192.168.30.0/24                                                                                  |              | 1      |              | vlan3 |       |
| R 192.168.45.0/24                                                                                   | 192.168.30.1 | 2      | 192.168.30.1 | vlan3 | 02:46 |

**Related commands** [show ip rip](#)

# show ip rip vrf interface

**Overview** Use this command to display information about the RIP interfaces that are associated with a specific VRF instance.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip rip {vrf <vrf-name>|global} interface [<interface-name>]`

| Parameter        | Description                              |
|------------------|------------------------------------------|
| vrf              | Specific VRF instance.                   |
| <vrf-name>       | The name of the VRF instance.            |
| global           | The global routing and forwarding table. |
| <interface-name> | The IP RIP interface (VLAN).             |

**Mode** User Exec and Privileged Exec

**Example** To display information about the RIP database associated with a VRF instance ‘blue’, use the command:

```
awplus# show ip rip vrf blue interface
```

**Output** Figure 32-15: Example output from **show ip rip vrf blue interface vlan3**

|                                                                                                     |              |        |              |       |       |
|-----------------------------------------------------------------------------------------------------|--------------|--------|--------------|-------|-------|
| Codes: R - RIP, Rc - RIP connected, Rs - RIP static<br>C - Connected, S - Static, O - OSPF, B - BGP |              |        |              |       |       |
| Network                                                                                             | Next Hop     | Metric | From         | If    | Time  |
| Rc 192.168.30.0/24                                                                                  |              | 1      |              | vlan3 |       |
| R 192.168.45.0/24                                                                                   | 192.168.30.1 | 2      | 192.168.30.1 | vlan3 | 02:46 |

**NOTE:** The Time parameter operates as follows:

- RIP updates occur approximately every 30 seconds.
- Each update resets a count-down timer to 180 seconds (3 minutes).
- The Time parameter displays the count-down from the last reset.

**Related commands** [show ip rip](#)

# show ip route

**Overview** Use this command to display routing entries in the FIB (Forwarding Information Base). The FIB contains the best routes to a destination, and your device uses these routes when forwarding traffic. You can display a subset of the entries in the FIB based on protocol.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

**VRF-lite** If VRF-lite is configured, you can display routing entries in the FIB associated with either the global routing domain or a named VRF.

**Syntax** `show ip route [bgp|connected|ospf|rip|static|  
<ip-addr>|<ip-addr/prefix-length>]`

**Syntax (VRF-lite)** `show ip route {vrf <vrf-name>|global}  
[bgp|connected|ospf|rip|static]`

| Parameter               | Description                                                                              |
|-------------------------|------------------------------------------------------------------------------------------|
| global                  | If VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf                     | Apply the command to the specified VRF instance.                                         |
| <vrf-name>              | The name of the VRF instance.                                                            |
| bgp                     | Displays only the routes learned from BGP.                                               |
| connected               | Displays only the routes learned from connected interfaces.                              |
| ospf                    | Displays only the routes learned from OSPF.                                              |
| rip                     | Displays only the routes learned from RIP.                                               |
| static                  | Displays only the static routes you have configured.                                     |
| <ip-addr>               | Displays the routes for the specified address. Enter an IPv4 address.                    |
| <ip-addr/prefix-length> | Displays the routes for the specified network. Enter an IPv4 address and prefix length.  |

**Mode** User Exec and Privileged Exec

**Examples** To display the static routes in the FIB, use the command:

```
awplus# show ip route static
```

To display the OSPF routes in the FIB, use the command:

```
awplus# show ip route ospf
```

**Example (VRF-lite)** To display all routing entries in the FIB associated with a VRF instance `red`, use the command:

```
awplus# show ip route vrf red
```

**Output** Each entry in the output from this command has a code preceding it, indicating the source of the routing entry. For example, O indicates OSPF as the origin of the route. The first few lines of the output list the possible codes that may be seen with the route entries.

Typically, route entries are composed of the following elements:

- code
- a second label indicating the sub-type of the route
- network or host IP address
- administrative distance and metric
- next hop IP address
- outgoing interface name
- time since route entry was added

Figure 32-16: Example output from the **show ip route** command

```
Codes: C - connected, S - static, R - RIP, B - BGP
 O - OSPF, IA - OSPF inter area
 N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
 E1 - OSPF external type 1, E2 - OSPF external type 2
 * - candidate default

O 10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:20:54
C 3.3.3.0/24 is directly connected, vlan1
C 10.10.31.0/24 is directly connected, vlan2
C 10.70.0.0/24 is directly connected, vlan4
O E2 14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:18:56
C 33.33.33.33/32 is directly connected, lo
```

**Connected Route** An example of a connected route entry consists of:

```
C 10.10.31.0/24 is directly connected, vlan2
```

This route entry denotes:

- Route entries for network 10.10.31.0/24 are derived from the IP address of local interface vlan2.
- These routes are marked as Connected routes (C) and always preferred over routes for the same network learned from other routing protocols.

**OSPF Route** An example of an OSPF route entry consists of:

```
O 10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:20:54
```

This route entry denotes:

- This route in the network 10.10.37.0/24 was added by OSPF.
- This route has an administrative distance of 110 and metric/cost of 11.
- This route is reachable via next hop 10.10.31.16.
- The outgoing local interface for this route is vlan2.
- This route was added 20 minutes and 54 seconds ago.

### OSPF External Route

An example of an OSPF external route entry consists of:

```
O E2 14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:18:56
```

This route entry denotes that this route is the same as the other OSPF route explained above; the main difference is that it is a Type 2 External OSPF route.

### Related commands

[ip route](#)

[ip route vrf](#)

[maximum-paths](#)

[show ip route database](#)

# show ip route database

**Overview** This command displays the routing entries in the RIB (Routing Information Base).

When multiple entries are available for the same prefix, RIB uses the routes' administrative distances to choose the best route. All best routes are entered into the FIB (Forwarding Information Base). To view the routes in the FIB, use the [show ip route](#) command.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > (output redirection token).

**Syntax** `show ip route database [bgp|connected|ospf|rip|static]`

**Syntax (VRF-lite)** `show ip route [vrf <vrf-name>|global] database [bgp|connected|ospf|rip|static]`

| Parameter  | Description                                                                              |
|------------|------------------------------------------------------------------------------------------|
| global     | If VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf        | Apply the command to the specified VRF instance.                                         |
| <vrf-name> | The name of the VRF instance.                                                            |
| bgp        | Displays only the routes learned from BGP.                                               |
| connected  | Displays only the routes learned from connected interfaces.                              |
| ospf       | Displays only the routes learned from OSPF.                                              |
| rip        | Displays only the routes learned from RIP.                                               |
| static     | Displays only the static routes you have configured.                                     |

**Mode** User Exec and Privileged Exec

**Example** To display the static routes in the RIB, use the command:

```
awplus# show ip route database static
```

**Output** Figure 32-17: Example output from the **show ip route database** command:

```
Codes: C - connected, S - static, R - RIP, B - BGP
 O - OSPF, IA - OSPF inter area
 N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
 E1 - OSPF external type 1, E2 - OSPF external type 2
 > - selected route, * - FIB route, p - stale info

O *> 9.9.9.9/32 [110/31] via 10.10.31.16, vlan2, 00:19:21
O 10.10.31.0/24 [110/1] is directly connected, vlan2, 00:28:20
C *> 10.10.31.0/24 is directly connected, vlan2
S *> 10.10.34.0/24 [1/0] via 10.10.31.16, vlan2

O *> 55.55.55.55/32 [110/21] via 10.10.31.16, vlan2, 00:21:19
C *> 127.0.0.0/8 is directly connected, lo
```

**Example (VRF-lite)** To display all routing entries in the RIB associated with a VRF instance `red`, use the command:

```
awplus# show ip route vrf red database
```

**Output** Figure 32-18: Example output from the **show ip route vrf red database** command

```
[VRF: red]
Codes: C - connected, S - static, R - RIP, B - BGP
 O - OSPF, IA - OSPF inter area
 N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
 E1 - OSPF external type 1, E2 - OSPF external type 2
 > - selected route, * - FIB route, p - stale info

O 192.168.10.0/24 [110/1] is directly connected, vlan1, 06:45:51
C *> 192.168.10.0/24 is directly connected, vlan1
B > 192.168.33.0/24 [20/0] via 192.168.30.3, 06:45:52
O E2 *> 192.168.110.0/24 [110/20] via 192.168.10.2, vlan1, 06:45:00
O E2 *> 192.168.111.0/24 [110/20] via 192.168.10.2, vlan1, 06:45:00
```

The routes added to the FIB are marked with a \*. When multiple routes are available for the same prefix, the best route is indicated with the > symbol. All unselected routes have neither the \* nor the > symbol.

```
S *> 10.10.34.0/24 [1/0] via 10.10.31.16, vlan2
O 10.10.34.0/24 [110/31] via 10.10.31.16, vlan2, 00:21:19
```

These route entries denote:

- The same prefix was learned from OSPF and from static route configuration.

- Since this static route has a lower administrative distance than the OSPF route (110), the static route (1) is selected and installed in the FIB.

If the static route becomes unavailable, then the device automatically selects the OSPF route and installs it in the FIB.

# show ip route summary

**Overview** This command displays a summary of the current RIB (Routing Information Base) entries.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

**Syntax** `show ip route summary`

**Syntax (VRF-lite)** `show ip route summary [vrf <vrf-name>|global]`

| Parameter  | Description                              |
|------------|------------------------------------------|
| vrf        | Specific VRF instance.                   |
| <vrf-name> | The name of the VRF instance.            |
| global     | The global routing and forwarding table. |

**Mode** User Exec and Privileged Exec

**Example** To display a summary of the current RIB entries, use the command:

```
awplus# show ip route summary
```

**Output** Figure 32-19: Example output from the **show ip route summary** command

|                                                      |          |
|------------------------------------------------------|----------|
| IP routing table name is Default-IP-Routing-Table(0) |          |
| IP routing table maximum-paths is 4                  |          |
| Route Source                                         | Networks |
| connected                                            | 5        |
| ospf                                                 | 2        |
| Total                                                | 8        |

**Example (VRF-lite)** To display a summary of the current RIB entries associated with a VRF instance red, use the command:

```
awplus# show ip route summary vrf red
```

**Output** Figure 32-20: Example output from the **show ip route summary vrf red** command

```
IP routing table name is Default-IP-Routing-Table(0)
IP routing table maximum-paths is 4
Route Source Networks
connected 1
Total 1
FIB 0

[VRF: red]
Route Source Networks
connected 1
ospf 2
Total 3
```

# show ip vrf

**Overview** This command displays brief configurations for a specific VRF instance.

**Syntax** `show ip vrf <vrf-name>`

| Parameter  | Description                   |
|------------|-------------------------------|
| <vrf-name> | The name of the VRF instance. |

**Mode** User Exec and Privileged Exec

**Example** To display brief information for the VRF instance red, use the command:

```
awplus# show ip vrf red
```

**Output** Figure 32-21: Example output from the show ip vrf red command

|      |            |            |
|------|------------|------------|
| Name | Default RD | Interfaces |
| red  | 500:1      | lo1, vlan1 |

**Related commands** [show ip vrf interface](#)

# show ip vrf detail

**Overview** This command displays the detailed configuration for a specific VRF instance.

**Syntax** `show ip vrf detail <vrf-name>`

| Parameter  | Description                   |
|------------|-------------------------------|
| <vrf-name> | The name of the VRF instance. |

**Mode** User Exec and Privileged Exec

**Example** To display the detailed information for all VRF instances, use the command:

```
awplus# show ip vrf detail
```

**Output** Figure 32-22: Example output from the **show ip detail** command, for all VRF instances

```
VRF blue; Description: VRF for customer blue
FIB ID 3; Router ID: 192.168.30.1 (automatic)
Default RD 500:3
 Interfaces:
 lo3, vlan3
 Export route-target communities
 RT: 500:3
 Import route-target communities
 RT: 500:4
 Import route-map: blue45
 No export route-map

VRF red
FIB ID 1; Router ID: 192.168.10.1 (automatic)
Default RD 500:1
 Interfaces:
 lo1, vlan1
 Export route-target communities
 RT: 500:1
 Import route-target communities
 RT: 500:1
 Import route-map: red43
 No export route-map
```

**Related commands** [show ip vrf](#)

# show ip vrf interface

**Overview** This command displays protocol, operational status, and address information, for interfaces existing within either a specified VRF instance, or all VRF instances.

**Syntax** `show ip vrf interface <vrf-name>`

| Parameter  | Description                   |
|------------|-------------------------------|
| <vrf-name> | The name of the VRF instance. |

**Mode** User Exec and Privileged Exec

**Example** To display all interfaces and IP addresses associated with all VRF instances, use the command:

```
awplus# show ip vrf interface
```

**Output** Figure 32-23: Example output from the **show ip vrf interface** command

| Interface | IP-Address      | Status   | Protocol | Vrf   |
|-----------|-----------------|----------|----------|-------|
| lo1       | unassigned      | admin up | running  | red   |
| lo2       | unassigned      | admin up | running  | green |
| vlan1     | 192.168.10.1/24 | admin up | running  | red   |
| vlan2     | 192.168.20.1/24 | admin up | running  | green |

**Example** To display all interfaces and IP addresses associated with the VRF instance `red`, use the command:

```
awplus# show ip vrf interface red
```

**Output** Figure 32-24: Example output from the **show ip vrf interface red** command

| Interface | IP-Address      | Status   | Protocol | Vrf |
|-----------|-----------------|----------|----------|-----|
| lo1       | unassigned      | admin up | running  | red |
| vlan1     | 192.168.10.1/24 | admin up | running  | red |

**Related commands** [show ip vrf](#)

# show running-config vrf

**Overview** This command displays the running system VRF-related configurations for all VRF instances.

**Syntax** `show running-config vrf`

**Mode** Privileged Exec

**Example** To display the running system VRF-related configurations, use the command:

```
awplus# show running-config vrf
```

**Output** Figure 32-25: Example output from the **show running config vrf** command

```
ip vrf red
rd 500:1
route-target export 500:1
route-target export 500:4
import map red 43
!
```

**Related commands** [show ip vrf](#)

# snmp-server host

**Overview** This command specifies an SNMP trap host destination to which Trap or Inform messages generated by the device are sent.

For SNMP version 1 and 2c you must specify the community name parameter. For SNMP version 3, specify the authentication/encryption parameters and the user name. If the version is not specified, the default is SNMP version 1. Inform messages can be sent instead of traps for SNMP version 2c and 3.

Use the **no** variant of this command to remove an SNMP trap host. The trap host must already exist.

The trap host is uniquely identified by:

- host IP address (IPv4 or IPv6)
- inform or trap messages
- community name (SNMPv1 or SNMP v2c) or the authentication/encryption parameters and user name (SNMP v3).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax**

```
snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
[version 1] <community-name>

snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 2c <community-name>

snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>

no snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
[version 1] <community-name>

no snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 2c <community-name>

no snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>
```

**Syntax (VRF-Lite)**

```
snmp-server host {<ipv4-address>|<ipv6-address>} [vrf
<vrf-name>] [informs|traps] version {1|2c|3} {auth|noauth|priv}
{<community-name>|<user-name>}

no snmp-server host {<ipv4-address>|<ipv6-address>} [vrf
<vrf-name>] [informs|traps] version {1|2c|3} {auth|noauth|priv}
{<community-name>|<user-name>}
```

| Parameter      | Description                                                                    |
|----------------|--------------------------------------------------------------------------------|
| <ipv4-address> | IPv4 trap host address in the format A.B.C.D, for example, 192.0.2.2.          |
| <ipv6-address> | IPv6 trap host address in the format x::x::x for example, 2001:db8::8a2e:7334. |

| Parameter                           | Description                                                                                    |
|-------------------------------------|------------------------------------------------------------------------------------------------|
| <code>vrf &lt;vrf-name&gt;</code>   | Specify the VRF instance to use. If you do not specify an instance it will use the global VRF. |
| <code>informs</code>                | Send Inform messages to this host.                                                             |
| <code>traps</code>                  | Send Trap messages to this host (default).                                                     |
| <code>version</code>                | SNMP version to use for notification messages. Default: version 1.                             |
| <code>1</code>                      | Use SNMPv1 (default).                                                                          |
| <code>2c</code>                     | Use SNMPv2c.                                                                                   |
| <code>3</code>                      | Use SNMPv3.                                                                                    |
| <code>auth</code>                   | Authentication.                                                                                |
| <code>noauth</code>                 | No authentication.                                                                             |
| <code>priv</code>                   | Encryption.                                                                                    |
| <code>&lt;community-name&gt;</code> | The SNMPv1 or SNMPv2c community name.                                                          |
| <code>&lt;user-name&gt;</code>      | SNMPv3 user name.                                                                              |

**Default** No host is defined.

**Mode** Global Configuration

**Usage notes** You can test connectivity to the host by using the command `test snmp trap snmp`.

**Examples** To configure the device to send generated traps to the IPv4 host destination 192.0.2.5 with the SNMPv2c community name 'public', use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server host 192.0.2.5 version 2c public
```

To configure the device to send generated traps to the IPv6 host destination 2001:db8::8a2e:7334 with the SNMPv2c community name 'private', use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server host 2001:db8::8a2e:7334 version 2c
private
```

To remove a configured trap host of 192.0.2.5 with the SNMPv2c community name 'public', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server host 192.0.2.5 version 2c public
```

To configure the device to send generated traps to an IPv4 host destination 192.168.1.2 with the SNMPv2c community name 'public' and on a VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server host 192.0.1.2 vrf red version 2c
public
```

**Command  
changes**

Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

# snmp-server vrf

**Overview** Use this command to isolate the SNMP Agent to operate within a previously configured non-global named VRF. This means the SNMP Agent can only respond to requests from SNMP Managers operating within the same VRF.

Use the **no** variant of this command to revert the SNMP Agent to operating within the default global VRF.

**Syntax** `snmp-server vrf <vrf-name>`  
`no snmp-server vrf`

| Parameter                     | Description                         |
|-------------------------------|-------------------------------------|
| <code>vrf</code>              | The VRF instance to operate within. |
| <code>&lt;vrf-name&gt;</code> | The VRF instance name.              |

**Default** Global VRF

**Mode** Global Configuration

**Examples** To configure the SNMP Agent to operate within the VRF instance named 'red', use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server vrf red
```

To revert the SNMP Agent to operating within the default global VRF, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-server vrf
```

**Related commands** [show snmp-server](#)  
[snmp-server](#)

**Command changes** Version 5.5.2-2.1: command added

# ssh

**Overview** Use this command to initiate a Secure Shell connection to a remote SSH server.

If the server requests a password to login, you need to type in the correct password at the "Password:" prompt.

An SSH client identifies the remote SSH server by its public key registered on the client device. If the server identification is changed, server verification fails. If the public key of the server has been changed, the public key of the server must be explicitly added to the known host database.

**NOTE:** A hostname specified with SSH cannot begin with a hyphen (-) character.

**Syntax** `ssh [ip|ipv6] [user <username>|port <1-65535>|version 2]  
<remote-device> [<command>]`

**Syntax in secure mode** `ssh [cipher  
{aes128-cbc|aes256-cbc|aes128-ctr|aes192-ctr|aes256-ctr}]  
[hmac {hmac-sha2-256}]  
[public-key {ecdsa-sha2-nistp256|ecdsa-sha2-nistp384}]  
[key-exchange {ecdh-sha2-nistp256|ecdh-sha2-nistp384}]  
[ip|ipv6] [user <username>|port <1-65535>|version 2]  
<remote-device> [<command>]`

**Syntax (VRF-lite)** `ssh vrf <vrf-name> [ip|ipv6] [user <username>|port  
<1-65535>|version 2] <remote-device> [<command>]`

| Parameter    | Description                                                                                                                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cipher       | The supported cipher name.<br>Select either: aes128-cbc or aes256-cbc.                                                                                                                                                  |
| hmac         | The supported hmac name: hmac-sha2-256                                                                                                                                                                                  |
| public-key   | The supported public-key name.<br>Select either:<br>ecdsa-sha2-nistp256 or ecdsa-sha2-nistp384                                                                                                                          |
| key-exchange | The supported key-exchange name.<br>Select either:<br>ecdsa-sha2-nistp256 or ecdsa-sha2-nistp384                                                                                                                        |
| vrf          | Apply the command to the specified VRF instance. When using VRF, specifying a VRF name means the command will apply to that VRF instance, and not specifying a VRF name means the command will apply to the global VRF. |
| <vrf-name>   | The name of the VRF instance.                                                                                                                                                                                           |
| ip           | Specify IPv4 SSH.                                                                                                                                                                                                       |
| ipv6         | Specify IPv6 SSH.                                                                                                                                                                                                       |

| Parameter       | Description                                                                                                                                                                                                                                              |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| user            | Login user. If user is specified, the username is used for login to the remote SSH server when user authentication is required. Otherwise the current user name is used.<br><br><username>      User name to login on the remote server.                 |
| port            | SSH server port. If port is specified, the SSH client connects to the remote SSH server with the specified TCP port. Otherwise, the client port configured by "ssh client" command or the default TCP port (22) is used.<br><br><1-65535>      TCP port. |
| version         | SSH client version. From 5.5.1-1.1 onwards, SSH only supports version 2.                                                                                                                                                                                 |
| <remote-device> | IPv4/IPv6 address or hostname of a remote server. The address is in the format A.B.C.D for an IPv4 address, or in the format X:X::X:X for an IPv6 address. Note that a hostname specified with SSH cannot begin with a hyphen (-) character.             |
| <command>       | A command to execute on the remote server. If a command is specified, the command is executed on the remote SSH server and the session is disconnected when the remote command finishes.                                                                 |

**Mode**      User Exec and Privileged Exec

**Usage notes**      This command contains some additional security parameters (cipher, hmac, public-key, and key exchange). To access these parameters you must enable Secure Mode on the device by using the command: **crypto secure-mode**.

```
awplus(config)# crypto secure-mode
```

**Examples**      To login to the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 as user 'manager', use the command:

```
awplus# ssh ip user manager 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 that is listening on TCP port 2000, use the command:

```
awplus# ssh port 2000 192.0.2.5
```

To login to the remote SSH server 'example\_host' using an IPv6 session, use the command:

```
awplus# ssh ipv6 example_host
```

To run the **cmd** command on the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5 cmd
```

**Example (VRF-lite)**      To login to the remote SSH server at 192.168.1.1 on VRF "red", use the command:

```
awplus# ssh vrf red 192.168.1.1
```

- Version 5.5.1-1.1: support removed for SSH protocol v1
- Version 5.4.8-2.1: secure mode syntax added for x950, SBx908 GEN2.
- Version 5.4.8-1.2: secure mode syntax added for x220, x930, x550, XS900MX.
- Version 5.4.6-2.1: VRF-lite support added for AR-Series devices.

# ssh client

**Overview** This command modifies the default configuration parameters of the Secure Shell (SSH) client. The configuration is used for any SSH client on the device to connect to remote SSH servers. Any parameters specified on SSH client explicitly override the default configuration parameters.

The change affects the current user shell only. When the user exits the login session, the configuration does not persist. This command does not affect existing SSH sessions.

The **no** variant of this command resets configuration parameters of the Secure Shell (SSH) client changed by the [ssh client](#) command, and restores the defaults.

This command does not affect the existing SSH sessions.

**Syntax**

```
ssh client {port <1-65535>|version 2|session-timeout <0-3600>|connect-timeout <1-600>}
no ssh client {port|version|session-timeout|connect-timeout}
```

**Syntax (VRF-lite)**

```
ssh client {port <1-65535>|version 2|session-timeout <0-3600>|connect-timeout <1-600>|vrf <vrf-name>}
no ssh client
{port|version|session-timeout|connect-timeout|vrf}
```

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| port            | The default TCP port of the remote SSH server. If an SSH client specifies an explicit port of the server, it overrides the default TCP port.<br>Default: 22                                                                                                                                                                                                     |
|                 | <1-65535> TCP port number.                                                                                                                                                                                                                                                                                                                                      |
| version         | The SSH version used by the client for SSH sessions.<br>From 5.5.1-1.1 onwards, the SSH client supports only version 2                                                                                                                                                                                                                                          |
| session-timeout | The global session timeout for SSH sessions. If the session timer lapses since the last time an SSH client received data from the remote server, the session is terminated. If the value is 0, then the client does not terminate the session. Instead, the connection is terminated when it reaches the TCP timeout.<br>Default: 0 (session timer remains off) |
|                 | <0-3600> Timeout in seconds.                                                                                                                                                                                                                                                                                                                                    |
| connect-timeout | The maximum time period that an SSH session can take to become established. The SSH client terminates the SSH session if this timeout expires and the session is still not established.<br>Default: 30                                                                                                                                                          |
|                 | <1-600> Timeout in seconds.                                                                                                                                                                                                                                                                                                                                     |
| vrf <vrf-name>  | The VRF to use for SSH clients.<br>Default: the global VRF.                                                                                                                                                                                                                                                                                                     |

**Mode** Privileged Exec

**Examples** To configure the default TCP port for SSH clients to 2200, and the session timer to 10 minutes, use the command:

```
awplus# ssh client port 2200 session-timeout 600
```

To configure the connect timeout of SSH client to 10 seconds, use the command:

```
awplus# ssh client connect-timeout 10
```

To restore the connect timeout to its default, use the command:

```
awplus# no ssh client connect-timeout
```

**Example (VRF-lite)** To configure SSH clients to use the VRF named 'red', use the command:

```
awplus# ssh client vrf red
```

**Related commands** [show ssh client](#)  
[ssh](#)

**Command changes** Version 5.5.3-1.1: added to AR1050V  
Version 5.5.2-1.1: **vrf** parameter added for products that support VRF  
Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# ssh client vrf

**Overview** Use this command to modify the configured VRF of the SSH client. Use this configuration for any SSH client on the device to connect to remote SSH servers.

Use the **no** variant of this command to restore the configured VRF to the default VRF (global VRF).

**Syntax** `ssh client vrf <vrf-name>`  
`no client vrf`

| Parameter                        | Description                                                             |
|----------------------------------|-------------------------------------------------------------------------|
| <code>vrf&lt;vrf-name&gt;</code> | The name of the VRF to use for SSH clients. This overrides the default. |

**Default** Global VRF

**Mode** Global Configuration

**Usage notes** Any VRF parameter specified on the SSH client explicitly overrides the default configuration parameters. This also affects the copy commands that utilize SSH such as **copy scp** and **copy sftp**.

This change affects all new user shell sessions. Existing sessions will not be affected.

A user may override this on a per-session basis using the executive mode variant of this command.

**Examples** To configure the VRF named 'management' for SSH clients, use the commands:

```
awplus# configure terminal
awplus(config)# ssh client vrf management
```

To restore to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh client vrf
```

**Related commands** [show ssh client](#)  
[ssh client](#)

**Command changes** Version 5.5.2-2.1: command added

# ssh server vrf

**Overview** Use this command to specify a VRF for the SSH server to operate within.  
Use the **no** variant of this command to return the SSH server to the default VRF.

**Syntax** `ssh server vrf [<vrf-name>]`  
`no ssh server vrf`

| Parameter  | Description                  |
|------------|------------------------------|
| <vrf-name> | The name of the VRF instance |

**Default** The global VRF

**Mode** Global Configuration

**Example** To configure the SSH server to operate within the VRF instance named 'red', use the command:

```
awplus# configure terminal
awplus(config)# ssh server vrf red
```

To return the SSH server to operating within the global VRF instance, use the command:

```
awplus# configure terminal
awplus(config)# no ssh server vrf
```

**Related commands** [show ssh server](#)  
[ssh](#)  
[ssh server](#)

**Command changes** Version 5.5.2-1.1: command added

# tacacs-server host

**Overview** Use this command to specify a remote TACACS+ server host for authentication, authorization and accounting, and to set the shared secret key to use with the TACACS+ server. The parameters specified with this command override the corresponding global parameters for TACACS+ servers.

Use the **no** variant of this command to remove the specified server host as a TACACS+ authentication and authorization server.

**Syntax** `tacacs-server host {<host-name>|<ip-address>} [key [8]  
<key-string>]`  
`no tacacs-server host {<host-name>|<ip-address>}`

**Syntax (VRF-lite)** `tacacs-server host {<host-name>|<ip-address>} [vrf <vrf-name>]  
[key [8] <key-string>]`  
`no tacacs-server host {<host-name>|<ip-address>} [vrf  
<vrf-name>]`

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <host-name>       | Server host name. The DNS name of the TACACS+ server host.                                                                                                                                                                                                                                                                                                                                                                     |
| <ip-address>      | The IP address of the TACACS+ server host, in dotted decimal notation A.B.C.D.                                                                                                                                                                                                                                                                                                                                                 |
| vrf<br><vrf-name> | The name of a VRF instance. Use this to specify the VRF that the TACACS+ server is accessible by. Servers are uniquely identified by their address and VRF, so multiple servers can have the same address or host-name as long as the VRF is different. The default is the global VRF.                                                                                                                                         |
| key               | Set shared secret key with TACACS+ servers.                                                                                                                                                                                                                                                                                                                                                                                    |
| 8                 | Specifies that you are entering a password as a string that has already been encrypted instead of entering a plain text password. The running config displays the new password as an encrypted string even if password encryption is turned off.                                                                                                                                                                               |
| <key-string>      | Shared key string applied, a value in the range 1 to 64 characters. Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and the TACACS+ server. This key must match the encryption used on the TACACS+ server. This setting overrides the global setting of the <a href="#">tacacs-server key</a> command. If no key value is specified, the global value is used. |

**Default** No TACACS+ server is configured by default.

**Mode** Global Configuration

**Usage** A TACACS+ server host cannot be configured multiple times like a RADIUS server.

As many as four TACACS+ servers can be configured and consulted for login authentication, enable password authentication and accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, not if a login authentication attempt is rejected. The reasons a server would fail are:

- it is not network reachable
- it is not currently TACACS+ capable
- it cannot communicate with the switch properly due to the switch and the server having different secret keys

**Examples** To add the server tac1.company.com as the TACACS+ server host, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host tac1.company.com
```

To set the secret key to 'secret' on the TACACS+ server 192.168.1.1, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host 192.168.1.1 key secret
```

To remove the TACACS+ server tac1.company.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server host tac1.company.com
```

**Examples (VRF-lite)** To add the server tac1.company.com as the TACACS+ server host in the VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host tac1.company.com vrf red
```

To remove the TACACS+ server 192.168.1.1 from the VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server host 192.168.1.1 vrf red
```

# tcpdump

**Overview** Use this command to start a tcpdump, which gives the same output as the Unix-like **tcpdump** command to display TCP/IP traffic. Press <ctrl> + c to stop a running tcpdump.

**Syntax** `tcpdump <line>`

**Syntax (VRF-lite)** `tcpdump [vrf <vrf-name>] <line>`

| Parameter  | Description                                                                                                                                                                          |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <line>     | Specify the dump options. For more information on the options for this placeholder see <a href="http://www.tcpdump.org/tcpdump_man.html">http://www.tcpdump.org/tcpdump_man.html</a> |
| vrf        | Apply the command to the specified VRF instance.                                                                                                                                     |
| <vrf-name> | The name of the VRF instance.                                                                                                                                                        |

**Mode** Privileged Exec

**Example** To start a tcpdump running to capture IP packets, enter the command:

```
awplus# tcpdump ip
```

**Example (VRF-lite)** To start a tcpdump on interface vlan2 associated with a VRF instance red, enter the command:

```
awplus# tcpdump vrf red vlan2
```

**Output** Figure 32-26: Example output from the **tcpdump** command

```
03:40:33.221337 IP 192.168.1.1 > 224.0.0.13: PIMv2, Hello,
length: 34
1 packets captured
2 packets received by filter
0 packets dropped by kernel
```

# telnet

**Overview** Use this command to open a telnet session to a remote device.

**Syntax** `telnet {<hostname>|[ip] <ipv4-addr>|[ipv6] <ipv6-addr>} [  
<port>]`

**Syntax (VRF-lite)** `telnet [vrf <vrf-name>] {<hostname>|[ip] <ipv4-addr>|[ipv6] <ipv6-addr>} [  
<port>]`

| Parameter   | Description                                                                                                                               |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| vrf         | Apply this command to a VRF instance.                                                                                                     |
| <vrf-name>  | The name of the VRF instance.                                                                                                             |
| <hostname>  | The host name of the remote system.                                                                                                       |
| ip          | Keyword used to specify the IPv4 address or host name of a remote system.                                                                 |
| <ipv4-addr> | An IPv4 address of the remote system.                                                                                                     |
| ipv6        | Keyword used to specify the IPv6 address of a remote system                                                                               |
| <ipv6-addr> | Placeholder for an IPv6 address in the format x:x:x:x, for example, 2001:db8::8a2e:7334                                                   |
| <port>      | Specify a TCP port number (well known ports are in the range 1-1023, registered ports are 1024-49151, and private ports are 49152-65535). |

**Mode** User Exec and Privileged Exec

**Examples** To connect to TCP port 2602 on the device at 10.2.2.2, use the command:

```
awplus# telnet 10.2.2.2 2602
```

To connect to the telnet server `host.example`, use the command:

```
awplus# telnet host.example
```

To connect to the telnet server `host.example` on TCP port 100, use the command:

```
awplus# telnet host.example 100
```

**Example (VRF-lite)** To open a telnet session to a remote host `192.168.0.1` associated with VRF instance `red`, use the command:

```
awplus# telnet vrf red ip 192.168.0.1
```

# timers (RIP)

**Overview** Use this command to adjust routing network timers.  
Use the **no** variant of this command to restore the defaults.

**Syntax** `timers basic <update> <timeout> <garbage>`  
`no timers basic`

| Parameter | Description                                                                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <update>  | <5-2147483647><br>Specifies the period at which RIP route update packets are transmitted. The default is 30 seconds.                                                                                              |
| <timeout> | <5-2147483647><br>Specifies the routing information timeout timer in seconds. The default is 180 seconds. After this interval has elapsed and no updates for a route are received, the route is declared invalid. |
| <garbage> | <5-2147483647><br>Specifies the routing garbage collection timer in seconds. The default is 120 seconds.                                                                                                          |

**Default** Enabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** This command adjusts the RIP timing parameters.

The update timer is the time between sending out updates, that contain the complete routing table, to every neighboring router.

If an update for a given route has not been seen for the time specified by the timeout parameter, that route is no longer valid. However, it is retained in the routing table for a short time, with metric 16, so that neighbors are notified that the route has been dropped.

When the time specified by the garbage parameter expires the metric 16 route is finally removed from the routing table. Until the garbage time expires, the route is included in all updates sent by the router.

All the routers in the network must have the same timers to ensure the smooth operation of RIP throughout the network.

**Examples** To set the update timer to 30, the routing information timeout timer to 180, and the routing garbage collection timer to 120, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# timers basic 30 180 120
```

To set the update timer to 30, the routing information timeout timer to 180, and the routing garbage collection timer to 120 with VRF, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# timers basic 30 180 120
```

# traceroute

**Overview** Use this command to trace the route to the specified IPv4 host.

**Syntax** `traceroute {<ip-addr>|<hostname>}`

**Syntax (VRF-lite)** `traceroute [vrf <vrf-name>] {<ip-addr>|<hostname>}`

| Parameter  | Description                                                             |
|------------|-------------------------------------------------------------------------|
| <ip-addr>  | The destination IPv4 address. The IPv4 address uses the format A.B.C.D. |
| <hostname> | The destination hostname.                                               |
| vrf        | Apply the command to the specified VRF instance.                        |
| <vrf-name> | The name of the VRF instance.                                           |

**Mode** User Exec and Privileged Exec

**Example** `awplus# traceroute 10.10.0.5`

**Example (VRF-lite)** `awplus# traceroute vrf red 192.168.0.1`

# version (RIP)

**Overview** Use this command to specify a RIP version used globally by the router.

If VRF-lite is configured, you can specify a RIP version either globally, or for a particular VRF instance.

Use the **no** variant of this command to restore the default version.

**Syntax** `version {1|2}`  
`no version`

| Parameter | Description                              |
|-----------|------------------------------------------|
| 1 2       | Specifies the version of RIP processing. |

**Default** Version 2

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Setting the version command has no impact on receiving updates, only on sending them. The [ip rip send version](#) command overrides the value set by the [version \(RIP\)](#) command on an interface-specific basis. The [ip rip receive version](#) command allows you to configure a specific interface to accept only packets of the specified RIP version. The [ip rip receive version](#) command and the [ip rip send version](#) command override the value set by this command.

**Examples** To specify a RIP version, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# version 1
```

To specify a RIP version with VRF, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# version 1
```

**Related commands** [ip rip receive version](#)  
[ip rip send version](#)  
[show running-config](#)

## vrf

**Overview** Use this command to add a VRF name to a DHCP server's address pool. This enables the DHCP server to become VRF-aware and allocate IP addresses which are the same as other pools.

One of the benefits of using this command is that it allows you to share DHCP leases across multiple isolated networks.

Use the **no** variant of this command to remove a VRF name from the DHCP server pool.

**Syntax** `vrf <vrf-name>`  
`no vrf`

| Parameter  | Description                            |
|------------|----------------------------------------|
| <vrf-name> | The name of the specific VRF instance. |

**Default** Global VRF

**Mode** DHCP Configuration

**Usage notes** You need to enter this **vrf** command before entering the [network \(DHCP\)](#) and [range](#) address commands.  
For more information, see the [DHCP Feature Overview and Configuration Guide](#).

**Example** To add the VRF name 'red' to the DHCP pool named 'P1', use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P1
awplus(dhcp-config)# vrf red
```

To remove a VRF name from the DHCP pool named 'P1', use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P1
awplus(dhcp-config)# no vrf
```

**Related commands** [network \(DHCP\)](#)  
[range](#)  
[show ip dhcp pool](#)

**Command changes** Version 5.5.1-1.1: command added

# 33

# VXLAN Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Virtual Extensible LAN (VXLAN).

VXLAN is an overlay encapsulation technology. It creates a virtual network overlaid on top of the existing physical network infrastructure. It uses the underlay IP network and builds a flexible Layer 2 overlay logical network on it.

For more information, see the [VXLAN Feature Overview and Configuration Guide](#).

# flood-list

**Overview** Use this command to create a named flood list, which contains a list of remote VTEP (VXLAN Tunnel End Point) names.

When using the **no** variant of the command, specifying a remote VTEP name will remove that remote VTEP from the flood list. Specifying only the flood list name will destroy the flood list entirely and automatically disassociate it from any map-access commands that have referenced it. Any L2VNIs affected by this will begin to be flooded to all known remote VTEPs (the standard behaviour when no flood list is specified).

**Syntax** `flood-list <list-name> [vteps <vtep-name>...]`  
`no flood-list <list-name> [vteps <vtep-name>...]`

| Parameter   | Description                                      |
|-------------|--------------------------------------------------|
| <list-name> | The name of the flood list, (max 20 characters). |
| <vtep-name> | The VTEP name or a list of remote VTEP names.    |

**Default** N/A.

**Mode** VXLAN Configuration

**Usage notes** By default, when a VLAN is mapped to an L2VNI, the local device will assume that all configured remote VTEPs are involved in the L2VNI and will flood all BUM (Broadcast, Unknown unicast, Multicast) traffic for that L2VNI to all configured remote VTEPs.

It is possible however to have an L2VNI that is only associated with a subset of the remote VTEPs on the device. This configuration scenario can be achieved by creating a flood list that specifies a set of remote VTEPs, which can then be associated with the L2VNI when it is created using the **map-access vlan vni** command.

A flood list can be created with no remote VTEPs. If such a flood list were associated with a VNI mapping, it would prevent traffic for that VNI being forwarded to any remote VTEPs.

When remote VTEPs are specified in a list, all of the remote VTEPs must exist for the command to be accepted. When the command is accepted, the newly specified remote VTEPs are added to the existing flood list. In the running configuration. The flood list may occupy multiple lines if required to display all of the remote VTEP names in the list. The order of the remote VTEPs in the list does not matter.

**Example** To create a new flood list named 'LectureBlockA', which includes the remote VTEPs LectureTheaterA2 and LectureTheatreA3, use the commands:

```
awplus# configure terminal
awplus(config)# nvo vxlan
awplus(config-vxlan)# flood-list LectureBlockA vteps
LectureTheaterA2 LectureTheaterA3
```

To remove LectureTheatreA3 from the 'LectureBlockA' flood list, use the commands:

```
awplus# configure terminal
awplus(config)# nvo vxlan
awplus(config-vxlan)# no flood-list LectureBlockA vteps
LectureTheaterA3
```

To destroy the 'LectureBlockA' flood list entirely, use the commands:

```
awplus# configure terminal
awplus(config)# nvo vxlan
awplus(config-vxlan)# no flood-list LectureBlockA
```

**Related commands**

- [source-interface \(vxlan\)](#)
- [remote-vtep](#)
- [map-access vlan vni](#)
- [nvo vxlan](#)

**Command changes** Version 5.5.1-0.1: command added

# map-access vlan vni

**Overview** Use this command to map an existing VLAN ID to an L2VNI. The VLAN and L2VNI cannot already be in use in VXLAN, and a [source-interface \(vxlan\)](#) must be configured before this command will be accepted.

Use the **no** variant of this command to remove a mapping between a VLAN ID and L2VNI.

**Syntax** `map-access vlan <vlan-id> vni <vni-id> [flood-list <list-name>]`  
`no map-access vlan <vlan-id>`

| Parameter   | Description                                                                  |
|-------------|------------------------------------------------------------------------------|
| <vlan-id>   | VLAN ID, in the range 1-4094                                                 |
| <vni-id>    | Layer 2 VNI to associate with the specified VLAN ID, in the range 1-16777215 |
| <list-name> | The name of an existing flood list.                                          |

**Mode** VXLAN Configuration

**Usage notes** You can optionally specify the name of a flood list. This is useful if an L2VNI is only operating on a sub-set of all configured remote VTEPs.

- If no flood list is specified, then the device will assume all existing configured remote VTEPs are members of this L2VNI and will flood BUM (Broadcast, Unknown unicast, Multicast traffic) traffic to them.
- If a flood list is specified, then the device will only flood BUM traffic for the L2VNI to the remote VTEPs specified in the flood list.

**Example** To associate VLAN 5 with VNI 10005, use the commands:

```
awplus# configure terminal
awplus(config)# nvo vxlan
awplus(config-vxlan)# map-access vlan 5 vni 10005
```

To associate VLAN 6 with VNI 10006 and a flood-list, use the commands:

```
awplus# configure terminal
awplus(config)# nvo vxlan
awplus(config-vxlan)# map-access vlan 6 vni 10006 flood-list
VNI10006
```

To remove the association between VLAN 6 and VNI 10006, use the commands:

```
awplus# configure terminal
awplus(config)# nvo vxlan
awplus(config-vxlan)# no map-access vlan 6
```

|                         |                                  |

# nvo vxlan

**Overview** Use this command to enter the **config-vxlan** mode, where all other VXLAN commands are entered.

If you want to do L3 operations (and routing) of traffic within a VXLAN tunnel, we recommend using VRF. In that case, assign VLANs mapped to the VNIs to a named VRF. The tunnel itself exists in the global VRF.

Use the **no** variant of this command to remove all VXLAN configuration under VXLAN configuration mode from the device.

**Syntax** `nvo vxlan`  
`no nvo vxlan`

**Mode** Global Configuration

**Example** To enter the VXLAN configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# nvo vxlan
awplus(config-vxlan)#
```

**Related commands** [source-interface \(vxlan\)](#)  
[remote-vtep](#)  
[map-access vlan vni](#)  
[flood-list](#)  
[show vxlan](#)

**Command changes** Version 5.5.1-0.1: command added

# platform inter-chip-header 4-word

**Overview** Use this command to enable extended ACL VLAN actions or to enable VXLAN platform support.

Use the **no** variant of this command to disable extended ACL VLAN actions or to disable VXLAN platform support.

**Syntax** `platform inter-chip-header 4-word`  
`no platform inter-chip-header`

**Default** Not enabled.

**Mode** Global Configuration

**Example** To enable extended ACL VLAN actions or to enable VXLAN platform support, use the command:

```
awplus# platform inter-chip-header 4-word
```

To return to the default platform settings, use the command:

```
awplus# no platform inter-chip-header
```

**Related commands** [show platform](#)

**Command changes** Version 5.5.1-0.1: command added

# platform l3-vxlan enable

**Overview** Use this command to enable VXLAN tunneling on your device.  
Use the **no** variant of this command to return to the default platform settings.

**Syntax** platform l3-vxlan enable  
no platform l3-vxlan enable

**Default** Not enabled.

**Mode** Global Configuration

**Usage notes** This command is required to enable VXLAN tunneling on your device.

**Example** To enable VXLAN tunneling, use the command:

```
awplus# platform l3-vxlan enable
```

To return the default platform settings, use the command:

```
awplus# no platform l3-vxlan enable
```

**Related commands** [show platform](#)

**Command changes** Version 5.5.1-2.1: command added

# remote-vtep

**Overview** Use this command to create a VTEP (VXLAN Tunnel End Point) tunnel between the local device and the remote IP address specified in this command.

Use the **no** variant of this command to remove a VTEP.

**Syntax** `remote-vtep <vtep-name> <ip-address>`  
`no remote-vtep <vtep-name>`

| Parameter                       | Description                                                                              |
|---------------------------------|------------------------------------------------------------------------------------------|
| <code>&lt;vtep-name&gt;</code>  | A unique name that identifies the remote device. The name must be 20 characters or less. |
| <code>&lt;ip-address&gt;</code> | The IPv4 address of the far end of the tunnel.                                           |

**Default** N/A.

**Mode** VXLAN Configuration

**Example** To create a VXLAN tunnel called LectureTheaterA2 with the remote IP address 192.168.4.7, use the commands:

```
awplus# configure terminal
awplus(config)# nvo vxlan
awplus(config-vxlan)# remote-vtep LectureTheaterA2 192.168.4.7
```

**Related commands** [source-interface \(vxlan\)](#)  
[nvo vxlan](#)  
[map-access vlan vni](#)  
[flood-list](#)

**Command changes** Version 5.5.1-0.1: command added

# show vxlan

**Overview** Use this command to see the configuration state of VXLAN in the system. As VXLAN tunnels are stateless, this command should mainly be used to check that the tunnels have been configured as intended. It can also be used to check that nexthops have been learned for the configured remote VTEPs.

**Syntax** `show vxlan`

**Mode** Privileged Exec

**Usage** Resource usage:

- there is a maximum limit of 127 VTEPs that can be configured, and 1000 VNIs. There is also a limit of 8192 that is the number of VTEPs \* VNIs. Finally the virtual ports are used when trunked VLANs are added to ports, with each trunked VLAN added to a single port consuming 1 virtual port, so 10 trunked VLANs added onto 5 ports would consume 50 virtual ports.

**Example** To show the VXLAN configuration state, use the command:

```
awplus# show vxlan
```

**Output** Figure 33-1: Example output from **show vxlan**

```
awplus#show vxlan
Resource Usage:

VTEP Usage 3/127
VNI Usage 2/1000
VTEP multiplied by VNI usage 6/8192
Hardware Virtual Port Usage 4/16384

Remote VTEPs (3)

VTEP branch-office-1 (172.16.43.1)
 VNIs (2): 10040, 10050

**Command changes** Version 5.5.1-2.0: command added

# source-interface (vxlan)

**Overview** Use this command to configure the device to accept the loopback interface as a termination point for VXLAN tunnels. To use this command, you must first ensure the loopback interface has an IPv4 host address configured as its primary IP address.

Use the **no** variant of this command to remove the VXLAN tunnel source interface. Note that all remote VTEPs ( VXLAN Tunnel End Points ) must be deconfigured first.

**Syntax** `source-interface <int-name>`  
`no source-interface`

| Parameter                     | Description                      |
|-------------------------------|----------------------------------|
| <code>&lt;int-name&gt;</code> | The loopback interface name 'lo' |

**Default** Not set.

**Mode** VXLAN Configuration

**Example** To configure IP address 192.168.1.1 as the tunnel source, use the commands:

```
awplus# configure terminal
awplus(config)# interface lo
awplus(config-if)# ip address 192.168.1.1
awplus(config-if)# exit
awplus(config)# nvo vxlan
awplus(config-vxlan)# source-interface lo
```

# Link Health Monitoring for Switches Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Link Health Monitoring for switches.

For more information, see the [Link Health Monitoring for Switches Feature Overview and Configuration Guide](#).

- Command List**
- “consecutive probe loss” on page 1969
  - “debug linkmon” on page 1971
  - “destination (linkmon-probe)” on page 1973
  - “dscp (linkmon-probe)” on page 1974
  - “egress interface (linkmon-probe)” on page 1975
  - “enable (linkmon-probe)” on page 1976
  - “interval (linkmon-probe)” on page 1977
  - “ip-version (linkmon-probe)” on page 1978
  - “jitter” on page 1979
  - “latency” on page 1981
  - “linkmon probe” on page 1983
  - “linkmon probe-history” on page 1985
  - “linkmon profile” on page 1987
  - “sample-size (linkmon-probe)” on page 1988
  - “service linkmon” on page 1989
  - “show linkmon probe” on page 1990
  - “show linkmon probe-history” on page 1993
  - “show linkmon trigger” on page 1995

- [“size \(linkmon-probe\)”](#) on page 1997
- [“source \(linkmon-probe\)”](#) on page 1998
- [“url \(linkmon-probe\)”](#) on page 1999

# consecutive probe loss

**Overview** Use this command within a specific link performance profile to configure the allowable consecutive probe loss thresholds of probes that use that performance profile.

Use the **no** variant of this command to delete a consecutive probe loss threshold.

**Syntax**

```
consecutive-probe-loss bad-when <consecutive-probe-losses>
consecutive-probe-loss good-when <consecutive-probe-successes>
consecutive-probe-loss unreachable-when
<consecutive-probe-losses>
no consecutive-probe-loss bad-when
no consecutive-probe-loss good-when
no consecutive-probe-loss unreachable-when
```

| Parameter                                      | Description                                                                                                                                      |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| bad-when<br><consecutive-probe-losses>         | The number of probes that must be lost consecutively, at which point the associated link is considered to be bad, in a range of <1-100>.         |
| good-when<br><consecutive-probe-successes>     | The number of probes that must succeed consecutively, at which point the associated link is considered to be good, in a range of <1-100>.        |
| unreachable-when<br><consecutive-probe-losses> | The number of probes that must be lost consecutively, at which point the associated link is considered to be unreachable, in a range of <1-100>. |

**Default** The performance profile is disabled.

**Mode** Linkmon Profile Configuration

**Usage notes** These setting are all optional.

The **bad-when** parameter is used to set the thresholds where if the number of probe replies that have been lost consecutively is equal to or above this value, then that link is considered bad. If **bad-when** is not configured, this metric will never result in a link being considered bad.

The **unreachable-when** parameter is used to set the thresholds where if the number of probe replies that have been lost consecutively is equal to or above this value, then that link is considered unreachable or down. If **unreachable-when** is not configured, this metric will never result in a link being considered unreachable.

The **good-when** parameter is used to state the thresholds where if the number of probe replies that have been successfully received consecutively is equal to or above this value, then that link is considered good. If **good-when** is not configured, then when a link is considered bad or unreachable due to this metric, the first successful probe result will consider the link as good.

**Example** To configure the point at or above which consecutive probe loss is unacceptable to be 10, the point at or above which consecutive probe success is acceptable to be 5, and the point at or above which consecutive probe loss indicates the destination is unreachable to be 15 for performance profile named "profile0", use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon profile profile0
awplus(config-linkmon-profile)# consecutive-probe-loss
bad-when 10
awplus(config-linkmon-profile)# consecutive-probe-loss
good-when 5
awplus(config-linkmon-profile)# consecutive-probe-loss
unreachable-when 15
```

To delete consecutive-probe-loss thresholds in performance profile "profile0", use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon profile profile0
awplus(config-linkmon-profile)# no consecutive-probe-loss
bad-when
awplus(config-linkmon-profile)# no consecutive-probe-loss
good-when
awplus(config-linkmon-profile)# no consecutive-probe-loss
unreachable-when
```

**Command changes** Version 5.4.8-1.1: command added  
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

# debug linkmon

**Overview** Use this command to enable Link Health Monitoring debugging.  
Use the **no** variant of this command to disable Link Health Monitoring debugging.

**Syntax** debug linkmon [probe|ip-address|interface|trigger]  
no debug linkmon [probe|ip-address|interface|trigger]  
debug linkmon probe name <name>  
no debug linkmon probe name <name>

| Parameter  | Description                                                                          |
|------------|--------------------------------------------------------------------------------------|
| probe      | Link Health Monitoring probe.                                                        |
| ip-address | IP addresses that are of interest to Link Health Monitoring.                         |
| interface  | Interfaces that are of interest to Link Health Monitoring.                           |
| trigger    | This debug option will show debugging for Link Health Monitoring triggers.           |
| <name>     | The name identifying a Link Health Monitoring probe or Link Health Monitoring group. |

**Default** No debugging is enabled.

**Mode** Privileged Exec

**Usage notes** If **probe** is specified, then debug related to all Link Health Monitoring probes is enabled.  
If **probe name <name>** is specified, then debug related to the named Link Health Monitoring probe is enabled.  
If **ip-address** is specified, then debug related to configuration of IP addresses that are of interest to Link Health Monitoring are enabled. These IP addresses could influence Link Health Monitoring group members being considered up/down.  
If **interface** is specified, then debug related to up/down state of Link Health Monitoring is enabled.  
If **trigger** is specified, then debug related to Link Health Monitoring triggers is enabled.

**Example** To enable debugging on the Link Health Monitoring probe 'probe1', use the following command:

```
awplus# debug linkmon probe name probe1
```

To enable debugging on all Link Health Monitoring probes, use the following command:

```
awplus# debug linkmon probe
```

To disable debugging on all Link Health Monitoring probes, use the following command:

```
awplus# no debug linkmon probe
```

**Related commands**

**Command changes**

Version 5.4.8-0.2: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

# destination (linkmon-probe)

**Overview** Use this command to set the destination of a Link Health Monitoring probe. This is a required configuration option for probes.

Use the **no** variant of this command to remove the destination of a probe.

**Syntax** `destination {<ip-address>|<fqdn>}`  
`no destination`

| Parameter                       | Description                                                                                                                                              |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | The destination of the probe, an IPv4 or IPv6 IP address.                                                                                                |
| <code>&lt;fqdn&gt;</code>       | The destination of the probe, an FQDN (fully qualified domain name). The IP address of the FQDN will be automatically resolved by the DNS on the device. |

**Mode** Linkmon ICMP Probe Configuration

**Example** To set the destination of a probe named 'probe1' to 192.168.2.200, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# destination 192.168.2.200
```

To set the destination of a probe named 'probe1' to 2001:db8:a0b:12f0::1, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# destination
2001:db8:a0b:12f0::1
```

To set the destination of a probe named 'probe1' to the FQDN of "google.com", use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# destination google.com
```

To remove the destination of a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no destination
```

**Related commands** [linkmon probe](#)

**Command changes** Version 5.4.8-1.1: command added  
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

# dscp (linkmon-probe)

**Overview** Use this command to set the DSCP value of packets used for Link Health Monitoring probes.

Use the **no** variant of this command to set it back to the default.

**Syntax** `dscp <dscp-value>`  
`no dscp`

| Parameter                       | Description                                                              |
|---------------------------------|--------------------------------------------------------------------------|
| <code>&lt;dscp-value&gt;</code> | The DSCP value for the probe packet in range <code>&lt;0-63&gt;</code> . |

**Default** The default DSCP value is 0.

**Mode** Linkmon ICMP Probe Configuration

**Example** To set the DSCP of a probe named 'probe1' to 10, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# dscp 10
```

To set the DSCP of a probe named 'probe1' back to default, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no dscp
```

**Related commands** [linkmon probe](#)

**Command changes** Version 5.4.8-1.1: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

# egress interface (linkmon-probe)

**Overview** Use this command to force a Link Health Monitoring probe to egress out of a specific interface.

Use the **no** variant of this command to return interface selection back to the default behavior.

**Syntax** `egress interface <interface>`  
`no egress interface`

| Parameter                      | Description                                                                                                                                   |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;interface&gt;</code> | The name of the egress interface for the probe. The specified egress interface needs to be locally configured and in an up and running state. |

**Default** No egress interface is defined by default. The egress interface will be selected using standard routing behavior to reach the probe's destination.

**Mode** Linkmon HTTP Probe Configuration, or Linkmon ICMP Probe Configuration

**Example** To set the egress interface for a probe named 'probe1' to 'vlan2', use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# egress interface vlan2
```

To set the egress interface for a probe named 'probe1' back to the default, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no egress interface
```

**Command changes** Version 5.4.8-1.1: command added  
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

# enable (linkmon-probe)

**Overview** Use this command to enable individual Link Health Monitoring probes. When a probe is enabled, it will begin transmitting, processing, and storing results.

Use the **no** variant of this command to disable a probe.

**Syntax** enable  
no enable

**Default** Disabled

**Mode** Linkmon HTTP Probe Configuration, or Linkmon ICMP Probe Configuration

**Example** To enable a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# enable
```

To disable a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no enable
```

**Related commands** [linkmon probe](#)

**Command changes** Version 5.4.8-1.1: command added  
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

# interval (linkmon-probe)

**Overview** Use this command to set the interval between Link Health Monitoring probe packets.

Use the **no** variant of this command to set the interval back to the default.

**Syntax** `interval <probe-interval>`  
`no interval`

| Parameter                           | Description                                                                                                                                                           |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;probe-interval&gt;</code> | The gap between probes being transmitted. For ICMP probes, this is a range of 100-10000 milliseconds. For HTTP probes, this is a range of 30000-3600000 milliseconds. |

**Default** For ICMP probes, the default interval is 1000 milliseconds. For HTTP probes, the default interval is 60000 milliseconds.

**Mode** Linkmon HTTP Probe Configuration, or Linkmon ICMP Probe Configuration

**Example** To set the interval of a probe named 'probe1' to 100, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# interval 100
```

To set the interval of a probe named 'probe1' back to default, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no interval
```

**Related commands** [linkmon probe](#)

**Command changes** Version 5.4.8-1.1: command added  
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

# ip-version (linkmon-probe)

**Overview** Use this command to set the IP version for the Link Health Monitoring ICMP probe.  
Use the **no** variant of this command to set it back to the default.

**Syntax** `ip-version {4|6}`  
`no ip-version`

| Parameter | Description                        |
|-----------|------------------------------------|
| 4         | Internet Protocol (IPv4)           |
| 6         | Internet Protocol version 6 (IPv6) |

**Default** IPv4

**Mode** Linkmon HTTP Probe Configuration, or Linkmon ICMP Probe Configuration

**Example** To set the IP version as IPv6 for a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# ip-version 6
```

To set the IP version back to the default for a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no ip-version
```

**Command changes** Version 5.4.8-1.1: command added  
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

# jitter

**Overview** Use this command to configure the thresholds for the jitter metric. This metric is used to judge whether probes associated with this performance profile are good or bad.

Use the **no** variant of this command to remove jitter bad-above and jitter good-below ranges.

**Syntax** jitter bad-above <unacceptable-jitter-point>  
jitter good-below <acceptable-jitter-point>  
no jitter bad-above  
no jitter good-below

| Parameter                                | Description                                                                                                                                                                                                                                        |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bad-above<br><unacceptable-jitter-point> | The point above which jitter is unacceptable in range <1-1000> in milliseconds.<br>When a probe associated with this profile has a jitter result greater than this value, the associated Link Health Monitoring member will be considered 'bad'.   |
| good-below<br><acceptable-jitter-point>  | The point at or below which jitter is acceptable in range <1-1000> in milliseconds.<br>When a probe associated with this profile has a jitter result less than this value, the associated Link Health Monitoring member will be considered 'good'. |

**Mode** Linkmon Profile Configuration

**Usage notes** If only **bad-above** is configured, then if the probe results indicate a link is above this value, then that link is considered bad. As soon as the results fall below this value, the link will be immediately considered good.

The combination of these two parameters allow for hysteresis, which may prevent link-flapping behavior. For example, with a **bad-above** value of 100, and a **good-below** value of 90, if the jitter rises to 100 the link will be marked 'bad', but it will not be marked 'good' until it reaches or falls below 90.

If only **good-below** is configured, then probe results will not cause a link to be considered bad.

**Example** To configure the point above which jitter is unacceptable to be 100ms and the point at or below which jitter is acceptable to be 90ms for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)# jitter bad-above 100
awplus(config-linkmon-profile)# jitter good-below 90
```

To delete the jitter ranges for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)# no jitter bad-above
awplus(config-linkmon-profile)# no jitter good-below
```

**Related  
commands**

changes**

Version 5.4.8-0.2: command added  
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

# latency

**Overview** Use this command to configure the thresholds for the latency metric. This metric is used to judge whether probes associated with this performance profile are good or bad.

Use the **no** variant of this command to remove latency bad-above and latency good-below ranges.

**Syntax** latency bad-above *<unacceptable-latency-point>*  
latency good-below *<acceptable-latency-point>*  
no latency bad-above  
no latency good-below

| Parameter                                              | Description                                                                                                                                                                                                                                                       |
|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bad-above<br><i>&lt;unacceptable-latency-point&gt;</i> | The point above which latency is unacceptable in range <i>&lt;1-2000&gt;</i> in milliseconds.<br>When a probe associated with this profile has a latency result greater than this value, the associated Link Health Monitoring member will be considered 'bad'.   |
| good-below<br><i>&lt;acceptable-latency-point&gt;</i>  | The point at or below which latency is acceptable in range <i>&lt;1-2000&gt;</i> in milliseconds.<br>When a probe associated with this profile has a latency result less than this value, the associated Link Health Monitoring member will be considered 'good'. |

**Mode** Linkmon Profile Configuration

**Usage notes** If only **bad-above** is configured, then if the probe results indicate a link is above this value, then that link is considered bad. As soon as the results fall below this value, the link will be immediately considered good.

The combination of these two parameters allow for hysteresis, which may prevent link-flapping behavior. For example, with a **bad-above** value of 100, and a **good-below** value of 90, if the latency rises to 100 the link will be marked 'bad', but it will not be marked 'good' until it reaches or falls below 90.

If only **good-below** is configured, then probe results will not cause a link to be considered bad.

**Example** To configure the point above which latency is unacceptable to be 100ms and the point at or below which latency is acceptable to be 90ms for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)# latency bad-above 100
awplus(config-linkmon-profile)# latency good-below 90
```

To delete the latency ranges for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)# no latency bad-above
awplus(config-linkmon-profile)# no latency good-below
```

# linkmon probe

**Overview** Use this command to create a Link Health Monitoring probe and enter the appropriate Link Health Monitoring Probe Configuration Mode where this probe can be configured.

Use the **no** variant of this command to delete the Link Health Monitoring probe.

**Syntax** `linkmon probe name <probe-name> [type {icmp-ping|http-get}]`  
`no linkmon probe name <probe-name>`

| Parameter    | Description                                                                                                                                                                                                                    |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <probe-name> | The name of the probe.                                                                                                                                                                                                         |
| type         | The type of the probe. Indicates the packet type or protocol used by the probe, either of icmp-ping (ICMP) or http-get (HTTP). This parameter is optional. If not entered, a newly created probe's type defaults to icmp-ping. |

**Default** The default probe type for a newly created probe is **icmp-ping**. The optional parameter **type** is only required to create a probe type other than the default. The **type** parameter is not required when editing an existing probe or deleting a probe.

**Mode** Global Configuration

**Usage notes** The optional probe **type** parameter represents the packet type or protocol used in the transmission of the probe. A probe of type **icmp-ping** will present some different configuration options to a probe of type **http-get**.

An **icmp-ping** Link Health Monitoring probe requires a destination, and must be enabled for probing to begin.

An **http-get** Link Health Monitoring probe requires a URL, and must be enabled for probing to begin.

**Example** To create a probe named 'probe1' using the default probe type and enter Link Health Monitoring ICMP Probe Configuration Mode to configure it, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)#
```

To create a probe named 'probe1' using the default ICMP probe type and enter Link Health Monitoring ICMP Probe Configuration Mode to configure it, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name probe1 type icmp-ping
awplus(config-linkmon-icmp-probe)#
```

To create a probe named 'probe1' using the HTTP probe type and enter Link Health Monitoring HTTP Probe Configuration Mode to configure it, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name probe1 http-probe
awplus(config-linkmon-http-probe)#
```

To remove a probe named 'probe1', use the following commands:

```
awplus# configure terminal
awplus(config)# no linkmon probe name probe1
```

**Command  
changes**

Version 5.4.8-0.2: command added  
Version 5.4.8-1.1: now operates as a modal command, with the new type parameter used to determine whether to enter ICMP or HTTP probe mode  
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

# linkmon probe-history

**Overview** Use this command to create a collection instance that records the metrics gathered by a Link Health Monitoring probe.

Use the **no** variant of this command to remove the specified collection instance.

**Syntax** `linkmon probe-history [<1-65535>] probe <probe-name> interval <1-2678400> buckets <1-65535>`  
`no linkmon probe-history <1-65535>`

| Parameter                  | Description                                                                                                              |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------|
| probe-history<br><1-65535> | The ID of the probe history collection instance. If this is not set on creation then it will be automatically allocated. |
| probe<br><probe-name>      | The name of the probe to record metrics for.                                                                             |
| interval<br><1-2678400>    | The interval that metrics are collated, in seconds.                                                                      |
| buckets<br><1-65535>       | The maximum number of metric history samples.                                                                            |

**Mode** Global Configuration

**Usage notes** Metrics are collated every **interval** seconds. Up to **buckets** samples of metrics are collated.

Different **interval** and **buckets** values can be used to record specific kinds of histories. For example, an **interval** value of 1 and a **buckets** value of 3600 would record per second metrics of a probe for an hour. An **interval** value of 3600 and a **buckets** value of 744 would record per hour metrics of a probe for 31 days.

Using the Web API, metric values for a sample are returned as a sum and a count. The sum can be divided by the count for an average. For example, if 10 probes have been sent during a history interval, then the metric counts would be 10 for a sample, and the sum would be the total of the metric values.

If a probe receives no reply then no metric is recorded.

Packet loss is not recorded exactly. Instead the probes sent and probe replies received is recorded.

**CAUTION:** This configuration option can consume a large amount of RAM on the device, particularly if you configure high numbers of buckets. The memory is reserved when the command is entered, so if the memory consumption from this command is too high, entering the command will trigger the device's low memory management procedure. The device will continue to operate when it reaches a low memory state, but if available memory decreases further into a critical zone, a warning message will be printed and the device will reboot.

**Example** To create a Link Health Monitoring probe history collection instance with an ID of 10 for a probe named 'probe1' that collates metrics every second while keeping up to 300 samples, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe-history 10 probe probe1 interval
1 buckets 300
```

To create a Link Health Monitoring probe history collection instance with an automatically allocated ID for a probe named 'probe1' that collates metrics every 60 seconds while keeping up to 3600 samples, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe-history probe probe1 interval 60
buckets 3600
```

# linkmon profile

**Overview** Use this command to create a Link Health Monitoring performance profile and enter Linkmon Profile Configuration mode where this profile can be configured.

Use the **no** variant of this command to remove a configured performance profile.

**Syntax** `linkmon profile <profile-name>`  
`no linkmon profile <profile-name>`

| Parameter                         | Description                          |
|-----------------------------------|--------------------------------------|
| <code>&lt;profile-name&gt;</code> | The name of the performance profile. |

**Mode** Global Configuration

**Example** To create a new performance profile named 'profile1', use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)#
```

To remove a performance profile named 'profile1', use the following commands:

```
awplus# configure terminal
awplus(config)# no linkmon profile profile1
```

# sample-size (linkmon-probe)

**Overview** Use this command to set the sample size used for calculating latency and jitter metrics for a Link Health Monitoring probe.

Use the **no** variant of this command to set the sample size back to the default value.

**Syntax** `sample-size <1-100>`  
`no sample-size`

| Parameter                  | Description                                                                         |
|----------------------------|-------------------------------------------------------------------------------------|
| <code>&lt;1-100&gt;</code> | The number of probe samples to use when calculating the latency and jitter metrics. |

**Default** The default sample size is 5.

**Mode** Linkmon ICMP Probe Configuration

**Example** To set the sample size a probe named 'probe1' to 10, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# sample-size 10
```

To set the sample size a probe named 'probe1' back to the default, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no sample-size
```

# service linkmon

**Overview** Use this command to enable the Link Health Monitoring service. This is required before any other link health monitoring configuration can be entered.

Use the **no** variant of this command to disable the Link Health Monitoring service.

**Syntax** `service linkmon`  
`no service linkmon`

**Default** The Link Health Monitoring service is disabled.

**Mode** Global Configuration

**Example** To enable the Link Health Monitoring service, use the commands:

```
awplus# configure terminal
awplus(config)# service linkmon
```

To disable the Link Health Monitoring service, use the commands:

```
awplus# configure terminal
awplus(config)# no service linkmon
```

**Command changes** Version 5.5.1-0.1: command added

# show linkmon probe

**Overview** Use this command to display output for one or all link monitoring probes.

**Syntax** show linkmon probe [<probe-name>]

| Parameter    | Description                                |
|--------------|--------------------------------------------|
| <probe-name> | The name of the specific probe to display. |

**Mode** User Exec and Privileged Exec

**Example** To show the output for all link monitoring probes, use the following command:

```
awplus# show linkmon probe
```

To show the output for a link monitoring probe named 'probe1', use the following command:

```
awplus# show linkmon probe probe1
```

**Output** Figure 34-1: Example output from **show linkmon probe**

```

Table 34-1: Parameters in the output from **show linkmon probe**

| Parameter        | Description                                                                                                                                                                |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name             | The name of the probe.                                                                                                                                                     |
| Status           | Whether the probe is enabled or disabled. If it is enabled, then the device will attempt to send probes if the link is up. If it is disabled, then no probes will be sent. |
| Type             | The type of probe packet sent.                                                                                                                                             |
| IP version       | The IP version being used, IPv4 or IPv6.                                                                                                                                   |
| Destination      | The destination IP address that the probes are sent to.                                                                                                                    |
| Egress Interface | The interface that the probe packets should egress.                                                                                                                        |
| Source           | The source IP address or interface.                                                                                                                                        |
| DSCP             | The DSCP value to use when sending the packet.                                                                                                                             |
| Packet Size      | The size of a probe packet.                                                                                                                                                |
| Interval         | The number of milliseconds between sending out each probe.                                                                                                                 |
| Sample Size      | The number of probe results to use when calculating the latency and jitter metrics.                                                                                        |
| Latency          | The average latency based on the last <b>sample size</b> samples.                                                                                                          |
| Jitter           | The average jitter based on the last <b>sample size</b> samples.                                                                                                           |
| Packet Loss      | The percentage of packets lost based on the last 100 probes.                                                                                                               |

Table 34-1: Parameters in the output from **show linkmon probe** (cont.)

| Parameter           | Description                                                         |
|---------------------|---------------------------------------------------------------------|
| Probes Sent         | The number of probe packets that have been sent.                    |
| Last Probe Sent     | The time that the last probe packet was sent.                       |
| Last Probe Received | The time that the device last successfully received a probe packet. |

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

# show linkmon probe-history

**Overview** Use this command to show information about Link Health Monitoring probe metric history collection instances.

**Syntax** `show linkmon probe-history [<1-65535>|probe <probe-name>]`

| Parameter    | Description                                            |
|--------------|--------------------------------------------------------|
| <1-65535>    | The ID of the collection instance to show history for. |
| <probe-name> | The name of the probe to show history for.             |

**Mode** User Exec and Privileged Exec

**Example** To show all Link Health Monitoring probe history collection instances, use the following command:

```
awplus# show linkmon probe-history
```

To show a Link Health Monitoring probe history collection instance with the ID of '10', use the following command:

```
awplus# show linkmon probe-history 10
```

To show all Link Health Monitoring probe history collection instances that are using a probe named 'probe1', use the following command:

```
awplus# show linkmon probe-history probe probe1
```

**Output** Figure 34-2: Example output from **show linkmon probe-history**

Table 34-2: Parameters in the output from **show linkmon probe-history**

| Parameter    | Description                                                  |
|--------------|--------------------------------------------------------------|
| ID           | The ID of the Link Health Monitoring probe-history.          |
| Probe        | The name of the probe that this history is for.              |
| Interval     | The amount of time between each history sample (in seconds). |
| Buckets      | The total number of samples that are stored.                 |
| Latency min  | The minimum latency that is in the history.                  |
| Latency max  | The maximum latency that is in the history.                  |
| Latency avg  | The average latency of the samples stored in the history.    |
| Jitter min   | The minimum jitter that is in the history.                   |
| Jitter max   | The maximum jitter that is in the history.                   |
| Jitter avg   | The average jitter of the samples stored in the history.     |
| Packets Tx   | The total number of packets transmitted in this history.     |
| Packets Rx   | The total number of packets received in this history.        |
| Packets Loss | The percentage of packets lost in the history.               |

# show linkmon trigger

**Overview** Use this command to view the status of link health monitoring probe type triggers.

**Syntax** show linkmon trigger [<1-250>]

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| <1-250>   | The trigger ID for a link health monitoring trigger. |

**Mode** Privileged Exec

**Example** To view the status of all link health monitoring triggers, use the command:

```
awplus# show linkmon trigger
```

To view the status of link health monitoring trigger 1, use the command:

```
awplus# show linkmon trigger 1
```

**Output** Figure 34-3: Example output from **show linkmon trigger**

```
awplus#show linkmon trigger
Trigger 1

Match State: bad
Change Count: 5
Last Change:
 Current State: good
 Previous State: unknown
 Change Time: 09 Feb 2021 21:41:15
 Cause: Rx probe 'my_probe', consecutive probe
success (3>=3)

Probe: my_probe
Enabled: Yes
Latest Metrics
 Latency : 1ms
 Jitter : 1ms
 Loss Rate : 22.6%
 Consecutive Success : 7

Profile: my_profile
 latency bad above : - ms
 latency good below : - ms
 jitter bad above : - ms
 jitter good below : - ms
 Consecutive success good when : 3
 Consecutive loss bad when : 2
 Consecutive loss unreachable when : 4
```

Table 34-3: Parameters in the output from **show linkmon trigger**

| Parameter           | Description                                                                                                                             |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Match State         | If the state of the probe is the same as the match state, the trigger will activate.                                                    |
| Change Count        | The number of times the probe has changed state.                                                                                        |
| Current State       | The current state of the probe.                                                                                                         |
| Previous State      | The previous state of the probe.                                                                                                        |
| Change Time         | The timestamp when the probe last changed state.                                                                                        |
| Cause               | The reason why the probe last changed state.                                                                                            |
| Probe               | The name of the probe.                                                                                                                  |
| Enabled             | Whether the probe is enabled.                                                                                                           |
| Latency             | The last latency metric of the probe.                                                                                                   |
| Jitter              | The last jitter metric of the probe.                                                                                                    |
| Loss Rate           | The loss rate of the probe, up to 100 metric results calculated.                                                                        |
| Consecutive Success | The number of probes that have consecutively succeeded.                                                                                 |
| Profile             | The name of the profile the probe results are being compared to. The profile determines the acceptable jitter, latency, and probe loss. |

**Command changes** Version 5.5.1-0.1: command added

## size (linkmon-probe)

**Overview** Use this command to set the size of the packets used by a Link Health Monitoring probe.

Use the **no** variant of this command to set the size back to the default.

**Syntax** `size <64-1500>`  
`no size`

| Parameter                    | Description                            |
|------------------------------|----------------------------------------|
| <code>&lt;64-1500&gt;</code> | The size of the probe packet in bytes. |

**Default** The default packet size is 100 bytes.

**Mode** Linkmon ICMP Probe Configuration

**Example** To set the size of a probe named 'probe1' to 1000, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# size 1000
```

To set the size of a probe named 'probe1' back to the default, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no size
```

**Related commands** [linkmon probe](#)

**Command changes** Version 5.4.8-1.1: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

# source (linkmon-probe)

**Overview** Use this command to set the source IP address or interface for a Link Health Monitoring probe.

Use the **no** variant of this command to return it to the default.

**Syntax** `source {<interface>|<ip-address>}`  
`no source`

| Parameter                       | Description                                                                                                                                                                                         |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;interface&gt;</code>  | The name of the interface that probes are sourcing from. The specified interface needs to be locally configured with at least one valid IPv4 address, and the interface is in up and running state. |
| <code>&lt;ip-address&gt;</code> | The source IPv4 address for this probe. The specified IP address needs to be locally configured on an interface that is in an up-and-running state.                                                 |

**Default** No source IP address is defined by default. The source IP address will be selected using standard routing behavior to reach the probe's destination.

**Mode** Linkmon ICMP Probe Configuration

**Example** To set the source interface as 'lo' for a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# source lo
```

To set the source interface back to default for a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no source
```

# url (linkmon-probe)

**Overview** Use this command to set the destination URL of a Link Health Monitoring probe. This is a required configuration option for http-get probes.

Use the **no** variant of this command to remove the URL.

**Syntax** url <url>  
no url

| Parameter | Description                                                                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <url>     | The destination the probe is being sent to. The URL must use ASCII characters and conform to the URL syntax in RFC 3986, with http or https protocol at the start and an optional port number on the end, such as :80, :443 or :8080. |

**Mode** Linkmon HTTP Probe Configuration

**Example** To set the destination URL of a Link Health Monitoring probe named “test-probe”, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name test-probe type http
awplus(config-linkmon-http-probe)# url
http://www.alliedtelesis.co.nz/
```

Some other examples of supported URL formats:

```
awplus(config-linkmon-http-probe)# url
https://www.facebook.com/
awplus(config-linkmon-http-probe)# url
http://intranet.atlnz.lc:8080
```

To remove the URL, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name test-probe type http
awplus(config-linkmon-http-probe)# no url
```

# Part 4: Multicast Applications

## Introduction

**Overview** Devices running AlliedWare Plus use IGMP (Internet Group Management Protocol) and MLD (Multicast Listener Discovery) to track which multicast groups their clients belong to. This enables them to send the correct multimedia streams to the correct destinations. IGMP is used for IPv4 multicasting, and MLD is used for IPv6 multicasting.

This chapter describes the commands to configure IGMP Querier behaviour and selection, IGMP Snooping and IGMP Proxy.

# clear ip igmp

**Overview** Use this command to clear all IGMP group membership records on all interfaces where it is configured .

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `clear ip igmp`

**Syntax (VRF-lite)** `clear ip igmp [vrf <vrf-name>]`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name                              |

**Mode** Privileged Exec

**Example** To delete all IGMP records, use the command

```
awplus# clear ip igmp
```

**Related commands**

- [clear ip igmp group](#)
- [clear ip igmp interface](#)
- [show ip igmp interface](#)
- [show running-config](#)

**Command changes**

- Version 5.4.7-1.1: VRF-lite support added SBx8100.
- Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# clear ip igmp group

**Overview** Use this command to clear IGMP group membership records for a specific group on either all interfaces, a single interface, or for a range of interfaces.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `clear ip igmp group *`  
`clear ip igmp group <ip-address> <interface>`

**Syntax (VRF-lite)** `clear ip igmp [vrf <vrf-name>] group <ip-address> <interface>`

| Parameter    | Description                                                                                                    |
|--------------|----------------------------------------------------------------------------------------------------------------|
| *            | Clears all groups on all interfaces. This has the same effect as the <b>clear ip igmp</b> command.             |
| vrf          | Applies the command to the specified VRF instance.                                                             |
| <vrf-name>   | The VRF instance name                                                                                          |
| <ip-address> | Specifies the group whose membership records will be cleared from all interfaces, entered in the form A.B.C.D. |
| <interface>  | Specifies the name of the interface; all groups learned on this interface are deleted.                         |

**Mode** Privileged Exec

**Usage notes** This command applies to groups learned by IGMP, IGMP Snooping, or IGMP Proxy. In addition to the group, an interface can be specified. Specifying this will mean that only entries with the group learned on the interface will be deleted.

**Examples** To delete all group records, use the command:

```
awplus# clear ip igmp group *
```

To delete records for 224.1.1.1 on vlan1, use the command:

```
awplus# clear ip igmp group 224.1.1.1 vlan1
```

**Related commands** [clear ip igmp](#)  
[clear ip igmp interface](#)  
[show ip igmp interface](#)  
[show running-config](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# clear ip igmp interface

**Overview** Use this command to clear IGMP group membership records on a particular interface.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `clear ip igmp interface <interface>`

**Syntax (VRF-lite)** `clear ip igmp [vrf <vrf-name>] interface <interface>`

| Parameter   | Description                                                                            |
|-------------|----------------------------------------------------------------------------------------|
| vrf         | Applies the command to the specified VRF instance.                                     |
| <vrf-name>  | The VRF instance name                                                                  |
| <interface> | Specifies the name of the interface. All groups learned on this interface are deleted. |

**Mode** Privileged Exec

**Usage notes** This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

**Example** To delete records for VRF red on vlan2, use the command:  
`awplus# clear ip igmp vrf red interface vlan2`

**Related commands** [clear ip igmp](#)  
[clear ip igmp group](#)  
[show ip igmp interface](#)  
[show running-config](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# debug igmp

**Overview** Use this command to enable debugging of either all IGMP or a specific component of IGMP.

Use the **no** variant of this command to disable all IGMP debugging, or debugging of a specific component of IGMP.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `debug igmp {all|decode|encode|events|fsm|tib}`  
`no debug igmp {all|decode|encode|events|fsm|tib}`

**Syntax (VRF-lite)** `debug igmp [vrf <vrf-name>] {all|decode|encode|events|fsm|tib}`  
`no debug igmp [vrf <vrf-name>]`  
`{all|decode|encode|events|fsm|tib}`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name.                             |
| all        | Enable or disable all debug options for IGMP       |
| decode     | Debug of IGMP packets that have been received      |
| encode     | Debug of IGMP packets that have been sent          |
| events     | Debug IGMP events                                  |
| fsm        | Debug IGMP Finite State Machine (FSM)              |
| tib        | Debug IGMP Tree Information Base (TIB)             |

**Modes** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug igmp all`

**Related commands** [show debugging igmp](#)  
[undebug igmp](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip igmp

**Overview** Use this command to enable IGMP on an interface. The command configures the device as an IGMP querier.

Use the **no** variant of this command to return all IGMP related configuration to the default on this interface.

**Syntax** `ip igmp`  
`no ip igmp`

**Default** Disabled

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** An IP address must be assigned to the interface first, before this command will work.

**Example** To specify an interface as an IGMP querier, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp access-group

**Overview** This command adds an access control list to a VLAN interface configured for IGMP, IGMP Snooping, or IGMP Proxy. The access control list is used to control and filter the multicast groups learned on the VLAN interface.

The **no** variant of this command disables the access control filtering on the interface.

**Syntax** `ip igmp access-group {<access-list-number>|<access-list-name>}`  
`no ip igmp access-group`

| Parameter                               | Description                                          |
|-----------------------------------------|------------------------------------------------------|
| <code>&lt;access-list-number&gt;</code> | Standard IP access-list number, in the range <1-99>. |
| <code>&lt;access-list-name&gt;</code>   | Standard IP access-list name.                        |

**Default** By default there are no access lists configured on any interface.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

**Example** In the following example, hosts serviced by VLAN interface vlan2 can only join the group 225.2.2.2:

```
awplus# configure terminal
awplus(config)# access-list 1 permit 225.2.2.2 0.0.0.0
awplus(config)# interface vlan2
awplus(config-if)# ip igmp access-group 1
```

# ip igmp flood-group

**Overview** Use this command to configure a static multicast group that will flood matching packets to all ports in the VLAN and not mirror any packets matching that group to the CPU.

Use the **no** variant of this command to remove an IGMP flooding group.

**Syntax** `ip igmp flood-group <ip-address> [<vlan-id>]`  
`no ip igmp flood-group <ip-address>`

| Parameter    | Description                                                                    |
|--------------|--------------------------------------------------------------------------------|
| <ip-address> | Standard IP Multicast group address, entered in the form A.B.C.D.              |
| <vlan-id>    | Layer 3 downstream interface list for Layer 3 forwarding of multicast packets. |

**Default** Not set.

**Mode** Interface Configuration

**Usage notes** Multicast packets from an unregistered source will be mirrored to the CPU to ensure IGMP and PIM-SM knows about the group. In certain networks, it is possible for a large number of packets with a number of different sources destined for the same group address, to overwhelm a switches hardware table. This could cause packets to be stuck mirrored to the CPU forever, resulting in high CPU usage and in some cases stack failovers.

This command adds an all sources multicast entry into the switches multicast hardware table, to flood multicast packets to all ports within the VLAN without mirroring the traffic to CPU. This significantly reduces the number of hardware entries consumed.

The Layer 3 variant of this command:

```
ip igmp flood-group <ip-address> <vlan-id>
```

is only supported on one VLAN group address. Any number of the Layer 2 variants can be used.

**Example** To configure an IGMP flooding group to Layer 2 ports only, use the following commands. This will flood any UDP packet to group 239.255.255.250 to all ports in vlan1:

```
awplus# configure terminal
awplus(config)# int vlan1
awplus(config-if)# ip igmp flood-group 239.255.255.250
```

To configure an IGMP flooding group to Layer 2 ports and Layer 3 forwarding, use the following commands. This will flood any UDP packet to group 239.255.255.250 to all ports in vlan2 and forward any UDP packet to all ports in vlan3:

```
awplus# configure terminal
awplus(config)# int vlan2
awplus(config-if)# ip igmp flood-group 239.255.255.250 vlan3
```

To remove an IGMP flooding group from vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# int vlan2
awplus(config-if)# no ip igmp flood-group 239.255.255.250
```

IGMP Flooding Groups are integrated into the existing command: **show ip igmp groups**

**Output** Figure 35-1: Example output from **show ip igmp groups**

```
awplus#show ip igmp groups
IGMP Connected Group Membership
Group Address Interface Uptime Expires Last Reporter
239.255.255.250 vlan3000 01:20:59 stopped 0.0.0.0
```

**Related commands** [ip igmp static-group](#)

**Command changes** Version 5.5.0-2.3: command added

# ip igmp flood specific-query

**Overview** Use this command if you want IGMP to flood specific queries to all VLAN member ports, instead of only sending the queries to multicast group member ports.

Use the **no** variant of this command if you want IGMP to only send the queries to multicast group member ports.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ip igmp flood specific-query`  
`no ip igmp flood specific-query`

**Syntax (VRF-lite)** `ip igmp [vrf <vrf-name>] flood specific-query`  
`no ip igmp [vrf <vrf-name>] flood specific-query`

| Parameter                     | Description                                        |
|-------------------------------|----------------------------------------------------|
| <code>vrf</code>              | Applies the command to the specified VRF instance. |
| <code>&lt;vrf-name&gt;</code> | The VRF instance name.                             |

**Default** By default, specific queries are flooded to all VLAN member ports.

**Mode** Global Configuration

**Usage** In an L2 switched network running IGMP, it is considered more robust to flood all specific queries. In most cases, the benefit of flooding specific queries to all VLAN member ports outweighs the disadvantages.

However, sometimes this is not the case. For example, if hosts with very low CPU capability receive specific queries for multicast groups they are not members of, their performance may degrade unacceptably. In this situation, it is desirable for IGMP to send specific queries to known member ports only. This minimizes the performance degradation of such hosts. In those circumstances, use this command to turn off flooding of specific queries.

**Example** To cause IGMP to flood specific queries only to multicast group member ports, use the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp flood specific-query
```

**Related commands** [show ip igmp interface](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip igmp immediate-leave

**Overview** In IGMP version 2, use this command to minimize the leave latency of IGMP memberships for specified multicast groups. The specified access list number or name defines the multicast groups in which the immediate leave feature is enabled.

Use the **no** variant of this command to disable this feature.

**Syntax** `ip igmp immediate-leave group-list  
{<access-list-number>|<access-list-number-expanded>|  
<access-list-name>}`  
`no ip igmp immediate-leave`

| Parameter                     | Description                                                    |
|-------------------------------|----------------------------------------------------------------|
| <access-list-number>          | Access-list number, in the range <1-99>.                       |
| <access-list-number-expanded> | Access-list number (expanded range), in the range <1300-1999>. |
| <access-list-name>            | Standard IP access-list name.                                  |

**Default** Disabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

**Example** The following example shows how to enable the immediate-leave feature on the VLAN interface vlan2 for a specific range of multicast groups:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp immediate-leave group-list 34
awplus(config-if)# exit
awplus(config)# access-list 34 permit 225.192.20.0 0.0.0.255
```

**Related commands** [ip igmp last-member-query-interval](#)

# ip igmp last-member-query-count

**Overview** Use this command to set the last-member query-count value for an interface.  
Use the **no** variant of this command to return to the default on an interface.

**Syntax** `ip igmp last-member-query-count <2-7>`  
`no ip igmp last-member-query-count`

| Parameter | Description                    |
|-----------|--------------------------------|
| <2-7>     | Last member query count value. |

**Default** The default last member query count value is 2.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

**Example** To set the last-member query-count to 3 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp last-member-query-count 3
```

**Related commands** [ip igmp last-member-query-interval](#)  
[ip igmp startup-query-count](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp last-member-query-interval

**Overview** Use this command to configure the frequency at which the router sends IGMP group specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

**Syntax** `ip igmp last-member-query-interval <interval>`  
`no ip igmp last-member-query-interval`

| Parameter  | Description                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------|
| <interval> | The frequency in milliseconds at which IGMP group-specific host query messages are sent, in the range 1000-25500. |

**Default** 1000 milliseconds

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

**Example** To change the IGMP group-specific host query message interval to 2 seconds (2000 milliseconds) on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp last-member-query-interval 2000
```

**Related commands** [ip igmp immediate-leave](#)  
[ip igmp last-member-query-count](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp limit

**Overview** Use this command to configure the limit on the maximum number of group membership entries for the device as a whole or for the specified interface (if in interface mode). Once the specified number of group memberships is reached, all further membership reports will be ignored.

Optionally, you can configure an access-list to stop certain addresses from being subject to the limit.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to unset the limit and any specified exception access-list.

**Syntax** `ip igmp limit <limit-value> [except  
{<access-list-number>|<access-list-number-expanded>|  
<access-list-name>}]  
no ip igmp limit`

**Syntax (VRF-lite)** `ip igmp [vrf <vrf-name>] limit <limit-value> [except  
{<access-list-number>|<access-list-number-expanded>|  
<access-list-name>}]  
no ip igmp [vrf <vrf-name>] limit`

| Parameter                     | Description                                                     |
|-------------------------------|-----------------------------------------------------------------|
| vrf                           | Applies the command to the specified VRF instance.              |
| <vrf-name>                    | The VRF instance name.                                          |
| <limit-value>                 | Maximum number of group membership entries, from 2 to 2097152.  |
| <access-list-number>          | Access-list number, in the range 1 to 99.                       |
| <access-list-number-expanded> | Access-list number (expanded range), in the range 1300 to 1999. |
| <access-list-name>            | IP access-list name.                                            |

**Default** 2095152

**Mode** Global Configuration and Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

**Example** To configure an IGMP limit of 100 group membership entries on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp limit 100
```

To configure an IGMP limit of 100 group membership entries across all interfaces on which IGMP is enabled, and exclude group 224.1.1.1 from this limitation, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 1 permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp limit 100 except 1
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added to SBx8100.  
Version 5.4.8-1.1: VRF-lite support added to x930, SBx908 GEN2.

# ip igmp maximum-groups

**Overview** Use this command to set a limit, per switch port, on the number of IGMP groups clients can join. This stops a single client from using all the switch's available group-entry resources, and ensures that clients on all ports have a chance to join IGMP groups.

Use the **no** variant of this command to remove the limit.

**Syntax** `ip igmp maximum-groups <0-65535>`  
`no ip igmp maximum-groups`

| Parameter | Description                                                                               |
|-----------|-------------------------------------------------------------------------------------------|
| <0-65535> | The maximum number of IGMP groups clients can join on this switch port. 0 means no limit. |

**Default** The default is 0, which means no limit

**Mode** Interface mode for a switch port

**Usage notes** We recommend using this command with IGMP snooping fast leave on the relevant VLANs. To enable fast leave, use the command:

```
awplus(config-if)# ip igmp snooping fast-leave
```

The device keeps count of the number of groups learned by each port. This counter is incremented when group joins are received via IGMP reports. It is decremented when:

- Group memberships time out
- Group leaves are received via leave messages or reports

Also, the port's group counter is cleared when:

- The port goes down
- You run the command **clear ip igmp group \***
- The port is removed from a VLAN
- The port is on a VCSack back-up member, and that member reboots or otherwise leaves the stack.

You can see the current value of the group counter by using either of the commands:

```
awplus# show ip igmp snooping statistics interface <port-list>
awplus# show ip igmp interface <port>
```

**Example** To limit clients to 10 groups on port 1.0.1, which is in vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ip igmp maximum-groups 10
awplus(config-if)# exit
awplus(config)# interface vlan1
awplus(config-if)# ip igmp snooping fast-leave
```

**Related commands**

- [clear ip igmp group](#)
- [ip igmp snooping fast-leave](#)
- [show ip igmp interface](#)
- [show ip igmp snooping statistics](#)

# ip igmp mroute-proxy

**Overview** Use this command to enable IGMP mroute proxy on this downstream interface and associate it with the upstream proxy service interface.

Use the **no** variant of this command to remove the association with the proxy-service interface.

**Syntax** `ip igmp mroute-proxy <interface>`  
`no ip igmp mroute-proxy`

| Parameter   | Description                |
|-------------|----------------------------|
| <interface> | The name of the interface. |

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP Proxy.

You must also enable the IGMP proxy service on the upstream interface, using the [ip igmp proxy-service](#) command. You can associate one or more downstream mroute proxy interfaces on the device with a single upstream proxy service interface. This downstream mroute proxy interface listens for IGMP reports, and forwards them to the upstream IGMP proxy service interface.

IGMP Proxy does not work with other multicast routing protocols, such as PIM-SM or PIM-DM.

**Example** To configure vlan3 as the upstream proxy-service interface for the downstream vlan2 interface, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast-routing
awplus(config)# interface vlan3
awplus(config-if)# ip igmp proxy-service
awplus(config-if)# ip igmp
awplus(config)# interface vlan2
awplus(config-if)# ip igmp mroute-proxy vlan3
awplus(config-if)# ip igmp
```

**Related commands** [ip igmp](#)  
[ip igmp proxy-service](#)  
[ip multicast-routing](#)

# ip igmp proxy-service

**Overview** Use this command to enable an interface to be the upstream IGMP proxy-service interface for the device. All associated downstream IGMP mroute proxy interfaces on this device will have their memberships consolidated on this proxy service interface, according to IGMP host-side functionality.

Use the **no** variant of this command to remove the designation of the interface as an upstream proxy-service interface.

**Syntax** `ip igmp proxy-service`  
`no ip igmp proxy-service`

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP Proxy.

This command is used with the [ip igmp mroute-proxy](#) command to enable forwarding of IGMP reports to a proxy service interface for all forwarding entries for this interface. You must also enable the downstream IGMP mroute proxy interfaces on this device using the command [ip igmp mroute-proxy](#).

IGMP Proxy does not work with other multicast routing protocols, such as PIM-SM or PIM-DM.

From version 5.4.7-1.1 onwards, IGMP mroute proxy interfaces do not have to be configured with an IP address before they can operate. Instead, it is possible to have an addressless interface operate as an IGMP mroute proxy interface.

This feature is useful when IGMP Proxy needs to run on many downstream interfaces. For example, you may want to use it if your device has one subscriber (multicast receiver) per VLAN, and many receivers (many VLANs) connected to the device. In such a situation, assigning IP addresses to each VLAN may not be practicable.

Note that for such interface to be able to send queries to hosts directly attached to the interface, it is necessary to enable IGMP snooping querier on the interface, using the command [ip igmp snooping querier](#).

**Example** To configure vlan3 as the upstream proxy-service interface for the downstream vlan2 interface, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast-routing
awplus(config)# interface vlan3
awplus(config-if)# ip igmp proxy-service
awplus(config-if)# ip igmp
awplus(config)# interface vlan2
awplus(config-if)# ip igmp mroute-proxy vlan3
awplus(config-if)# ip igmp
```

**Related  
commands**

[ip igmp](#)  
[ip igmp mroute-proxy](#)  
[ip igmp snooping querier](#)  
[ip multicast-routing](#)

**Command  
changes**

Version 5.4.7-1.1: Addressless interface support added.  
Version 5.4.7-1.1: VRF-lite support added to SBx8100.  
Version 5.4.8-1.1: VRF-lite support added to x930, SBx908 GEN2.

# ip igmp querier-timeout

**Overview** Use this command to configure the timeout period before the device takes over as the querier for the interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

**Syntax** `ip igmp querier-timeout <timeout>`  
`no ip igmp querier-timeout`

| Parameter | Description                                                           |
|-----------|-----------------------------------------------------------------------|
| <timeout> | IGMP querier timeout interval value in seconds, in the range 1-65535. |

**Default** The default timeout interval is 255 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP.  
The timeout value should not be less than the current active querier's general query interval.

**Example** To configure the device to wait 130 seconds from the time it received the last query before it takes over as the querier for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp querier-timeout 130
```

**Related commands** [ip igmp query-interval](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp query-holdtime

**Overview** This command sets the time that an IGMP Querier waits after receiving a query solicitation before it sends an IGMP Query. IGMP General Query messages will not be sent during the hold time interval.

Use the **no** variant of this command to return to the default query hold time period.

**Syntax** `ip igmp query-holdtime <interval>`  
`no ip igmp query-holdtime`

| Parameter  | Description                                                    |
|------------|----------------------------------------------------------------|
| <interval> | Query interval value in milliseconds, in the range <100-5000>. |

**Default** By default the delay before sending IGMP General Query messages is 500 milliseconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** Use this command to configure a value for the IGMP query hold time in the current network. IGMP Queries can be generated after receiving Query Solicitation (QS) packets and there is a possibility of a DoS (Denial of Service) attack if a stream of Query Solicitation (QS) packets are sent to the IGMP Querier, eliciting a rapid stream of IGMP Queries. This command applies to interfaces on which the device is acting as an IGMP Querier.

Use the [ip igmp query-interval](#) command when a delay for IGMP general query messages is required and IGMP general query messages are required. The **ip igmp query-holdtime** command stops IGMP query messages during the configured holdtime interval, so the rate of IGMP Queries that can be sent out of an interface can be restricted.

See the [IGMP Feature Overview and Configuration Guide](#) for introductory information about the Query Solicitation feature.

**NOTE:** *This command will function on the switch in the stand-alone mode, but it is not supported when the device forms part of a VCS Stack.*

**Examples** To set the IGMP query holdtime to 900 ms for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-holdtime 900
```

To reset the IGMP query holdtime to the default (500 ms) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-holdtime
```

**Related  
commands**

[ip igmp query-interval](#)  
[ip igmp snooping tcn query solicit](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp query-interval

- Overview** Use this command to configure the period for sending IGMP General Query messages.
- The IGMP query interval specifies the time between IGMP General Query messages being sent.
- Use the **no** variant of this command to return to the default query interval period.
- NOTE:** The IGMP query interval must be greater than IGMP query maximum response time.

- Syntax** `ip igmp query-interval <interval>`  
`no ip igmp query-interval`

| Parameter  | Description                                              |
|------------|----------------------------------------------------------|
| <interval> | Query interval value in seconds, in the range <2-18000>. |

- Default** The default IGMP query interval is 125 seconds.
- Mode** Interface Configuration for a VLAN interface.
- Usage notes** This command applies to interfaces configured for IGMP. Note that the IGMP query interval is automatically set to a greater value than the IGMP query max response time.
- For example, if you set the IGMP query max response time to 2 seconds using the [ip igmp query-max-response-time](#) command, and the IGMP query interval is currently less than 3 seconds, then the IGMP query interval period will be automatically reconfigured to be 3 seconds, so it is greater than the IGMP query maximum response time.
- Use the **ip igmp query-interval** command when a non-default interval for IGMP General Query messages is required.
- The [ip igmp query-holdtime](#) command can occasionally delay the sending of IGMP Queries.

- Examples** To set the period between IGMP host-query messages to 3 minutes (180 seconds) for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-interval 180
```

To reset the period between sending IGMP host-query messages to the default (125 seconds) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-interval
```

**Related  
commands**

[ip igmp query-holdtime](#)  
[ip igmp query-max-response-time](#)  
[ip igmp startup-query-interval](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp query-max-response-time

**Overview** Use this command to configure the maximum response time advertised in IGMP Queries.

Use the **no** variant of this command to restore the default.

**NOTE:** The IGMP query maximum response time must be less than the IGMP query interval.

**Syntax** `ip igmp query-max-response-time <response-time>`  
`no ip igmp query-max-response-time`

| Parameter                          | Description                                          |
|------------------------------------|------------------------------------------------------|
| <code>&lt;response-time&gt;</code> | Response time value in seconds, in the range 1-3180. |

**Default** The default IGMP query maximum response time is 10 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to interfaces configured for IGMP.  
Note that the IGMP query interval is automatically set to a greater value than the IGMP query maximum response time.

For example, if you set the IGMP query interval to 3 seconds using the [ip igmp query-interval](#) command, and the current IGMP query interval is less than 3 seconds, then the IGMP query maximum response time will be automatically reconfigured to be 2 seconds, so it is less than the IGMP query interval time.

To get the network to converge faster, use the **ip igmp query-max-response-time** command and set a low response time value, such as one or two seconds, so that the clients will respond immediately with a report as a response to the IGMP Queries.

**Examples** To set a maximum response time of 8 seconds for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-max-response-time 8
```

To reset the default maximum response time to the default (10 seconds) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-max-response-time
```

**Related  
commands**    `ip igmp query-interval`  
                  `show ip igmp interface`  
                  `show running-config`

# ip igmp ra-option

**Overview** Use this command to enable strict Router Alert (RA) option validation. With strict RA option enabled, IGMP packets without RA options are ignored.

Use the **no** variant of this command to disable strict RA option validation.

**Syntax** `ip igmp ra-option`  
`no ip igmp ra-option`

**Default** The default state of RA validation is unset.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to interfaces configured for IGMP and IGMP Snooping.

**Examples** To enable strict Router Alert (RA) option validation on vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp ra-option
```

# ip igmp robustness-variable

**Overview** Use this command to change the robustness variable value on an interface.  
Use the **no** variant of this command to return to the default on an interface.

**Syntax** `ip igmp robustness-variable <1-7>`  
`no ip igmp robustness-variable`

| Parameter | Description                    |
|-----------|--------------------------------|
| <1-7>     | The robustness variable value. |

**Default** The default robustness variable value is 2.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to interfaces configured for IGMP and IGMP Snooping.

**Examples** To set the robustness variable to 3 on vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp robustness-variable 3
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping

**Overview** Use this command to enable IGMP Snooping. When this command is used in the Global Configuration mode, IGMP Snooping is enabled at the device level. When this command is used in Interface Configuration mode, IGMP Snooping is enabled for the specified VLANs.

Use the **no** variant of this command to either globally disable IGMP Snooping, or disable IGMP Snooping on a specified interface.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**NOTE:** IGMP snooping cannot be disabled on an interface if IGMP snooping has already been disabled globally. IGMP snooping can be disabled on both an interface and globally if disabled on the interface first and then disabled globally.

**Syntax** `ip igmp snooping`  
`no ip igmp snooping`

**Syntax (VRF-lite)** `ip igmp [vrf <vrf-name>] snooping`  
`no ip igmp [vrf <vrf-name>] snooping`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name.                             |

**Default** By default, IGMP Snooping is enabled both globally and on all VLANs.

**Mode** Global Configuration and Interface Configuration for a VLAN interface.

**Usage notes** It is possible to disable IGMP snooping globally or on a per-VLAN basis, using the command **no ipv6 igmp snooping**. However, we recommend leaving IGMP snooping enabled unless an Allied Telesis support representative tells you to disable it, even if you are not actively using the device for multicast.

For IGMP snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (both are enabled by default).

**Examples** To enable IGMP Snooping on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ip igmp snooping
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping
```

**Related commands**    [ipv6 mld snooping](#)  
                          [show ip igmp interface](#)  
                          [show running-config](#)

**Command changes**    Version 5.4.7-1.1: VRF-lite support added.

# ip igmp snooping fast-leave

**Overview** Use this command to enable IGMP Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing. The IGMP group-membership entry is removed as soon as an IGMP leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

**Syntax** `ip igmp snooping fast-leave`  
`no ip igmp snooping fast-leave`

**Default** IGMP Snooping fast-leave processing is disabled.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This IGMP Snooping command can only be configured on VLAN interfaces.

**Example** To enable fast-leave processing on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping fast-leave
```

**Related commands** `show ip igmp interface`  
`show running-config`

# ip igmp snooping mrouter

**Overview** Use this command to statically configure the specified port as a multicast router port for IGMP Snooping for an interface. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to remove the static configuration of the port as a multicast router port.

**Syntax** `ip igmp snooping mrouter interface <port>`  
`no ip igmp snooping mrouter interface <port>`

| Parameter | Description                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------|
| <port>    | The port may be a device port (e.g. port1.0.2), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4). |

**Mode** Interface Configuration for a VLAN interface.

**Example** To configure port1.0.2 statically as a multicast router interface for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping mrouter interface port1.0.2
```

**Related commands** [show ip igmp snooping mrouter](#)

# ip igmp snooping querier

**Overview** Use this command to enable IGMP querier operation when no multicast routing protocol is configured. When enabled, the IGMP Snooping querier sends out periodic IGMP queries for all interfaces. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to disable IGMP querier configuration.

**Syntax** `ip igmp snooping querier`  
`no ip igmp snooping querier`

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** The IGMP Snooping querier uses the 0.0.0.0 Source IP address because it only masquerades as a proxy IGMP querier for faster network convergence.

It does not start, or automatically cease, the IGMP Querier operation if it detects query message(s) from a multicast router.

If an IP address is assigned to a VLAN, which has IGMP querier enabled on it, then the IGMP Snooping querier uses the VLAN's IP address as the Source IP Address in IGMP queries.

The IGMP Snooping Querier will not stop sending IGMP Queries if there is another IGMP Snooping Querier in the network with a lower Source IP Address.

**NOTE:** Do not enable the IGMP Snooping Querier feature on a Layer 2 device when there is an operational IGMP Querier in the network.

**Example** To configure vlan2 as a Snooping querier, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping querier
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping report-suppression

**Overview** Use this command to enable report suppression for IGMP versions 1 and 2. This command applies to interfaces configured for IGMP Snooping.

Report suppression stops reports being sent to an upstream multicast router port when there are already downstream ports for this group on this interface.

Use the **no** variant of this command to disable report suppression.

**Syntax** `ip igmp snooping report-suppression`  
`no ip igmp snooping report-suppression`

**Default** Report suppression does not apply to IGMPv3, and is turned on by default for IGMPv1 and IGMPv2 reports.

**Mode** Interface Configuration for a VLAN interface.

**Example** To enable report suppression for IGMPv2 reports for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp version 2
awplus(config-if)# ip igmp snooping report-suppression
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping routermode

**Overview** Use this command to set the destination IP addresses as router multicast addresses.

Use the **no** variant of this command to set it to the default. You can also remove a specified IP address from a custom list of multicast addresses.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax**

```
ip igmp snooping routermode
{all|default|ip|multicasterouter|address <ip-address>}
no ip igmp snooping routermode [address <ip-address>]
```

**Syntax (VRF-lite)**

```
ip igmp [vrf <vrf-name>] snooping routermode
{all|default|ip|multicasterouter|address <ip-address>}
no ip igmp [vrf <vrf-name>] snooping routermode [address
<ip-address>]
```

| Parameter               | Description                                                                                                                                                                                           |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vrf                     | Applies the command to the specified VRF instance.                                                                                                                                                    |
| <vrf-name>              | The VRF instance name                                                                                                                                                                                 |
| all                     | All reserved multicast addresses (224.0.0.x). Packets from all possible addresses in range 224.0.0.x are treated as coming from routers.                                                              |
| default                 | Default set of reserved multicast addresses. Packets from 224.0.0.1, 224.0.0.2, 224.0.0.4, 224.0.0.5, 224.0.0.6, 224.0.0.9, 224.0.0.13, 224.0.0.15 and 224.0.0.24 are treated as coming from routers. |
| ip                      | Custom reserved multicast addresses. Packets from custom IP address in the 224.0.0.x range are treated as coming from routers.                                                                        |
| multicasterouter        | Packets from DVMRP (224.0.0.4) and PIM (224.0.0.13) multicast addresses are treated as coming from routers.                                                                                           |
| address<br><ip-address> | Packets from the specified multicast address are treated as coming from routers. The address must be in the 224.0.0.x range.                                                                          |

**Default** The default routermode is **default** (not **all**) and shows the following reserved multicast addresses:

```
Router mode.....Def
```

```
Reserved multicast address
```

```
224.0.0.1
224.0.0.2
224.0.0.4
224.0.0.5
224.0.0.6
224.0.0.9
224.0.0.13
224.0.0.15
224.0.0.24
```

**Mode** Global Configuration

**Examples** To set **ip igmp snooping routermode** for all default reserved addresses enter:

```
awplus(config)# ip igmp snooping routermode default
```

To remove the multicast address 224.0.0.5 from the custom list of multicast addresses enter:

```
awplus(config)# no ip igmp snooping routermode address
224.0.0.5
```

**Related commands** [ip igmp trusted](#)  
[show ip igmp snooping routermode](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip igmp snooping source-timeout

**Overview** Use this command to set the global IGMP Snooping source time-out value (in seconds) on the switch.

Use the **no** variant of this command to set the source time-out value to be the same as the group membership timeout.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

If the platform supports multicast for VRFs, then specifying a VRF name will configure the command on that VRF. If you do not specify a VRF, the command will configure the global VRF. The VRF option is only available for the global command and not the interface command.

**Syntax** `ip igmp snooping source-timeout <timeout>`  
`no ip igmp snooping source-timeout <timeout>`

**Syntax (VRF-lite)** `ip igmp [vrf <vrf-name>] snooping source-timeout <timeout>`  
`no ip igmp [vrf <vrf-name>] snooping source-timeout <timeout>`

| Parameter                     | Description                                        |
|-------------------------------|----------------------------------------------------|
| <code>vrf</code>              | Applies the command to the specified VRF instance. |
| <code>&lt;vrf-name&gt;</code> | The VRF instance name                              |
| <code>&lt;timeout&gt;</code>  | Time-out value in seconds <0-86400>                |

**Default** Global IGMP Snooping source-timeout is disabled by default, and unregistered multicast will be timed-out like normal entries.

Interface IGMP Snooping source timeout is disabled by default, and unregistered multicast will be timed-out like normal entries, unless VRF global settings override.

**Mode** Interface/Global Configuration

**Usage notes** The timeout determines how long unregistered multicast entries will be kept for. If the value '0' is specified, then effectively all unregistered multicast entries will never be timed out, and can only be cleared by using the command **clear ip igmp group**. The interface settings will always take precedence over the global setting.

**Example** To configure IGMP Snooping source timeout on 'vlan1', use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip igmp snooping source-timeout 200
```

**Example** To configure IGMP Snooping source timeout globally on a switch, use the commands:

```
awplus# configure terminal
awplus(config)# ip igmp snooping source-timeout 200
```

**Related commands** [show ip igmp snooping source-timeout](#)

**Command changes** Version 5.4.7-1.1: command added

# ip igmp snooping tcn query solicit

**Overview** Use this command to enable IGMP (Internet Group Management Protocol) Snooping TCN (Topology Change Notification) Query Solicitation feature. When this command is used in the Global Configuration mode, Query Solicitation is enabled.

Use the **no** variant of this command to disable IGMP Snooping TCN Query Solicitation. When the **no** variant of this command is used in Interface Configuration mode, this overrides the Global Configuration mode setting and Query Solicitation is disabled.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ip igmp snooping tcn query solicit`  
`no ip igmp snooping tcn query solicit`

**Syntax (VRF-lite)** `ip igmp [vrf <vrf-name>] snooping tcn query solicit`  
`no ip igmp [vrf <vrf-name>] snooping tcn query solicit`

| Parameter                     | Description                                        |
|-------------------------------|----------------------------------------------------|
| <code>vrf</code>              | Applies the command to the specified VRF instance. |
| <code>&lt;vrf-name&gt;</code> | The VRF instance name.                             |

**Default** IGMP Snooping TCN Query Solicitation is disabled by default on the device, unless the device is the Master Node in an EPSR ring, or is the Root Bridge in a Spanning Tree.

When the device is the Master Node in an EPSR ring, or the device is the Root Bridge in a Spanning Tree, then IGMP Snooping TCN Query Solicitation is enabled by default and cannot be disabled using the Global Configuration mode command. However, Query Solicitation can be disabled for specified interfaces using the **no** variant of this command from the Interface Configuration mode.

**Mode** Global Configuration, and Interface Configuration for a VLAN interface.

**Usage notes** Once enabled, if the device is not an IGMP Querier, on detecting a topology change, the device generates IGMP Query Solicit messages that are sent to all the ports of the vlan configured for IGMP Snooping on the device.

On a device that is not the Master Node in an EPSR ring or the Root Bridge in a Spanning Tree, Query Solicitation can be disabled using the **no** variant of this command after being enabled.

If the device that detects a topology change is an IGMP Querier then the device will generate an IGMP Query message.

Note that the **no** variant of this command when issued in Global Configuration mode has no effect on a device that is the Master Node in an EPSR ring or on a device that is a Root Bridge in a Spanning Tree. Query Solicitation is not disabled for the device these instances. However, Query Solicitation can be disabled on a per-vlan basis from the Interface Configuration mode.

See the following state table that shows when Query Solicit messages are sent in these instances:

| Command issued from Global Configuration | Command issued from Interface Configuration | Device is STP Root Bridge or the EPSR Master Node | IGMP Query Solicit message sent on VLAN |
|------------------------------------------|---------------------------------------------|---------------------------------------------------|-----------------------------------------|
| No                                       | Yes                                         | Yes                                               | Yes                                     |
| Yes                                      | No                                          | Yes                                               | No                                      |
| Yes                                      | Yes                                         | Yes                                               | Yes                                     |

See the [IGMP Feature Overview and Configuration Guide](#) for introductory information about the Query Solicitation feature.

**NOTE:** This command will function on the switch in the stand-alone mode, but it is not supported when the device forms part of a VCS Stack.

**Examples** To enable Query Solicitation on a device, use the commands:

```
awplus# configure terminal
awplus(config)# ip igmp snooping tcn query solicit
```

To disable Query Solicitation on a device, use the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp snooping tcn query solicit
```

To enable Query Solicitation for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping tcn query solicit
```

To disable Query Solicitation for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip igmp snooping tcn query solicit
```

**Command changes**    Version 5.4.7-1.1: VRF-lite support added SBx8100.  
                              Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip igmp source-address-check

**Overview** This command enables the checking of the Source Address for an IGMP Report, rejecting any IGMP Reports originating on devices outside of the local subnet.

Use the **no** variant of this command to disable the checking of the Source Address for an IGMP Report, which allows IGMP Reports from devices outside of the local subnet.

**Syntax** `ip igmp source-address-check`  
`no ip igmp source-address-check`

**Default** Source address checking for IGMP Reports is enabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This is a security feature, and should be enabled unless IGMP Reports from outside the local subnet are expected, for example, if Multicast VLAN Registration is active in the network.

The no variant of this command is required to disable the IGMP Report source address checking feature in networks that use Multicast VLAN Registration to allow IGMP Reports from devices outside of the local subnet.

**Examples** To deny IGMP Reports from outside the current subnet for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp source-address-check
```

To allow IGMP Reports from outside the current subnet for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp source-address-check
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp ssm

**Overview** Use this command to define a non-default Source Specific Multicast (SSM) range of IP multicast addresses in IGMP. Incoming IGMPv1 and IGMPv2 join requests are ignored if the multicast IP address is in the SSM range and no SSM mapping is configured for these addresses. By default, the SSM range is 232/8. To define the SSM range to be other than the default, use one of the access-list parameter options.

Use the **no** variant of this command to change the SSM range in IGMP back to the default.

**Syntax** `ip igmp ssm range {<access-list-number>|<access-list-name>}`  
`no ip igmp ssm`

| Parameter            | Description                               |
|----------------------|-------------------------------------------|
| <access-list-number> | Access-list number, in the range 1 to 99. |
| <access-list-name>   | Standard IP access-list name.             |

**Default** By default the SSM range is 232/8.

**Mode** Global Configuration

**Examples** To configure a non-default SSM range to be used in IGMP enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 224.1.1.0 0.0.0.255
awplus(config)# ip igmp ssm range 10
```

To return to the default configuration enter the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp ssm
```

**Related commands** [access-list \(standard numbered\)](#)  
[ip pim ssm](#)

# ip igmp ssm-map enable

**Overview** Use this command to enable Source Specific Multicast (SSM) mapping on the device.

Use the **no** variant of this command to disable SSM mapping.

**Syntax** `ip igmp ssm-map enable`  
`no ip igmp ssm-map enable`

**Mode** Global Configuration

**Usage notes** This command applies to VLAN interfaces configured for IGMP.

**Example** To enable SSM on the device enter the commands:

```
awplus# configure terminal
awplus(config)# ip igmp ssm-map enable
```

**Related commands** [ip igmp ssm-map static](#)

# ip igmp ssm-map static

**Overview** Use this command to specify the static mode of defining Source Specific Multicast (SSM) mapping. SSM statically assigns sources to IGMPv1 and IGMPv2 groups to translate such (\*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.

Use the **no** variant of this command to remove the SSM map association.

**Syntax**

```
ip igmp ssm-map static
{<access-list-number>|<access-list-number-extended>|
<access-list-name>} <ip-address>

no ip igmp ssm-map static
{<access-list-number>|<access-list-number-extended>|
<access-list-name>} <ip-address>
```

| Parameter                     | Description                                                              |
|-------------------------------|--------------------------------------------------------------------------|
| <access-list-number>          | Access-list number, in the range 1 to 99.                                |
| <access-list-number-extended> | Access-list number (expanded range), in the range 1300 to 1999.          |
| <access-list-name>            | Standard IP access-list name.                                            |
| <ip-address>                  | Source address to use for static map group, entered in the form A.B.C.D. |

**Mode** Global Configuration

**Usage notes** This command applies to VLAN interfaces configured for IGMP. You can use Standard numbered and Standard named ACLs plus Expanded Numbered ACLs.

**Examples** This example shows how to configure an SSM static mapping for group-address 224.1.1.1, using a standard numbered ACL shown as 10:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp ssm-map static 10 1.2.3.4
```

This example shows how to configure an SSM static mapping for group-address 224.1.1.1, using an expanded numbered ACL shown as 1301:

```
awplus# configure terminal
awplus(config)# access-list 1301 permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp ssm-map static 1301 1.2.3.4
```

This example shows how to configure an SSM static mapping for group-address 224.1.1.1, using a standard named ACL shown as sales:

```
awplus# configure terminal
awplus(config)# access-list sales permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp ssm-map static sales 1.2.3.4
```

**Related commands** [ip igmp ssm-map enable](#)

# ip igmp static-group

**Overview** Use this command to statically configure multicast group membership entries on a VLAN interface, or to statically forward a multicast channel out a particular port or port range.

To statically add only a group membership, do not specify any parameters.

To statically add a (\*,g) entry to forward a channel out of a port, specify only the multicast group address and the switch port range.

To statically add an (s,g) entry to forward a channel out of a port, specify the multicast group address, the source IP address, and the switch port range.

To use Source Specific Multicast mapping to determine the source IP address of the multicast server use the **ssm-map** parameter instead of specifying the source IP address.

Use the **no** variant of this command to delete static group membership entries.

**Syntax**

```
ip igmp static-group <ip-address> [source
{<ip-source-addr>|ssm-map}] [interface <port>]

no ip igmp static-group <ip-address> [source
{<ip-source-addr>|ssm-map}] [interface <port>]
```

| Parameter        | Description                                                                                                                                                                                                                                    |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address>     | Standard IP Multicast group address, entered in the form A.B.C.D, to be configured as a static group member.                                                                                                                                   |
| source           | Optional.                                                                                                                                                                                                                                      |
| <ip-source-addr> | Standard IP source address, entered in the form A.B.C.D, to be configured as a static source from where multicast packets originate.                                                                                                           |
| ssm-map          | This parameter uses Source Specific Multicast (SSM) Mapping to determine the source IP address associated with the specified IP Multicast group address. SSM mappings are configured using the <a href="#">ip igmp ssm-map static</a> command. |
| interface        | Use this parameter to specify a specific switch port or switch port range to statically forward the multicast group out of. If not used, static configuration is applied on all ports in the VLAN.                                             |
| <port>           | The port or port range to statically forward the group out of. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2).                                                |

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to IGMP operation, or to IGMP Snooping on a VLAN interface.

**Example** The following example show how to statically add group and source records for IGMP on vlan3:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip igmp
awplus(config-if)# ip igmp static-group 226.1.2.4 source
10.2.3.4
```

# ip igmp startup-query-count

**Overview** Use this command to configure the IGMP startup query count for an interface. The IGMP startup query count is the number of IGMP General Query messages sent by a querier at startup. The default IGMP startup query count is 2.

Use the **no** variant of this command to return an interface's configured IGMP startup query count to the default.

**Syntax** `ip igmp startup-query-count <startup-query-count>`  
`no ip igmp startup-query-count`

| Parameter                                | Description                                              |
|------------------------------------------|----------------------------------------------------------|
| <code>&lt;startup-query-count&gt;</code> | Specify the IGMP startup query count, in the range 2-10. |

**Default** The default IGMP startup query count is 2.

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the IGMP startup query count to 4 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp startup-query-count 4
```

**Related commands** [ip igmp last-member-query-count](#)  
[ip igmp startup-query-interval](#)

# ip igmp startup-query-interval

**Overview** Use this command to configure the IGMP startup query interval for an interface. The IGMP startup query interval is the amount of time in seconds between successive IGMP General Query messages sent by a querier during startup. The default IGMP startup query interval is one quarter of the IGMP query interval value.

Use the **no** variant of this command to return an interface's configured IGMP startup query interval to the default.

**Syntax** `ip igmp startup-query-interval <startup-query-interval>`  
`no ip igmp startup-query-interval`

| Parameter                                   | Description                                                                                                                              |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;startup-query-interval&gt;</code> | Specify the IGMP startup query interval, in the range of 2-1800 seconds. The value must be one quarter of the IGMP query interval value. |

**Default** The default IGMP startup query interval is one quarter of the IGMP query interval value.

**NOTE:** *The IGMP startup query interval must be one quarter of the IGMP query interval.*

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the IGMP startup query interval to 15 seconds for vlan2, which is one quarter of the IGMP query interval of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp query-interval 60
awplus(config-if)# ip igmp startup-query-interval 15
```

**Related commands** [ip igmp last-member-query-interval](#)  
[ip igmp query-interval](#)  
[ip igmp startup-query-count](#)

# ip igmp trusted

**Overview** Use this command to allow IGMP to process packets received on certain trusted ports only.

Use the **no** variant of this command to stop IGMP from processing specified packets if the packets are received on the specified ports or aggregator.

**Syntax** `ip igmp trusted {all|query|report|routermode}`  
`no ip igmp trusted {all|query|report|routermode}`

| Parameter  | Description                                                                                        |
|------------|----------------------------------------------------------------------------------------------------|
| all        | Specifies whether or not the interface is allowed to receive all IGMP and other routermode packets |
| query      | Specifies whether or not the interface is allowed to receive IGMP queries                          |
| report     | Specifies whether or not the interface is allowed to receive IGMP membership reports               |
| routermode | Specifies whether or not the interface is allowed to receive routermode packets                    |

**Default** By default, all ports and aggregators are trusted interfaces, so IGMP is allowed to process all IGMP query, report, and router mode packets arriving on all interfaces.

**Mode** Interface mode for one or more switch ports or aggregators

**Usage** Because all ports are trusted by default, use this command in its **no** variant to stop IGMP processing packets on ports you do not trust.

For example, you can use this command to make sure that only ports attached to approved IGMP routers are treated as router ports.

**Example** To stop ports port1.0.3-port1.0.6 from being treated as router ports by IGMP, use the commands:

```
awplus(config)# interface port1.0.3-port1.0.6
awplus(config-if)# no ip igmp trusted routermode
```

**Related commands** [ip igmp snooping routermode](#)

# ip igmp version

**Overview** Use this command to set the current IGMP version (IGMP version 1, 2 or 3) on an interface.

Use the **no** variant of this command to return to the default version.

**Syntax** `ip igmp version <1-3>`  
`no ip igmp version`

| Parameter                        | Description                  |
|----------------------------------|------------------------------|
| <code>version &lt;1-3&gt;</code> | IGMP protocol version number |

**Default** The default IGMP version is 3.

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the IGMP version to 2 for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp version 2
```

**Related commands** [show ip igmp interface](#)

# show debugging igmp

**Overview** Use this command to see what debugging is turned on for IGMP.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show debugging igmp`

**Syntax (VRF-lite)** `show debugging igmp [vrf <vrf-name>]`

| Parameter                     | Description                                        |
|-------------------------------|----------------------------------------------------|
| <code>vrf</code>              | Applies the command to the specified VRF instance. |
| <code>&lt;vrf-name&gt;</code> | The VRF instance name.                             |

**Mode** User Exec and Privileged Exec

**Example** To display the IGMP debugging options set, enter the command:

```
awplus# show debugging igmp
```

**Output** Figure 35-2: Example output from the **show debugging igmp** command

```
IGMP Debugging status:
IGMP Decoder debugging is on
IGMP Encoder debugging is on
IGMP Events debugging is on
IGMP FSM debugging is on
IGMP Tree-Info-Base (TIB) debugging is on
```

**Related commands** [debug igmp](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp groups

**Overview** Use this command to display the multicast groups with receivers directly connected to the router, and learned through IGMP.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax**

```
show ip igmp groups [brief]
show ip igmp groups <ip-address> [detail]
show ip igmp groups <interface> [<ip-address>] [detail]
```

**Syntax (VRF-lite)**

```
show ip igmp [vrf <vrf-name>|global] groups [brief]
show ip igmp [vrf <vrf-name>|global] groups <ip-address> [detail]
show ip igmp [vrf <vrf-name>|global] groups <interface> [<ip-address>] [detail]
```

| Parameter    | Description                                                  |
|--------------|--------------------------------------------------------------|
| vrf          | Applies the command to the specified VRF instance.           |
| <vrf-name>   | The VRF instance name                                        |
| global       | The global routing and forwarding table                      |
| <ip-address> | Address of the multicast group, entered in the form A.B.C.D. |
| <interface>  | Interface name for which to display local information.       |
| brief        | Brief display of all interfaces.                             |
| detail       | Detailed display of the interface.                           |

**Mode** User Exec and Privileged Exec

**Example** The following command displays local-membership information for all ports in all interfaces:

```
awplus# show ip igmp groups
```

**Output** Figure 35-3: Example output from **show ip igmp groups**

| IGMP Connected Group Membership |           |          |          |               |
|---------------------------------|-----------|----------|----------|---------------|
| Group Address                   | Interface | Uptime   | Expires  | Last Reporter |
| 224.0.1.1                       | port1.0.1 | 00:00:09 | 00:04:17 | 10.10.0.82    |
| 224.0.1.24                      | port1.0.2 | 00:00:06 | 00:04:14 | 10.10.0.84    |
| ...                             |           |          |          |               |

Table 35-1: Parameters in the output of **show ip igmp groups**

| Parameter     | Description                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------|
| Group Address | Address of the multicast group.                                                                              |
| Interface     | Port through which the group is reachable.                                                                   |
| Uptime        | The time in weeks, days, hours, minutes, and seconds that this multicast group has been known to the device. |
| Expires       | Time (in hours, minutes, and seconds) until the entry expires.                                               |
| Last Reporter | Last host to report being a member of the multicast group.                                                   |

**Command  
changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

Version 5.4.8-2.3: **brief** parameter added.

# show ip igmp interface

**Overview** Use this command to display the state of IGMP, IGMP Proxy service, and IGMP Snooping for a specified VLAN, or all VLANs. IGMP is shown as Active or Disabled in the show output. You can also display the number of groups a switch port belongs to.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp interface [<interface>]`

**Syntax (VRF-lite)** `show ip igmp [vrf <vrf-name>|global] interface [<interface>]`

| Parameter   | Description                                                                                                                                                                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vrf         | Applies the command to the specified VRF instance.                                                                                                                                                                                                          |
| <vrf-name>  | The VRF instance name                                                                                                                                                                                                                                       |
| global      | The global routing and forwarding table                                                                                                                                                                                                                     |
| <interface> | The name of the interface.<br>If you specify a switch port number, the output displays the number of groups the port belongs to, and the port’s group membership limit, if a limit has been set (with the command <a href="#">ip igmp maximum-groups</a> ). |

**Mode** User Exec and Privileged Exec

**Output** The following output shows IGMP interface status for vlan2 with IGMP Snooping enabled:

```
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
 IGMP Disabled, Inactive, Version 3 (default)
 IGMP interface has 0 group-record states
 IGMP activity: 0 joins, 0 leaves
 IGMP robustness variable is 2
 IGMP last member query count is 2
 IGMP query interval is 125 seconds
```

```
IGMP query holdtime is 500 milliseconds
IGMP querier timeout is 255 seconds
IGMP max query response time is 10 seconds
Last member query response interval is 1000 milliseconds
Group Membership interval is 260 seconds
Strict IGMPv3 ToS checking is disabled on this interface
Source Address checking is enabled
IGMP Snooping is globally enabled
IGMP Snooping query solicitation is globally disabled
 Num. query-solicit packets: 57 sent, 0 recvd
IGMP Snooping is enabled on this interface
IGMP Snooping fast-leave is not enabled
IGMP Snooping querier is not enabled
IGMP Snooping report suppression is enabled
```

The following output shows IGMP interface status for vlan2 with IGMP Snooping disabled:

```
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
 IGMP Disabled, Inactive, Version 3 (default)
 IGMP interface has 0 group-record states
 IGMP activity: 0 joins, 0 leaves
 IGMP robustness variable is 2
 IGMP last member query count is 2
 IGMP query interval is 125 seconds
 IGMP query holdtime is 500 milliseconds
 IGMP querier timeout is 255 seconds
 IGMP max query response time is 10 seconds
 Last member query response interval is 1000 milliseconds
 Group Membership interval is 260 seconds
 Strict IGMPv3 ToS checking is disabled on this interface
 Source Address checking is enabled
 IGMP Snooping is globally enabled
 IGMP Snooping query solicitation is globally disabled
 Num. query-solicit packets: 57 sent, 0 recvd
 IGMP Snooping is not enabled on this interface
 IGMP Snooping fast-leave is not enabled
 IGMP Snooping querier is not enabled
 IGMP Snooping report suppression is enabled
```

The following output displays membership information for port1.0.1:

```
awplus#show ip igmp interface port1.0.1
IGMP information for port1.0.1
 Maximum groups limit set: 10
 Number of groups port belongs to: 0
```

### Command changes

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp proxy

**Overview** Use this command to display the state of IGMP Proxy services for a specified interface or for all interfaces.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ip igmp proxy`

**Syntax (VRF-lite)** `show ip igmp [vrf <vrf-name>|global] proxy`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name.                             |
| global     | The global routing and forwarding table            |

**Mode** User Exec and Privileged Exec

**Example** To display the state of IGMP Proxy services for all interfaces, enter the command:

```
awplus# show ip igmp proxy
```

**Output** Figure 35-4: Example output from **show ip igmp proxy**

```
awplus#show ip igmp proxy
Interface vlan40 (Index 340)
Administrative status: enabled
Operational status: up
Upstream interface is vlan30
Number of multicast groups: 1
```

**Related commands** [ip igmp proxy-service](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added.

# show ip igmp proxy groups

**Overview** Use this command to display multicast groups with receivers directly connected to the router, learned through IGMP, which use a proxy service. You can also use a filter to specify a multicast group IP address and /or interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax**

```
show ip igmp proxy groups [detail]
show ip igmp proxy groups <multicast-group> [detail]
show ip igmp proxy groups <vlan> [detail]
show ip igmp proxy groups <vlan> <multicast-group> [detail]
```

**Syntax (VRF-lite)**

```
show ip igmp [vrf <vrf-name>|global] proxy groups [detail]
show ip igmp [vrf <vrf-name>|global] proxy groups <multicast-group> [detail]
show ip igmp [vrf <vrf-name>|global] proxy groups <vlan> [detail]
show ip igmp [vrf <vrf-name>|global] proxy groups <vlan> <multicast-group> [detail]
```

| Parameter         | Description                                                                |
|-------------------|----------------------------------------------------------------------------|
| vrf               | Applies the command to the specified VRF instance.                         |
| <vrf-name>        | The VRF instance name.                                                     |
| global            | The global routing and forwarding table                                    |
| groups            | Specify IGMP proxy group membership information.                           |
| detail            | Specify detailed IGMPv3 source information.                                |
| <vlan>            | Specify the name of a single VLAN interface, for example <b>vlan1</b> .    |
| <multicast-group> | Specify the IPv4 address in of the multicast group, in the format A.B.C.D. |

**Mode** User Exec

**Example** To display local membership information for IGMP proxy service interfaces, use the command:

```
awplus# show ip igmp proxy groups
```

**Output** Figure 35-5: Example output from **show ip igmp proxy groups**

```
awplus#show ip igmp proxy groups
IGMP Connected Proxy Group Membership
Group Address Interface Member state
224.9.10.11 vlan10 Delay
```

**Example** To display local membership information for IGMP proxy service interfaces, use the command:

```
awplus# show ip igmp proxy groups detail
```

**Output** Figure 35-6: Example output from **show ip igmp proxy groups detail**

```
awplus#show ip igmp proxy groups detail
Interface: vlan10
Group: 224.9.10.11
Group mode: Exclude
Member state: Delay
Source list is empty

Summary :
IGMP Connected Proxy Group Membership

224.9.10.11 vlan10 DelayDetail :
Interface: vlan10
Group: 224.9.10.11
Group mode: Exclude
Member state: Delay
Source list is empty
```

Table 35-2: Parameters in the output of **show ip igmp proxy groups**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface    | The interface that received the IGMP report.                                                                                                                                                                                                                                                                                               |
| Group        | The multicast group address that has been requested by the IGMP report.                                                                                                                                                                                                                                                                    |
| Group mode   | <b>Include</b> mode indicates that the multicast receiver has sent an IGMPv3 report for a group with a list of addresses that it wants to receive traffic from.<br><b>Exclude</b> mode indicates that the multicast receiver has sent an IGMPv3 report for a group with a list of addresses that it does not want to receive traffic from. |
| Member state | <b>Delay</b> indicates that no group or source query timers are running for the specified group, otherwise the member state is shown as <b>Idle</b> .                                                                                                                                                                                      |

**Command changes**    Version 5.4.7-1.1: VRF-lite support added SBx8100.  
                          Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp snooping mrouter

**Overview** Use this command to display the multicast router ports, both static and dynamic, in a VLAN.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ip igmp snooping mrouter [interface <interface>]`

**Syntax (VRF-lite)** `show ip igmp [vrf <vrf-name>|global] snooping mrouter [interface <interface>]`

| Parameter   | Description                                        |
|-------------|----------------------------------------------------|
| vrf         | Applies the command to the specified VRF instance. |
| <vrf-name>  | The VRF instance name.                             |
| global      | The global routing and forwarding table            |
| interface   | A specific interface.                              |
| <interface> | The name of the VLAN interface.                    |

**Mode** User Exec and Privileged Exec

**Example** To show all multicast router interfaces, use the command:

```
awplus# show ip igmp snooping mrouter
```

To show the multicast router interfaces in `vlan1`, use the command:

```
awplus# show ip igmp snooping mrouter interface vlan1
```

**Output** Figure 35-7: Example output from **show ip igmp snooping mrouter**

| VLAN | Interface | Static/Dynamic        |
|------|-----------|-----------------------|
| 1    | port1.0.1 | Statically configured |
| 200  | port1.0.2 | Statically configured |

Figure 35-8: Example output from **show ip igmp snooping mrouter interface vlan1**

| VLAN | Interface | Static/Dynamic        |
|------|-----------|-----------------------|
| 1    | port1.0.1 | Statically configured |

**Command changes**    Version 5.4.7-1.1: VRF-lite support added SBx8100.  
                          Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp snooping routermode

**Overview** Use this command to display the current router mode and the list of IP addresses set as router multicast addresses from the [ip igmp snooping routermode](#) command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ip igmp snooping routermode`

**Syntax (VRF-lite)** `show ip igmp [vrf <vrf-name>|global] snooping routermode`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name                              |
| global     | The global routing and forwarding table            |

**Mode** User Exec and Privileged Exec

**Example** To show the router mode and the list of router multicast addresses, use the command:

```
awplus# show ip igmp snooping routermode
```

**Output** Figure 35-9: Example output from **show ip igmp snooping routermode**

```
awplus#show ip igmp snooping routermode
Router mode.....Def
Reserved multicast address

 224.0.0.1
 224.0.0.2
 224.0.0.4
 224.0.0.5
 224.0.0.6
 224.0.0.9
 224.0.0.13

```

**Related commands** [ip igmp snooping routermode](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp snooping source-timeout

**Overview** Use this command to display the configured IGMP snooping source timeouts for a specified VLAN or VLAN range.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Specifying a VRF name will show the IGMP source timeouts for that VRF or use global for the global VRF. Not specifying a VRF will display the information for all VRFs.

**Syntax** `show ip igmp snooping source-timeout [interface|<interface-range>]`

**Syntax (VRF-lite)** `show ip igmp [vrf <vrf-name>|global] snooping source-timeout [interface|<interface-range>]`

| Parameter         | Description                                        |
|-------------------|----------------------------------------------------|
| vrf               | Applies the command to the specified VRF instance. |
| <vrf-name>        | The VRF instance name                              |
| global            | The global routing and forwarding table            |
| <interface-range> | The name of the VLAN interface or VLAN range       |

**Mode** Privileged Exec

**Example** To display the configured IGMP snooping source timeouts for all VLANs, use the command:

```
awplus# show ip igmp snooping source-timeout
```

**Output** Figure 35-10: Example output from **show ip igmp snooping source-timeout**

```
awplus#show ip igmp snooping source-timeout
Global IGMP snooping source-timeout is enabled (60 secs)

vlan1 enabled (300 secs)
vlan2 inherits global setting
vlan1000 inherits global settingawplus#show ip igmp
snooping source-timeout int vlan1
Global IGMP snooping source-timeout is enabled (60 secs)vlan1
enabled (300 secs)
```

**Example** To display the configured IGMP snooping source timeouts for VLAN1, use the command:

```
awplus# show ip igmp snooping source-timeout int vlan1
```

**Output** Figure 35-11: Example output from **show ip igmp snooping source-timeout int vlan1**

```
awplus#show ip igmp snooping source-timeout int vlan1
Global IGMP snooping source-timeout is enabled (60 secs)vlan1
enabled (300 secs)
```

**Related commands** [ip igmp snooping source-timeout](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

# show ip igmp snooping statistics

**Overview** Use this command to display IGMP Snooping statistics data.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ip igmp snooping statistics interface <interface-range> [group [<ip-address>]]`

**Syntax (VRF-lite)** `show ip igmp [vrf <vrf-name>|global] snooping statistics interface <interface-range> [group [<ip-address>]]`

| Parameter    | Description                                                                                                                                                                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vrf          | Applies the command to the specified VRF instance.                                                                                                                                                                                                                          |
| <vrf-name>   | The VRF instance name                                                                                                                                                                                                                                                       |
| global       | The global routing and forwarding table                                                                                                                                                                                                                                     |
| <ip-address> | Optionally specify the address of the multicast group, entered in the form A.B.C.D.                                                                                                                                                                                         |
| <interface>  | Specify the name of the interface or interface range. If you specify a port number, the output displays the number of groups the port belongs to, and the port's group membership limit, if a limit has been set (with the command <a href="#">ip igmp maximum-groups</a> ) |

**Mode** Privileged Exec

**Example** To display IGMP statistical information for **vlan1** and **vlan2**, use the command:

```
awplus# show ip igmp snooping statistics interface vlan1-vlan2
```

**Output** Figure 35-12: Example output from the **show ip igmp snooping statistics** command for VLANs

```
awplus#show ip igmp interface vlan1-vlan2
IGMP Snooping statistics for vlan1

IGMP Snooping statistics for vlan2
Interface: port1.0.2
Group: 224.1.1.2
Uptime: 00:00:19
Group mode: Exclude (Expires: 00:05:10)
Last reporter: 10.4.4.6
Source list is empty
```

Figure 35-13: Example output from the **show ip igmp snooping statistics** command for a switch port

```
awplus#show ip igmp interface port1.0.1
IGMP information for port1.0.1
 Maximum groups limit set: 10
 Number of groups port belongs to: 0
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# undebbug igmp

**Overview** This command applies the functionality of the no `debug igmp` command.

# 36

# MLD and MLD Snooping Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of configuration, clear, and show commands related to MLD and MLD Snooping.

The Multicast Listener Discovery (MLD) module includes the MLD Proxy service and MLD Snooping functionality. Some of the following commands may have commonalities and restrictions; these are described under the Usage section for each command.

MLD and MLD Snooping commands only apply to switch ports, not Ethernet interfaces.

Before using PIM-SMv6:

- IPv6 must be enabled on an interface ([ipv6 enable](#)),
- IPv6 forwarding must be enabled globally for routing IPv6 ([ipv6 forwarding](#)), and
- IPv6 multicasting must be enabled globally ([ipv6 multicast-routing](#)).

- Command List**

# clear ipv6 mld

**Overview** Use this command to clear all MLD local memberships on all interfaces.

**Syntax** `clear ipv6 mld`

**Mode** Privileged Exec

**Usage** This command applies to interfaces configured for MLD Layer 3 multicast protocols and learned by MLD Snooping.

**Example** To clear all MLD local memberships on all interfaces, use the command:

```
awplus# clear ipv6 mld
```

**Related commands** [clear ipv6 mld group](#)  
[clear ipv6 mld interface](#)

# clear ipv6 mld group

**Overview** Use this command to clear MLD specific local-membership(s) on all interfaces, for all groups or a particular group.

**Syntax** `clear ipv6 mld group {*|<ipv6-address>}`

| Parameter      | Description                                                                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| *              | Clears all groups on all interfaces. This is an alias to the <a href="#">clear ipv6 mld</a> command.                                                                               |
| <ipv6-address> | Specify the group address for which MLD local-memberships are to be cleared from all interfaces.<br>Specify the IPv6 multicast group address in the format in the format X:X::X:X. |

**Mode** Privileged Exec

**Usage** This command applies to interfaces configured for MLD Layer 3 multicast protocols and learned by MLD Snooping.

**Example** To clear all groups on all interfaces, use the command:

```
awplus# clear ipv6 mld group *
```

**Related commands** [clear ipv6 mld](#)  
[clear ipv6 mld interface](#)

# clear ipv6 mld interface

**Overview** Use this command to clear MLD interface entries.

**Syntax** `clear ipv6 mld interface <interface>`

| Parameter                      | Description                                                                          |
|--------------------------------|--------------------------------------------------------------------------------------|
| <code>&lt;interface&gt;</code> | Specifies name of the interface; all groups learned from this interface are deleted. |

**Mode** Privileged Exec

**Usage** This command applies to interfaces configured for MLD Layer 3 multicast protocols and learned by MLD Snooping.

**Example** To clear the entries from vlan2, use the command:

```
awplus# clear ipv6 mld interface vlan2
```

**Related commands** [clear ipv6 mld](#)  
[clear ipv6 mld group](#)

# debug mld

**Overview** Use this command to enable all MLD debugging modes, or a specific MLD debugging mode.

Use the **no** variant of this command to disable all MLD debugging modes, or a specific MLD debugging mode.

**Syntax** `debug mld {all|decode|encode|events|fsm|tib}`  
`no debug mld {all|decode|encode|events|fsm|tib}`

| Parameter | Description                            |
|-----------|----------------------------------------|
| all       | Debug all MLD.                         |
| decode    | Debug MLD decoding.                    |
| encode    | Debug MLD encoding.                    |
| events    | Debug MLD events.                      |
| fsm       | Debug MLD Finite State Machine (FSM).  |
| tib       | Debug MLD Tree Information Base (TIB). |

**Mode** Privileged Exec and Global Configuration

**Usage notes** This command applies to interfaces configured for MLD Layer 3 multicast protocols and learned by MLD Snooping.

**Examples**

```
awplus# configure terminal
awplus(config)# debug mld all
awplus# configure terminal
awplus(config)# debug mld decode
awplus# configure terminal
awplus(config)# debug mld encode
awplus# configure terminal
awplus(config)# debug mld events
```

**Related commands** [show debugging mld](#)

## ipv6 mld

**Overview** Use this command to enable the MLD protocol operation on an interface. This command enables MLD protocol operation in stand-alone mode, and can be used to learn local-membership information prior to enabling a multicast routing protocol on the interface.

Use the **no** variant of this command to return all MLD related configuration to the default (including MLD Snooping).

**NOTE:** *There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing.*

**Syntax** `ipv6 mld`  
`no ipv6 mld`

**Default** MLD is disabled by default.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

**Example** To enable MLD on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld
```

**Related commands** [show ipv6 mld interface](#)

# ipv6 mld access-group

**Overview** Use this command to control the multicast local-membership groups learned on an interface.

Use the **no** variant of this command to disable this access control.

**Syntax** `ipv6 mld access-group <IPv6-access-list-name>`  
`no ipv6 mld access-group`

| Parameter                                  | Description                                                                                                                                                     |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;IPv6-access-list-name&gt;</code> | Specify a Standard or an Extended software IPv6 access-list name. See <a href="#">IPv6 Software Access Control List (ACL) Commands</a> for supported IPv6 ACLs. |

**Default** No access list is configured by default.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Examples** In the following example, the VLAN interface `vlan2` will only accept MLD joins for groups in the range `ff1e:0db8:0001::/64`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard group1 permit
ff1e:0db8:0001::/64
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld access-group group1
```

In the following example, the VLAN interfaces `vlan2-vlan4` will only accept MLD joins for groups in the range `ff1e:0db8:0001::/64`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard group1 permit
ff1e:0db8:0001::/64
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld access-group group1
```

# ipv6 mld immediate-leave

**Overview** Use this command to minimize the leave latency of MLD memberships.  
Use the **no** variant of this command to disable this feature.

**Syntax** `ipv6 mld immediate-leave group-list <IPv6-access-list-name>`  
`no ipv6 mld immediate-leave`

| Parameter                                  | Description                                                                                                                                                                                                                                      |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;IPv6-access-list-name&gt;</code> | Specify a Standard or an Extended software IPv6 access-list name that defines multicast groups in which the immediate leave feature is enabled.<br>See <a href="#">IPv6 Software Access Control List (ACL) Commands</a> for supported IPv6 ACLs. |

**Default** Disabled

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Example** The following example shows how to enable the immediate-leave feature on an interface for a specific range of multicast groups. In this example, the router assumes that the group access-list consists of groups that have only one node membership at a time per interface:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld immediate-leave v6grp
awplus(config-if)# exit
```

**Related commands** [ipv6 mld last-member-query-interval](#)

# ipv6 mld last-member-query-count

**Overview** Use this command to set the last-member query-count value.  
Use the **no** variant of this command to return to the default on an interface.

**Syntax** `ipv6 mld last-member-query-count <value>`  
`no ipv6 mld last-member-query-count`

| Parameter | Description                                |
|-----------|--------------------------------------------|
| <value>   | Count value. Valid values are from 2 to 7. |

**Default** The default last-member query-count value is 2.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Example** To set the last-member query-count to 3 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-count 3
```

# ipv6 mld last-member-query-interval

**Overview** Use this command to configure the interval at which the router sends MLD group-specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

**Syntax** `ipv6 mld last-member-query-interval <milliseconds>`  
`no ipv6 mld last-member-query-interval`

| Parameter                         | Description                                                                                                           |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <code>&lt;milliseconds&gt;</code> | The time delay between successive query messages (in milliseconds). Valid values are from 1000 to 25500 milliseconds. |

**Default** 1000 milliseconds

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Example** The following example changes the MLD group-specific host query message interval to 2 seconds:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-interval 2000
```

**Related commands** [ipv6 mld immediate-leave](#)

# ipv6 mld limit

**Overview** Use this command to configure a limit on the maximum number of group memberships that may be learned. The limit may be set for the device as a whole, or for a specific interface.

Once the specified group membership limit is reached, all further local-memberships will be ignored.

Optionally, an exception access-list can be configured to specify the group-address(es) that are exempted from being subject to the limit.

Use the **no** variant of this command to unset the limit and any specified exception access-list.

**Syntax** `ipv6 mld limit <limitvalue> [except <IPv6-access-list-name>]`  
`no ipv6 mld limit`

| Parameter               | Description                                                                                                                                                                                                                                                     |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <limitvalue>            | <2-512> Maximum number of group membership states.                                                                                                                                                                                                              |
| <IPv6-access-list-name> | Specify a Standard or an Extended software IPv6 access-list name that defines multicast groups, which are exempted from being subject to the configured limit.<br>See <a href="#">IPv6 Software Access Control List (ACL) Commands</a> for supported IPv6 ACLs. |

**Default** The default limit, which is reset by the **no** variant of this command, is the same as maximum number of group membership entries that can be learned with the **ipv6 mld limit** command.

The default limit of group membership entries that can be learned is 512 entries.

**Mode** Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

**Examples** The following example configures an MLD limit of 100 group-memberships across all VLAN interfaces on which MLD is enabled, and excludes groups in the range `ff1e:0db8:0001::/64` from this limitation:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard v6grp permit
ff1e:0db8:0001::/64
awplus(config)# ipv6 mld limit 100 except v6grp
```

The following example configures an MLD limit of 100 group-membership states on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld limit 100
```

The following example configures an MLD limit of 100 group-membership states on the VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld limit 100
```

**Related commands**   [ipv6 mld immediate-leave](#)  
[show ipv6 mld groups](#)

# ipv6 mld querier-timeout

**Overview** Use this command to configure the timeout period before the router takes over as the querier for the interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

**Syntax** `ipv6 mld querier-timeout <seconds>`  
`no ipv6 mld querier-timeout`

| Parameter | Description                                                                                                                                                            |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <seconds> | Number of seconds that the router waits after the previous querier has stopped querying before it takes over as the querier. Valid values are from 2 to 65535 seconds. |

**Default** 255 seconds

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** This command applies to interfaces configured for MLD Layer 3 multicast protocols.

**Example** The following example configures the router to wait 120 seconds from the time it received the last query before it takes over as the querier for the interface:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld querier-timeout 120
```

**Related commands** [ipv6 mld query-interval](#)

# ipv6 mld query-interval

**Overview** Use this command to configure the frequency of sending MLD host query messages.

Use the **no** variant of this command to return to the default frequency.

**Syntax** `ipv6 mld query-interval <seconds>`  
`no ipv6 mld query-interval`

| Parameter | Description                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <seconds> | Variable that specifies the time delay between successive MLD host query messages (in seconds). Valid values are from 1 to 18000 seconds. |

**Default** The default query interval is 125 seconds.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This command applies to interfaces configured for MLD Layer 3 multicast protocols.

**Example** The following example changes the frequency of sending MLD host-query messages to 2 minutes:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-interval 120
```

**Related commands** [ipv6 mld querier-timeout](#)

# ipv6 mld query-max-response-time

**Overview** Use this command to configure the maximum response time advertised in MLD queries.

Use the **no** variant of with this command to restore the default.

**Syntax** `ipv6 mld query-max-response-time <seconds>`  
`no ipv6 mld query-max-response-time`

| Parameter | Description                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------|
| <seconds> | Maximum response time (in seconds) advertised in MLD queries. Valid values are from 1 to 240 seconds. |

**Default** 10 seconds

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This command applies to interfaces configured for MLD Layer 3 multicast protocols.

**Example** The following example configures a maximum response time of 8 seconds:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-max-response-time 8
```

# ipv6 mld robustness-variable

**Overview** Use this command to change the robustness variable value on an interface.  
Use the **no** variant of this command to return to the default on an interface.

**Syntax** `ipv6 mld robustness-variable <value>`  
`no ipv6 mld robustness-variable`

| Parameter | Description                   |
|-----------|-------------------------------|
| <value>   | Valid values are from 1 to 7. |

**Default** The default robustness variable value is 2.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This command applies to interfaces configured for MLD Layer 3 multicast protocols.

**Example** The following example changes the robustness variable value to 3:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld robustness-variable 3
```

# ipv6 mld snooping

**Overview** Use this command to enable MLD Snooping. When this command is issued in the Global Configuration mode, MLD Snooping is enabled globally for the device. When this command is issued in Interface mode for a VLAN then MLD Snooping is enabled for the specified VLAN. Note that MLD Snooping is enabled on the VLAN only if it is enabled globally and on the VLAN.

Use the **no** variant of this command to globally disable MLD Snooping in Global Configuration mode, or for the specified VLAN interface in Interface mode.

**NOTE:** *There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing.*

**Syntax** `ipv6 mld snooping`  
`no ipv6 mld snooping`

**Default** By default, MLD Snooping is enabled both globally and on all VLANs.

**Mode** Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** It is possible to disable MLD snooping globally or on a per-VLAN basis, using the command **no ipv6 mld snooping**. However, we recommend leaving MLD snooping enabled unless an Allied Telesis support representative tells you to disable it, even if you are not actively using the device for multicast.

For MLD Snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (both are enabled by default).

MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

**Examples** To configure MLD Snooping on the VLAN interfaces vlan2-vlan4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping
```

To disable MLD Snooping for the VLAN interfaces vlan2-vlan4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config)# no ipv6 mld snooping
```

To configure MLD Snooping globally for the device, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 mld snooping
```

To disable MLD Snooping globally for the device, enter the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 mld snooping
```

# ipv6 mld snooping fast-leave

**Overview** Use this command to enable MLD Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing; the MLD group-membership is removed as soon as an MLD leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

**Syntax** `ipv6 mld snooping fast-leave`  
`no ipv6 mld snooping fast-leave`

**Default** MLD Snooping fast-leave processing is disabled.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** This MLD Snooping command can only be configured on VLAN interfaces.

**Examples** This example shows how to enable fast-leave processing on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping fast-leave
```

This example shows how to enable fast-leave processing on the VLAN interface `vlan2-vlan4`.

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping fast-leave
```

# ipv6 mld snooping mrouter

**Overview** Use this command to statically configure the specified port as a Multicast Router interface for MLD Snooping within the specified VLAN.

See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to remove the static configuration of the interface as a Multicast Router interface.

**Syntax** `ipv6 mld snooping mrouter interface <port>`  
`no ipv6 mld snooping mrouter interface <port>`

| Parameter | Description                   |
|-----------|-------------------------------|
| <port>    | Specify the name of the port. |

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** This MLD Snooping command statically configures a switch port as a Multicast Router interface.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

For example, if port1.0.1 and port1.0.6 are ports on an EPSR data VLAN vlan101, which is the destination for a static IPv6 multicast route, then configure both ports as multicast router (mrouter) ports as shown in the example commands listed below:

Figure 36-1: Example **ipv6 mld snooping mrouter** commands when static IPv6 multicast routing is being used and the destination VLAN is an EPSR data VLAN:

```
awplus>enable
awplus#configure terminal
awplus(config)#interface vlan101
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.1
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.6
```

**Examples** This example shows how to specify the next-hop interface to the multicast router for VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping mrouter interface
port1.0.5
```

This example shows how to specify the next-hop interface to the multicast router for VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping mrouter interface
port1.0.5
```

**Related commands** [ipv6 multicast route](#)

# ipv6 mld snooping querier

**Overview** Use this command to enable MLD querier operation on a subnet (VLAN) when no multicast routing protocol is configured in the subnet (VLAN). When enabled, the MLD Snooping querier sends out periodic MLD queries for all interfaces on that VLAN.

Use the **no** variant of this command to disable MLD querier configuration.

**Syntax** `ipv6 mld snooping querier`  
`no ipv6 mld snooping querier`

**Mode** Interface Configuration for a specified VLAN interface.

**Usage** This command can only be configured on a single VLAN interface - not on multiple VLANs.

The MLD Snooping querier uses the 0.0.0.0 Source IP address because it only masquerades as an MLD querier for faster network convergence.

The MLD Snooping querier does not start, or automatically cease, the MLD Querier operation if it detects query message(s) from a multicast router. It restarts as an MLD Snooping querier if no queries are seen within the other querier interval.

Do not enable MLD Snooping querier if you have already enabled MLD on your device.

Do not enable MLD Snooping querier on your device and then enable MLD afterwards.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ipv6 mld snooping querier`

# ipv6 mld snooping report-suppression

**Overview** Use this command to enable report suppression from hosts for Multicast Listener Discovery version 1 (MLDv1) on a VLAN in Interface Configuration mode.

Use the **no** variant of this command to disable report suppression on a VLAN in Interface Configuration mode.

**Syntax** `ipv6 mld snooping report-suppression`  
`no ipv6 mld snooping report-suppression`

**Default** Report suppression does not apply to MLDv2, and is turned on by default for MLDv1 reports.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage** This MLD Snooping command can only be configured on VLAN interfaces.

MLDv1 Snooping maybe configured to suppress reports from hosts. When a querier sends a query, only the first report for particular set of group(s) from a host will be forwarded to the querier by the MLD Snooping device. Similar reports (to the same set of groups) from other hosts, which would not change group memberships in the querier, will be suppressed by the MLD Snooping device to prevent 'flooding' of query responses.

**Examples** This example shows how to enable report suppression for MLD reports on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 mld snooping report-suppression
```

This example shows how to enable report suppression for MLD reports on VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no ipv6 mld snooping report-suppression
```

# ipv6 mld ssm-map enable

**Overview** Use this command to enable the Source Specific Multicast (SSM) mapping feature on the device.

Use the **no** variant of this command to disable the SSM mapping feature on the device.

**Syntax** `ipv6 mld ssm-map enable`  
`no ipv6 mld ssm-map enable`

**Mode** Global Configuration

**Usage notes** This command enables the SSM mapping feature for group members in the defined SSM range. Configure the group member and the SSM range using the [ipv6 mld ssm-map static](#) command.

**Example** This example shows how to enable the MLD SSM mapping feature on the device.

```
awplus# configure terminal
awplus(config)# ipv6 mld ssm-map enable
```

**Related commands** [ipv6 mld ssm-map static](#)

# ipv6 mld ssm-map static

**Overview** Use this command to statically define a Source Specific Multicast (SSM) mapping. The SSM mapping statically assigns sources to MLDv1 groups to translate such (\*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.

Use the **no** variant of this command to remove the SSM map association.

**Syntax** `ipv6 mld ssm-map static <access-list-name> X:X::X:X`  
`no ipv6 mld ssm-map static <access-list-name> X:X::X:X`

| Parameter          | Description                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------|
| <access-list-name> | IPv6 named standard access-list.                                                                              |
| X:X::X:X           | IPv6 source address that is associated with the above access-list. The IPv6 address uses the format X:X::X:X. |

**Mode** Global Configuration

**Usage notes** Use this command to configure SSM mappings after enabling SSM mapping with the [ipv6 mld ssm-map enable](#) command.

**Example** This example shows how to configure an SSM static mapping for the group-address ff0e::1/128.

```
awplus# configure terminal
awplus(config)# ipv6 mld ssm-map enable
awplus(config)# ipv6 access-list standard v6grp permit ff0e::1/128
awplus(config)# ipv6 mld ssm-map static v6grp 2006::3
```

**Related commands** [ipv6 mld ssm-map enable](#)

# ipv6 mld static-group

**Overview** Use this command to statically configure IPv6 group membership entries on an interface. To statically add only a group membership, do not specify any parameters.

Use the **no** variant of this command to delete static group membership entries.

**Syntax** `ipv6 mld static-group <ipv6-group-address> [source <ipv6-source-address>|ssm-map] [interface <port>]`  
`no ipv6 mld static-group <ipv6-group-address> [source <ipv6-source-address>|ssm-map] [interface <port>]`

| Parameter             | Description                                                                                                                                                                                                                                                                |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipv6-group-address>  | Specify a standard IPv6 Multicast group address to be configured as a static group member. The IPv6 address uses the format X:X::X:X.                                                                                                                                      |
| <ipv6-source-address> | Optional. Specify a standard IPv6 source address to be configured as a static source from where multicast packets originate. The IPv6 address uses the format X:X::X:X.                                                                                                    |
| ssm-map               | Mode of defining SSM mapping. SSM mapping statically assigns sources to MLDv1 groups to translate these (*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.                                                                                               |
| <port>                | Optional. Physical interface. This parameter specifies a physical port. If this parameter is used, the static configuration is applied to just that physical interface. If this parameter is not used, the static configuration is applied on all interfaces in the group. |

**Mode** Interface Configuration for a specified VLAN interface.

**Usage notes** This command applies to MLD Snooping on a VLAN interface to statically add groups and/or source records.

**Examples** To add a static group record, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10
```

To add a static group and source record, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
fe80::2fd:6cff:fe1c:b
```

To add a static group record on a specific port on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 interface
port1.0.8
```

To add an SSM mapping record on a specific port on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
ssm-map interface port1.0.8
```

# ipv6 mld version

**Overview** Use this command to set the current MLD protocol version on an interface.  
Use the **no** variant of this command to return to the default version on an interface.

**Syntax** `ipv6 mld version <version>`  
`no ipv6 mld version`

| Parameter | Description                                                    |
|-----------|----------------------------------------------------------------|
| <version> | MLD protocol version number. Valid version numbers are 1 and 2 |

**Default** The default MLD protocol version number is 2.

**Mode** Interface Configuration for a specified VLAN interface.

**Usage notes** This command applies to interfaces configured for MLD Layer 3 multicast protocols and MLD Snooping.  
  
Note this command is intended for use where there is another querier (when there is another device with MLD enabled) on the same link that can only operate with MLD version 1. Otherwise, the default MLD version 2 is recommended for performance.

**Example** To set the MLD protocol version to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld version 1
```

# show debugging mld

**Overview** Use this command to see what debugging is turned on for MLD. MLD debugging modes are enabled with the [debug mld](#) command.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show debugging mld`

**Mode** Privileged Exec

**Example** `awplus# show debugging mld`

## Output

```
show debugging mld
MLD Debugging status:
 MLD Decoder debugging is on
 MLD Encoder debugging is on
 MLD Events debugging is on
 MLD FSM debugging is on
 MLD Tree-Info-Base (TIB) debugging is on
```

**Related commands** [debug mld](#)

# show ipv6 mld groups

**Overview** Use this command to display the multicast groups that have receivers directly connected to the router and learned through MLD.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ipv6 mld groups [<ipv6-address>|<interface>] [detail]`

**Syntax (VRF-lite)** `show ipv6 mld [vrf <vrf-name>|global] groups [<ipv6-address>|<interface>] [detail]`

| Parameter      | Description                                                                 |
|----------------|-----------------------------------------------------------------------------|
| <ipv6-address> | Optional.<br>Specify the address of the multicast group in format X:X::X:X. |
| <interface>    | Optional.<br>The interface to display information about.                    |
| detail         | Display more detailed information.                                          |
| vrf            | Applies the command to the specified VRF instance.                          |
| <vrf-name>     | The VRF instance name.                                                      |
| global         | The global routing and forwarding table.                                    |

**Mode** User Exec and Privileged Exec

**Examples** The following command displays local-membership information for all interfaces:

```
awplus# show ipv6 mld groups
```

The following command displays detailed local-membership information for all interfaces:

```
awplus# show ipv6 mld groups detail
```

**Output** Figure 36-2: Example output for **show ipv6 mld groups**

|                                |                    |          |          |                         |  |
|--------------------------------|--------------------|----------|----------|-------------------------|--|
| awplus#show ipv6 mld groups    |                    |          |          |                         |  |
| MLD Connected Group Membership |                    |          |          |                         |  |
| Group Address                  | Interface          | Uptime   | Expires  | Last Reporter           |  |
| ff08::1                        | vlan10 (port1.0.1) | 00:07:27 | 00:03:10 | fe80::200:1ff:fe20:b5ac |  |

Figure 36-3: Example output for **show ipv6 mld groups detail**

```
awplus# show ipv6 mld groups detail
MLD Connected Group Membership Details for port1.0.1
Interface: port1.0.1
Group: ff08::1
Uptime: 00:00:13
Group mode: Include ()
Last reporter: fe80::eecd:6dff:fe6b:4783
Group source list: (R - Remote, M - SSM Mapping, S - Static)
 Source Address Uptime v2 Exp Fwd Flags
 2001:db8::1 00:00:13 00:04:07 Yes R
 2002:db8::3 00:00:13 00:04:07 Yes R
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 mld interface

**Overview** Use this command to display the state of MLD and MLD Snooping for a specified interface, or all interfaces.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ipv6 mld interface [<interface>]`

**Syntax (VRF-lite)** `show ipv6 mld [vrf <vrf-name>|global] interface [<interface>]`

| Parameter   | Description                                            |
|-------------|--------------------------------------------------------|
| <interface> | Optionally, an interface to display information about. |
| vrf         | Applies the command to the specified VRF instance.     |
| <vrf-name>  | The VRF instance name.                                 |
| global      | The global routing and forwarding table.               |

**Mode** User Exec and Privileged Exec

**Example** The following command displays MLD interface status on all interfaces enabled for MLD:

```
awplus# show ipv6 mld interface
```

**Output** Figure 36-4: Example output for **show ipv6 mld interface**

```
awplus#show ipv6 mld interface

Interface vlan1 (Index 301)
 MLD Enabled, Active, Querier, Version 2 (default)
 Internet address is fe80::215:77ff:fec9:7468
 MLD interface has 0 group-record states
 MLD activity: 0 joins, 0 leaves
 MLD robustness variable is 2
 MLD last member query count is 2
 MLD query interval is 125 seconds
 MLD querier timeout is 255 seconds
 MLD max query response time is 10 seconds
 Last member query response interval is 1000 milliseconds
 Group Membership interval is 260 seconds
 MLD Snooping is globally enabled
 MLD Snooping is enabled on this interface
 MLD Snooping fast-leave is not enabled
 MLD Snooping querier is enabled
 MLD Snooping report suppression is enabled
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 mld snooping mrrouter

**Overview** Use this command to display the multicast router interfaces, both configured and learned, in a VLAN. If you do not specify a VLAN interface then all the VLAN interfaces are displayed.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ipv6 mld snooping mrrouter [<interface>]`

**Syntax (VRF-lite)** `show ipv6 mld [vrf <vrf-name>|global] snooping mrrouter [<interface>]`

| Parameter   | Description                                            |
|-------------|--------------------------------------------------------|
| <interface> | Optionally, an interface to display information about. |
| vrf         | Applies the command to the specified VRF instance.     |
| <vrf-name>  | The VRF instance name.                                 |
| global      | The global routing and forwarding table.               |

**Mode** User Exec and Privileged Exec

**Example** To display the multicast router interfaces in vlan2, use the command:

```
awplus# show ipv6 mld snooping mrrouter vlan2
```

To display the multicast router interfaces for all VLAN interfaces, use the command:

```
awplus# show ipv6 mld snooping mrrouter
```

**Output** Figure 36-5: Example output for **show ipv6 mld snooping mrrouter vlan2**

```
awplus#show ipv6 mld snooping mrrouter vlan2
VLAN Interface Static/Dynamic
2 port1.0.2 Dynamically Learned
2 port1.0.3 Dynamically Learned
```

Figure 36-6: Example output for **show ipv6 mld snooping mrrouter**

```
awplus#show ipv6 mld snooping mrrouter
VLAN Interface Static/Dynamic
2 port1.0.2 Dynamically Learned
2 port1.0.3 Dynamically Learned
3 port1.0.4 Statically Assigned
3 port1.0.5 Statically Assigned
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 mld snooping statistics

**Overview** Use this command to display MLD Snooping statistics data.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus”\\_Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ipv6 mld snooping statistics interface <interface>`

**Syntax (VRF-lite)** `show ipv6 mld [vrf <vrf-name>|global] snooping statistics interface <interface>`

| Parameter   | Description                                        |
|-------------|----------------------------------------------------|
| <interface> | The interface to display information about.        |
| vrf         | Applies the command to the specified VRF instance. |
| <vrf-name>  | The VRF instance name.                             |
| global      | The global routing and forwarding table.           |

**Mode** User Exec and Privileged Exec

**Example** To display MLDv2 statistical information for an interface, use the command:

```
awplus# show ipv6 mld snooping statistics interface vlan1
```

**Output** Figure 36-7: Example output for **show ipv6 mld snooping statistics interface vlan1**

```
awplus#show ipv6 mld snooping statistics interface vlan1
MLD Snooping statistics for vlan1
Interface: port1.0.1
Group: ff08::1
Uptime: 00:02:18
Group mode: Include ()
Last reporter: fe80::eecd:6dff:fe6b:4783
Group source list: (R - Remote, M - SSM Mapping, S - Static)
 Source Address Uptime v2 Exp Fwd Flags
 2001:db8::1 00:02:18 00:02:02 Yes R

```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# 37

# Multicast Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of multicast commands for configuring:

- IPv4 and IPv6 multicast forwarding
- IPv4 and IPv6 static multicast routes
- mroutes (routes back to a multicast source)

For commands for other multicast protocols, see:

- [IGMP and IGMP Snooping Commands](#)
- [MLD and MLD Snooping Commands](#)
- [PIM-SM Commands](#)
- [PIM-SMv6 Commands](#)
- [PIM-DM Commands](#)

**NOTE:** Before using PIM-SMv6 commands, IPv6 must be enabled on an interface with the [ipv6 enable](#) command, IPv6 forwarding must be enabled globally for routing IPv6 with the [ipv6 forwarding](#) command, and IPv6 multicasting must be enabled globally with the [ipv6 multicast-routing](#) command.

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the [clear ipv6 mroute](#) command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306. The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96.

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical

*networks (other than for testing purposes) nor should they appear on any public network.*

  - “platform multicast-ratelimit” on page 2142
  - “platform stop-unreg-mc-flooding” on page 2143
  - “show debugging nsm mcast” on page 2145
  - “show ip mroute” on page 2146
  - “show ip mvif” on page 2149
  - “show ip rpf” on page 2150
  - “show ipv6 mif” on page 2151
  - “show ipv6 mroute” on page 2152
  - “show ipv6 multicast forwarding” on page 2154

# clear ip mroute

**Overview** Use this command to delete one or more dynamically-added route entries from the IPv4 multicast routing table.

You need to do this if, for example, you want to create a static route instead of an existing dynamic route.

**NOTE:** If you use this command, you should also use the [clear ip igmp group](#) command to clear IGMP group membership records.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `clear ip mroute {*|<ipv4-group-address>  
[<ipv4-source-address>]} [pim sparse-mode]`

**Syntax (VRF-lite)** `clear ip mroute [vrf <vrf-name>] {*|<ipv4-group-address>  
[<ipv4-source-address>]} [pim sparse-mode]`

| Parameter             | Description                                                            |
|-----------------------|------------------------------------------------------------------------|
| vrf                   | Applies the command to the specified VRF instance.                     |
| <vrf-name>            | The VRF instance name.                                                 |
| *                     | Deletes all dynamically-learned IPv4 multicast routes.                 |
| <ipv4-group-address>  | Group IPv4 address, in dotted decimal notation in the format A.B.C.D.  |
| <ipv4-source-address> | Source IPv4 address, in dotted decimal notation in the format A.B.C.D. |
| pim sparse-mode       | Clear specified IPv4 multicast route(s) for PIM Sparse Mode only.      |

**Mode** Privileged Exec

**Usage notes** When this command is used, the Multicast Routing Information Base (MRIB) clears the specified dynamic IPv4 multicast route entries in its IPv4 multicast route table, and deletes the entries from the multicast forwarder. The MRIB also sends a “clear” message to the relevant multicast protocols.

This command does not delete static routes from the routing table or the configuration. To delete static routes, use the **no** parameter of the command [ip multicast route](#), or the command [clear ip multicast route](#).

**Examples** To delete a specific dynamic route (from 192.168.3.3 for the group 225.1.1.1), use the command:

```
awplus# clear ip mroute 225.1.1.1 192.168.3.3
```

To delete all dynamic multicast routes, use the command:

```
awplus# clear ip mroute *
```

**Related commands**   [clear ip multicast route](#)  
                          [ip multicast route](#)  
                          [show ip mroute](#)

**Command changes**   Version 5.4.7-1.1: VRF-lite support added SBx8100.  
                          Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# clear ip mroute statistics

**Overview** Use this command to delete multicast route statistics entries from the IP multicast routing table.

**Syntax** `clear ip mroute statistics {*|<ipv4-group-addr> [<ipv4-source-addr>]}`

**Syntax (VRF-lite)** `clear ip mroute [vrf <vrf-name>] statistics {*|<ipv4-group-address> [<ipv4-source-address>]}`

| Parameter             | Description                                                            |
|-----------------------|------------------------------------------------------------------------|
| vrf                   | Applies the command to the specified VRF instance.                     |
| <vrf-name>            | The VRF instance name.                                                 |
| *                     | Deletes all dynamically-learned IPv4 multicast routes.                 |
| <ipv4-group-address>  | Group IPv4 address, in dotted decimal notation in the format A.B.C.D.  |
| <ipv4-source-address> | Source IPv4 address, in dotted decimal notation in the format A.B.C.D. |

**Mode** Privileged Exec

**Example** `awplus# clear ip mroute statistics 225.1.1.2 192.168.4.4`  
`awplus# clear ip mroute statistics *`

# clear ip multicast route

**Overview** Use this command to delete all user-added static IPv4 multicast routes.

**Syntax** `clear ip multicast route *`

| Parameter | Description                               |
|-----------|-------------------------------------------|
| *         | Deletes all static IPv4 multicast routes. |

**Mode** Privileged Exec

**Usage notes** This command deletes all static IPv4 multicast routes from the routing table. To delete a single static route, use the **no** parameter of the command [ip multicast route](#). To delete dynamic routes, use the command [clear ip mroute](#).

**Example** To delete all static IPv4 multicast route entries, use the command:

```
awplus# clear ip multicast route *
```

**Related commands**

- [clear ip mroute](#)
- [ip multicast route](#)
- [show ip mroute](#)

# clear ipv6 mroute

**Overview** Use this command to delete one or more dynamically-added route entries from the IPv6 multicast routing table.

You need to do this if, for example, you want to create a static route instead of an existing dynamic route.

**NOTE:** If you use this command, you should also use the [clear ipv6 mld group](#) command to clear MLD group membership records.

**Syntax** `clear ipv6 mroute {*|<ipv6-group-address>  
[<ipv6-source-address>]} [pim sparse-mode]`

| Parameter             | Description                                                          |
|-----------------------|----------------------------------------------------------------------|
| *                     | Deletes all dynamically-learned IPv6 multicast routes.               |
| <ipv6-group-address>  | Group IPv6 address, in hexadecimal notation in the format X.X::X.X.  |
| <ipv6-source-address> | Source IPv6 address, in hexadecimal notation in the format X.X::X.X. |
| pim sparse-mode       | Clear specified IPv6 multicast route(s) for PIM Sparse Mode only.    |

**Mode** Privileged Exec

**Usage notes** When this command is used, the Multicast Routing Information Base (MRIB) clears the specified dynamic IPv6 multicast route entries in its IPv6 multicast route table, and deletes the entries from the multicast forwarder. The MRIB also sends a “clear” message to the relevant multicast protocols.

This command does not delete static routes from the routing table or the configuration. To delete static routes, use the **no** parameter of the command [ipv6 multicast route](#).

**Examples** To delete a specific dynamic route (from ff08::1 for the group 2001::2), use the command:

```
awplus# clear ipv6 mroute 2001::2 ff08::1
```

To delete all dynamic multicast routes, use the command:

```
awplus# clear ipv6 mroute *
```

**Related commands** [ipv6 multicast route](#)  
[show ipv6 mroute](#)

# clear ipv6 mroute statistics

**Overview** Use this command to delete multicast route statistics entries from the IPv6 multicast routing table.

**Syntax** `clear ipv6 mroute statistics {*|<ipv6-group-address> [<ipv6-source-address>]}`

| Parameter          | Description                                                          |
|--------------------|----------------------------------------------------------------------|
| *                  | All multicast route entries.                                         |
| <ipv6-group-addr>  | Group IPv6 address, in hexadecimal notation in the format X.X::X.X.  |
| <ipv6-source-addr> | Source IPv6 address, in hexadecimal notation in the format X.X::X.X. |

**Mode** Privileged Exec

**Examples** `awplus# clear ipv6 mroute statistics 2001::2 ff08::1`  
`awplus# clear ipv6 mroute statistics *`

# ipv6 multicast forward-slow-path-packet

**Overview** Use this command to enable multicast packets to be forwarded to the CPU. Enabling this command will ensure that the Layer 3 MTU is set correctly for each IP multicast group and will apply the value of the smallest MTU among the outgoing interfaces for the multicast group.

It will also ensure that a received packet that is larger than the MTU value will result in the generation of an ICMP Too Big message.

Use the **no** variant of this command to disable the above functionality.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ipv6 multicast forward-slow-path-packet`  
`no ipv6 multicast forward-slow-path-packet`

**Syntax (VRF-lite)** `ipv6 multicast [vrf <vrf-name>] forward-slow-path-packet`  
`no ipv6 multicast [vrf <vrf-name>] forward-slow-path-packet`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name                              |

**Default** Disabled.

**Mode** Privileged Exec

**Example** To enable the ipv6 multicast forward-slow-path-packet function, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast forward-slow-path-packet
```

**Related commands** [show ipv6 forwarding](#)

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# debug nsm

**Overview** This command specifies a set of debug options for use by Allied Telesis authorized service personnel only.

Use the **no** variant of this command to remove debug options.

**Syntax** `debug nsm [all|events|ha|kernel]`  
`no debug nsm [all|events|ha|kernel]`

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| all       | Enables all the nsm debugging options               |
| events    | Enables the nsm events debugging options            |
| ha        | Enables the nsm high availability debugging options |
| kernel    | Enables the nsm kernel debugging options            |

**Mode** Global Configuration, Privileged Exec

**Usage notes** This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

**Related commands** [show debugging nsm mcast](#)

**Command changes** Version 5.4.7-2.1 command added.

# debug nsm mcast

**Overview** Use this command to debug IPv4 events in the Multicast Routing Information Base (MRIB).

This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `debug nsm mcast`  
`{all|fib-msg|mrt|mtrace|mtrace-detail|register|stats|vif}`

**Syntax (VRF-lite)** `debug nsm mcast [vrf <vrf-name>]`  
`{all|fib-msg|mrt|mtrace|mtrace-detail|register|stats|vif}`

| Parameter     | Description                                        |
|---------------|----------------------------------------------------|
| vrf           | Applies the command to the specified VRF instance. |
| <vrf-name>    | The VRF instance name.                             |
| all           | All IPv4 multicast debugging.                      |
| fib-msg       | Forwarding Information Base (FIB) messages.        |
| mrt           | Multicast routes.                                  |
| mtrace        | Multicast traceroute.                              |
| mtrace-detail | Multicast traceroute detailed debugging.           |
| register      | Multicast PIM register messages.                   |
| stats         | Multicast statistics.                              |
| vif           | Multicast interface.                               |

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging of all multicast route events, use the commands:

```
awplus# configure terminal
awplus(config)# debug nsm mcast all
```

To enable debugging of PIM register entries, use the commands:

```
awplus# configure terminal
awplus(config)# debug nsm mcast register
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# debug nsm mcast6

**Overview** Use this command to debug IPv6 events in the Multicast Routing Information Base (MRIB).

This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

**Syntax** `debug nsm mcast6 {all|fib-msg|mrt|register|stats|vif}`  
`no debug nsm mcast6 {all|fib-msg|mrt|register|stats|vif}`

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| all       | All IPv6 multicast route debugging.         |
| fib-msg   | Forwarding Information Base (FIB) messages. |
| mrt       | Multicast routes.                           |
| register  | Multicast PIM register messages.            |
| stats     | Multicast statistics.                       |
| vif       | Multicast interfaces.                       |

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging of all multicast route events, use the commands:

```
awplus# configure terminal
awplus(config)# debug nsm mcast6 all
```

To enable debugging of PIM register entries, use the commands:

```
awplus# configure terminal
awplus(config)# debug nsm mcast6 register
```

# ip mroute

**Overview** Use this command to inform multicast of the RPF (Reverse Path Forwarding) route to a given IPv4 multicast source.

Use the **no** variant of this command to delete a route to an IPv4 multicast source.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ip mroute <ipv4-source-address/mask-length>  
[bgp|ospf|rip|static] <rpf-address> [<admin-distance>]`  
`no ip mroute <ipv4-source-address/mask-length>  
[bgp|ospf|rip|static]`

**Syntax (VRF-lite)** `ip mroute [vrf <vrf-name>] <ipv4-source-address/mask-length>  
[bgp|ospf|rip|static] <rpf-address> [<admin-distance>]`  
`no ip mroute [vrf <vrf-name>] <ipv4-source-address/mask-length>  
[bgp|ospf|rip|static]`

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vrf                                   | Applies the command to the specified VRF instance.                                                                                                                                                                                                                                                                                             |
| <vrf-name>                            | The name of the VRF instance.                                                                                                                                                                                                                                                                                                                  |
| <ipv4-source-address/<br>mask-length> | A multicast source IPv4 address and mask length, in dotted decimal notation in the format A.B.C.D/M.                                                                                                                                                                                                                                           |
| bgp                                   | BGP unicast routing protocol.                                                                                                                                                                                                                                                                                                                  |
| ospf                                  | OSPF unicast routing protocol.                                                                                                                                                                                                                                                                                                                 |
| rip                                   | RIP unicast routing protocol.                                                                                                                                                                                                                                                                                                                  |
| static                                | Specifies a static route.                                                                                                                                                                                                                                                                                                                      |
| <rpf-address>                         | A.B.C.D<br>The closest known address on the multicast route back to the specified source. This host IPv4 address can be within a directly connected subnet or within a remote subnet. In the case that the address is in a remote subnet, a lookup is done from the unicast route table to find the next hop address on the path to this host. |
| <admin-distance>                      | The administrative distance. Use this to determine whether the RPF lookup selects the unicast or multicast route. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence. The default is 0 and the range available is 0-255.               |

**Mode** Global Configuration

**Usage notes** Typically, when a Layer 3 multicast routing protocol is determining the RPF (Reverse Path Forwarding) interface for the path to an IPv4 multicast source, it uses the unicast route table to find the best path to the source. However, in some networks a deliberate choice is made to send multicast via different paths to those used for unicast. In this case, the interface via which a multicast stream from a given source enters a router may not be the same as the interface that connects to the best unicast route to that source.

This command enables the user to statically configure the device with “multicast routes” back to given sources. When performing the RPF check on a stream from a given IPv4 source, the multicast routing protocol will look at these static entries as well as looking into the unicast routing table. The route with the lowest administrative distance - whether a static “multicast route” or a route from the unicast route table - will be chosen as the RPF route to the source.

Note that in this context the term “multicast route” does not imply a route via which the current router will forward multicast; instead it refers to the route the multicast will have traversed in order to arrive at the current router.

**Examples** The following example creates a static multicast IPv4 route back to the sources in the 10.10.3.0/24 subnet. The multicast route is via the host 192.168.2.3, and has an administrative distance of 2:

```
awplus# configure terminal
awplus(config)# ip mroute 10.10.3.0/24 static 2 192.168.2.3 2
```

The following example creates a static multicast IPv4 route back to the sources in the 192.168.3.0/24 subnet. The multicast route is via the host 10.10.10.50. The administrative distance on this route has the default value of 0:

```
awplus# configure terminal
awplus(config)# ip mroute 192.168.3.0/24 10.10.10.50
```

**Validation  
Commands** [clear ip mroute](#)  
[show ip mroute](#)  
[show ip rpf](#)

**Command  
changes** Version 5.4.6-2.1: VRF-lite support added.

# ip multicast allow-register-fragments

**Overview** Use this command to allow PIM to register fragmented packets. It is disabled by default.

Use the **no** variant of this command to stop PIM from registering fragmented packets.

**Syntax** `ip multicast allow-register-fragments`  
`no ip multicast allow-register-fragments`

**Default** This command is disabled by default

**Mode** Global Configuration

**Usage notes** Most multicast streams are not fragmented, and therefore this command is unnecessary. By default, when IP multicast packets are fragmented, the switch attempts to reassemble them before registering the packets. This is necessary for tasks such as network address translation, or a firewall.

However, reassembly may be difficult for switches where the CPU cannot handle a large amount of traffic. In that situation, with the CPU failing to reassemble the fragmented packets, there can be a delay in forwarding multicast streams.

We do not recommend enabling this feature if a firewall or network address translation is being used. This feature should only be enabled if multicast data is fragmented and the data rate is too high for the CPU to manage reassembly.

**Example** To allow PIM to register fragmented packets, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast allow-register-fragments
```

# ip multicast forward-first-packet

**Overview** Use this command to enable multicast to forward the first multicast packets coming to the device.

Use the **no** variant of this command to disable this feature.

**Syntax** `ip multicast forward-first-packet`  
`no ip multicast forward-first-packet`

**Default** By default, this feature is disabled.

**Mode** Global Configuration

**Usage notes** If this command is enabled, the device will forward the first packets in a multicast stream that create the multicast route, possibly causing degradation in the quality of the multicast stream, such as the pixelation of video and audio data.

**NOTE:** *If you use this command, ensure that the [ip igmp snooping](#) command is enabled, the default setting, otherwise the device will not process the first packets of the multicast stream correctly.*

The device will forward the first multicast packets to all interfaces which are on the same VLAN as those which asked for this multicast group.

**Examples** To enable the forwarding of the first multicast packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast forward-first-packet
```

To disable the forwarding of the first multicast packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast forward-first-packet
```

# ip multicast handle-igmp-immediately

**Overview** Use this command to allow traffic to be switched as soon as an IGMP report is received.

Use the **no** variant of this command to revert to the default setting.

**Syntax** `ip multicast handle-igmp-immediately`  
`no ip multicast handle-igmp-immediately`

**Default** Turned off. This means that traffic will be switched after either a 1 second delay or if the IGMP buffer fills with 250 packets.

**Mode** Global Configuration

**Example** To turn on this feature, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast handle-igmp-immediately
```

**Related commands** [show running-config](#)

**Command changes** Supported since software version 5.4.9-2.0

# ip multicast route

**Overview** Use this command to add an IPv4 static multicast route for a specific multicast source and group IPv4 address to the multicast Routing Information Base (RIB). This IPv4 multicast route is used to forward multicast traffic from a specific source and group ingressing on an upstream interface to a single or range of downstream interfaces.

Use the **no** variant of this command to either remove an IPv4 static multicast route set with this command or to remove a specific downstream interface from an IPv4 static multicast route for a specific multicast source and group IPv4 address.

**Syntax**

```
ip multicast route <ipv4-source-addr> <ipv4-group-addr>
<upstream-interface> [<downstream-interface>]

no ip multicast route <ipv4-source-addr> <ipv4-group-addr>
[<upstream-interface> <downstream-interface>]
```

| Parameter              | Description                                                                          |
|------------------------|--------------------------------------------------------------------------------------|
| <ipv4-source-addr>     | Source IPv4 address, in dotted decimal notation in the format A.B.C.D.               |
| <ipv4-group-addr>      | Group IPv4 address, in dotted decimal notation in the format A.B.C.D.                |
| <upstream-interface>   | Upstream interface on which the multicast packets ingress.                           |
| <downstream-interface> | Downstream interface or range of interfaces to which the multicast packets are sent. |

**Default** By default, this feature is disabled.

**Mode** Global Configuration

**Usage notes** Only one multicast route entry per IPv4 address and multicast group can be specified. Therefore, if one entry for a static multicast route is configured, PIM will not be able to update this multicast route in any way.

If a dynamic multicast route exists you cannot create a static multicast route with the same source IPv4 address, group IPv4 address, upstream interface and downstream interfaces. An error message is displayed and logged. To add a new static multicast route, either wait for the dynamic multicast route to timeout or clear the dynamic multicast route with the [clear ip mroute](#) command.

To update an existing static multicast route entry with more or a new set of downstream interfaces, you must first remove the existing static multicast route and then add the new static multicast route with all downstream interfaces specified. If you attempt to update an existing static multicast route entry with an additional interface or interfaces, an error message is displayed and logged.

To create a blackhole or null route where packets from a specified source and group address coming from an upstream interface are dropped rather than

forwarded, do not specify the optional *<downstream-interface>* parameter when entering this command.

To remove a specific downstream interface from an existing static multicast route entry, specify the interface you want to remove with the *<downstream-interface>* parameter when entering the **no** variant of this command.

**Examples** To create a static multicast route for the multicast source IPv4 address 2.2.2.2 and group IPv4 address 224.9.10.11, specifying the upstream VLAN interface as vlan10 and the downstream VLAN interface as vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
vlan20
```

To create a blackhole route for the multicast source IPv4 address 2.2.2.2 and group IPv4 address 224.9.10.11, specifying the upstream VLAN interface as vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
```

To create an IPv4 static multicast route for the multicast source IPv4 address 2.2.2.2 and group IP address 224.9.10.11, specifying the upstream VLAN interface as vlan10 and the downstream VLAN range as vlan20-25, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
vlan20-25
```

To remove the downstream VLAN 23 from the IPv4 static multicast route created with the above command, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast route 2.2.2.2 224.9.10.11
vlan10 vlan23
```

To delete an IPv4 static multicast route for the multicast source IP address 2.2.2.2 and group IP address 224.9.10.11, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast route 2.2.2.2 224.9.10.11
```

**Related commands**

- [clear ip mroute](#)
- [clear ip multicast route](#)
- [show ip mroute](#)

# ip multicast route-limit

**Overview** Use this command to limit the number of multicast routes that can be added to an IPv4 multicast routing table.

Use the **no** variant of this command to return the IPv4 route limit to the default.

**Syntax** `ip multicast route-limit <limit> [<threshold>]`  
`no ip multicast route-limit`

**Syntax (VRF-lite)** `ip multicast [vrf <vrf-name>] route-limit <limit> [<threshold>]`  
`no ip multicast [vrf <vrf-name>] route-limit`

| Parameter   | Description                                                                                                                        |
|-------------|------------------------------------------------------------------------------------------------------------------------------------|
| vrf         | Applies the command to the specified VRF instance.                                                                                 |
| <vrf-name>  | The VRF instance name.                                                                                                             |
| <limit>     | <1-2147483647> Number of routes.                                                                                                   |
| <threshold> | <1-2147483647> Threshold above which to generate a warning message. The mroute warning threshold must not exceed the mroute limit. |

**Default** The default limit and threshold value is 2147483647.

**Mode** Global Configuration

**Usage notes** This command limits the number of multicast IPv4 routes (mroutes) that can be added to a router, and generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded, and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

When VRF-lite is configured you can apply this command to a specific VRF instance. If you don't specify a specific VRF instance the command is applied to the global VRF. Note there is a hardware limit for all VRFs combined and it is possible for one VRF to consume all these routes and therefore other VRFs will not be able to create additional routes. To prevent this situation from occurring, consider the multicast route limit per VRF carefully.

**Examples** `awplus# configure terminal`  
`awplus(config)# ip multicast route-limit 34 24`  
`awplus# configure terminal`  
`awplus(config)# no ip multicast route-limit`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip multicast wrong-vif-suppression

**Overview** Use this command to prevent unwanted multicast packets received on an unexpected interface being trapped to the CPU.

Use the no variant of this command to disable wrong VIF suppression.

**Syntax** `ip ip multicast wrong-vif-suppression`  
`no ip multicast wrong-vif-suppression`

**Default** By default, this feature is disabled.

**Mode** Global Configuration

**Usage notes** Use this command if there is excessive CPU load and multicast traffic is enabled. To confirm that VIF messages are being sent to the CPU use the [debug nsm mcast6](#) command.

**Examples** To enable the suppression of wrong VIF packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast wrong-vif-suppression
```

To disable the suppression of wrong VIF packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast wrong-vif-suppression
```

# ip multicast-routing

**Overview** Use this command to turn on/off IPv4 multicast routing on the router; when turned off the device does not perform multicast functions.

Use the **no** variant of this command to disable IPv4 multicast routing after enabling it. Note the default stated below.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ip multicast-routing`  
`no ip multicast-routing`

**Syntax (VRF-lite)** `ip multicast-routing [vrf <vrf-name>]`  
`no ip multicast-routing [vrf <vrf-name>]`

| Parameter                     | Description                                        |
|-------------------------------|----------------------------------------------------|
| <code>vrf</code>              | Applies the command to the specified VRF instance. |
| <code>&lt;vrf-name&gt;</code> | The VRF instance name                              |

**Default** By default, IPv4 multicast routing is off.

**Mode** Global Configuration

**Usage notes** When the **no** variant of this command is used, the Multicast Routing Information Base (MRIB) cleans up Multicast Routing Tables (MRT), stops IGMP operation, and stops relaying multicast forwarder events to multicast protocols.

When multicast routing is enabled, the MRIB starts processing any MRT addition/deletion requests, and any multicast forwarding events.

You must enable multicast routing before issuing other multicast commands.

**Example** `awplus# configure terminal`  
`awplus(config)# ip multicast-routing`

**Validation Commands** `show running-config`

**Command changes** Version 5.4.7-1.1: VRF-lite support added for SBx8100.  
Version 5.4.8-1.1: VRF-lite support added for x930, SBx908 GEN2.

# ip multicast-routing ssm-only-hw

**Overview** Use this command to suppress the creation of (\*,G) entries in hardware, but not suppress (S,G) entries. This command prevents a large number of (\*,G) entries from being created in hardware, which improves the performance when there are many multicast groups with many downstream interfaces. (\*,G) entries will still be created as needed in the CPU.

However, using this command may cause multicast data to be briefly flooded on the incoming interface, if it comes from interfaces other than the “correct” incoming interface. The “correct” incoming interface is determined by Unicast Reverse Path Forwarding (uRPF).

Use the **no** variant of this command to return to creating both (\*,G) and (S,G) entries in hardware.

**Syntax** `ip multicast-routing ssm-only-hw`  
`no ip multicast-routing ssm-only-hw`

**Syntax (VRF-lite)** `ip multicast-routing [vrf <vrf-name>] ssm-only-hw`  
`no ip multicast-routing [vrf <vrf-name>] ssm-only-hw`

| Parameter                     | Description                                        |
|-------------------------------|----------------------------------------------------|
| <code>vrf</code>              | Applies the command to the specified VRF instance. |
| <code>&lt;vrf-name&gt;</code> | The VRF instance name                              |

**Default** Disabled

**Mode** Global Configuration

**Example** To suppress the creation of (\*,G) entries in hardware, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast-routing ssm-only-hw
```

**Related commands** [ip multicast-routing](#)

**Command changes** Version 5.4.8-1.1: command added

# ipv6 mroute

**Overview** Use this command to inform multicast of the RPF (Reverse Path Forwarding) route to a given IPv6 multicast source.

Use the **no** variant of this command to delete a route to an IPv6 multicast source.

**Syntax** `ipv6 mroute <ipv6-source-address/mask-length>  
[<rpf-interface>] [<rpf-address>] [rip|static]  
[<admin-distance>]`

`no ipv6 mroute <ipv6-source-address/mask-length> [rip|static]`

| Parameter                                            | Description                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-source-address/mask-length&gt;</code> | A multicast source IPv6 address and mask length, in hexadecimal notation in the format X.X::X.X/M.                                                                                                                                                                                                                                                  |
| <code>rip</code>                                     | RIPng IPv6 unicast routing protocol.                                                                                                                                                                                                                                                                                                                |
| <code>static</code>                                  | Specifies a static route.                                                                                                                                                                                                                                                                                                                           |
| <code>&lt;rpf-interface&gt;</code>                   | The RPF interface or the pseudo-interface <b>null</b> .                                                                                                                                                                                                                                                                                             |
| <code>&lt;rpf-address&gt;</code>                     | X.X::X:X<br>The closest known address on the IPv6 multicast route back to the specified source. This host IPv6 address can be within a directly connected subnet or within a remote subnet. In the case that the address is in a remote subnet, a lookup is done from the unicast route table to find the nexthop address on the path to this host. |
| <code>&lt;admin-distance&gt;</code>                  | The administrative distance. Use this to determine whether the RPF lookup selects the unicast or multicast route. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence. The default is 0 and the range available is 0-255.                    |

**Mode** Global Configuration

**Usage notes** Typically, when a Layer 3 multicast routing protocol is determining the RPF (Reverse Path Forwarding) interface for the path to a multicast source, it uses the unicast IPv6 route table to find the best path to the source. However, in some networks a deliberate choice is made to send multicast via different paths to those used for unicast. In this case, the interface via which a multicast stream from a given source enters a router may not be the same as the interface that connects to the best unicast route to that source.

This command enables the user to statically configure the switch with "multicast routes" back to given sources. When performing the RPF check on a stream from a given IPv6 source, the multicast routing protocol will look at these static entries as well as looking into the unicast routing table. The route with the lowest

administrative distance - whether a static “multicast route” or a route from the unicast route table - will be chosen as the RPF route to the source.

Note that in this context the term “multicast route” does not imply a route via which the current router will forward multicast; instead it refers to the route the multicast will have traversed in order to arrive at the current router.

**Examples** The following example creates a static multicast route back to the sources in the 2001::1/64 subnet. The multicast route is via the host 2002::2, and has an administrative distance of 2:

```
awplus# configure terminal
awplus(config)# ipv6 mroute 2001::1/64 static 2 2002::2
```

The following example creates a static multicast route back to the sources in the 2002::2/64 subnet. The multicast route is via the host 2001::1. The administrative distance on this route has the default value of 0:

```
awplus# configure terminal
awplus(config)# ipv6 mroute 2002::2/64 2001::1
```

**Validation  
Commands**

- clear ipv6 mroute
- show ipv6 mroute
- show ipv6 mroute

# ipv6 multicast route

**Overview** Use this command to add an IPv6 static multicast route for a specific multicast source and group IPv6 address to the multicast Routing Information Base (RIB). This IPv6 multicast route is used to forward IPv6 multicast traffic from a specific source and group ingressing on an upstream interface to a single or range of downstream interfaces.

See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to either remove an IPv6 static multicast route set with this command or to remove a specific downstream interface from an IPv6 static multicast route for a specific IPv6 multicast source and group address.

**Syntax** `ipv6 multicast route <ipv6-source-addr> <ipv6-group-addr>  
<upstream-interface> [<downstream-interface>]`  
`no ipv6 multicast route <ipv6-source-addr> <ipv6-group-addr>  
[<upstream-interface> <downstream-interface>]`

| Parameter                                 | Description                                                                          |
|-------------------------------------------|--------------------------------------------------------------------------------------|
| <code>&lt;ipv6-source-addr&gt;</code>     | Source IPv6 address, in dotted decimal notation in the format X.X::X.X.              |
| <code>&lt;ipv6-group-addr&gt;</code>      | Group IP address, in dotted decimal notation in the format X.X::X.X.                 |
| <code>&lt;upstream-interface&gt;</code>   | Upstream interface on which the multicast packets ingress.                           |
| <code>&lt;downstream-interface&gt;</code> | Downstream interface or range of interfaces to which the multicast packets are sent. |

**Default** By default, no static routes exist.

**Mode** Global Configuration

**Usage notes** Only one multicast route entry per IPv6 address and multicast group can be specified. Therefore, if one entry for an IPv6 static multicast route is configured, PIM will not be able to update this multicast route in any way.

If a dynamic multicast route exists, you cannot create a static multicast route with the same source IPv6 address and group IPv6 address. An error message is displayed and logged. To add a new static multicast route, either wait for the dynamic multicast route to time out or clear the dynamic multicast route with the [clear ipv6 mroute](#) command.

To update an existing IPv6 static multicast route entry with new or additional downstream interfaces, you must first remove the existing static multicast route and then add the new static multicast route with all downstream interfaces

specified. If you attempt to update an existing static multicast route entry with an additional interface or interfaces an error message is displayed and logged.

To create a blackhole or null route where packets from a specified source and group address coming from an upstream interface are dropped rather than forwarded, do not specify the optional *<downstream-interface>* parameter when entering this command.

To remove a specific downstream interface from an existing static multicast route entry, specify the interface you want to remove with the *<downstream-interface>* parameter when entering the **no** variant of this command.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

For example, if port1.0.1 and port1.0.8 are ports on an EPSR data VLAN vlan101, which is the destination for a static IPv6 multicast route, then configure both ports as multicast router (mrouter) ports as shown in the example commands listed below:

```
awplus>enable
awplus#configure terminal
awplus(config)#interface vlan101
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.1
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.8
```

See [ipv6 mld snooping mrouter](#) for a command description and command examples.

**Examples** To create an IPv6 static multicast route for the multicast source IPv6 address 2001::1 and group IPv6 address ff08::1, specifying the upstream VLAN interface as vlan10 and the downstream VLAN interface as vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
vlan20
```

To create a blackhole route for the IPv6 multicast source IP address 2001::1 and group IP address ff08::1, specifying the upstream VLAN interface as vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
```

To create an IPv6 static multicast route for the multicast source IPv6 address 2001::1 and group IPv6 address ff08::1, specifying the upstream VLAN interface as vlan10 and the downstream VLAN range as vlan20-25, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
vlan20-25
```

To remove the downstream VLAN 23 from the IPv6 static multicast route created with the above command, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route 2001::1 ff08::1 vlan10
vlan23
```

To delete an IPv6 static multicast route for the multicast source IPv6 address 2001::1 and group IPv6 address ff08::1, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route 2001::1 ff08::1
```

# ipv6 multicast route-limit

**Overview** Use this command to limit the number of multicast routes that can be added to an IPv6 multicast routing table.

Use the **no** variant of this command to return the IPv6 route limit to the default.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ipv6 multicast route-limit <limit> [<threshold>]`  
`no ipv6 multicast route-limit`

**Syntax (VRF-lite)** `ipv6 multicast [vrf <vrf-name>] route-limit <limit> [<threshold>]`  
`no ipv6 multicast [vrf <vrf-name>] route-limit`

| Parameter   | Description                                                                                                                        |
|-------------|------------------------------------------------------------------------------------------------------------------------------------|
| <limit>     | <1-2147483647> Number of routes.                                                                                                   |
| <threshold> | <1-2147483647> Threshold above which to generate a warning message. The mroute warning threshold must not exceed the mroute limit. |
| vrf         | Applies the command to the specified VRF instance.                                                                                 |
| <vrf-name>  | The VRF instance name                                                                                                              |

**Default** The default limit and threshold value is 2147483647.

**Mode** Global Configuration

**Usage notes** This command limits the number of multicast IPv6 routes (mroutes) that can be added to a router, and generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded, and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

**Examples** To change the limit to 34 routes and the warning threshold to 24 routes, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route-limit 34 24
```

To return to the default limits, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route-limit
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 multicast-routing

**Overview** Use this command to turn on/off IPv6 multicast routing on the router; when turned off the device does not perform multicast functions.

Use the **no** variant of this command to disable IPv6 multicast routing after enabling it. Note the default stated below.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ipv6 multicast-routing`  
`no ipv6 multicast-routing`

**Syntax (VRF-lite)** `ipv6 multicast-routing [vrf <vrf-name>]`  
`no ipv6 multicast-routing [vrf <vrf-name>]`

| Parameter                     | Description                                        |
|-------------------------------|----------------------------------------------------|
| <code>vrf</code>              | Applies the command to the specified VRF instance. |
| <code>&lt;vrf-name&gt;</code> | The VRF instance name                              |

**Default** Off

**Mode** Global Configuration

**Usage** When the **no** variant of this command is used, the Multicast Routing Information Base (MRIB) cleans up Multicast Routing Tables (MRT), and stops relaying multicast forwarder events to multicast protocols.

When multicast routing is enabled, the MRIB starts processing any MRT addition/deletion requests, and any multicast forwarding events.

You must enable multicast routing before issuing other multicast commands.

**Examples** To enable multicast routing, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast-routing
```

To disable multicast routing again, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast-routing
```

**Validation Commands** `show running-config`

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# multicast

**Overview** Use this command to enable a device port to route multicast packets that ingress the port.

Use the **no** variant of this command to stop the device port from routing multicast packets that ingress the port. Note that this does not affect Layer 2 forwarding of multicast packets. If you enter **no multicast** on a port, multicast packets received on that port will not be forwarded to other VLANs, but ports in the same VLANs as the receiving port will still receive the multicast packets.

**CAUTION:** *We do not recommend disabling multicast routing in a live network. Some non-multicast protocols use multicast packets and will not function correctly if you disable it.*

**Syntax** multicast  
no multicast

**Default** By default, all device ports route multicast packets.

**Mode** Interface Configuration

**Examples** To disable routing of multicast packets on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no multicast
```

To re-enable routing of multicast packets on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# multicast
```

**Validation  
Commands** [show running-config](#)

# platform l2mc-overlap

**Overview** Use this command to enable checking for overlapping (shared) multicast entries, so that shared entries are not deleted if they are still in use.

An overlap exists if the resulting MAC address is the same for two different multicast groups. For example, 224.1.1.1 and 239.1.1.1 will result in a multicast overlap—packets destined for 239.1.1.1 will also be sent to 224.1.1.1.

Use the **no** version of this command to disable checking for overlapping entries before deletion.

**Syntax** `platform l2mc-overlap`  
`no platform l2mc-overlap`

**Mode** Global Configuration

**Default** Disabled

**Usage notes** When overlap handling is on, group entries will not be deleted if a multicast overlap exists. However, this may have the unexpected behavior of flooding multicast packets to ports which have not joined the group. If this is an issue, either turn off the command or redesign the network to ensure no multicast groups overlap.

This command is disabled by default. We recommend you enable it if you have multicast packets with a TTL of 1.

**Example** To prevent the deletion of overlapping (shared) Layer 2 multicast entries, use the command:

```
awplus# configure terminal
awplus(config)# platform l2mc-overlap
```

**Related commands** [show platform](#)

**Command changes** Version 5.5.1-0.1: Default changed to enabled

Version 5.5.1-1.2: Command added to SBx908 GEN2 and x950 Series. Note that it is disabled by default on these switches.

# platform multicast-ratelimit

**Overview** Use this command to set the maximum number of multicast packets to be forwarded to the CPU (in packets per second). Setting the value to zero disables rate limiting.

This command should be used with care. Increasing or removing the limit could make the device less responsive under heavy multicast load.

Use the **no** variant of this command to return the limit to its default.

**Syntax** `platform multicast-ratelimit <0-1000>`  
`no platform multicast-ratelimit`

**Default** 100 packets per second (pps)

**Mode** Global Configuration

**Usage notes** If you find that the CPU load on your device from multicast traffic is higher than desired, reducing this rate may reduce the CPU load.

**Example** To set the rate to 30pps, use the commands:

```
awplus# configure terminal
awplus(config)# platform multicast-ratelimit 30
```

**Command changes** Version 5.4.8-1.1: default changed to 100pps on SBx908 GEN2, SBx8100, and x930 Series switches.

# platform stop-unreg-mc-flooding

**Overview** If a multicast stream is arriving at a network device, and that network device has received no IGMP reports that request the receipt of the stream, then that stream is referred to as "unregistered". IGMP snooping actively prevents the flooding of unregistered streams to all ports in the VLAN on which the stream is received. However, there are brief moments at which this prevention is not in operation, and an unregistered stream may be briefly flooded. This command stops this flooding during even those brief periods when IGMP snooping is not explicitly preventing the flooding.

Use the **no** variant of this command to revert to default behavior and disable this feature.

**NOTE:** *This command should not be used within any IPv6 networks. IPv6 neighbor discovery operation is inhibited by this feature.*

This command does not affect the flooding of Local Network Control Block IPv4 multicast packets in the address range 224.0.0.1 to 224.0.0.255 (224.0.0/24). Such packets will continue to be uninterruptedly flooded, as they need to be.

**Syntax** `platform stop-unreg-mc-flooding`  
`no platform stop-unreg-mc-flooding`

**Default** This feature is disabled by default.

**Mode** Global Configuration

**Usage notes** This command stops the periodic flooding of unknown or unregistered multicast packets when the Group Membership interval timer expires and there are no subscribers to a multicast group. If there is multicast traffic in a VLAN without subscribers, multicast traffic temporarily floods out of the VLAN when the Group Membership interval timer expires, which happens when the switch does not get replies from Group Membership queries.

This command also stops the initial flood of multicast packets that happens when a new multicast source starts to send traffic. This flooding lasts until snooping realises that this the multicast group is arriving at the switch, and puts an entry into hardware to prevent it from being flooded.

This command is useful in networks where low-performance devices are attached. The operation of such devices can be impaired by them receiving unnecessary streams of traffic. For example, in sites where IP cameras are in use, the flooding of video streams to a whole VLAN can send enough traffic to the cameras to cause interruption of their video streaming.

Do not use this command in IPv6 networks. The following console message is displayed after entering this command to warn you of this:

```
% WARNING: IPv6 will not work with this setting enabled
% Please consult the documentation for more information
```

**Examples** To enable this feature and stop multicast packet flooding, use the following commands:

```
awplus# configure terminal
awplus(config)# platform stop-unreg-mc-flooding
```

To disable this feature and allow multicast packet flooding, use the following commands:

```
awplus# configure terminal
awplus(config)# no platform stop-unreg-mc-flooding
```

**Related commands** [show platform](#)  
[show running-config](#)

# show debugging nsm mcast

**Overview** Use this command to show the status of the NSM multicast debugging.

**Syntax** show debugging nsm mcast

**Syntax (VRF-lite)** show debugging nsm mcast [<vrf-name>]

| Parameter  | Description       |
|------------|-------------------|
| <vrf-name> | VRF instance name |

**Mode** Privileged Exec

**Usage notes** This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

**Example** To show debugging for NSM multicast, use the following command:

```
awplus# show debug nsm mcast
```

**Output** Figure 37-1: Example output from **show debug nsm mcast**

```
awplus# show debugging nsm mcast
Debugging status:
 NSM multicast vif debugging is on
 NSM multicast route debugging is on
 NSM multicast route statistics debugging is on
 NSM multicast FIB message debugging is on
 NSM multicast PIM Register message debugging is on
 NSM multicast traceroute debugging is on
 NSM multicast traceroute detailed debugging is on
```

**Related commands** [debug nsm mcast](#)

**Command changes** Version 5.4.7-2.1: command added  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2

# show ip mroute

**Overview** Use this command to display the contents of the IPv4 multicast routing (mroute) table.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ip mroute [<ipv4-group-addr>] [<ipv4-source-addr>]  
[dense|sparse|static] [count|summary]`

**Syntax (VRF-lite)** `show ip mroute [vrf <vrf-name>|global] [<ipv4-group-addr>]  
[<ipv4-source-addr>] [dense|sparse|static] [count|summary]`

| Parameter          | Description                                                                               |
|--------------------|-------------------------------------------------------------------------------------------|
| vrf                | Applies the command to the specified VRF instance.                                        |
| <vrf-name>         | The VRF instance name.                                                                    |
| global             | The global routing and forwarding table                                                   |
| <ipv4-group-addr>  | Group IPv4 address, in dotted decimal notation in the format A.B.C.D.                     |
| <ipv4-source-addr> | Source IPv4 address, in dotted decimal notation in the format A.B.C.D.                    |
| dense              | Display dense IPv4 multicast routes.                                                      |
| sparse             | Display sparse IPv4 multicast routes.                                                     |
| static             | Display static IPv4 multicast routes.                                                     |
| count              | Display the route and packet count from the IPv4 multicast routing (mroute) table.        |
| summary            | Display the contents of the IPv4 multicast routing (mroute) table in an abbreviated form. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip mroute 10.10.3.34 224.1.4.3
awplus# show ip mroute 10.10.5.24 225.2.2.2 count
awplus# show ip mroute 10.10.1.34 summary
```

**Output** The following is a sample output of this command displaying the IPv4 multicast routing table, with and without specifying the group and source IPv4 address:

Figure 37-2: Example output from the **show ip mroute** command

```
awplus# show ip mroute
IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

(10.10.1.52, 224.0.1.3), uptime 00:00:31, stat expires 00:02:59
Owner PIM-SM, Flags: TF
 Incoming interface: vlan2
 Outgoing interface list:
 vlan3 (1)
```

Figure 37-3: Example output from the **show ip mroute** command with the source and group IPv4 address specified

```
awplus# show ip mroute 10.10.1.52 224.0.1.3

IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

(10.10.1.52, 224.0.1.3), uptime 00:03:24, stat expires 00:01:28
Owner PIM-SM, Flags: TF
 Incoming interface: vlan2
 Outgoing interface list:
 vlan3 (1)
```

The following is a sample output of this command displaying the packet count from the IPv4 multicast routing table:

Figure 37-4: Example output from the **show ip mroute count** command

```
awplus# show ip mroute count
IP Multicast Statistics
Total 1 routes using 132 bytes memory
Route limit/Route threshold: 2147483647/2147483647
Total NOCACHE/WRONGVIF/WHOLEPKT rcv from fwd: 1/0/0
Total NOCACHE/WRONGVIF/WHOLEPKT sent to clients: 1/0/0
Immediate/Timed stat updates sent to clients: 0/0
Reg ACK rcv/Reg NACK rcv/Reg pkt sent: 0/0/0
Next stats poll: 00:01:10

Forwarding Counts: Pkt count/Byte count, Other Counts: Wrong If
pkts
Fwd msg counts: WRONGVIF/WHOLEPKT rcv
Client msg counts: WRONGVIF/WHOLEPKT/Imm Stat/Timed Stat sent
Reg pkt counts: Reg ACK rcv/Reg NACK rcv/Reg pkt sent

(10.10.1.52, 224.0.1.3), Forwarding: 2/19456, Other: 0
 Fwd msg: 0/0, Client msg: 0/0/0/0, Reg: 0/0/0
```

The following is a sample output for this command displaying the IPv4 multicast routing table in an abbreviated form:

Figure 37-5: Example output from the **show ip mroute summary** command

```
awplus# show ip mroute summary

IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

(10.10.1.52, 224.0.1.3), 00:01:32/00:03:20, PIM-SM, Flags: TF
```

**Command  
changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip mvif

**Overview** Use this command to display the contents of the IPv4 Multicast Routing Information Base (MRIB) VIF table.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ip mvif <interface>`

**Syntax (VRF-lite)** `show ip mvif [vrf <vrf-name>|global] <interface>`

| Parameter   | Description                                        |
|-------------|----------------------------------------------------|
| vrf         | Applies the command to the specified VRF instance. |
| <vrf-name>  | The VRF instance name.                             |
| global      | The global routing and forwarding table            |
| <interface> | The interface to display information about.        |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip mvif vlan2`

**Output** Figure 37-6: Example output from the **show ip mvif** command

| Interface | Vif<br>Idx | Owner<br>Module | TTL | Local<br>Address | Remote<br>Address | Uptime   |
|-----------|------------|-----------------|-----|------------------|-------------------|----------|
| vlan2     | 0          | PIM-SM          | 1   | 192.168.1.53     | 0.0.0.0           | 00:04:26 |
| Register  | 1          |                 | 1   | 192.168.1.53     | 0.0.0.0           | 00:04:26 |
| vlan3     | 2          | PIM-SM          | 1   | 192.168.10.53    | 0.0.0.0           | 00:04:25 |

**Command changes** Version 5.4.7-1.1: VRF-lite support added for SBx8100.

Version 5.4.8-1.1: VRF-lite support added for x930, SBx908 GEN2.

# show ip rpf

**Overview** Use this command to display Reverse Path Forwarding (RPF) information for the specified IPv4 source address.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ip rpf <source-addr>`

**Syntax (VRF-lite)** `show ip rpf [vrf <vrf-name>|global] <source-addr>`

| Parameter     | Description                                                            |
|---------------|------------------------------------------------------------------------|
| vrf           | Applies the command to the specified VRF instance.                     |
| <vrf-name>    | The VRF instance name.                                                 |
| global        | The global routing and forwarding table                                |
| <source-addr> | Source IPv4 address, in dotted decimal notation in the format A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip rpf 10.10.10.50`

**Command changes** Version 5.4.7-1.1: VRF-lite support added for SBx8100.  
Version 5.4.8-1.1: VRF-lite support added for x930, SBx908 GEN2.

# show ipv6 mif

**Overview** Use this command to display the contents of the IPv6 Multicast Routing Information Base (MRIB) MIF table.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ipv6 mif [<interface>]`

**Syntax (VRF-lite)** `show ipv6 mif [vrf <vrf-name>|global] [<interface>]`

| Parameter   | Description                                        |
|-------------|----------------------------------------------------|
| <interface> | An interface to display information about.         |
| vrf         | Applies the command to the specified VRF instance. |
| <vrf-name>  | The VRF instance name.                             |
| global      | The global routing and forwarding table.           |

**Mode** User Exec and Privileged Exec

**Example** To display the contents of the MIF table for all interfaces, use the following command:

```
awplus# show ipv6 mif
```

To display the contents of the MIF table for a specific interface, use the following command:

```
awplus# show ipv6 mif vlan2
```

**Output** Figure 37-7: Example output from the **show ipv6 mif** command

```
awplus#show ipv6 mif
```

| Interface | Mif | Owner                 | Uptime   |
|-----------|-----|-----------------------|----------|
|           | Idx | Module                |          |
| vlan3     | 0   | MLD/MLD Proxy-Service | 03:28:48 |
| vlan2     | 1   | MLD/MLD Proxy-Service | 03:28:48 |
| vlan1     | 2   | MLD/MLD Proxy-Service | 03:28:48 |

Figure 37-8: Example output from the **show ipv6 mif** command with the interface parameter specified

| Interface | Mif | Owner                 | TTL | Remote  | Uptime   |
|-----------|-----|-----------------------|-----|---------|----------|
|           | Idx | Module                |     | Address |          |
| vlan2     | 0   | MLD/MLD Proxy-Service | 1   | 0.0.0.0 | 00:05:17 |

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 mroute

**Overview** Use this command to display the contents of the IPv6 multicast routing (mroute) table.

**Syntax** `show ipv6 mroute [<ipv6-group-addr>] [<ipv6-source-addr>]  
[{count|summary}]`

| Parameter          | Description                                                                               |
|--------------------|-------------------------------------------------------------------------------------------|
| <ipv6-group-addr>  | Group IPv6 address, in hexadecimal notation in the format X.X::X.X.                       |
| <ipv6-source-addr> | Source IPv6 address, in hexadecimal notation in the format X.X::X.X.                      |
| count              | Display the route and packet count from the IPv6 multicast routing (mroute) table.        |
| summary            | Display the contents of the IPv6 multicast routing (mroute) table in an abbreviated form. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ipv6 mroute
awplus# show ipv6 mroute count
awplus# show ipv6 mroute summary
awplus# show ipv6 mroute 2001::2 ff08::1 count
awplus# show ipv6 mroute 2001::2 ff08::1
awplus# show ipv6 mroute 2001::2 summary
```

**Output** The following is a sample output of this command displaying the IPv6 multicast routing table for a single static IPv6 Multicast route:

Figure 37-9: Example output from the **show ipv6 mroute** command

```
awplus#show ipv6 mroute
IPv6 Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface
(2001::2, ff08::1), uptime 03:18:38
Owner IMI, Flags: F
Incoming interface: vlan2
Outgoing interface list:
vlan3
```

The following is a sample output of this command displaying the IPv6 multicast routing count table for a single static IPv6 Multicast route:

Figure 37-10: Example output from the **show ipv6 mroute count** command

```
awplus#show ipv6 mroute count

IPv6 Multicast Statistics
Total 1 routes using 152 bytes memory
Route limit/Route threshold: 1024/1024
Total NOCACHE/WRONGmif/WHOLEPKT rcv from fwd: 6/0/0
Total NOCACHE/WRONGmif/WHOLEPKT sent to clients: 6/0/0
Immediate/Timed stat updates sent to clients: 0/0
Reg ACK rcv/Reg NACK rcv/Reg pkt sent: 0/0/0
Next stats poll: 00:01:14

Forwarding Counts: Pkt count/Byte count, Other Counts: Wrong If
pkts

```

# show ipv6 multicast forwarding

**Overview** Use this command to view the status of multicast forwarding.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ipv6 multicast forwarding`

**Syntax (VRF-lite)** `show ipv6 multicast forwarding [vrf <vrf-name>|global]`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name                              |
| global     | The Global routing/forwarding table                |

**Mode** Privileged Exec

**Example** To show the status of the multicast forwarding, use the following command:

```
awplus# show ipv6 multicast forwarding
```

**Output** Figure 37-12: Example output from the **show ipv6 multicast forwarding** command:

```
ipv6 multicast forwarding is disabled
```

**Related commands** [ipv6 multicast forward-slow-path-packet](#)

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# PIM-SM Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of PIM-SM commands. For commands common to PIM-SM and PIM-DM, see the [Multicast Commands](#) chapter.

- Command List**
- “clear ip pim sparse-mode bsr rp-set \*” on page 2157
  - “clear ip pim sparse-mode packet statistics” on page 2158
  - “clear ip mroute pim sparse-mode” on page 2159
  - “debug pim sparse-mode” on page 2160
  - “debug pim sparse-mode timer” on page 2162
  - “ip multicast allow-register-fragments” on page 2165
  - “ip pim accept-register list” on page 2166
  - “ip pim anycast-rp” on page 2167
  - “ip pim bsr-border” on page 2168
  - “ip pim bsr-candidate” on page 2169
  - “ip pim cisco-register-checksum” on page 2170
  - “ip pim cisco-register-checksum group-list” on page 2171
  - “ip pim crp-cisco-prefix” on page 2172
  - “ip pim dr-priority” on page 2173
  - “ip pim exclude-genid” on page 2174
  - “ip pim ext-srcs-directly-connected” on page 2175
  - “ip pim hello-holdtime (PIM-SM)” on page 2176
  - “ip pim hello-interval (PIM-SM)” on page 2177
  - “ip pim ignore-rp-set-priority” on page 2178

- [“ip pim jp-timer”](#) on page 2179
- [“ip pim neighbor-filter \(PIM-SM\)”](#) on page 2180
- [“ip pim register-rate-limit”](#) on page 2181

- [“undebg all pim sparse-mode”](#) on page 2221

# clear ip pim sparse-mode bsr rp-set \*

**Overview** Use this command to clear all Rendezvous Point (RP) sets learned through the PIMv2 Bootstrap Router (BSR).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `clear ip pim sparse-mode bsr rp-set *`

**Syntax (VRF-lite)** `clear ip pim [vrf <vrf-name>] sparse-mode bsr rp-set *`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name.                             |
| *          | Clears all RP sets.                                |

**Mode** Privileged Exec

**Usage notes** For multicast clients, note that one router will be automatically or statically designated as the RP, and all routers must explicitly join through the RP. A Designated Router (DR) sends periodic Join/Prune messages toward a group-specific RP for each group that it has active members.

For multicast sources, note that the Designated Router (DR) unicasts Register messages to the RP encapsulating the data packets from the multicast source. The RP forwards decapsulated data packets toward group members.

**Example** `awplus# clear ip pim sparse-mode bsr rp-set *`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# clear ip pim sparse-mode packet statistics

**Overview** Use this command to clear the PIM sparse mode packet statistics counter.

If the platform supports multicast for VRFs, then specifying a VRF name will clear the counters for that VRF. If you do not specify a VRF, then the counters will be cleared for the global VRF.

**Syntax** `clear ip pim sparse-mode packet statistics`

**Syntax (VRF-lite)** `clear ip pim [<vrf-name>|global] sparse-mode packet statistics`

| Parameter  | Description                             |
|------------|-----------------------------------------|
| <vrf-name> | The VRF instance name                   |
| global     | The global routing and forwarding table |

**Mode** Privileged Exec

**Example** The following command clears the current packet receive counts for PIM sparse-mode:

```
awplus# configure terminal
awplus(config)# clear ip pim sparse-mode statistics
```

**Output** Figure 38-1: Example output from **clear ip pim sparse-mode statistics**

```
awplus(config)#clear ip pim sparse-mode statistics
PIM-SM Receive Packet Statistics :
All PIM-SM : Total : 0 Valid : 0
Hello : Total : 0 Valid : 0
Register : Total : 0 Valid : 0
Register Stop : Total : 0 Valid : 0
Join/Prune : Total : 0 Valid : 0
Bootstrap : Total : 0 Valid : 0
Assert : Total : 0 Valid : 0
Candidate-RP : Total : 0 Valid : 0
```

**Related commands** [show ip pim sparse-mode packet statistics](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# clear ip mroute pim sparse-mode

**Overview** Use this command to clear all multicast route table entries learned through PIM-SM for a specified multicast group address, and optionally a specified multicast source address.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `clear ip mroute <Group-IP-address> pim sparse-mode`  
`clear ip mroute <Group-IP-address> <Source-IP-address> pim sparse-mode`

**Syntax (VRF-lite)** `clear ip mroute [vrf <vrf-name>] <Group-IP-address> pim sparse-mode`  
`clear ip mroute [vrf <vrf-name>] <Group-IP-address> <Source-IP-address> pim sparse-mode`

| Parameter           | Description                                                          |
|---------------------|----------------------------------------------------------------------|
| vrf                 | Applies the command to the specified VRF instance.                   |
| <vrf-name>          | The VRF instance name.                                               |
| <Group-IP-address>  | Specify a multicast group IPv6 address, entered in the form A.B.C.D. |
| <Source-IP-address> | Specify a source group IP address, entered in the form A.B.C.D.      |

**Mode** Privileged Exec

**Example** `awplus# clear ip mroute pim sparse-mode 224.0.0.0`  
`awplus# clear ip mroute 192.168.7.1 pim sparse-mode 224.0.0.0`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# debug pim sparse-mode

**Overview** Use this command to turn on some or all PIM-SM debugging.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to turn off some or all PIM-SM debugging.

**Syntax** `debug pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [packet] [state] [mtrace]`

`no debug pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [packet] [state] [mtrace]`

**Syntax (VRF-lite)** `debug pim [vrf <vrf-name>] sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [packet] [state] [mtrace]`  
`no debug pim [vrf <vrf-name>] sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [packet] [state] [mtrace]`

| Parameter  | Description                                                                                |
|------------|--------------------------------------------------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance.                                         |
| <vrf-name> | The VRF instance name.                                                                     |
| all        | Activates/deactivates all PIM-SM debugging.                                                |
| events     | Activates debug printing of events.                                                        |
| mfc        | Activates debug printing of MFC (Multicast Forwarding Cache in kernel) add/delete/updates. |
| mib        | Activates debug printing of PIM-SM MIBs.                                                   |
| nexthop    | Activates debug printing of PIM-SM next hop communications.                                |
| nsm        | Activates debugging of PIM-SM Network Services Module communications.                      |
| packet     | Activates debug printing of incoming and/or outgoing packets.                              |
| state      | Activates debug printing of state transition on all PIM-SM FSMs.                           |
| mtrace     | Activates debug printing of multicast traceroute.                                          |

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim sparse-mode all`

**Related commands** [show debugging pim sparse-mode](#)

**Command  
changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# debug pim sparse-mode timer

**Overview** Use this command to enable debugging for the specified PIM-SM timers.

Use the **no** variants of this command to disable debugging for the specified PIM-SM timers.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax**

```
debug pim sparse-mode timer assert [at]
no debug pim sparse-mode timer assert [at]
debug pim sparse-mode timer bsr [bst|crp]
no debug pim sparse-mode timer bsr [bst|crp]
debug pim sparse-mode timer hello [ht|nlt|tht]
no debug pim sparse-mode timer hello [ht|nlt|tht]
debug pim sparse-mode timer joinprune [jt|et|ppt|kat|ot]
no debug pim sparse-mode timer joinprune [jt|et|ppt|kat|ot]
debug pim sparse-mode timer register [rst]
no debug pim sparse-mode timer register [rst]
```

**Syntax (VRF-lite)**

```
debug pim [vrf <vrf-name>] sparse-mode timer assert [at]
no debug pim [vrf <vrf-name>] sparse-mode timer assert [at]
debug pim [vrf <vrf-name>] sparse-mode timer bsr [bst|crp]
no debug pim [vrf <vrf-name>] sparse-mode timer bsr [bst|crp]
debug pim [vrf <vrf-name>] sparse-mode timer hello [ht|nlt|tht]
no debug pim [vrf <vrf-name>] sparse-mode timer hello
[ht|nlt|tht]
debug pim [vrf <vrf-name>] sparse-mode timer joinprune
[jt|et|ppt|kat|ot]
no debug pim [vrf <vrf-name>] sparse-mode timer joinprune
[jt|et|ppt|kat|ot]
debug pim [vrf <vrf-name>] sparse-mode timer register [rst]
no debug pim [vrf <vrf-name>] sparse-mode timer register [rst]
```

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name.                             |
| assert     | Enable or disable debugging for the Assert timers. |
| at         | Enable or disable debugging for the Assert Timer.  |

| Parameter | Description                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------|
| bsr       | Enable or disable debugging for the specified Bootstrap Router timer, or all Bootstrap Router timers. |
| bst       | Enable or disable debugging for the Bootstrap Router: Bootstrap Timer.                                |
| crp       | Enable or disable debugging for the Bootstrap Router: Candidate-RP Timer.                             |
| hello     | Enable or disable debugging for the specified Hello timer, or all Hello timers.                       |
| ht        | Enable or disable debugging for the Hello timer: Hello Timer.                                         |
| nlt       | Enable or disable debugging for the Hello timer: Neighbor Liveness Timer.                             |
| tht       | Enable or disable debugging for the Hello timer: Triggered Hello Timer.                               |
| joinprune | Enable or disable debugging for the specified JoinPrune timer, or all JoinPrune timers.               |
| jt        | Enable or disable debugging for the JoinPrune timer: upstream Join Timer.                             |
| et        | Enable or disable debugging for the JoinPrune timer: Expiry Timer.                                    |
| ppt       | Enable or disable debugging for the JoinPrune timer: PrunePending Timer.                              |
| kat       | Enable or disable debugging for the JoinPrune timer: KeepAlive Timer.                                 |
| ot        | Enable or disable debugging for the JoinPrune timer: Upstream Override Timer.                         |
| register  | Enable or disable debugging for the Register timers.                                                  |
| rst       | Enable or disable debugging for the Register timer: Register Stop Timer.                              |

**Default** By default, all debugging is disabled.

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging for the PIM-SM Bootstrap Router bootstrap timer, use the commands:

```
awplus(config)# debug pim sparse-mode timer bsr bst
```

To enable debugging for the PIM-SM Hello: neighbor liveness timer, use the command:

```
awplus(config)# debug pim sparse-mode timer hello ht
```

To enable debugging for the PIM-SM Joinprune expiry timer, use the command:

```
awplus# debug pim sparse-mode timer joinprune et
```

To disable debugging for the PIM-SM Register timer, use the command:

```
awplus# no debug pim sparse-mode timer register
```

**Related commands** [show debugging pim sparse-mode](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip multicast allow-register-fragments

**Overview** Use this command to allow PIM to register fragmented packets. It is disabled by default.

Use the **no** variant of this command to stop PIM from registering fragmented packets.

**Syntax** `ip multicast allow-register-fragments`  
`no ip multicast allow-register-fragments`

**Default** This command is disabled by default

**Mode** Global Configuration

**Usage notes** Most multicast streams are not fragmented, and therefore this command is unnecessary. By default, when IP multicast packets are fragmented, the switch attempts to reassemble them before registering the packets. This is necessary for tasks such as network address translation, or a firewall.

However, reassembly may be difficult for switches where the CPU cannot handle a large amount of traffic. In that situation, with the CPU failing to reassemble the fragmented packets, there can be a delay in forwarding multicast streams.

We do not recommend enabling this feature if a firewall or network address translation is being used. This feature should only be enabled if multicast data is fragmented and the data rate is too high for the CPU to manage reassembly.

**Example** To allow PIM to register fragmented packets, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast allow-register-fragments
```

# ip pim accept-register list

**Overview** Use this command to configure the ability to filter out multicast sources specified by the given access-list at the Rendezvous Point (RP), so that the RP will accept/refuse to perform the register mechanism for the packets sent by the specified sources.

Use the **no** variant of this command to revert to default.

**Syntax** `ip pim accept-register list {<100-199>|<2000-2699>|<name>}`  
`no ip pim accept-register`

| Parameter   | Description                                                     |
|-------------|-----------------------------------------------------------------|
| <100-199>   | IP extended access-list, identified by number.                  |
| <2000-2699> | IP extended access list, identified by number (expanded range). |
| <name>      | IP access list, identified by name.                             |

**Default** By default, the RP accepts register packets from all multicast sources.

**Mode** Global Configuration

**Example** To create an ACL that denies packets from 100.1.1.1 to any destination, and use that ACL to filter at the RP point, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 121
awplus(config-ip-ext-acl)# deny ip 100.1.1.1 0.0.0.0 any
awplus(config-ip-ext-acl)# exit
awplus(config)# ip pim accept-register list 121
```

# ip pim anycast-rp

**Overview** Use this command to configure Anycast RP (Rendezvous Point) in a RP set.

Use the **no** variant of this command to remove the configuration.

**Syntax** `ip pim anycast-rp <anycast-rp-address> <member-rp-address>`  
`no ip pim anycast-rp <anycast-rp-address> [<member-rp-address>]`

| Parameter                               | Description                                                                                        |
|-----------------------------------------|----------------------------------------------------------------------------------------------------|
| <code>&lt;anycast-rp-address&gt;</code> | <A.B.C.D> Specify an anycast IP address to configure an Anycast RP (Rendezvous Point) in a RP set. |
| <code>&lt;member-rp-address&gt;</code>  | <A.B.C.D> Specify an Anycast RP (Rendezvous Point) address to configure an Anycast RP in a RP set. |

**Mode** Global Configuration

**Usage notes** Anycast is a network addressing and routing scheme where data is routed to the nearest or best destination as viewed by the routing topology. Compared to unicast with a one-to-one association between network address and network endpoint, and multicast with a one-to-many association between network address and network endpoint; anycast has a one-to-many association between network address and network endpoint. For anycast, each destination address identifies a set of receiver endpoints, from which only one receiver endpoint is chosen.

Anycast is often implemented using BGP to simultaneously advertise the same destination IP address range from many sources, resulting in packets address to destination addresses in this range being routed to the nearest source announcing the given destination IP address.

Use this command to specify the Anycast RP configuration in the Anycast RP set. Use the **no** variant of this command to remove the Anycast RP configuration. Note that the member RP address is optional when using the **no** parameter to remove the Anycast RP configuration. removing the anycast RP address also removes the member RP address.

**Examples** The following example shows how to configure the Anycast RP address with **ip pim anycast-rp**:

```
awplus# configure terminal
awplus(config)# ip pim anycast-rp 1.1.1.1 10.10.10.10
```

The following example shows how to remove the Anycast RP in the RP set specifying only the anycast RP address with **no ip pim anycast-rp**, but not specifying the member RP address:

```
awplus# configure terminal
awplus(config)# no ip pim anycast-rp 1.1.1.1
```

# ip pim bsr-border

**Overview** Use the **ip pim bsr-border** command to prevent Bootstrap Router (BSR) messages from being sent or received through an interface. The BSR border is the border of the PIM domain.

Use the **no** variant of this command to disable the configuration set with **ip pim bsr-border**.

**Syntax** `ip pim bsr-border`  
`no ip pim bsr-border`

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** When this command is configured on an interface, no PIM version 2 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM domain with this command to avoid BSR messages from being exchanged between the two PIM domains.

BSR messages should not be exchanged between different domains, because devices in one domain may elect Rendezvous Points (RPs) in the other domain, resulting in loss of isolation between the two PIM domains that would stop the PIM protocol from working as intended.

**Examples** The following example configures the VLAN interface vlan2 to be the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim bsr-border
```

The following example removes the VLAN interface vlan2 from the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim bsr-border
```

# ip pim bsr-candidate

**Overview** Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IP address mask of the interface.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

**Syntax** `ip pim bsr-candidate <interface> [<hash>] [<priority>]`  
`no ip pim bsr-candidate [<interface>]`

**Syntax (VRF-lite)** `ip pim [vrf <vrf-name>] bsr-candidate <interface> [<hash>] [<priority>]`  
`no ip pim [vrf <vrf-name>] bsr-candidate [<interface>]`

| Parameter                      | Description                                                                                                                                                                                                                                        |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>vrf</code>               | Applies the command to the specified VRF instance.                                                                                                                                                                                                 |
| <code>&lt;vrf-name&gt;</code>  | The VRF instance name.                                                                                                                                                                                                                             |
| <code>&lt;interface&gt;</code> | The interface.                                                                                                                                                                                                                                     |
| <code>&lt;hash&gt;</code>      | <0-32> configure hash mask length for RP selection. The default hash value if you do not configure this parameter is 10.                                                                                                                           |
| <code>&lt;priority&gt;</code>  | <0-255> configure priority for a BSR candidate. Note that you must also specify the <code>&lt;hash&gt;</code> (mask length) when specifying the <code>&lt;priority&gt;</code> . The default priority if you do not configure this parameter is 64. |

**Mode** Global Configuration

**Default** The default hash parameter value is 10 and the default priority parameter value is 64.

**Examples** To set the BSR candidate to the VLAN interface vlan2, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ip pim bsr-candidate vlan2 20 30
```

To withdraw the address of vlan2 from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ip pim bsr-candidate vlan2
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim cisco-register-checksum

**Overview** Use this command to configure the option to calculate the Register checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to disable this option.

**Syntax** `ip pim cisco-register-checksum`  
`no ip pim cisco-register-checksum`

**Syntax (VRF-lite)** `ip pim [vrf <vrf-name>] cisco-register-checksum`  
`no ip pim [vrf <vrf-name>] cisco-register-checksum`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name.                             |

**Default** This command is disabled by default. By default, Register Checksum is calculated only over the header.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim cisco-register-checksum`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim cisco-register-checksum group-list

**Overview** Use this command to configure the option to calculate the Register checksum over the whole packet on multicast groups specified by the access-list. This command is used to inter-operate with older Cisco IOS versions.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to revert to default settings.

**Syntax** `ip pim cisco-register-checksum group-list <acl>`  
`no ip pim cisco-register-checksum group-list <acl>`

**Syntax (VRF-lite)** `ip pim [vrf <vrf-name>] cisco-register-checksum group-list <acl>`  
`no ip pim [vrf <vrf-name>] cisco-register-checksum group-list <acl>`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name                              |
| <acl>      | The standard, expanded or named ACL to use.        |

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim cisco-register-checksum group-list 34`  
`awplus(config)# access-list 34 permit 224.0.1.3`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim crp-cisco-prefix

**Overview** Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0. RP advertisements for the default IPv4 multicast group range 224/4 are sent with a prefix of 1.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to revert to the default settings.

**Syntax** `ip pim crp-cisco-prefix`  
`no ip pim crp-cisco-prefix`

**Syntax (VRF-lite)** `ip pim [vrf <vrf-name>] crp-cisco-prefix`  
`no ip pim [vrf <vrf-name>] crp-cisco-prefix`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name.                             |

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim crp-cisco-prefix`  
`awplus# configure terminal`  
`awplus(config)# no ip pim crp-cisco-prefix`

**Related commands** [ip pim rp-candidate](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim dr-priority

**Overview** Use this command to set the Designated Router priority value.  
Use the **no** variant of this command to disable this function.

**Syntax** `ip pim dr-priority <priority>`  
`no ip pim dr-priority [<priority>]`

| Parameter  | Description                                                                                                                                      |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <priority> | Specify the Designated Router priority value, in the range 0 to 4294967294. Note that a higher value has a higher preference or higher priority. |

**Default** The default is 1. The negated form of this command restores the value to the default.

**Mode** Interface Configuration for a VLAN interface.

**Examples** To set the Designated Router priority value to 11234 for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim dr-priority
```

**Related commands** [ip pim ignore-rp-set-priority](#)

# ip pim exclude-genid

**Overview** Use this command to exclude the GenID option from Hello packets sent out by the PIM module on a particular interface. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

**Syntax** `ip pim exclude-genid`  
`no ip pim exclude-genid`

**Default** By default, this command is disabled; the GenID option is included.

**Mode** Interface Configuration for a VLAN interface.

**Example** To exclude the GenID option on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim exclude-genid
```

# ip pim ext-srcs-directly-connected

**Overview** Use this command to configure PIM to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM to treat only directly connected sources as directly connected.

**Syntax** `ip pim ext-srcs-directly-connected`  
`no ip pim ext-srcs-directly-connected`

**Default** The **no** variant of this command is the default behavior.

**Mode** Interface Configuration for a VLAN interface.

**Example** To configure PIM to treat all sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim ext-srcs-directly-connected
```

# ip pim hello-holdtime (PIM-SM)

**Overview** This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 \* the current hello-interval.

**Syntax** `ip pim hello-holdtime <holdtime>`  
`no ip pim hello-holdtime`

| Parameter  | Description                                                                      |
|------------|----------------------------------------------------------------------------------|
| <holdtime> | <1-65535><br>The holdtime value in seconds (no fractional seconds are accepted). |

**Default** The default hello-holdtime value is 3.5 \* the current hello-interval.

**Mode** Interface Configuration for a VLAN interface.

**Usage** Each time the hello-interval is updated, the hello-holdtime is also updated, according to the following rules:

If the hello-holdtime is not configured; or if the hello-holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 \* hello-interval). Otherwise, it retains the configured value.

**Example** To set the hello-hold time value on interface vlan2 use the commands

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-holdtime 123
```

# ip pim hello-interval (PIM-SM)

**Overview** This command configures a hello-interval value.  
Use the **no** variant of this command to reset the hello-interval to the default.

**Syntax** `ip pim hello-interval <interval>`  
`no ip pim hello-interval`

| Parameter  | Description                                                      |
|------------|------------------------------------------------------------------|
| <interval> | <1-65535> The value in seconds (no fractional seconds accepted). |

**Default** The default hello-interval value is 30 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage** When the hello-interval is configured, and the hello-holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 \* hello-interval). Otherwise, the hello-holdtime value is the configured value.

**Example** To set the hello-interval value on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-interval 123
```

# ip pim ignore-rp-set-priority

**Overview** Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this setting.

**Syntax** `ip pim ignore-rp-set-priority`  
`no ip pim ignore-rp-set-priority`

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim ignore-rp-set-priority`

# ip pim jp-timer

**Overview** Use this command to set the PIM-SM join/prune timer. Note that the value the device puts into the holdtime field of the join/prune packets it sends to its neighbors is 3.5 times the join/prune timer value set using this command.

Use the **no** variant of this command to return the PIM-SM join/prune timer to its default value of 60 seconds, which corresponds to a join/prune packet holdtime of 210 seconds.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ip pim jp-timer <1-65535>`  
`no ip pim jp-timer [<1-65535>]`

**Syntax (VRF-lite)** `ip pim [vrf <vrf-name>] jp-timer <1-65535>`  
`no ip pim [vrf <vrf-name>] jp-timer [<1-65535>]`

| Parameter  | Description                                                            |
|------------|------------------------------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance.                     |
| <vrf-name> | The VRF instance name                                                  |
| <1-65535>  | Specifies the join/prune timer value. The default value is 60 seconds. |

**Default** The default join/prune timer value is 60 seconds.

**Mode** Global Configuration

**Example** To set the join/prune timer value to 300 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim jp-timer 300
```

To return the join/prune timer to its default value of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim jp-timer
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

## ip pim neighbor-filter (PIM-SM)

**Overview** This command enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-SM will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering access list.

Use the **no** variant of this command to disable this function.

**Syntax** `ip pim neighbor-filter {<number>|<accesslist>}`  
`no ip pim neighbor-filter {<number>|<accesslist>}`

| Parameter    | Description                            |
|--------------|----------------------------------------|
| <number>     | <1-99> Standard IP access-list number. |
| <accesslist> | IP access list name.                   |

**Default** By default, there is no filtering.

**Mode** Interface Configuration for a VLAN interface.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip pim neighbor-filter 14`

# ip pim register-rate-limit

**Overview** Use this command to configure the rate of register packets sent by this DR, in units of packets per second.

Use the **no** variant of this command to remove the limit.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ip pim register-rate-limit <1-65535>`  
`no ip pim register-rate-limit`

**Syntax (VRF-lite)** `ip pim [vrf <vrf-name>] register-rate-limit <1-65535>`  
`no ip pim [vrf <vrf-name>] register-rate-limit`

| Parameter  | Description                                                          |
|------------|----------------------------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance.                   |
| <vrf-name> | The VRF instance name                                                |
| <1-65535>  | Specifies the maximum number of packets that can be sent per second. |

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim register-rate-limit 3444`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim register-rp-reachability

**Overview** Use this command to enable the RP reachability check for PIM Register processing at the DR. The default setting is no checking for RP-reachability.

Use the **no** variant of this command to disable this processing.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ip pim register-rp-reachability`  
`no ip pim register-rp-reachability`

**Syntax (VRF-lite)** `ip pim [vrf <vrf-name>] register-rp-reachability`  
`no ip pim [vrf <vrf-name>] register-rp-reachability`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name.                             |

**Default** This command is disabled; by default, there is no checking for RP-reachability.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim register-rp-reachability`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim register-source

**Overview** Use this command to configure the source address of register packets sent by this DR, overriding the default source address, which is the address of the RPF interface toward the source host.

Use the **no** variant of this command to un-configure the source address of Register packets sent by this DR, reverting back to use the default source address that is the address of the RPF interface toward the source host.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ip pim register-source [<source-address>|<interface>]`  
`no ip pim register-source`

**Syntax (VRF-lite)** `ip pim [vrf <vrf-name>] register-source`  
`[<source-address>|<interface>]`  
`no ip pim [vrf <vrf-name>] register-source`

| Parameter                           | Description                                                                                    |
|-------------------------------------|------------------------------------------------------------------------------------------------|
| <code>vrf</code>                    | Applies the command to the specified VRF instance.                                             |
| <code>&lt;vrf-name&gt;</code>       | The VRF instance name                                                                          |
| <code>&lt;source-address&gt;</code> | The IP address, entered in the form A.B.C.D, to be used as the source of the register packets. |
| <code>&lt;interface&gt;</code>      | The name of the interface to be used as the source of the register packets.                    |

**Usage notes** The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback interface address, but can also be a physical address. This address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM enabled.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim register-source 10.10.1.3`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim register-suppression

**Overview** Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds. Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the [ip pim rp-register-kat](#) command is not used.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

**Syntax** `ip pim register-suppression <1-65535>`  
`no ip pim register-suppression`

**Syntax (VRF-lite)** `ip pim [vrf <vrf-name>] register-suppression <1-65535>`  
`no ip pim [vrf <vrf-name>] register-suppression`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name.                             |
| <1-65535>  | Register suppression time in seconds.              |

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim register-suppression 192`

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim rp-address

**Overview** Use this command to statically configure the RP (Rendezvous Point) address for multicast groups.

Use the **no** variant of this command to remove a statically configured RP address for multicast groups.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ip pim rp-address <ip-address> group-list <group-prefix> [override]`  
`no ip pim rp-address <ip-address> group-list <group-prefix> [override]`

**Syntax (VRF-lite)** `ip pim [vrf <vrf-name>] rp-address <ip-address> group-list <group-prefix> [override]`  
`no ip pim [vrf <vrf-name>] rp-address <ip-address> group-list <group-prefix> [override]`

| Parameter      | Description                                                            |
|----------------|------------------------------------------------------------------------|
| vrf            | Applies the command to the specified VRF instance.                     |
| <vrf-name>     | The VRF instance name                                                  |
| <ip-address>   | IP address of RP, entered in the form A.B.C.D.                         |
| <group-prefix> | Multicast group IP prefix address of RP, entered in the form A.B.C.D/M |
| override       | Enables statically defined RPs to override dynamically learned RPs.    |

**Mode** Global Configuration

**Usage notes** The AlliedWare Plus PIM-SM implementation supports multiple static RPs. It also supports usage of static RP and the BSR (Bootstrap Router) mechanism simultaneously. The **ip pim rp-address** command is used to statically configure the RP address for multicast groups.

You need to understand the following information before using this command.

If the RP address configured by the BSR, and the statically configured RP address are both available for a group range, then the RP address configured through the BSR is chosen over the statically configured RP address, unless the 'override' parameter is specified, in which case, the static RP will be chosen.

After configuration, the RP address is inserted into a static RP group tree based on the configured group ranges. For each group range, multiple static RPs are maintained in a linked list. This list is sorted in a descending order of IP addresses.

When selecting static RPs for a group range, the first element (which is the static RP with highest IP address) is chosen.

RP address deletion is handled by removing the static RP from all the existing group ranges and recalculating the RPs for existing TIB states if required.

**NOTE:** A unique RP address may only be specified once as a static RP.

**Example**    `awplus# configure terminal`  
`awplus(config)# ip pim rp-address 192.0.2.10 group-list`  
`233.252.0.0/24 override`

Figure 38-2:    Output from the **show ip pim sparse-mode rp mapping** command

```
awplus#show ip pim sp rp mapping
PIM Group-to-RP Mappings
Group(s): 233.252.0.0/24, Static
RP: 192.0.2.10
Uptime: 00:00:17
```

**Related commands**    `ip pim rp-candidate`  
`ip pim rp-register-kat`

`show ip pim sparse-mode rp mapping`

**Command changes**    Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-0.5: Replaced <acl> parameter with <group-list> parameter.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim rp-candidate

**Overview** Use this command to make the router an RP (Rendezvous Point) candidate, using the IP address of the specified interface.

Use the **no** variant of this command to remove the RP status set using the **ip pim rp-candidate** command.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ip pim rp-candidate <interface> [priority <priority>] [interval <interval>] [grouplist <acl>]`  
`no ip pim rp-candidate [<interface>]`

**Syntax (VRF-lite)** `ip pim [vrf <vrf-name>] rp-candidate <interface> [priority <priority>] [interval <interval>] [grouplist <acl>]`  
`no ip pim [vrf <vrf-name>] rp-candidate [<interface>]`

| Parameter              | Description                                                                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vrf                    | Applies the command to the specified VRF instance.                                                                                                            |
| <vrf-name>             | The VRF instance name.                                                                                                                                        |
| <interface>            | Interface name.                                                                                                                                               |
| priority<br><priority> | The RP candidate priority for this interface on this device, from 0 to 255. The lower the priority value, the more likely this candidate is to become the RP. |
| interval<br><interval> | The advertisement interval, from 1 to 16383 seconds.                                                                                                          |
| grouplist <acl>        | The standard, expanded or named ACL to use.                                                                                                                   |

**Default** The priority value for a candidate RP is 192 by default until specified using the **priority** parameter.

**Mode** Global Configuration

**Usage notes** Entering the command **ip pim rp-candidate <interface>** without one of the optional **priority**, **interval**, or **grouplist** parameters will configure the candidate RP with a priority value of 192.

**Examples** To specify a priority of 3, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim rp-candidate vlan2 priority 3
```

To use the ACL numbered 3 to specify the group prefixes that are advertised in association with the RP address, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim rp-candidate vlan2 group-list 3
```

To stop the device from being an RP candidate on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim rp-candidate vlan2
```

[ip pim rp-register-kat](#)  
[ip pim crp-cisco-prefix](#)

**Command  
changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim rp-register-kat

**Overview** Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SM Register packets.

Use the **no** variant of this command to return the PIM-SM KAT timer to its default value of 210 seconds.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ip pim rp-register-kat <1-65535>`  
`no ip pim rp-register-kat`

**Syntax (VRF-lite)** `ip pim [vrf <vrf-name>] rp-register-kat <1-65535>`  
`no ip pim [vrf <vrf-name>] rp-register-kat`

| Parameter  | Description                                                         |
|------------|---------------------------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance.                  |
| <vrf-name> | The VRF instance name                                               |
| <1-65535>  | Specify the KAT timer in seconds. The default value is 210 seconds. |

**Mode** Global Configuration

**Default** The default PIM-SM KAT timer value is 210 seconds.

**Examples** `awplus# configure terminal`  
`awplus(config)# ip pim rp-register-kat 3454`  
`awplus# configure terminal`  
`awplus(config)# no ip pim rp-register-kat`

**Related commands** [ip pim rp-address](#)  
[ip pim rp-candidate](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim sparse-mode

**Overview** Use this command to enable PIM-SM on an interface.  
Use the **no** variant of this command to disable PIM-SM on an interface.

**Syntax** `ip pim sparse-mode`  
`no ip pim sparse-mode`

**Mode** Interface Configuration for a VLAN interface.

**Examples** To enable PIM-SM on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim sparse-mode
```

To disable PIM-SM on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim sparse-mode
```

# ip pim sparse-mode join-prune-batching

**Overview** Use this command to enable batching of Join and Prune messages in PIM-SM. This functionality reduces the number of PIM packets that must be sent to maintain a large number of groups

When using VRF-lite, you can use this command to enable Join and Prune batching in PIM-SM for a named VRF instance.

Use the **no** variant of this command to disable batching of Join and Prune messages in PIM-SM.

**Syntax** `ip pim sparse-mode join-prune-batching`  
`no ip pim sparse-mode join-prune-batching`

**Syntax (VRF-lite)** `ip pim [vrf <vrf-name>]sparse-mode join-prune-batching`  
`no ip pim [vrf <vrf-name>]sparse-mode join-prune-batching`

| Parameter  | Description                           |
|------------|---------------------------------------|
| vrf        | Apply this command to a VRF instance. |
| <vrf-name> | The name of the VRF instance.         |

**Default** Disabled.

**Mode** Global Configuration

**Examples** To enable Join/Prune batching for PIM-SM, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim sparse-mode join-prune-batching
```

To disable Join/Prune batching for PIM-SM, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim sparse-mode join-prune-batching
```

**Example (VRF-lite)** To enable Join/Prune batching for the VRF instance 'red', use the commands:

```
awplus# configure terminal
awplus(config)# ip pim vrf red sparse-mode join-prune-batching
```

To disable Join/Prune batching for the VRF instance 'red', use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim vrf red sparse-mode
join-prune-batching
```

**Related commands** [ip pim sparse-mode wrong-vif-suppression](#)

**Command changes** Version 5.4.8-2.3: command added.

# ip pim sparse-mode passive

**Overview** Use this command to enable and disable passive mode operation for local members on an interface.

Use the **no** variant of this command to disable passive mode operation for local members on an interface.

**Syntax** `ip pim sparse-mode passive`  
`no ip pim sparse-mode passive`

**Mode** Interface Configuration for a VLAN interface.

**Usage** Passive mode essentially stops PIM transactions on the interface, allowing only IGMP mechanism to be active. To turn off passive mode, use the **no ip pim sparse-mode passive** or the `ip pim sparse-mode` command. To turn off PIM activities on an interface, use the **no ip pim sparse-mode** command.

**Examples** To enable passive mode on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim sparse-mode passive
```

To disable passive mode on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim sparse-mode passive
```

# ip pim sparse-mode wrong-vif-suppression

**Overview** Use this command to permit or block multicast packets that arrive on the wrong interface.

When using VRF-lite, you can use this command to enable wrong VIF suppression for a named VRF instance.

Use the **no** variant of this command to disable wrong VIF suppression.

**Syntax** `ip pim sparse-mode wrong-vif-suppression`  
`no ip pim sparse-mode wrong-vif-suppression`

**Syntax (VRF-lite)** `ip pim [vrf <vrf-name>] sparse-mode wrong-vif-suppression`  
`no ip pim [vrf <vrf-name>] sparse-mode wrong-vif-suppression`

| Parameter  | Description                           |
|------------|---------------------------------------|
| vrf        | Apply this command to a VRF instance. |
| <vrf-name> | The name of the VRF instance.         |

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** This command enables wrong VIF suppression for PIM sparse-mode. Wrong VIF suppression prevents multicast packets received on the wrong upstream interface from being copied to the CPU.

**Examples** To enable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim sparse-mode wrong-vif-suppression
```

To disable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim sparse-mode wrong-vif-suppression
```

**Example (VRF-lite)** To enable wrong VIF suppression for the VRF instance 'green', use the commands:

```
awplus# configure terminal
awplus(config)# ip pim vrf green sparse-mode
wrong-vif-suppression
```

To disable wrong VIF suppression for the VRF instance 'green', use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim vrf green sparse-mode
wrong-vif-suppression
```

**Command changes** Version 5.4.8-2.3: command added.

# ip pim spt-threshold

**Overview** This command turns on the ability for the last-hop PIM router to switch to SPT (shortest-path tree).

The **no** variant of this command turns off the ability for the last-hop PIM router to switch to SPT.

**NOTE:** The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ip pim spt-threshold`  
`no ip pim spt-threshold`

**Syntax (VRF-lite)** `ip pim [vrf <vrf-name>] spt-threshold`  
`no ip pim [vrf <vrf-name>] spt-threshold`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name.                             |

**Mode** Global Configuration

**Examples** To enable the last-hop PIM-SM router to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# ip pim spt-threshold
```

To stop the last-hop PIM-SM router from being able to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip pim spt-threshold
```

**Related commands** [ip pim spt-threshold group-list](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim spt-threshold group-list

**Overview** Use this command to turn on the ability for the last-hop PIM router to switch to SPT (shortest-path tree) for multicast group addresses specified by the given access-list.

The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

Use the **no** variant of this command to turn off switching to the SPT.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ip pim spt-threshold group-list <acl>`  
`no ip pim spt-threshold group-list [<acl>]`

**Syntax (VRF-lite)** `ip pim [vrf <vrf-name>] spt-threshold group-list <acl>`  
`no ip pim [vrf <vrf-name>] spt-threshold group-list [<acl>]`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name                              |
| <acl>      | The standard, expanded or named ACL to use.        |

**Mode** Global Configuration

**Usage notes** Turn on/off the ability for the last-hop PIM router to switch to SPT for multicast group addresses specified by the given access-list.

**Example** `awplus# configure terminal`  
`awplus(config)# ip pim spt-threshold group-list 1`  
`awplus(config)# access-list 1 permit 224.0.1.3`

**Related commands** [ip pim spt-threshold](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# ip pim ssm

**Overview** Use this command to define the Source Specific Multicast (SSM) range of IP multicast addresses. The default keyword defines the SSM range as 232/8.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

To define the SSM range to be other than the default, use the **access-list** parameter option.

Use the **no** variant of this command to disable the SSM range.

**Syntax**

```
ip pim ssm default
ip pim ssm range {<access-list>|<named-access-list>}
no ip pim ssm
```

**Syntax (VRF-lite)**

```
ip pim [vrf <vrf-name>] ssm default
ip pim [vrf <vrf-name>] ssm range
{<access-list>|<named-access-list>}
no ip pim [vrf <vrf-name>] ssm
```

| Parameter           | Description                                        |
|---------------------|----------------------------------------------------|
| default             | Use 232/8 as the range for SSM.                    |
| vrf                 | Applies the command to the specified VRF instance. |
| <vrf-name>          | The VRF instance name.                             |
| <access-list>       | <1-99> Simple access-list.                         |
| <named-access-list> | Named Standard Access List.                        |

**Default** By default, the command is disabled.

**Mode** Global Configuration

**Usage** When an SSM range of IP multicast addresses is defined by this command, the no (\*,G) or (S,G,rpt) state will be initiated for groups in the SSM range.

The messages corresponding to these states will not be accepted or originated in the SSM range.

**Examples** To configure the SSM service for the IP address range defined by access list 10, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 225.1.1.1
awplus(config)# ip pim ssm range 10
```

To use the default address range for PIM-SSM, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim ssm default
```

To disable PIM-SSM, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim ssm
```

**Command  
changes**

Version 5.5.3-1.1: VRF-lite support added.

# service pim

**Overview** Use this command to enable PIM sparse mode services.  
Use the **no** version of the command to disable unused PIM sparse mode services.

**Syntax** `service pim`  
`no service pim`

**Default** Enabled

**Mode** Global Configuration

**Usage notes** Sometimes it may be desirable to disable unused services, in order to reduce memory use.  
Disabling the PIM services will only take effect after you save the configuration and restart the device.

**Example** To disable the PIM sparse mode service, use the commands:

```
awplus# configure terminal
awplus(config)# no service pim
```

**Output** Figure 38-3: Example output from **no service pim**

```
awplus(config)#no service pim
% Save the config and restart the device for this change to take
effect
```

**Command changes** Version 5.5.0-0.1: command added

# show debugging pim sparse-mode

**Overview** This command displays the status of the debugging of the system.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show debugging pim sparse-mode`

**Syntax (VRF-lite)** `show debugging pim [vrf <vrf-name>|global] sparse-mode`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name.                             |
| global     | The global routing and forwarding table            |

**Mode** User Exec and Privileged Exec

**Example** To display PIM-SM debugging settings, use the command:

```
awplus# show debugging pim sparse-mode
```

Figure 38-4: Output from **show debugging pim sparse-mode**

```
Debugging status:
 PIM event debugging is on
 PIM Hello THT timer debugging is on
 PIM event debugging is on
 PIM MFC debugging is on
 PIM state debugging is on
 PIM packet debugging is on
 PIM incoming packet debugging is on
 PIM outgoing packet debugging is on
```

**Related commands** [debug pim sparse-mode](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode bsr-router

**Overview** Use this command to show the Bootstrap Router (BSR) (v2) address.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ip pim sparse-mode bsr-router`

**Syntax (VRF-lite)** `show ip pim [vrf <vrf-name>|global] sparse-mode bsr-router`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name.                             |
| global     | The global routing and forwarding table            |

**Mode** User Exec and Privileged Exec

**Output** Figure 38-5: Output from the **show ip pim sparse-mode bsr-router** command

```
PIMv2 Bootstrap information
BSR address: 10.10.11.35 (?)
Uptime: 00:00:38, BSR Priority: 0, Hash mask length: 10
Expires: 00:01:32
Role: Non-candidate BSR
State: Accept Preferred
```

# show ip pim sparse-mode interface detail

**Overview** Use this command to show detailed information on a PIM-SM interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ip pim sparse-mode interface detail`

**Syntax (VRF-lite)** `show ip pim [vrf <vrf-name>|global] sparse-mode interface detail`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name.                             |
| global     | The global routing and forwarding table            |

**Mode** User Exec and Privileged Exec

**Output** Figure 38-7: Example output from the **show ip pim sparse-mode interface detail** command

```
vlan3 (vif 3):
 Address 192.168.1.149, DR 192.168.1.149
 Hello period 30 seconds, Next Hello in 15 seconds
 Triggered Hello period 5 seconds
 Neighbors:
 192.168.1.22

vlan2 (vif 0):
 Address 10.10.11.149, DR 10.10.11.149
 Hello period 30 seconds, Next Hello in 18 seconds
 Triggered Hello period 5 seconds
 Neighbors:
 10.10.11.4
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode local-members

**Overview** Use this command to show detailed local member information on an interface configured for PIM-SM. If you do not specify an interface then detailed local member information is shown for all interfaces configured for PIM-SM.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim sparse-mode local-members [<interface>]`

**Syntax (VRF-lite)** `show ip pim [vrf <vrf-name>|global] sparse-mode local-members [<interface>]`

| Parameter   | Description                                        |
|-------------|----------------------------------------------------|
| vrf         | Applies the command to the specified VRF instance. |
| <vrf-name>  | The VRF instance name.                             |
| global      | The global routing and forwarding table            |
| <interface> | Optional. Specify the interface.                   |

**Mode** User Exec and Privileged Exec

**Example** To show detailed PIM-SM information for all PIM-SM configured interfaces, use the command:

```
awplus# show ip pim sparse-mode local-members
```

To show detailed PIM-SM information for the PIM-SM configured interface vlan1, use the command:

```
awplus# show ip pim sparse-mode local-members vlan1
```

**Output** Figure 38-8: Example output from the **show ip pim sparse-mode local-members** command

```
awplus#show ip pim sparse-mode local-members
PIM Local membership information

vlan1:
 (*, 224.0.0.4) : Include

vlan203:
 (*, 223.0.0.3) : Include
```

**Output** Figure 38-9: Example output from the **show ip pim sparse-mode local-members** command on a specific interface.

```
awplus#show ip pim sparse-mode local-members vlan1
PIM Local membership information

vlan1:
 (*, 224.0.0.4) : Include
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode mroute

**Overview** Use this command to display the IP multicast routing table or the IP multicast routing table based on a specific address or addresses.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

If the platform supports multicast for VRFs then specifying a VRF name will show the multicast routing table for that VRF or use global for the global VRF. Not specifying a VRF will display the information for all VRFs.

**Syntax**

```
show ip pim sparse-mode mroute brief
show ip pim sparse-mode mroute
show ip pim sparse-mode mroute <group-address>
show ip pim sparse-mode mroute <source-address>
show ip pim sparse-mode mroute <source-address> <group-address>
```

**Syntax (VRF-lite)**

```
show ip pim [vrf <vrf-name>|global] sparse-mode mroute brief
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
<group-address>
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
<source-address>
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
<source-address> <group-address>
```

| Parameter        | Description                                                                                               |
|------------------|-----------------------------------------------------------------------------------------------------------|
| vrf              | Applies the command to the specified VRF instance.                                                        |
| <vrf-name>       | The VRF instance name.                                                                                    |
| global           | The global routing and forwarding table                                                                   |
| brief            | Shows only a summary of the number of each type of multicast entry and the cache.                         |
| <group-address>  | Group IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that group.   |
| <source-address> | Source IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that source. |

**Mode** Privileged Exec

**Usage notes** Note that when a feature license is enabled, the output for the **show ip pim sparse-mode mroute** command will only show 32 interfaces because of the terminal display width limit. Use the **show ip pim sparse-mode mroute detail** command to display detailed entries of the IP multicast routing table.

**Example** To display the IP multicast routing table for the address 40.40.40.11, enter the command:

```
awplus# show ip pim sparse-mode mroute 40.40.40.11
```

**Output** Figure 38-10: Example output from **show ip pim sparse-mode mroute brief**

```
awplus#show ip pim sparse-mode mroute brief

**Command  
changes**

Version 5.4.7-1.1: VRF-lite support added to SBx8100.

Version 5.4.8-1.1: VRF-lite support added to x930, SBx908 GEN2.

Version 5.4.8-2.1: **brief** parameter added.

# show ip pim sparse-mode mroute detail

**Overview** Use this command to display detailed entries of the IP multicast routing table, or detailed entries of the IP multicast routing table based on the specified address or addresses.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

If the platform supports multicast for VRFs then specifying a VRF name will show the PIM-SM RP mappings for that VRF or use global for the global VRF. Not specifying a VRF will display the information for all VRFs.

**Syntax**

```
show ip pim sparse-mode mroute [<group-address>] detail
show ip pim sparse-mode mroute [<source-address>] detail
show ip pim sparse-mode mroute [<group-address>
<source-address>] detail
show ip pim sparse-mode mroute [<source-address>
<group-address>] detail
```

**Syntax (VRF-lite)**

```
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
[<group-address>] detail
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
[<source-address>] detail
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
[<group-address> <source-address>] detail
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
[<source-address> <group-address>] detail
```

| Parameter        | Description                                                                                               |
|------------------|-----------------------------------------------------------------------------------------------------------|
| vrf              | Applies the command to the specified VRF instance.                                                        |
| <vrf-name>       | The VRF instance name.                                                                                    |
| global           | The global routing and forwarding table.                                                                  |
| <group-address>  | Group IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that group.   |
| <source-address> | Source IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that source. |
| detail           | Show detailed information.                                                                                |

**Usage notes** Based on the group and source address, the output is the selected route if present in the multicast route tree.

**Mode** User Exec and Privileged Exec

**Examples** The following example commands show detailed entries for IP multicast routing tables:

```
awplus# show ip pim sparse-mode mroute detail
awplus# show ip pim sparse-mode mroute 40.40.40.11 detail
awplus# show ip pim sparse-mode mroute 224.1.1.1 detail
awplus# show ip pim sparse-mode mroute 224.1.1.1 40.40.40.11
detail
```

**Output** Figure 38-12: Example output from **show ip pim sparse-mode mroute detail**

```

# show ip pim sparse-mode neighbor

**Overview** Use this command to show the PIM-SM neighbor information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ip pim sparse-mode neighbor [<interface>] [<ip-address>] [detail]`

**Syntax (VRF-lite)** `show ip pim [vrf <vrf-name>|global] sparse-mode neighbor [<interface>] [<ip-address>] [detail]`

| Parameter    | Description                                                                                           |
|--------------|-------------------------------------------------------------------------------------------------------|
| vrf          | Applies the command to the specified VRF instance.                                                    |
| <vrf-name>   | The VRF instance name.                                                                                |
| global       | The global routing and forwarding table                                                               |
| <interface>  | Interface name. Show neighbors on an interface.                                                       |
| <ip-address> | Show neighbors with a particular address on an interface. The IP address entered in the form A.B.C.D. |
| detail       | Show detailed information.                                                                            |

**Mode** Privileged Exec

**Examples** To show the neighbor information for all interfaces, use the command:

```
awplus# show ip pim sparse-mode neighbor
```

To show the neighbor information for vlan5, use the command:

```
awplus# show ip pim sparse-mode neighbor vlan5 detail
```

**Output** Figure 38-13: Example output from the **show ip pim sparse-mode neighbor** command

| Neighbor Address Mode | Interface | Uptime/Expires    | Ver | DR Priority/ |
|-----------------------|-----------|-------------------|-----|--------------|
| 10.10.0.9             | vlan2     | 00:55:33/00:01:44 | v2  | 1 /          |
| 10.10.0.136           | vlan2     | 00:55:20/00:01:25 | v2  | 1 /          |
| 10.10.0.172           | vlan2     | 00:55:33/00:01:32 | v2  | 1 / DR       |
| 192.168.0.100         | vlan3     | 00:55:30/00:01:20 | v2  | N / DR       |

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode nexthop

**Overview** Use this command to see the next hop information as used by PIM-SM.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ip pim sparse-mode nexthop`

**Syntax (VRF-lite)** `show ip pim [vrf <vrf-name>|global]sparse-mode nexthop`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name.                             |
| global     | The global routing and forwarding table            |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip pim sparse-mode nexthop`

Figure 38-15: Example output from the **show ip pim sparse-mode nexthop** command

| Flags: N = New, R = RP, S = Source, U = Unreachable |      |             |              |         |                 |        |      |        |  |
|-----------------------------------------------------|------|-------------|--------------|---------|-----------------|--------|------|--------|--|
| Destination                                         | Type | Nexthop Num | Nexthop Addr | Nexthop | Nexthop Ifindex | Metric | Pref | Refcnt |  |
| 10.10.0.9                                           | .RS. | 1           | 0.0.0.0      | 4       | 0               | 0      | 1    |        |  |

**Table 2:** Parameters in output of the **show ip pim sparse-mode nexthop** command

| Parameter    | Description                                                                                                  |
|--------------|--------------------------------------------------------------------------------------------------------------|
| Destination  | The destination address for which PIM-SM requires next hop information.                                      |
| Type         | The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable. |
| Nexthop Num  | The number of next hops to the destination. PIM-SM always uses only 1 next hop.                              |
| Nexthop Addr | The address of the primary next hop gateway.                                                                 |

**Table 2:** Parameters in output of the **show ip pim sparse-mode nexthop** command (cont.)

| Parameter          | Description                                                 |
|--------------------|-------------------------------------------------------------|
| Nexthop<br>IfIndex | The interface on which the next hop gateway can be reached. |
| Nexthop Name       | The name of next hop interface.                             |
| Metric             | The metric of the route towards the destination.            |
| Preference         | The preference of the route towards destination.            |
| Refcnt             | Only used for debugging.                                    |

**Command  
changes**

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip pim sparse-mode packet statistics

**Overview** Use this command to display the current packet receive counts for PIM sparse-mode.

If the device supports multicast for VRFs, then specifying a VRF name will show the PIM sparse-mode packet statistics for that VRF or use global for the global VRF. Not specifying a VRF will display the information for all VRFs.

**Syntax** `show ip pim sparse-mode packet statistics`

**Syntax (VRF-lite)** `show ip pim [vrf <vrf-name>|global] sparse-mode packet statistics`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name.                             |
| global     | The global routing and forwarding table            |

**Mode** Privileged Exec

**Example** The following command displays the current packet receive counts for PIM sparse-mode:

```
awplus# configure terminal
awplus(config)# show ip pim sparse-mode statistics
```

**Output** Figure 38-16: Example output from **show ip pim sparse-mode statistics**

```
awplus(config)#show ip pim sparse-mode statistics

# show ip pim sparse-mode rp-hash

**Overview** Use this command to display the Rendezvous Point (RP) to be chosen based on the group selected.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ip pim sparse-mode rp-hash <group-addr>`

**Syntax (VRF-lite)** `show ip pim [vrf <vrf-name>|global] sparse-mode rp-hash <group-addr>`

| Parameter    | Description                                                              |
|--------------|--------------------------------------------------------------------------|
| vrf          | Applies the command to the specified VRF instance.                       |
| <vrf-name>   | The VRF instance name.                                                   |
| global       | The global routing and forwarding table.                                 |
| <group-addr> | The group address for which to find the RP, entered in the form A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip pim sparse-mode rp-hash 224.0.1.3`

Figure 38-18: Output from the **show ip pim sparse-mode rp-hash** command

```
RP: 10.10.11.35
Info source: 10.10.11.35, via bootstrap
```

**Related commands** [show ip pim sparse-mode rp mapping](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

# show ip pim sparse-mode rp mapping

**Overview** Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

If the platform supports multicast for VRFs then specifying a VRF name will show the PIM-SM RP mappings for that VRF or use global for the global VRF. Not specifying a VRF will display the information for all VRFs.

**Syntax** `show ip pim sparse-mode rp mapping`

**Syntax (VRF-lite)** `show ip pim [vrf <vrf-name>|global] sparse-mode rp mapping`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name.                             |
| global     | The global routing and forwarding table.           |

**Mode** Privileged Exec

**Example** `awplus# show ip pim sparse-mode rp mapping`

**Output** Figure 38-19: Example output from **show ip pim sparse-mode rp mapping**

```
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4
RP: 10.10.0.9
 Info source: 10.10.0.9, via bootstrap, priority 192
 Uptime: 16:52:39, expires: 00:02:50
```

**Related commands** [show ip pim sparse-mode rp-hash](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# undebbug all pim sparse-mode

**Overview** Use this command to disable all PIM-SM debugging.

Use this command if the device supports multicast for VRFs. This command will disable all PIM-SM debugging for all VRFs.

**Syntax** `undebbug all pim sparse-mode`

**Mode** Privileged Exec

**Example** `awplus# undebbug all pim sparse-mode`

**Related commands** [debug pim sparse-mode](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

## Introduction

**Overview** This chapter provides an alphabetical reference of PIM-SMv6 commands. For IPv6 Multicast commands, see [Multicast Commands](#). For an overview of PIM-SMv6, see the [PIM-SMv6 Feature Overview and Configuration Guide](#).

IPv6 must be enabled on an interface with the [ipv6 enable](#) command, IPv6 forwarding must be enabled globally for routing IPv6 with the [ipv6 forwarding](#) command, and IPv6 multicasting must be enabled globally with the [ipv6 multicast-routing](#) command before using PIM-SMv6 commands.

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the [clear ipv6 mroute](#) command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous IPv6 static multicast routes.

**NOTE:** The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306. The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPv6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

# clear ipv6 mroute pim

**Overview** Use this command to clear all Multicast Forwarding Cache (MFC) entries in PIM-SMv6.

**NOTE:** Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the *clear ipv6 mroute* command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

**Syntax** `clear ipv6 mroute [*] pim sparse-mode`

| Parameter | Description                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------|
| *         | Clears all PIM-SMv6 multicast routes. Using this command without this optional operator only deletes the multicast router table entries. |

**Mode** Privileged Exec

**Example** `awplus# clear ipv6 mroute pim sparse-mode`  
`awplus# clear ipv6 mroute * pim sparse-mode`

# clear ipv6 mroute pim sparse-mode

**Overview** Use this command to clear all multicast route table entries learned through PIM-SMv6 for a specified multicast group address, and optionally a specified multicast source address.

**NOTE:** Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the *clear ipv6 mroute* command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

**Syntax** `clear ipv6 mroute <Group-IPv6-add> pim sparse-mode`  
`clear ipv6 mroute <Group-IPv6-add> <Source-IPv6-add> pim sparse-mode`

| Parameter         | Description                                                           |
|-------------------|-----------------------------------------------------------------------|
| <Group-IPv6-add>  | Specify a multicast group IPv6 address, entered in the form X:X::X:X. |
| <Source-IPv6-add> | Specify a source group IPv6 address, entered in the form X:X::X:X.    |

**Mode** Privileged Exec

**Example** `awplus# clear ipv6 mroute 2001:db8:: pim sparse-mode`  
`awplus# clear ipv6 mroute 2001:db8:: 2002:db8:: pim sparse-mode`

# clear ipv6 pim sparse-mode bsr rp-set \*

**Overview** Use this command to clear all Rendezvous Point (RP) sets learned through the PIM-SMv6 Bootstrap Router (BSR).

**NOTE:** Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the [clear ipv6 mroute](#) command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

**Syntax** `clear ipv6 pim sparse-mode bsr rp-set *`

| Parameter | Description         |
|-----------|---------------------|
| *         | Clears all RP sets. |

**Mode** Privileged Exec

**Usage** For multicast clients, note that one router will be automatically or statically designated as the RP, and all routers must explicitly join through the RP. A Designated Router (DR) sends periodic Join/Prune messages toward a group-specific RP for each group that it has active members.

For multicast sources, note that the Designated Router (DR) unicasts Register messages to the RP encapsulating the data packets from the multicast source. The RP forwards decapsulated data packets toward group members.

**Example** `awplus# clear ipv6 pim sparse-mode bsr rp-set *`

# debug ipv6 pim sparse-mode

**Overview** Use this command to activate PIM-SMv6 debugging.

Use the **no** variant of this command to deactivate PIMv6 debugging.

Note that the **undebg ipv6 pim sparse-mode** command is an alias of the **no** variant of this command.

**Syntax** `debug ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop]  
[nsm] [state] [timer]`  
`no debug ipv6 pim sparse-mode [all] [events] [mfc] [mib]  
[nexthop] [nsm] [state] [timer]`

| Parameter | Description                                                                   |
|-----------|-------------------------------------------------------------------------------|
| all       | Activates/deactivates all PIM-SMv6 debugging.                                 |
| events    | Activates debug printing of PIM-SMv6 events.                                  |
| mfc       | Activates debug printing of MFC (Multicast Forwarding Cache).                 |
| mib       | Activates debug printing of PIM-SMv6 MIBs.                                    |
| nexthop   | Activates debug printing of PIM-SMv6 next hop communications.                 |
| nsm       | Activates debugging of PIM-SMv6 NSM (Network Services Module) communications. |
| state     | Activates debug printing of state transition on all PIM-SMv6 FSMs.            |
| timer     | Activates debug printing of PIM-SMv6 timers.                                  |

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal  
awplus(config)# terminal monitor  
awplus(config)# debug ipv6 pim sparse-mode all  
awplus# configure terminal  
awplus(config)# terminal monitor  
awplus(config)# debug ipv6 pim sparse-mode events  
awplus# configure terminal  
awplus(config)# terminal monitor  
awplus(config)# debug ipv6 pim sparse-mode nexthop`

**Validation  
output**

Figure 39-1: Example output from the **show debugging ipv6 pim sparse-mode** command after issuing **multiple debug ipv6 pim sparse-mode** commands

```
awplus#debug ipv6 pim sparse-mode state
awplus#debug ipv6 pim sparse-mode events
awplus#debug ipv6 pim sparse-mode packet
awplus#show debugging ipv6 pim sparse-mode
PIM-SMv6 debugging status:
 PIM event debugging is on
 PIM MFC debugging is off
 PIM state debugging is on
 PIM packet debugging is on
 PIM Hello HT timer debugging is off
 PIM Hello NLT timer debugging is off
 PIM Hello THT timer debugging is off
 PIM Join/Prune JT timer debugging is off
 PIM Join/Prune ET timer debugging is off
 PIM Join/Prune PPT timer debugging is off
 PIM Join/Prune KAT timer debugging is off
 PIM Join/Prune OT timer debugging is off
 PIM Assert AT timer debugging is off
 PIM Register RST timer debugging is off
 PIM Bootstrap BST timer debugging is off
 PIM Bootstrap CRP timer debugging is off
 PIM mib debugging is off
 PIM nsm debugging is off
 PIM nexthop debugging is off
```

**Related  
commands**

[show debugging ipv6 pim sparse-mode](#)  
[undebug all ipv6 pim sparse-mode](#)  
[undebug ipv6 pim sparse-mode](#)

# debug ipv6 pim sparse-mode packet

**Overview** Use this command to activate PIM-SMv6 packet debugging.  
Use the no variant of this command to deactivate PIMv6 packet debugging.

**Syntax** debug ipv6 pim sparse-mode packet {in|out}  
no debug ipv6 pim sparse-mode packet {in|out}

| Parameter | Description                                                        |
|-----------|--------------------------------------------------------------------|
| packet    | Activates debug printing of incoming and/or outgoing IPv6 packets. |
| in        | Specify incoming packet debugging.                                 |
| out       | Specify outgoing packet debugging.                                 |

**Mode** Privileged Exec and Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode packet in
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode packet out
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# no debug ipv6 pim sparse-mode packet in
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# no debug ipv6 pim sparse-mode packet out
```

**Related commands** [show debugging ipv6 pim sparse-mode](#)  
[undebug all ipv6 pim sparse-mode](#)

# debug ipv6 pim sparse-mode timer

**Overview** Use this command to enable debugging for the specified PIM-SMv6 timers.

Use the **no** variants of this command to disable debugging for the specified PIM-SMv6 timers.

**Syntax**

```
debug ipv6 pim sparse-mode timer assert [at]
no debug ipv6 pim sparse-mode timer assert [at]
debug pim ipv6 sparse-mode timer bsr [bst|crp]
no debug pim ipv6 sparse-mode timer bsr [bst|crp]
debug pim ipv6 sparse-mode timer hello [ht|nlt|tht]
no debug pim ipv6 sparse-mode timer hello [ht|nlt|tht]
debug pim ipv6 sparse-mode timer joinprune [jt|et|ppt|kat|ot]
no debug pim ipv6 sparse-mode timer joinprune
[jt|et|ppt|kat|ot]
debug pim ipv6 sparse-mode timer register [rst]
no debug pim ipv6 sparse-mode timer register [rst]
```

| Parameter | Description                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------|
| assert    | Enable or disable debugging for the Assert timers.                                                    |
| at        | Enable or disable debugging for the Assert Timer.                                                     |
| bsr       | Enable or disable debugging for the specified Bootstrap Router timer, or all Bootstrap Router timers. |
| bst       | Enable or disable debugging for the Bootstrap Router: Bootstrap Timer.                                |
| crp       | Enable or disable debugging for the Bootstrap Router: Candidate-RP Timer.                             |
| hello     | Enable or disable debugging for the specified Hello timer, or all Hello timers.                       |
| ht        | Enable or disable debugging for the Hello timer: Hello Timer.                                         |
| nlt       | Enable or disable debugging for the Hello timer: Neighbor Liveness Timer.                             |
| tht       | Enable or disable debugging for the Hello timer: Triggered Hello Timer.                               |
| joinprune | Enable or disable debugging for the specified JoinPrune timer, or all JoinPrune timers.               |
| jt        | Enable or disable debugging for the JoinPrune timer: upstream Join Timer.                             |
| et        | Enable or disable debugging for the JoinPrune timer: Expiry Timer.                                    |
| ppt       | Enable or disable debugging for the JoinPrune timer: PrunePending Timer.                              |

| Parameter | Description                                                                   |
|-----------|-------------------------------------------------------------------------------|
| kat       | Enable or disable debugging for the JoinPrune timer: KeepAlive Timer.         |
| ot        | Enable or disable debugging for the JoinPrune timer: Upstream Override Timer. |
| register  | Enable or disable debugging for the Register timers.                          |
| rst       | Enable or disable debugging for the Register timer: Register Stop Timer.      |

**Default** By default, all debugging is disabled.

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging for the PIM-SMv6 Bootstrap Router bootstrap timer, use the commands:

```
awplus(config)# debug ipv6 pim sparse-mode timer bsr bst
```

To enable debugging for the PIM-SMv6 Hello: neighbor liveness timer, use the command:

```
awplus(config)# debug ipv6 pim sparse-mode timer hello ht
```

To enable debugging for the PIM-SMv6 Joinprune expiry timer, use the command:

```
awplus# debug ipv6 pim sparse-mode timer joinprune et
```

To disable debugging for the PIM-SMv6 Register timer, use the command:

```
awplus# no debug ipv6 pim sparse-mode timer register
```

**Related commands** [show debugging ipv6 pim sparse-mode](#)

# ipv6 pim accept-register

**Overview** Use this command to configure the ability to filter out multicast sources specified by the given software IPv6 access-list at the Rendezvous Point (RP), so that the RP will accept/refuse to perform the register mechanism for the packets sent by the specified sources. By default, the RP accepts register packets from all multicast sources.

Use the **no** variant of this command to revert to default.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ipv6 pim accept-register list <access-list>`  
`no ipv6 pim accept-register`

**Syntax (VRF-lite)** `ipv6 pim [vrf <vrf-name>] accept-register list <access-list>`  
`no ipv6 pim [vrf <vrf-name>] accept-register`

| Parameter     | Description                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <access-list> | Specify a Standard or an Extended software IPv6 Access list. See <a href="#">IPv6 Software Access Control List (ACL) Commands</a> for supported IPv6 ACLs. |
| vrf           | Applies the command to the specified VRF instance.                                                                                                         |
| <vrf-name>    | The VRF instance name                                                                                                                                      |

**Mode** Global Configuration

**Example** To use the ACL named G2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G2 permit
2001:db8::/128
awplus(config)# ipv6 pim accept-register list G2
```

To remove the configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim accept-register
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim anycast-rp

**Overview** Use this command to configure Anycast RP (Rendezvous Point) in an RP set.

Use the **no** variant of this command to remove the configuration.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ipv6 pim anycast-rp <anycast-rp-address> <member-rp-address>`  
`no ipv6 pim anycast-rp <anycast-rp-address>`  
`[<member-rp-address>]`

**Syntax (VRF-lite)** `ipv6 pim [vrf <vrf-name>] anycast-rp <anycast-rp-address>`  
`<member-rp-address>`  
`no ipv6 pim [vrf <vrf-name>] anycast-rp <anycast-rp-address>`  
`[<member-rp-address>]`

| Parameter                               | Description                                                                                                                 |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;anycast-rp-address&gt;</code> | <code>&lt;X:X::X:X&gt;</code> Specify an Anycast IPv6 address to configure an Anycast RP (Rendezvous Point) in a RP set.    |
| <code>&lt;member-rp-address&gt;</code>  | <code>&lt;A:B::C:D&gt;</code> Specify an Anycast RP (Rendezvous Point) IPv6 address to configure an Anycast RP in a RP set. |
| <code>vrf</code>                        | Applies the command to the specified VRF instance.                                                                          |
| <code>&lt;vrf-name&gt;</code>           | The VRF instance name.                                                                                                      |

**Mode** Global Configuration

**Usage notes** Anycast is a network addressing and routing scheme where data is routed to the nearest or best destination as viewed by the routing topology. Compared to unicast with a one-to-one association between network address and network endpoint, and multicast with a one-to-many association between network address and network endpoint; anycast has a one-to-many association between network address and network endpoint. For anycast, each destination address identifies a set of receiver endpoints, from which only one receiver endpoint is chosen.

Anycast is often implemented using BGP to simultaneously advertise the same destination IPv6 address range from many sources, resulting in packets addressed to destination addresses in this range being routed to the nearest source announcing the given destination IPv6 address.

Use this command to specify the Anycast RP configuration in the Anycast RP set. Use the **no** variant of this command to remove the Anycast RP configuration. Note that the member RP address is optional when using the **no** parameter to remove the Anycast RP configuration. Removing the Anycast RP address also removes the member RP address.

**Examples** The following example shows how to configure the Anycast RP address with **ipv6 pim anycast-rp**:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

The following example shows how to remove the Anycast RP in the RP set specifying only the Anycast RP address with **no ipv6 pim anycast-rp**, but not specifying the member RP address:

```
awplus# configure terminal
awplus(config)# no ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim bsr-border

**Overview** Use the **ipv6 pim bsr-border** command to prevent Bootstrap Router (BSR) messages from being sent or received through an interface. The BSR border is the border of the PIM-SMv6 domain.

Use the **no** variant of this command to disable the configuration set with **ipv6 pim bsr-border**.

**Syntax** `ipv6 pim bsr-border`  
`no ipv6 pim bsr-border`

**Mode** Interface Configuration for a VLAN interface.

**Usage** When this command is configured on an interface, no PIM-SMv6 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM-SMv6 domain with this command to avoid BSR messages from being exchanged between the two PIM-SMv6 domains.

BSR messages should not be exchanged between different domains, because devices in one domain may elect Rendezvous Points (RPs) in the other domain, resulting in loss of isolation between the two PIM domains that would stop the PIM-SMv6 protocol from working as intended.

**Examples** The following example configures the VLAN interface vlan2 to be the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim bsr-border
```

The following example removes the VLAN interface vlan2 from the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim bsr-border
```

# ipv6 pim bsr-candidate

**Overview** Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IPv6 address mask of the interface.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ipv6 pim bsr-candidate <interface> [<hash>] [<priority>]`  
`no ipv6 pim bsr-candidate [<interface>]`

**Syntax (VRF-lite)** `ipv6 pim [vrf <vrf-name>] bsr-candidate <interface> [<hash>] [<priority>]`  
`no ipv6 pim [vrf <vrf-name>] bsr-candidate [<interface>]`

| Parameter   | Description                                                                                                                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface> | Specify the interface.                                                                                                                                                                                      |
| <hash>      | <0-128> configure the hash mask length used for RP selection. The default hash value if you do not configure this parameter is 126.                                                                         |
| <priority>  | <0-255> configure priority for a BSR candidate. Note that you must also specify the <hash> (mask length) when specifying the <priority>. The default priority if you do not configure this parameter is 64. |
| vrf         | Applies the command to the specified VRF instance.                                                                                                                                                          |
| <vrf-name>  | The VRF instance name                                                                                                                                                                                       |

**Mode** Global Configuration

**Default** The default hash parameter value is 126 and the default priority parameter value is 64.

**Examples** To set the BSR candidate to the VLAN interface vlan2, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim bsr-candidate vlan2 20 30
```

To withdraw the address of vlan2 from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ipv6 pim bsr-candidate vlan2
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim cisco-register-checksum

**Overview** Use this command to configure the option to calculate the Register Checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this option.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ipv6 pim cisco-register-checksum`  
`no ipv6 pim cisco-register-checksum`

**Syntax (VRF-lite)** `ipv6 pim [vrf <vrf-name>] cisco-register-checksum`  
`no ipv6 pim [vrf <vrf-name>] cisco-register-checksum`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name                              |

**Default** This command is disabled by default. By default, Register Checksum is calculated only over the header.

**Mode** Global Configuration

**Example** To calculate the Register Checksum over the whole packet, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim cisco-register-checksum
```

To return to calculating the Register Checksum over the header, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim cisco-register-checksum
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim cisco-register-checksum group-list

**Overview** Use this command to configure the option to calculate the Register Checksum over the whole packet on multicast groups as specified by the software IPv6 access-list. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ipv6 pim cisco-register-checksum group-list <IPv6-access-list>`  
`no ipv6 pim cisco-register-checksum group-list`  
`<IPv6-access-list>`

**Syntax (VRF-lite)** `ipv6 pim [vrf <vrf-name>] cisco-register-checksum group-list`  
`<IPv6-access-list>`  
`no ipv6 pim [vrf <vrf-name>] cisco-register-checksum group-list`  
`<IPv6-access-list>`

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;IPv6-access-list&gt;</code> | Optional. Specify a Standard or Extended software IPv6 access list.<br>See <a href="#">IPv6 Software Access Control List (ACL) Commands</a> for supported IPv6 ACLs.<br>Use this parameter to configure the option to calculate the Register Checksum over the whole packet on multicast groups as specified by an IPv6 access list entered after this command. |
| <code>vrf</code>                      | Applies the command to the specified VRF instance.                                                                                                                                                                                                                                                                                                              |
| <code>&lt;vrf-name&gt;</code>         | The VRF instance name                                                                                                                                                                                                                                                                                                                                           |

**Mode** Global Configuration

**Default** This command is disabled by default. By default, Register Checksum is calculated only over the header.

**Example** To calculate the Register Checksum over the whole packet on the multicast groups ff0x::db8:0:0/96, as specified by the ACL named G1, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G1 permit
ff0x::db8:0:0/96
awplus(config)# ipv6 pim cisco-register-checksum group-list G1
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim crp-cisco-prefix

**Overview** Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0.

Use the **no** variant of this command to revert to the default settings.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ipv6 pim crp-cisco-prefix`  
`no ipv6 pim crp-cisco-prefix`

**Syntax (VRF-lite)** `ipv6 pim [vrf <vrf-name>] crp-cisco-prefix`  
`no ipv6 pim [vrf <vrf-name>] crp-cisco-prefix`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name                              |

**Mode** Global Configuration

**Example** To enable this option, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim crp-cisco-prefix
```

To disable this option again, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim crp-cisco-prefix
```

**Related commands** [ipv6 pim rp-candidate](#)

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim dr-priority

**Overview** Use this command to set the Designated Router priority value.  
Use the **no** variant of this command to disable this function.

**Syntax** `ipv6 pim dr-priority <priority>`  
`no ipv6 pim dr-priority [<priority>]`

| Parameter  | Description                                                                                                                                      |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <priority> | Specify the Designated Router priority value, in the range 0 to 4294967294. Note that a higher value has a higher preference or higher priority. |

**Default** The default value is 1. The negated form of this command restores the value to the default.

**Mode** Interface Configuration for a VLAN interface.

**Examples** To set the Designated Router priority value to 11234 for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim dr-priority
```

**Related commands** [ipv6 pim ignore-rp-set-priority](#)

# ipv6 pim exclude-genid

**Overview** Use this command to exclude the GenID option from Hello packets sent out by the PIM-SMv6 module on a particular interface. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

**Syntax** `ipv6 pim exclude-genid`  
`no ipv6 pim exclude-genid`

**Default** By default, this command is disabled; the GenID option is included.

**Mode** Interface Configuration for a VLAN interface.

**Examples** To exclude the GenID option in Hello packets on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim exclude-genid
```

To include the GenID option in Hello packets, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim exclude-genid
```

# ipv6 pim ext-srcs-directly-connected

**Overview** Use this command to configure PIM-SMv6 to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM-SMv6 to treat only directly connected sources as directly connected.

**Syntax** `ipv6 pim ext-srcs-directly-connected`  
`no ipv6 pim ext-srcs-directly-connected`

**Default** The **no** variant of this command is the default behavior.

**Mode** Interface Configuration for a VLAN interface.

**Example** To configure PIM-SMv6 to treat all sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim ext-srcs-directly-connected
```

To configure PIM-SMv6 to treat only directly connected sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim ext-srcs-directly-connected
```

# ipv6 pim hello-holdtime

**Overview** This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 \* the current hello-interval.

**Syntax** `ipv6 pim hello-holdtime <holdtime>`  
`no ipv6 pim hello-holdtime`

| Parameter  | Description                                                                      |
|------------|----------------------------------------------------------------------------------|
| <holdtime> | <1-65535><br>The holdtime value in seconds (no fractional seconds are accepted). |

**Default** The default hello-holdtime value is 3.5 \* the current hello-interval. The default hello-holdtime is restored using the negated form of this command.

**Mode** Interface Configuration for a VLAN interface.

**Usage** Each time the hello-interval is updated, the hello-holdtime is also updated, according to the following rules:

If the hello-holdtime is not configured; or if the hello-holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 \* hello-interval). Otherwise, it retains the configured value.

**Examples** To configure a hello-holdtime of 123 seconds on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-holdtime 123
```

To reset the hello-holdtime to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim hello-holdtime
```

# ipv6 pim hello-interval

**Overview** This command configures a hello-interval value for PIM-SMv6.

Use the **no** variant of this command to reset the hello-interval for PIM-SMv6 to the default.

**Syntax** `ipv6 pim hello-interval <interval>`  
`no ipv6 pim hello-interval`

| Parameter  | Description                                                      |
|------------|------------------------------------------------------------------|
| <interval> | <1-65535> The value in seconds (no fractional seconds accepted). |

**Default** The default hello-interval value is 30 seconds. The default is restored using the negated form of this command.

**Mode** Interface Configuration for a VLAN interface.

**Usage** When the hello-interval is configured, and the hello-holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 \* hello-interval). Otherwise, the hello-holdtime value is the configured value.

**Example** To set the hello-interval to 123 seconds on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-interval 123
```

To set the hello-interval to the default on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim hello-interval
```

# ipv6 pim ignore-rp-set-priority

**Overview** Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

Use the **no** variant of this command to disable this setting.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ipv6 pim ignore-rp-set-priority`  
`no ipv6 pim ignore-rp-set-priority`

**Syntax (VRF-lite)** `ipv6 pim [vrf <vrf-name>] ignore-rp-set-priority`  
`no ipv6 pim [vrf <vrf-name>] ignore-rp-set-priority`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name                              |

**Mode** Global Configuration

**Usage** This command is used to inter-operate with older Cisco IOS versions.

**Example** To enable this option, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim ignore-rp-set-priority
```

To disable this option again, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim ignore-rp-set-priority
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim jp-timer

**Overview** Use this command to set the PIM-SMv6 join/prune timer. Note that the value set by the join/prune timer is the value that the device puts into the holdtime field of the join/prune packets it sends to its neighbors.

Use the **no** variant of this command to return the PIM-SMv6 join/prune timer to its default value of 210 seconds.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ipv6 pim jp-timer <1-65535>`  
`no ipv6 pim jp-timer [<1-65535>]`

**Syntax (VRF-lite)** `ipv6 pim [vrf <vrf-name>] jp-timer <1-65535>`  
`no ipv6 pim [vrf <vrf-name>] jp-timer [<1-65535>]`

| Parameter  | Description                                                             |
|------------|-------------------------------------------------------------------------|
| <1-65535>  | Specifies the Join/Prune timer value. The default value is 210 seconds. |
| vrf        | Applies the command to the specified VRF instance.                      |
| <vrf-name> | The VRF instance name                                                   |

**Default** The default PIM-SMv6 join/prune timer value is 210 seconds.

**Mode** Global Configuration

**Example** To change the join/prune timer to 300 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim jp-timer 300
```

To return the join/prune timer to its default value, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim jp-timer
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim neighbor-filter

**Overview** This command enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-SMv6 will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering IPv6 access list.

Use the **no** variant of this command to disable this function.

**Syntax** `ipv6 pim neighbor-filter <IPv6-accesslist>`  
`no ipv6 pim neighbor-filter <IPv6-accesslist>`

| Parameter                             | Description                                                                                                                                                                                                     |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;IPv6-access list&gt;</code> | Specify a Standard or an Extended software IPv6 access list name for the PIM-SMv6 neighbor filter.<br>See the <a href="#">IPv6 Software Access Control List (ACL) Commands</a> chapter for supported IPv6 ACLs. |

**Default** By default, there is no neighbor filtering applied to an interface.

**Mode** Interface Configuration for a VLAN interface.

**Example** To enable filtering on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 access-list standard filter1 deny
fe80:20e:cff:fe01:facc
awplus(config-if)# ipv6 access-list standard filter1 permit any
awplus(config-if)# ipv6 pim neighbor-filter filter1
```

# ipv6 pim register-rate-limit

**Overview** Use this command to configure the rate of register packets sent by this DR, in units of packets per second. The configured rate is per (S, G) state, and is not a system wide rate.

Use the **no** variant of this command to remove the limit.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ipv6 pim register-rate-limit <1-65535>`  
`no ipv6 pim register-rate-limit`

**Syntax (VRF-lite)** `ipv6 pim [vrf <vrf-name>] register-rate-limit <1-65535>`  
`no ipv6 pim [vrf <vrf-name>] register-rate-limit`

| Parameter  | Description                                                          |
|------------|----------------------------------------------------------------------|
| <1-65535>  | Specifies the maximum number of packets that can be sent per second. |
| vrf        | Applies the command to the specified VRF instance.                   |
| <vrf-name> | The VRF instance name                                                |

**Mode** Global Configuration

**Default** The default is 0, which means no rate limit.

**Examples** To set the rate limit to 3444 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rate-limit 3444
```

To remove the rate limit, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim register-rate-limit
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim register-rp-reachability

**Overview** Use this command to enable the RP reachability check for PIMv6 Register processing at the DR. The default setting is no checking for RP-reachability.

Use the **no** variant of this command to disable this processing.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ipv6 pim register-rp-reachability`  
`no ipv6 pim register-rp-reachability`

**Syntax (VRF-lite)** `ipv6 pim [vrf <vrf-name>] register-rp-reachability`  
`no ipv6 pim [vrf <vrf-name>] register-rp-reachability`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name                              |

**Default** This command is disabled; by default, there is no checking for RP-reachability.

**Mode** Global Configuration

**Examples** To check for RP reachability, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rp-reachability
```

To stop checking for RP reachability, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim register-rp-reachability
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim register-source

**Overview** Use this command to configure the source IPv6 address of register packets sent by this DR, overriding the default source IPv6 address, which is the IPv6 address of the RPF interface toward the source host.

Use the **no** variant of this command to remove the IPv6 source address of Register packets sent by this DR, reverting back to use the default IPv6 source address that is the address of the RPF interface toward the source host.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ipv6 pim register-source [<source-IPv6-address>|<interface>]`  
`no ipv6 pim register-source`

**Syntax (VRF-lite)** `ipv6 pim [vrf <vrf-name>] register-source`  
`[<source-IPv6-address>|<interface>]`  
`no ipv6 pim [vrf <vrf-name>] register-source`

| Parameter             | Description                                                                                       |
|-----------------------|---------------------------------------------------------------------------------------------------|
| <source-IPv6-address> | The IPv6 address, entered in the form X:X::X:X, to be used as the source of the register packets. |
| <interface>           | The name of the interface to be used as the source of the register packets.                       |
| vrf                   | Applies the command to the specified VRF instance.                                                |
| <vrf-name>            | The VRF instance name                                                                             |

**Mode** Global Configuration

**Usage** The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback IPv6 interface address, but can also be a physical IPv6 address. This IPv6 address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM-SMv6 enabled.

**Mode** Global Configuration

**Examples** To configure the register source as 3ffe::24:2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source 3ffe::24:2
```

To configure the register source as vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source vlan2
```

To change back to the default, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# no ipv6 pim register-source
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim register-suppression

**Overview** Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ipv6 pim register-suppression <1-65535>`  
`no ipv6 pim register-suppression`

**Syntax (VRF-lite)** `ipv6 pim [vrf <vrf-name>] register-suppression <1-65535>`  
`no ipv6 pim [vrf <vrf-name>] register-suppression`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| <1-65535>  | Register suppression on time in seconds.           |
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name                              |

**Mode** Global Configuration

**Default** 60 seconds

**Usage** Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the [ipv6 pim rp-register-kat](#) command is not used.

**Examples** To change the register-suppression time to 192 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-suppression 192
```

To return to the default register-suppression time of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim register-suppression
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim rp-address

**Overview** Use this command to statically configure RP (Rendezvous Point) address for IPv6 multicast groups.

Use the **no** variant of this command to remove a statically configured RP (Rendezvous Point) address for IPv6 multicast groups.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ipv6 pimv6 rp-address <IPv6-address> [<IPv6-access-list>]  
[override]`  
`no ipv6 pim rp-address <IPv6-address> [<IPv6-access-list>]  
[override]`

**Syntax (VRF-lite)** `ipv6 pim [vrf <vrf-name>] rp-address <IPv6-address>  
[<IPv6-access-list>] [override]`  
`no ipv6 pim [vrf <vrf-name>] rp-address <IPv6-address>  
[<IPv6-access-list>] [override]`

| Parameter          | Description                                                                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <IPv6-address>     | Specify the IPv6 address of the Rendezvous Point, entered in the form X:X::X:X.                                                                                    |
| <IPv6-access-list> | Specify a Standard or an Extended software IPv6 access-list name.<br>See <a href="#">IPv6 Software Access Control List (ACL) Commands</a> for supported IPv6 ACLs. |
| override           | Specify this optional parameter keyword to enable any statically defined RPs to override dynamically learned RPs.                                                  |
| vrf                | Applies the command to the specified VRF instance.                                                                                                                 |
| <vrf-name>         | The VRF instance name                                                                                                                                              |

**Mode** Global Configuration

**Usage notes** The AlliedWare Plus™ PIM-SMv6 implementation supports multiple static RPs. It also supports usage of static RPs and the BSR mechanism simultaneously. This command is used to statically configure the RP address for IPv6 multicast groups.

You need to understand the following information before using this command:

If the RP address that is configured by the BSR, and the RP-address that is configured statically, are both available for a group range, then the RP address configured through BSR is chosen over the statically configured RP address.

A single static RP can be configured for multiple group ranges using software IPv6 access- lists (ACLs). However, configuring multiple static RPs with the same RP address is not allowed. The static RP can either be configured for the whole

multicast group range ff00::/8 (without using IPv6 ACLs) or for specific group ranges (using IPv6 ACLs). For example:

- **ipv6 pim rp-address 3ffe:10:10:5::153** will configure static RP 3ffe:10:10:5::153 for the default group range ff00::/8.
- **ipv6 pim rp-address 3fee:20:20:5::153 grp-list** will configure static RP 3fee:20:20:5::153 for all the group ranges represented by permit filters in the defined named **grp-list** ACL.

If multiple static RPs are available for a group range, then one with the highest IPv6 address is chosen.

Only **permit** filters in IPv6 ACLs are considered as valid group ranges. The default **permit** filter ::/0 is converted to the default multicast filter ff00::/8.

After configuration, the RP address is inserted into a static RP group tree based on the configured group ranges. For each group range, multiple static RPs are maintained in a list. This list is sorted in a descending order of IPv6 addresses. When selecting static RPs for a group range, the first element (which is the static RP with highest IPv6 address) is chosen.

RP address deletion is handled by removing the static RP from all the existing group ranges and recalculating the RPs for existing TIB states if required.

Group mode and RP address mappings learned through BSR take precedence over mappings statistically defined by this command. Commands with the **override** parameter take precedence over dynamically learned mappings.

**Examples** To configure static-RP 3ffe:30:30:5::153 for the group range 2001:db8::/128 (specified in the permit filter in the ACL named G2), use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G2 permit
2001:db8::/128
awplus(config)# ipv6 pim rp-address 3ffe:30:30:5::153 G2
```

To undo that configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp-address 3ffe:30:30:5::153 G2
```

**Related commands** [ipv6 pim rp-candidate](#)  
[ipv6 pim rp-register-kat](#)

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim rp-candidate

**Overview** Use this command to make the device an RP (Rendezvous Point) candidate, using the IPv6 address of the specified interface.

Use the **no** variant of this command to stop the device from being an RP candidate.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ipv6 pim rp-candidate <interface> [priority <priority>|interval <interval>|grouplist <accesslist>]`  
`no ipv6 pim rp-candidate [<interface>]`

**Syntax (VRF-lite)** `ipv6 pim [vrf <vrf-name>] rp-candidate <interface> [priority <priority>|interval <interval>|grouplist <accesslist>]`  
`no ipv6 pim [vrf <vrf-name>] rp-candidate [<interface>]`

| Parameter                 | Description                                                                                                                                                         |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface>               | The interface name.                                                                                                                                                 |
| priority<br><priority>    | The RP candidate priority for this interface on this device, from 0 to 255. The lower the priority value, the more likely this candidate is to become the RP.       |
| interval<br><interval>    | The advertisement interval, from 1 to 16383 seconds.                                                                                                                |
| grouplist<br><accesslist> | A Standard or an Extended software IPv6 access list name. See the <a href="#">IPv6 Software Access Control List (ACL) Commands</a> chapter for supported IPv6 ACLs. |
| vrf                       | Applies the command to the specified VRF instance.                                                                                                                  |
| <vrf-name>                | The VRF instance name                                                                                                                                               |

**Default** The priority value for a candidate RP is 192 by default until specified using the **priority** parameter.

**Mode** Global Configuration

**Usage notes** Note that issuing the command **ipv6 pim rp-candidate <interface>** without optional **priority**, **interval**, or **grouplist** parameters will configure the candidate RP with a priority value of 192.

**Examples** To specify a priority of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-candidate vlan2 priority 3
```

To stop the device from being an RP candidate on vlan2 , use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp-candidate vlan2
```

To use the ACL named G2 to specify the group prefixes that are advertised in association with the RP address, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G2 permit
2001:db8::/128
awplus(config)# ipv6 pim rp-candidate vlan2 group-list G2
```

Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim rp embedded

**Overview** Use this command to configure and enable embedded RP (Rendezvous Point) in PIM-SMv6.

This command only applies to the embedded RP group range **ff7x::/12** and **fffx::/12**.

Use the **no** variant of this command to disable embedded RP support. Since embedded RP support is enabled by default, use the **no** variant of this command to disable the default.

**Syntax** `ipv6 pim rp embedded`  
`no ipv6 pim rp embedded`

**Syntax (VRF-lite)** `ipv6 pim [vrf <vrf-name>] rp embedded`  
`no ipv6 pim [vrf <vrf-name>] rp embedded`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name                              |

**Mode** Global Configuration

**Default** Enabled

**Examples** The following example re-enables embedded RP support, the default state in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp embedded
```

The following example disables embedded RP support, which is enabled by default in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp embedded
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim rp-register-kat

**Overview** Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SMv6 Register packets.

Use the **no** variant of this command to return the PIM-SMv6 KAT timer to its default value of 210 seconds.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ipv6 pim rp-register-kat <1-65535>`  
`no ipv6 pim rp-register-kat`

**Syntax (VRF-lite)** `ipv6 pim [vrf <vrf-name>] rp-register-kat <1-65535>`  
`no ipv6 pim [vrf <vrf-name>] rp-register-kat`

| Parameter  | Description                                                         |
|------------|---------------------------------------------------------------------|
| <1-65536>  | Specify the KAT timer in seconds. The default value is 210 seconds. |
| vrf        | Applies the command to the specified VRF instance.                  |
| <vrf-name> | The VRF instance name                                               |

**Mode** Global Configuration

**Default** The default PIM-SMv6 KAT timer value is 210 seconds.

**Examples** To change the KAT timer to 3454 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-register-kat 3454
```

To return the KAT timer to its default setting, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp-register-kat
```

**Related commands** [ipv6 pim rp-address](#)  
[ipv6 pim rp-candidate](#)

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim sparse-mode

**Overview** Use this command to enable PIM-SMv6 on an interface.  
Use the **no** variant of this command to disable PIM-SMv6 on an interface.

**Syntax** `ipv6 pim sparse-mode`  
`no ipv6 pim sparse-mode`

**Mode** Interface Configuration for a VLAN interface.

**Examples** To enable PIM-SMv6 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode
```

To disable PIM-SMv6 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode
```

# ipv6 pim sparse-mode passive

**Overview** Use this command to enable and disable PIM-SMv6 passive mode operation for local members on an interface.

Use the **no** variant of this command to disable PIM-SMv6 passive mode operation for local members on an interface.

**Syntax** `ipv6 pim sparse-mode passive`  
`no ipv6 pim sparse-mode passive`

**Mode** Interface Configuration for a VLAN interface.

**Usage** Passive mode essentially stops PIM-SMv6 transactions on the interface, allowing only the MLD mechanism to be active.

**Examples** To enable passive mode on vlan2, use the commands

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode passive
```

To disable passive mode on vlan2, use the commands

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode passive
```

# ipv6 pim spt-threshold

**Overview** This command turns on the ability for the last-hop PIM-SMv6 router to switch to SPT (shortest-path tree).

The **no** variant of this command turns off the ability for the last-hop PIM-SMv6 router to switch to SPT.

**NOTE:** The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ipv6 pim spt-threshold`  
`no ipv6 pim spt-threshold`

**Syntax (VRF-lite)** `ipv6 pim [vrf <vrf-name>] spt-threshold`  
`no ipv6 pim [vrf <vrf-name>] spt-threshold`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name                              |

**Mode** Global Configuration

**Examples** To enable the last-hop PIM-SMv6 router to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim spt-threshold
```

To stop the last-hop PIM-SMv6 router from being able to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim spt-threshold
```

**Related commands** [ipv6 pim spt-threshold group-list](#)

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim spt-threshold group-list

**Overview** Use this command to turn on/off the ability for the last-hop PIM-SMv6 router to switch to SPT (shortest-path tree) for multicast group addresses as specified by the given software IPv6 access-list.

Use the **no** variant of this command to turn off switching to the SPT.

**NOTE:** The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `ipv6 pim spt-threshold group-list <IPv6-access-list>`  
`no ipv6 pim spt-threshold group-list <IPv6-access-list>`

**Syntax (VRF-lite)** `ipv6 pim [vrf <vrf-name>] spt-threshold group-list <IPv6-access-list>`  
`no ipv6 pim [vrf <vrf-name>] spt-threshold group-list <IPv6-access-list>`

| Parameter          | Description                                                                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <IPv6-access-list> | Specify a Standard or an Extended software IPv6 access-list name.<br>See the <a href="#">IPv6 Software Access Control List (ACL) Commands</a> chapter for supported IPv6 ACLs. |
| vrf                | Applies the command to the specified VRF instance.                                                                                                                             |
| <vrf-name>         | The VRF instance name                                                                                                                                                          |

**Mode** Global Configuration

**Examples** To enable the last-hop PIM-SMv6 router to switch to SPT for groups specified by the ACL named G1, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim spt-threshold group-list G1
awplus(config)# ipv6 access-list standard G1 permit
2001:db8::/128
```

To stop the last-hop PIM-SMv6 router from being able to switch to SPT for groups specified by the ACL named G1, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim spt-threshold group-list G1
```

**Related commands** [ipv6 pim spt-threshold](#)

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim ssm

**Overview** Use this command to define the Source Specific Multicast (SSM) range of IPv6 multicast addresses. PIM-SMv6 routers will only install (S,G) entries for multicast groups (addresses) residing in the SSM range.

Use the **no** variant of this command to disable the SSM range.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax**

```
ipv6 pim ssm range <named-access-list>
ipv6 pim ssm default
no ipv6 pim ssm
```

**Syntax (VRF-lite)**

```
ipv6 pim [vrf <vrf-name>] ssm range <named-access-list>
ipv6 pim [vrf <vrf-name>] ssm default
no ipv6 pim [vrf <vrf-name>] ssm
```

| Parameter           | Description                                        |
|---------------------|----------------------------------------------------|
| default             | Use FF3x::/32 as the range for SSM.                |
| range               | Specify an ACL for group range to be used for SSM. |
| <named-access-list> | Specify a named standard access list.              |
| vrf                 | Applies the command to the specified VRF instance. |
| <vrf-name>          | The VRF instance name                              |

**Default** Disabled

**Mode** Global Configuration

**Usage** Any (\*,G) or (S,G,rpt) joins received for multicast groups (addresses) within the range are not installed in PIM-SMv6 mroute table.

**Examples** To configure the SSM service for the IPv6 address range defined by IPv6 access list 'IPv6-PIM-SSM-RANGE', use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard IPv6-PIM-SSM-RANGE
permit ff3e::/32
awplus(config)# ipv6 pim ssm range IPv6-PIM-SSM-RANGE
```

To use the default address range for PIM-SSM, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 pim ssm default
```

To disable PIM-SSM, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim ssm
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# ipv6 pim unicast-bsm

**Overview** Use this command to enable support for the sending and receiving of unicast Boot Strap Messages (BSM) on an interface.

Use the **no** variant of this command to disable the sending and receiving of unicast BSM on an interface.

**Syntax** `ipv6 pim unicast-bsm`  
`no ipv6 pim unicast-bsm`

**Mode** Interface Configuration for a VLAN interface.

**Default** Unicast BSM is disabled by default on an interface.

**Usage** This command provides backward compatibility with older versions of the Boot Strap Router (BSR) specification, which directs unicast BSM to refresh the state of new or restarting neighbors. The current BSR specification defines a No Forward BSM to achieve the same result.

**Examples** To enable BSM messages on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim unicast-bsm
```

To disable BSM messages on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim unicast-bsm
```

# service pim6

**Overview** Use this command to enable IPv6 PIM sparse mode services.

Use the **no** version of the command to disable unused IPv6 PIM sparse mode services.

**Syntax** `service pim6`  
`no service pim6`

**Default** Enabled

**Mode** Global Configuration

**Usage notes** Sometimes it may be desirable to disable unused services, in order to reduce memory use.

Disabling the PIM services will only take effect after you save the configuration and restart the device.

**Example** To disable the IPv6 PIM sparse mode service, use the commands:

```
awplus# configure terminal
awplus(config)# no service pim6
```

**Output** Figure 39-2: Example output from **no service pim6**

```
awplus(config)#no service pim6
% Save the config and restart the device for this change to take
effect
```

**Command changes** Version 5.5.0-0.1: command added

# show debugging ipv6 pim sparse-mode

**Overview** Use this command to see what debugging is turned on for PIM-SMv6.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** show debugging ipv6 pim sparse-mode

**Mode** User Exec and Privileged Exec

**Example** To display PIM-SMv6 debugging settings, use the command:

```
awplus# show debugging ipv6 pim sparse-mode
```

Figure 39-3: Example output from the **show debugging ipv6 pim sparse-mode** command

```
awplus#show debugging ipv6 pim sparse-mode

# show ipv6 pim sparse-mode bsr-router

**Overview** Use this command to show the PIM-SMv6 Bootstrap Router (BSR) IPv6 address.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ipv6 pim sparse-mode bsr-router`

**Syntax (VRF-lite)** `show ipv6 pim [vrf <vrf-name>|global] sparse-mode bsr-router`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name.                             |
| global     | The global routing and forwarding table.           |

**Mode** User Exec and Privileged Exec

**Example** To display the BSR IPv6 address, use the command:

```
awplus# show ipv6 pim sparse-mode bsr-router
```

**Output** Figure 39-4: Example output from the **show ipv6 pim sparse-mode bsr-router** command

```
awplus#show ipv6 pim sparse-mode bsr-router
PIM6v2 Bootstrap information
 BSR address: 2001:203::213 (?)
 Uptime: 00:36:25, BSR Priority: 64, Hash mask length: 126
 Expires: 00:01:46
 Role: Candidate BSR
 State: Candidate BSR

 Candidate RP: 2001:5::211(vlan5)
 Advertisement interval 60 seconds
 Next C-RP advertisement in 00:00:43
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 pim sparse-mode interface

**Overview** Use this command to show PIM-SMv6 interface information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ipv6 pim sparse-mode interface [detail]`

**Syntax (VRF-lite)** `show ipv6 pim [vrf <vrf-name>|global] sparse-mode interface [detail]`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| detail     | Show detailed information.                         |
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name.                             |
| global     | The global routing and forwarding table.           |

**Mode** User Exec and Privileged Exec

**Examples** To display information about all PIM-SMv6 interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode interface
```

**Output** Figure 39-5: Example output from the **show ipv6 pim sparse-mode interface** command

```
awplus#show ipv6 pim sparse-mode interface
Interface VIFindex Ver/ Nbr DR
 Mode Count Priority
vlan2 0 v2/S 2 1
 Address : fe80::207:e9ff:fe02:81d

 DR : this system
```

**Table 1:** Parameters in the output from the **show ipv6 pim sparse-mode interface** command

| Parameters  | Description                                   |
|-------------|-----------------------------------------------|
| Address     | Primary PIM-SMv6 address.                     |
| Interface   | Name of the PIM-SMv6 interface.               |
| VIF Index   | The Virtual Interface index of the interface. |
| Ver/Mode    | PIMv6 version/Sparse mode.                    |
| Nbr Count   | Neighbor count of the PIM-SMv6 interface.     |
| DR Priority | Designated Router priority.                   |
| DR          | The IPv6 address of the Designated Router.    |

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 pim sparse-mode local-members

**Overview** Use this command to show detailed local member information on an interface configured for PIM-SMv6. If you do not specify an interface then detailed local member information is shown for all interfaces configured for PIM-SMv6.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ipv6 pim sparse-mode local-members [<interface>]`

**Syntax (VRF-lite)** `show ipv6 pim [vrf <vrf-name>|global] sparse-mode local-members [<interface>]`

| Parameter   | Description                                        |
|-------------|----------------------------------------------------|
| <interface> | An interface to display information about.         |
| vrf         | Applies the command to the specified VRF instance. |
| <vrf-name>  | The VRF instance name.                             |
| global      | The global routing and forwarding table.           |

**Mode** User Exec and Privileged Exec

**Example** To show detailed PIM-SMv6 information for all PIM-SMv6 configured interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode local-members
```

**Output** Figure 39-7: Example output from the **show ipv6 pim sparse-mode local-members** command

```
awplus#show ipv6 pim sparse-mode local-members
PIM Local membership information

vlan1:

```
awplus#show ipv6 pim sparse-mode local-members vlan1
PIM Local membership information

vlan1:

(*, ff02::1:ff6b:4783) : Include
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 pim sparse-mode mroute

**Overview** Use this command to display the IPv6 multicast routing table, or the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be entered simultaneously; two source IPv6 addresses cannot be entered simultaneously.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax**

```
show ipv6 pim sparse-mode mroute
show ipv6 pim sparse-mode mroute <group-IPv6-address>
show ipv6 pim sparse-mode mroute <source-IPv6-address>
show ipv6 pim sparse-mode mroute <group-IPv6-address>
<source-IPv6-address>
show ipv6 pim sparse-mode mroute <source-IPv6-address>
<group-IPv6-address>
show ipv6 pim sparse-mode mroute brief
```

**Syntax (VRF-lite)**

```
show ipv6 pim [vrf <vrf-name>|global] sparse-mode mroute
show ipv6 pim [vrf <vrf-name>|global] sparse-mode mroute
<group-IPv6-address>
show ipv6 pim [vrf <vrf-name>|global] sparse-mode mroute
<source-IPv6-address>
show ipv6 pim [vrf <vrf-name>|global] sparse-mode mroute
<group-IPv6-address> <source-IPv6-address>
show ipv6 pim [vrf <vrf-name>|global] sparse-mode mroute
<source-IPv6-address> <group-IPv6-address>
show ipv6 pim [vrf <vrf-name>|global] sparse-mode mroute brief
```

| Parameter             | Description                                                                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <group-IPv6-address>  | Group IPv6 address, entered in the form X:X::X:X. Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.  |
| <source-IPv6-address> | Source IPv6 address, entered in the form X:X::X:X. Based on the source and group IPv6 address, the output is the selected route if present in the multicast route tree. |
| brief                 | Brief display.                                                                                                                                                          |
| vrf                   | Applies the command to the specified VRF instance.                                                                                                                      |

| Parameter  | Description                              |
|------------|------------------------------------------|
| <vrf-name> | The VRF instance name.                   |
| global     | The global routing and forwarding table. |

**Mode** User Exec and Privileged Exec

**Usage notes** Note that when a feature license is enabled, the output for the `show ipv6 pim sparse-mode mroute` command will only show 100 interfaces because of the terminal display width limit. Use the `show ipv6 pim sparse-mode mroute detail` command to display detailed entries of the IPv6 multicast routing table.

**Examples**

```
awplus# show ipv6 pim sparse-mode mroute
awplus# show ipv6 pim sparse-mode mroute 2001:db8::
awplus# show ipv6 pim sparse-mode mroute 2001:db8:: 2002:db8::
awplus# show ipv6 pim sparse-mode mroute brief
```

**Output** Figure 39-9: Example output from the `show ipv6 pim sparse-mode mroute` command

```
awplus#show ipv6 pim sparse-mode mroute
IPv6 Multicast Routing Table

```
awplus#show ipv6 pim sparse-mode mroute brief
IPv6 Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 0
(S,G) Entries: 2
(S,G,rpt) Entries: 2
FCR Entries: 0
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 pim sparse-mode mroute detail

**Overview** Use this command to display detailed entries of the IPv6 multicast routing table, or detailed entries of the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be used simultaneously; two IPv6 source addresses cannot be used simultaneously.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax**

```
show ipv6 pim sparse-mode mroute
[<group-IPv6-address>|<source-IPv6-address>] detail

show ipv6 pim sparse-mode mroute [<group-IPv6-address>
<source-IPv6-address>] detail

show ipv6 pim sparse-mode mroute [<source-IPv6-address>
<group-IPv6-address>] detail
```

**Syntax (VRF-lite)**

```
show ipv6 pim [vrf <vrf-name>|global] sparse-mode mroute
[<group-IPv6-address>|<source-IPv6-address>] detail

show ipv6 pim [vrf <vrf-name>|global] sparse-mode mroute
[<group-IPv6-address> <source-IPv6-address>] detail

show ipv6 pim [vrf <vrf-name>|global] sparse-mode mroute
[<source-IPv6-address> <group-IPv6-address>] detail
```

| Parameter             | Description                                                                                                  |
|-----------------------|--------------------------------------------------------------------------------------------------------------|
| <group-IPv6-address>  | Group IPv6 address, entered in the form X:X::X:X. Output is all multicast entries belonging to that group.   |
| <source-IPv6-address> | Source IPv6 address, entered in the form X:X::X:X. Output is all multicast entries belonging to that source. |
| detail                | Show detailed information.                                                                                   |
| vrf                   | Applies the command to the specified VRF instance.                                                           |
| <vrf-name>            | The VRF instance name.                                                                                       |
| global                | The global routing and forwarding table.                                                                     |

**Mode** User Exec and Privileged Exec

**Usage notes** Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.

**Examples**    awplus# show ipv6 pim sparse-mode mroute detail  
              awplus# show ipv6 pim sparse-mode mroute 2001:db8:: detail  
              awplus# show ipv6 pim sparse-mode mroute 2001:db8:: 2002:db8::  
              detail

**Output**    Figure 39-11: Example output from the **show ipv6 pim sparse-mode mroute detail** command

```
awplus#show ipv6 pim sparse-mode mroute detail

**Command changes**    Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 pim sparse-mode neighbor

**Overview** Use this command to show the PIM-SMv6 neighbor information.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ipv6 pim sparse-mode neighbor [<interface>]  
[<IPv6-address>] [detail]`

**Syntax (VRF-lite)** `show ipv6 pim [vrf <vrf-name>|global] sparse-mode neighbor  
[<interface>] [<IPv6-address>] [detail]`

| Parameter      | Description                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------|
| <interface>    | Interface name. Show neighbors on an interface.                                                          |
| <IPv6-address> | Show neighbors with a particular address on an interface. The IPv6 address entered in the form X:X::X:X. |
| detail         | Show detailed information.                                                                               |
| vrf            | Applies the command to the specified VRF instance.                                                       |
| <vrf-name>     | The VRF instance name.                                                                                   |
| global         | The global routing and forwarding table.                                                                 |

**Mode** User Exec and Privileged Exec

**Examples** `awplus# show ipv6 pim sparse-mode neighbor`  
`awplus# show ipv6 pim sparse-mode neighbor vlan5 detail`

**Output** Figure 39-12: Example output from the **show ipv6 pim sparse-mode neighbor** command

```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 pim sparse-mode nexthop

**Overview** Use this command to see the next hop information as used by PIM-SMv6.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ipv6 pim sparse-mode nexthop`

**Syntax (VRF-lite)** `show ipv6 pim [vrf <vrf-name>|global] sparse-mode nexthop`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name.                             |
| global     | The global routing and forwarding table.           |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 pim sparse-mode nexthop`

**Output** Figure 39-14: Example output from the **show ipv6 pim sparse-mode nexthop** command

|                                                     |      |             |                         |                 |              |        |      |        |
|-----------------------------------------------------|------|-------------|-------------------------|-----------------|--------------|--------|------|--------|
| awplus#show ipv6 pim sparse-mode nexthop            |      |             |                         |                 |              |        |      |        |
| Flags: N = New, R = RP, S = Source, U = Unreachable |      |             |                         |                 |              |        |      |        |
| Destination                                         | Type | Nexthop Num | Nexthop Addr            | Nexthop Ifindex | Nexthop Name | Metric | Pref | Refcnt |
| 3ffe:10:10:5::153                                   | .RS. | 1           | fe80::20e:cff:fe01:facc | 2               | 30           | 110    | 1    |        |

**Table 2:** Parameters in output of the **show ipv6 pim sparse-mode nexthop** command

| Parameter   | Description                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------|
| Destination | The destination address for which PIM-SMv6 requires next hop information.                                    |
| Type        | The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable. |
| Nexthop Num | The number of next hops to the destination. PIM-SMv6 always uses only 1 next hop.                            |

**Table 2:** Parameters in output of the **show ipv6 pim sparse-mode nexthop** command (cont.)

| Parameter       | Description                                                 |
|-----------------|-------------------------------------------------------------|
| Nexthop Addr    | The address of the primary next hop gateway.                |
| Nexthop IfIndex | The interface on which the next hop gateway can be reached. |
| Nexthop Name    | The name of next hop interface.                             |
| Metric          | The metric of the route towards the destination.            |
| Preference      | The preference of the route towards destination.            |
| Refcnt          | Only used for debugging.                                    |

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 pim sparse-mode rp-hash

**Overview** Use this command to display the Rendezvous Point (RP) to be chosen based on the IPv6 group address selected.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ipv6 pim sparse-mode rp-hash <IPv6-group-addr>`

**Syntax (VRF-lite)** `show ipv6 pim [vrf <vrf-name>|global] sparse-mode rp-hash <IPv6-group-addr>`

| Parameter         | Description                                                               |
|-------------------|---------------------------------------------------------------------------|
| <IPv6-group-addr> | The IPv6 group address used to find the RP, entered in the form X:X::X:X. |
| vrf               | Applies the command to the specified VRF instance.                        |
| <vrf-name>        | The VRF instance name.                                                    |
| global            | The global routing and forwarding table.                                  |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 pim sparse-mode rp-hash ff04:10`

**Output** Figure 39-15: Output from the **show ipv6 pim sparse-mode rp-hash** command:

```
awplus#show ipv6 pim sparse-mode rp-hash ff04::10
RP: 3ffe:10:10:5::153
Info source: 3ffe:10:10:5::153, via bootstrap
```

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# show ipv6 pim sparse-mode rp mapping

**Overview** Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax** `show ipv6 pim sparse-mode rp mapping`

**Syntax (VRF-lite)** `show ipv6 pim [vrf <vrf-name>|global] sparse-mode rp mapping`

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| vrf        | Applies the command to the specified VRF instance. |
| <vrf-name> | The VRF instance name.                             |
| global     | The global routing and forwarding table.           |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 pim sparse-mode rp mapping`

**Output** Figure 39-16: Output from the **show ipv6 pim sparse-mode rp mapping** command

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff00::/8
 RP: 3ffe:10:10:5::153
 Info source: 3ffe:10:10:5::153, via bootstrap, priority 192
 Uptime: 05:36:40
```

**Table 3:** Parameters in output of the **show ipv6 pim sparse-mode rp nexthop** command

| Parameter       | Description                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------|
| Destination     | The destination address for which PIM-SMv6 requires next hop information.                                    |
| Type            | The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable. |
| Nexthop Num     | The number of next hops to the destination. PIM-SMv6 always uses only 1 next hop.                            |
| Nexthop Addr    | The address of the primary next hop gateway.                                                                 |
| Nexthop IfIndex | The interface on which the next hop gateway can be reached.                                                  |
| Nexthop Name    | The name of next hop interface.                                                                              |
| Metric          | The metric of the route towards the destination.                                                             |
| Preference      | The preference of the route towards destination.                                                             |
| Refcnt          | Only used for debugging.                                                                                     |

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

# undebug all ipv6 pim sparse-mode

**Overview** Use this command to disable all PIM-SMv6 debugging.

**Syntax** `undebug all ipv6 pim sparse-mode`

**Mode** Privileged Exec

**Example** `awplus# undebug all ipv6 pim sparse-mode`

**Related commands** [debug ipv6 pim sparse-mode](#)

# undebg ipv6 pim sparse-mode

**Overview** Use this command to deactivate PIM-SMv6 debugging. Note that this command is an alias of the no variant of the [debug ipv6 pim sparse-mode](#) command.

**Syntax** undebg ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [state] [timer]

| Parameter | Description                                                                     |
|-----------|---------------------------------------------------------------------------------|
| all       | Deactivates all PIM-SMv6 debugging.                                             |
| events    | Deactivates debug printing of PIM-SMv6 events.                                  |
| mfc       | Deactivates debug printing of MFC (Multicast Forwarding Cache).                 |
| mib       | Deactivates debug printing of PIM-SMv6 MIBs.                                    |
| nexthop   | Deactivates debug printing of PIM-SMv6 next hop communications.                 |
| nsm       | Deactivates debugging of PIM-SMv6 NSM (Network Services Module) communications. |
| state     | Deactivates debug printing of state transition on all PIM-SMv6 FSMs.            |
| timer     | Deactivates debug printing of PIM-SMv6 timers.                                  |

**Mode** Privileged Exec and Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebg ipv6 pim sparse-mode all
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebg ipv6 pim sparse-mode events
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebg ipv6 pim sparse-mode nexthop
```

**Validation  
Output**

Figure 39-18: Example output from the **show debugging ipv6 pim sparse-mode** command after issuing the **undebg ipv6 pim sparse-mode all** command

```
awplus#undebg ipv6 pim sparse-mode all
awplus#show debugging ipv6 pim sparse-mode
PIM-SMv6 debugging status:
 PIM event debugging is off
 PIM MFC debugging is off
 PIM state debugging is off
 PIM packet debugging is off

# debug pim dense-mode all

**Overview** This command enables PIM-DM debugging.  
The **no** variant of this command disables PIM-DM debugging.

**Syntax** `debug pim dense-mode all`  
`no debug pim dense-mode all`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode all`

**Output** Figure 40-1: Example output from the **debug pim dense-mode all** command

```
PIM event debugging is on
PIM MFC debugging is on
PIM state debugging is on
PIM packet debugging is on
PIM incoming packet debugging is on
PIM outgoing packet debugging is on
```

**Validation Commands** `show debugging pim dense-mode`

**Related commands** `debug pim dense-mode context`  
`debug pim dense-mode decode`  
`debug pim dense-mode encode`  
`debug pim dense-mode fsm`  
`debug pim dense-mode mrt`  
`debug pim dense-mode nexthop`  
`debug pim dense-mode nsm`  
`debug pim dense-mode vif`

# debug pim dense-mode context

- Overview** This command enables debugging of general configuration context.
- The **no** variant of this command disables debugging of general configuration context.
- This command also enables debugging of general configuration and Virtual Routing (VR), and Virtual Routing and Forwarding (VRF) context.
- The **no** variant of this command also disables debugging of general configuration and Virtual Routing (VR), and Virtual Routing and Forwarding (VRF) context.

**Syntax** `debug pim dense-mode context`  
`no debug pim dense-mode context`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode context`

**Related commands**

- `debug pim dense-mode all`
- `debug pim dense-mode decode`
- `debug pim dense-mode encode`
- `debug pim dense-mode fsm`
- `debug pim dense-mode mrt`
- `debug pim dense-mode nexthop`
- `debug pim dense-mode nsm`
- `debug pim dense-mode vif`

# debug pim dense-mode decode

**Overview** This command enables debugging of the PIM-DM message decoder.  
The **no** variant of this command disables debugging of the PIM-DM message decoder.

**Syntax** `debug pim dense-mode decode`  
`no debug pim dense-mode decode`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode decoder`

**Related commands**

- `debug pim dense-mode all`
- `debug pim dense-mode context`
- `debug pim dense-mode encode`
- `debug pim dense-mode fsm`
- `debug pim dense-mode mrt`
- `debug pim dense-mode nexthop`
- `debug pim dense-mode nsm`
- `debug pim dense-mode vif`

# debug pim dense-mode encode

**Overview** This command enables debugging of the PIM-DM message encoder.  
The **no** variant of this command disables debugging of the PIM-DM message encoder.

**Syntax** `debug pim dense-mode encode`  
`no debug pim dense-mode encode`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode encoder`

**Related commands** `debug pim dense-mode all`  
`debug pim dense-mode context`  
`debug pim dense-mode decode`  
`debug pim dense-mode fsm`  
`debug pim dense-mode mrt`  
`debug pim dense-mode nexthop`  
`debug pim dense-mode nsm`  
`debug pim dense-mode vif`

# debug pim dense-mode fsm

**Overview** This command enables debugging of Finite-State Machine (FSM) specific information of all Multicast Routing Table (MRT) and MRT Virtual Multicast Interface (MRT-VIF) entries.

The **no** variant of this command disables debugging of Finite-State Machine (FSM) specific information of all Multicast Routing Table (MRT) and MRT Virtual Multicast Interface (MRT-VIF) entries.

**Syntax** `debug pim dense-mode fsm`  
`no debug pim dense-mode fsm`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode fsm`

**Related commands**

- `debug pim dense-mode all`
- `debug pim dense-mode context`
- `debug pim dense-mode decode`
- `debug pim dense-mode encode`
- `debug pim dense-mode mrt`
- `debug pim dense-mode nexthop`
- `debug pim dense-mode nsm`
- `debug pim dense-mode vif`

# debug pim dense-mode mrt

**Overview** This command enables debugging of MRT and MRT-VIF entry handling (for example, creation and deletion of).

The **no** variant of this command disables debugging of MRT and MRT-VIF entry handling.

**Syntax** `debug pim dense-mode mrt`  
`no debug pim dense-mode mrt`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode mrt`

**Related commands** `debug pim dense-mode all`  
`debug pim dense-mode context`  
`debug pim dense-mode decode`  
`debug pim dense-mode encode`  
`debug pim dense-mode fsm`  
`debug pim dense-mode nexthop`  
`debug pim dense-mode nsm`  
`debug pim dense-mode vif`

# debug pim dense-mode nexthop

**Overview** This command enables debugging of Reverse Path Forwarding (RPF) neighbor next hop cache handling.

The **no** variant of this command disables debugging of Reverse Path Forwarding (RPF) neighbor next hop cache handling.

**Syntax** `debug pim dense-mode nexthop`  
`no debug pim dense-mode nexthop`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode nexthop`

**Related commands** `debug pim dense-mode all`  
`debug pim dense-mode context`  
`debug pim dense-mode decode`  
`debug pim dense-mode encode`  
`debug pim dense-mode fsm`  
`debug pim dense-mode mrt`  
`debug pim dense-mode nsm`  
`debug pim dense-mode vif`

# debug pim dense-mode nsm

**Overview** This command enables debugging of PIM-DM interface with NSM.  
The **no** variant of this command disables debugging of PIM-DM interface with NSM.

**Syntax** `debug pim dense-mode nsm`  
`no debug pim dense-mode nsm`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode nsm`

**Related commands** `debug pim dense-mode all`  
`debug pim dense-mode context`  
`debug pim dense-mode decode`  
`debug pim dense-mode encode`  
`debug pim dense-mode fsm`  
`debug pim dense-mode mrt`  
`debug pim dense-mode nexthop`  
`debug pim dense-mode vif`

# debug pim dense-mode vif

**Overview** This command enables debugging of VIF handling.  
The **no** variant of this command disables debugging of VIF handling.

**Syntax** `debug pim dense-mode vif`  
`no debug pim dense-mode vif`

**Mode** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug pim dense-mode vif`

**Related commands** `debug pim dense-mode all`  
`debug pim dense-mode context`  
`debug pim dense-mode decode`  
`debug pim dense-mode encode`  
`debug pim dense-mode fsm`  
`debug pim dense-mode mrt`  
`debug pim dense-mode nexthop`  
`debug pim dense-mode nsm`

# ip pim dense-mode

**Overview** This command enables or disables PIM-DM operation from Interface mode on the current VLAN interface. This command also disables passive mode on the VLAN interface if passive mode has been enabled using an [ip pim dense-mode passive](#) command.

The **no** variant of this command disables all PIM-DM activities on the interface.

**Syntax** `ip pim dense-mode`  
`no ip pim dense-mode`

**Mode** Interface Configuration for a VLAN interface.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip pim dense-mode`

# ip pim dense-mode passive

**Overview** This command enables PIM-DM passive mode operation from Interface mode on the current VLAN interface.

The **no** variant of this command disables passive mode.

**Syntax** `ip pim dense-mode passive`  
`no ip pim dense-mode passive`

**Mode** Interface Configuration for a VLAN interface.

**Usage** Configuring a VLAN interface as a passive PIM-DM interface indicates that the VLAN interface is connected to a stub network (i.e. a network that does not contain any PIM Routers). So, multicast streams that arrive on other PIM-DM interfaces can be routed to hosts on the passive PIM-DM interface, but no PIM neighbor relationships will be formed on the passive PIM-DM interface.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip pim dense-mode passive`

# ip pim dense-mode wrong-vif-suppression

**Overview** Use this command to permit or block packets that arrive on the wrong VLAN Interface (VIF) for PIM dense-mode.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to disable dense-mode wrong VIF suppression

**Syntax** `ip pim dense-mode wrong-vif-suppression`  
`no ip pim dense-mode wrong-vif-suppression`

**Syntax (VRF-lite)** `ip pim [vrf <vrf-name>]dense-mode wrong-vif-suppression`  
`no ip pim [vrf <vrf-name>]dense-mode wrong-vif-suppression`

| Parameter  | Description                           |
|------------|---------------------------------------|
| vrf        | Apply this command to a VRF instance. |
| <vrf-name> | The name of the VRF instance.         |

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** This command enables wrong VIF suppression for PIM dense-mode. Wrong VIF suppression prevents multicast packets received on the wrong upstream interface from being copied to the CPU.

**Examples** To enable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim dense-mode wrong-vif-suppression
```

To disable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim dense-mode wrong-vif-suppression
```

**Example (VRF-lite)** To enable wrong VIF suppression for the VRF instance 'blue', use the commands:

```
awplus# configure terminal
awplus(config)# ip pim vrf blue sparse-mode
wrong-vif-suppression
```

To disable wrong VIF suppression for the VRF instance 'blue', use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim vrf blue sparse-mode
wrong-vif-suppression
```

**Command changes** Version 5.4.8-2.3: command added.

# ip pim ext-srcs-directly-connected

**Overview** Use this command to configure PIM to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM to treat only directly connected sources as directly connected.

**Syntax** `ip pim ext-srcs-directly-connected`  
`no ip pim ext-srcs-directly-connected`

**Default** The **no** variant of this command is the default behavior.

**Mode** Interface Configuration for a VLAN interface.

**Example** To configure PIM to treat all sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim ext-srcs-directly-connected
```

## ip pim hello-holdtime (PIM-DM)

**Overview** This command configures a **hello-holdtime**. The PIM **hello-holdtime** on a VLAN interface is the period which the router will wait to receive a hello from neighbors on that interface. If the router does not receive a hello from a given neighbor within that period, then it will decide that the neighbor is no longer an active PIM Router, and will terminate the neighbor relationship.

You cannot configure a **hello-holdtime** value that is less than the current **hello-interval**. Each time the **hello-interval** is updated, the **hello-holdtime** is also updated, according to the following rules:

- If the **hello-holdtime** is not configured; or if the hello holdtime is configured and less than the current **hello-interval** value, it is modified to 3.5 times the **hello-interval** value.
- Otherwise, it retains the configured value.

Use the **no** variant of this command to return the hello-holdtime value to its default of 3.5 times the current hello-interval value.

**Syntax** `ip pim hello-holdtime <holdtime>`  
`no ip pim hello-holdtime`

| Parameter                     | Description                                                                                         |
|-------------------------------|-----------------------------------------------------------------------------------------------------|
| <code>&lt;holdtime&gt;</code> | <code>&lt;1-65535&gt;</code><br>The holdtime value in seconds (no fractional seconds are accepted). |

**Mode** Interface Configuration for a VLAN interface.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip pim hello-holdtime 123`

# ip pim hello-interval (PIM-DM)

**Overview** This command configures a PIM **hello-interval** value. The PIM **hello-interval** on a VLAN interface is the period at which the router will transmit PIM hello messages on that interface.

When the **hello-interval** is configured, and the **hello-holdtime** is not configured, or when the configured **hello-holdtime** value is less than the new **hello-interval** value; the **hello-holdtime** value is modified to 3.5 times the **hello-interval** value. Otherwise, the **hello-holdtime** value is the configured value. The default is 30 seconds.

Use the **no** variant of this command to reset the **hello-interval** to the default.

**Syntax** `ip pim hello-interval <interval>`  
`no ip pim hello-interval`

| Parameter  | Description                                                      |
|------------|------------------------------------------------------------------|
| <interval> | <1-65535> The value in seconds (no fractional seconds accepted). |

**Mode** Interface Configuration for a VLAN interface.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip pim hello-interval 123`

# ip pim max-graft-retries

**Overview** This command configures PIM-DM to send a limited number of Graft message retries, after which time the device will remove all information regarding the particular (Source, Group), or until the device receives an acknowledgment, whichever occurs first.

The **no** variant of this command configures PIM-DM to send Graft message retries until the device receives an acknowledgment, which is the default behavior.

**Syntax** `ip pim max-graft-retries <1-65535>`  
`no pim max-graft-retries`

| Parameter         | Description                                                 |
|-------------------|-------------------------------------------------------------|
| no                | Negate a command or set its defaults.                       |
| ip                | Internet Protocol (IP).                                     |
| pim               | PIM Interface commands.                                     |
| max-graft-retries | PIM Graft message retries.                                  |
| <1-65535>         | Graft message retries before ceasing Graft message retries. |

**Default** By default, Graft retries are sent by PIM-DM until the device receives an acknowledgment.

**Mode** Interface Configuration for a VLAN interface.

**Usage** Graft messages are used to reduce the join latency when a previously pruned branch of the source tree must be grafted back, when a member joins the group after the PIM-DM device has sent a Prune message to prune unwanted traffic. Graft messages are the only PIM-DM messages that receive an acknowledgment.

If Graft messages were not used, then the member waiting for pruned off traffic would have to wait up to 3 minutes for the periodic re-flooding to occur to begin receiving multicast traffic again. By using Grafts, the Prune can be reversed much faster than waiting for periodic re-flooding to begin receiving multicast traffic again.

**Examples** To configure PIM-DM on the VLAN interface vlan2 to send a maximum of 10 Graft message retries, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim max-graft-retries 10
```

To configure PIM-DM on the VLAN interface vlan2 to send Graft message retries forever, which is the default behavior, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim max-graft-retries
```

**Validation  
Commands**

- show ip mroute
- show ip pim dense-mode mroute
- show running-config

## ip pim neighbor-filter (PIM-DM)

**Overview** Enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-DM will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering access list.

Use the **no** variant of this command to disable this function.

**Syntax** `ip pim neighbor-filter [<number>|<accesslist>]`  
`no ip pim neighbor-filter [<number>|<accesslist>]`

| Parameter    | Description                            |
|--------------|----------------------------------------|
| <number>     | <1-99> Standard IP access list number. |
| <accesslist> | IP access list name.                   |

**Default** By default, there is no filtering.

**Mode** Interface Configuration for a VLAN interface.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip pim neighbor-filter 14`

# ip pim propagation-delay

**Overview** This command configures the PIM **propagation-delay** value. The PIM **propagation-delay** is the expected delay in the transfer of PIM messages across the VLAN interface that it is attached to.

Use the **no** variant of this command to return the **propagation-delay** to the default (1000 milliseconds).

**Syntax** `ip pim propagation-delay <delay>`  
`no ip pim propagation-delay`

| Parameter | Description                                                                 |
|-----------|-----------------------------------------------------------------------------|
| <delay>   | <1000-5000> The value in milliseconds.<br>The default is 1000 milliseconds. |

**Default** The propagation-delay is set to 1000 milliseconds by default.

**Mode** Interface Configuration for a VLAN interface.

**Examples**

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim propagation-delay 2000
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim propagation-delay
```

# ip pim state-refresh origination-interval

**Overview** This command configures a PIM **state-refresh origination-interval** value. The origination interval is the number of seconds between PIM state refresh control messages. The default is 60 seconds.

Use the **no** variant of this command to return the origination interval to the default.

**Syntax** `ip pim state-refresh origination-interval <interval>`  
`no ip pim state-refresh origination-interval`

| Parameter  | Description                                                                                                                               |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <interval> | <1-100> The integer value in seconds (no fractional seconds accepted). The default <b>state-refresh origination-interval</b> value is 60. |

**Default** The state-refresh origination-interval is set to 60 seconds by default, and is reset using negation.

**Mode** Interface Configuration for a VLAN interface.

**Example** `awplus# configure terminal`  
`awplus(config)# interface vlan2`  
`awplus(config-if)# ip pim state-refresh origination-interval 65`

# service pdm

**Overview** Use this command to enable PIM dense mode services.  
Use the **no** version of the command to disable unused PIM dense mode services.

**Syntax** service pdm  
no service pdm

**Default** Enabled

**Mode** Global Configuration

**Usage notes** Sometimes it may be desirable to disable unused services, in order to reduce memory use.  
Disabling the PIM services will only take effect after you save the configuration and restart the device.

**Example** To disable the PIM dense mode service, use the commands:

```
awplus# configure terminal
awplus(config)# no service pdm
```

**Output** Figure 40-2: Example output from **no service pdm**

```
awplus(config)#no service pdm
% Save the config and restart the device for this change to take
effect
```

**Command changes** Version 5.5.0-0.1: command added

# show debugging pim dense-mode

**Overview** This command displays the status of the debugging of the system.  
For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show debugging pim dense-mode`

**Mode** User Exec and Privileged Exec

**Output** Figure 40-3: Example output from the show debugging pim dense-mode command

```
PIM-DM Debugging status:

PIM-DM VR-VRF Context debugging is off
PIM-DM Decoder debugging is off
PIM-DM Encoder debugging is off
PIM-DM FSM debugging is off
PIM-DM MRT debugging is off
PIM-DM NHOP debugging is off
PIM-DM NSM debugging is off
PIM-DM VIF debugging is off
```

**Related commands** [debug pim dense-mode all](#)

# show ip pim dense-mode interface

**Overview** This command displays the PIM-DM interface information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim dense-mode interface`

**Mode** User Exec and Privileged Exec

**Example** To display information about the PIM-DM interfaces, use the command:

```
awplus# show ip pim dense-mode interface
```

## Output

**Table 1:** Example output from the **show ip pim dense-mode interface** command

| Total configured interfaces: 100      Maximum allowed: 100                     |           |          |              |              |
|--------------------------------------------------------------------------------|-----------|----------|--------------|--------------|
| Total active interfaces:      100                                              |           |          |              |              |
| Address                                                                        | Interface | VIFIndex | Ver/<br>Mode | Nbr<br>Count |
| 10.1.100.4                                                                     | vlan100   | 4        | v2/D         | 0            |
| 10.2.101.10                                                                    | vlan1001  | 5        | v2/D         | 0            |
| 10.2.102.10                                                                    | vlan1002  | 6        | v2/D         | 0            |
| 10.2.103.10                                                                    | vlan1003  | 7        | v2/D         | 0            |
| 10.2.104.10                                                                    | vlan1004  | 8        | v2/D         | 0            |
| 10.2.105.10                                                                    | vlan1005  | 9        | v2/D         | 0            |
| 10.2.106.10                                                                    | vlan1006  | 10       | v2/D         | 0            |
| 10.2.107.10                                                                    | vlan1007  | 11       | v2/D         | 0            |
| ... Note that this screen has been edited to remove any additional interfaces. |           |          |              |              |

**Table 2:** Parameters in the output of the **show ip pim dense-mode interface** command

| Parameter                   | Description                                                             |
|-----------------------------|-------------------------------------------------------------------------|
| Total configured interfaces | The number of configured PIM Dense Mode interfaces.                     |
| Maximum allowed             | The maximum number of PIM Dense Mode interfaces that can be configured. |
| Total active interfaces     | The number of active PIM Dense Mode interfaces.                         |
| Address                     | Primary PIM-DM address.                                                 |

**Table 2:** Parameters in the output of the **show ip pim dense-mode interface** command (cont.)

| Parameter | Description                              |
|-----------|------------------------------------------|
| Interface | Name of the PIM-DM interface.            |
| VIF Index | The Virtual Interface index of the VLAN. |
| Ver/Mode  | PIM version/Dense mode.                  |
| Nbr Count | Neighbor count of the PIM-DM interface.  |

**Related commands**

- [ip pim dense-mode](#)
- [show ip pim dense-mode neighbor](#)

# show ip pim dense-mode interface detail

**Overview** This command displays detailed information on a PIM-DM interface.  
For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** `show ip pim dense-mode interface detail`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip pim dense-mode interface detail`

**Output** Figure 40-4: Example output from the **show ip pim dense-mode interface detail** command

```
vlan2 (vif-id: 0):

Address 192.168.1.53/24
Hello period 30 seconds, Next Hello in 30 seconds

Neighbors:
 192.168.1.152/32
 192.168.1.149/32
vlan3 (vif-id: 2):
Address 192.168.10.53/24
Hello period 30 seconds, Next Hello in 8 seconds
Neighbors: none
```

# show ip pim dense-mode mroute

- Overview** Use this command to display the IP PIM-DM multicast routing table.
- For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).
- Syntax** `show ip pim dense-mode mroute`
- Mode** User Exec and Privileged Exec
- Example** `awplus# show ip pim dense-mode mroute`
- Output** Figure 40-5: Example output from the **show ip pim dense-mode mroute** command

```
PIM-DM Multicast Routing Table

(192.168.10.52, 224.1.1.1)
Source directly connected on vlan3
State-Refresh Originator State: Originator
Upstream IF: vlan3, State: Forwarding
Downstream IF List:
vlan2, in 'olist':
Downstream State: NoInfo
Assert State: NoInfo
```

# show ip pim dense-mode neighbor

**Overview** This command displays PIM-DM neighbor information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim dense-mode neighbor`

**Mode** User Exec and Privileged Exec

**Usage notes** The total number of PIM-DM neighbors is restricted to 500 PIM-DM neighbors.

When the 500 PIM-DM neighbor limit is reached, as a result of receiving hello packets from new PIM-DM neighbors, a log entry will be issued to the log file in the below format:

```
<date> <time> <facility>.<severity> <program[<pid>]>: <message>

2008 Dec 10 00:58:39 user.err x908 PIM-DM[1150]: [VIF] Nbr
Create: Cannot create more than 500 neighbours - ignoring
neighbour 100.0.1.247/32 on vlan100
```

**Example** `awplus# show ip pim dense-mode neighbor`

**Output** Figure 40-6: Example output from the **show ip pim dense-mode neighbor** command

```
Total number of neighbors: 500
Neighbor-Address Interface Uptime/Expires Ver
192.168.1.152 vlan2 17:15:42/00:01:28 v2
192.168.1.149 vlan2 17:15:34/00:01:34 v2
```

# show ip pim dense-mode neighbor detail

- Overview** This command displays detailed PIM-DM neighbor information.  
For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).
- Syntax** `show ip pim dense-mode neighbor detail`
- Mode** User Exec and Privileged Exec
- Example** `awplus# show ip pim dense-mode neighbor detail`
- Output** Figure 40-7: Example output from the **show ip pim dense-mode neighbor detail** command

```
Neighbor 192.168.1.152 (vlan2)
Up since 17:16:20, Expires in 00:01:20
Neighbor 192.168.1.149 (vlan2)
Up since 17:16:12, Expires in 00:01:26
```

# show ip pim dense-mode nexthop

**Overview** This command displays the next hop information as used by PIM-DM. In the context of PIM-DM, the term '**next hop**' refers to the next hop router on the path back to the source address of a multicast stream.

For information on filtering and saving command output, see the ["Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide](#).

**Syntax** `show ip pim dense-mode nexthop`

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ip pim dense-mode nexthop`

**Output** Figure 40-8: Example output from the **show ip pim dense-mode neighbor nexthop** command

| Destination   | Nexthop Num | Nexthop Addr | Nexthop Interface | Metric | Pref |
|---------------|-------------|--------------|-------------------|--------|------|
| 192.168.10.52 | 1           | 0.0.0.0      | vlan2             | 3      | 1    |

**Table 3:** Parameters in the output of the **show ip pim dense-mode neighbor nexthop** command

| Parameter         | Description                                                            |
|-------------------|------------------------------------------------------------------------|
| Destination       | Destination address for which PIM-DM requires next hop information.    |
| Nexthop Num       | Number of next hops to the destination. PIM can only use one next hop. |
| Nexthop Addr      | Address of the current next hop gateway.                               |
| Nexthop Interface | Name of the next hop interface.                                        |
| Metric            | Metric of the route towards the destination.                           |
| Preference        | Preference of the route towards the destination.                       |

# undebug all pim dense-mode

**Overview** Use this command from the Global Configuration mode to disable all PIM-DM debugging.

**Syntax** `undebug all pim dense-mode`

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# undebug all pim dense-mode`

**Related commands**

- `debug pim dense-mode all`
- `debug pim dense-mode context`
- `debug pim dense-mode decode`
- `debug pim dense-mode encode`
- `debug pim dense-mode fsm`
- `debug pim dense-mode mrt`

- [“show ip msdp sa-cache”](#) on page 2366

# clear ip msdp sa-cache

**Overview** Use this command to clear all the source-active (SA) messages in the SA-cache. The SA-cache contains multicast SA messages that are being sent to or received from MSDP peers.

**Syntax** `clear ip msdp sa-cache`

**Mode** Privileged Exec

**Example** To remove all entries in the SA-cache, use the commands:

```
awplus# clear ip msdp sa-cache
```

**Related commands** [show ip msdp sa-cache](#)

**Command changes** Version 5.5.1-0.1: command added

# debug msdp

**Overview** Use this command to enable debugging for MSDP.  
Use the **no** variant of this command to disable debugging for MSDP.

**Syntax**

```
debug msdp all
debug msdp state
debug msdp packet [in|out]
no debug msdp all
no debug msdp state
no debug msdp packet [in|out]
```

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| all       | Enable all MSDP debugging options.          |
| state     | Enable debugging for the MSDP peer state.   |
| packet    | Enable debugging for MSDP packets.          |
| in        | Enable debugging for incoming MSDP packets. |
| out       | Enable debugging for outgoing MSDP packets. |

**Default** Debugging is disabled.

**Mode** Global Configuration or Privileged Exec

**Example** To enable debugging for the MSDP peer state, use the command:

```
awplus# debug msdp state
```

To enable debugging for incoming MSDP packets, use the command:

```
awplus# debug msdp packet in
```

To disable all MSDP debugging, use the command:

```
awplus# no debug msdp all
```

**Related commands**

- [debug msdp timer](#)
- [show debugging msdp](#)

**Command changes** Version 5.5.1-0.1: command added

# debug msdp timer

**Overview** Use this command to enable debugging for the specified MSDP timers.  
Use the **no** variant of this command to disable debugging for MSDP timers.

**Syntax** `debug msdp timer [connect|hold|keep-alive|sa-advert|sa-state]`  
`no debug msdp timer`  
`[connect|hold|keep-alive|sa-advert|sa-state]`

| Parameter  | Description                               |
|------------|-------------------------------------------|
| connect    | Debugging for the connect retry timer.    |
| hold       | Debugging for the peer hold-time timer.   |
| keep-alive | Debugging for the keep-alive timer.       |
| sa-advert  | Debugging for the SA-advertisement timer. |
| sa-state   | Debugging for the SA-cache timer.         |

**Default** Debugging is disabled.

**Mode** Privileged Exec

**Example** To enable debugging for all timers, use the command:

```
awplus# debug msdp timer
```

To enable debugging for the connect retry timer, use the command:

```
awplus# debug msdp timer connect
```

To disable debugging for the peer hold-time timer, use the command:

```
awplus# no debug msdp timer hold
```

**Related commands** [debug msdp](#)  
[show debugging msdp](#)

**Command changes** Version 5.5.1-0.1: command added

# ip msdp hold-time

**Overview** Use this command to configure the global MSDP hold-time timeout.

The hold-time timeout defines how long a peer will wait between MSDP messages before dropping the connection. It is important that the hold-time timeout is greater than the keep-alive timeout configured on each peer. The global hold-time will be overridden if a specific hold-time timeout is configured for an individual peer.

Use the **no** variant of this command to reset the hold-time timeout to the default (75 seconds).

**Syntax** `ip msdp hold-time <15-75>`  
`no ip msdp hold-time`

| Parameter | Description                         |
|-----------|-------------------------------------|
| <15-75>   | The hold-time timeout (in seconds). |

**Default** 75 seconds.

**Mode** Global Configuration

**Example** To configure the hold-time timeout to 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp hold-time 60
```

To reset the hold-time timeout to the default of 75 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp hold-time
```

**Related commands**

- `ip msdp keep-alive`
- `ip msdp mesh-group`
- `ip msdp mesh-group member`
- `ip msdp mesh-group member hold-time`
- `ip msdp mesh-group member keep-alive`
- `ip msdp peer`
- `ip msdp peer hold-time`
- `ip msdp peer keep-alive`
- `ip msdp sa-cache-timeout`

**Command changes** Version 5.5.1-0.1: command added

# ip msdp keep-alive

**Overview** Use this command to configure the global MSDP keep-alive timeout.

The keep-alive timeout defines the period between keep-alive messages being sent to each peer. It is important that the keep-alive timeout is less than the hold-time timeout configured on each peer device. The global keep-alive will be overridden if a specific keep-alive timeout is configured for an individual peer.

Use the **no** variant of this command to reset the keep-alive timeout to the default (60 seconds).

**Syntax** `ip msdp keep-alive <10-60>`  
`no ip msdp keep-alive`

| Parameter | Description                          |
|-----------|--------------------------------------|
| <10-60>   | The keep-alive timeout (in seconds). |

**Default** 60 seconds.

**Mode** Global Configuration

**Example** To configure the keep-alive timeout to 45 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp keep-alive 45
```

To reset the keep-alive timeout to the default of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp keep-alive
```

**Related commands**

**Command changes** Version 5.5.1-0.1: command added

# ip msdp mesh-group

**Overview** Use this command to create an MSDP mesh-group with an associated local source address.

Use the **no** variant of this command to delete an MSDP mesh-group.

**Syntax** `ip msdp mesh-group <group-name> local-address <ip-address>`  
`no ip msdp mesh-group <group-name>`

| Parameter                       | Description                      |
|---------------------------------|----------------------------------|
| <code>&lt;group-name&gt;</code> | The name of the MSDP mesh-group. |
| <code>&lt;ip-address&gt;</code> | The IPv4 local address.          |

**Default** No mesh-groups are configured.

**Mode** Global Configuration

**Example** To create an MSDP mesh-group named 'group' with a local address of 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp mesh-group group local-address
192.168.1.5
```

To delete an MSDP mesh-group named 'group', use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp mesh-group group
```

**Related commands**

- [ip msdp hold-time](#)

- [show ip msdp mesh-group](#)
- [show ip msdp peer](#)

**Command changes** Version 5.5.1-0.1: command added

# ip msdp mesh-group member

**Overview** Use this command to include an MSDP peer as a member of an MSDP mesh-group. The mesh-group needs to be configured with the [ip msdp mesh-group](#) command before members can be added.

Use the **no** variant of this command to remove an MSDP peer from an MSDP mesh-group.

**Syntax** `ip msdp mesh-group <group-name> member <ip-address>`  
`no ip msdp mesh-group <group-name> member <ip-address>`

| Parameter                       | Description                      |
|---------------------------------|----------------------------------|
| <code>&lt;group-name&gt;</code> | The name of the MSDP mesh-group. |
| <code>&lt;ip-address&gt;</code> | The IPv4 address of the peer.    |

**Default** Peers are not included in a mesh-group.

**Mode** Global Configuration

**Example** To add the peer at 192.168.1.3 to an MSDP mesh-group named 'group', use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp mesh-group group member 192.168.1.3
```

To remove the peer at 192.168.1.3 from an MSDP mesh-group named 'group', use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp mesh-group group member 192.168.1.3
```

`show ip msdp mesh-group`

**Command changes** Version 5.5.1-0.1: command added

# ip msdp mesh-group member hold-time

**Overview** Use this command to configure the MSDP hold-time timeout for an MSDP mesh-group member.

The hold-time timeout defines how long a peer will wait between MSDP messages before dropping the connection. It is important that the hold-time timeout is greater than the keep-alive timeout configured on each peer. The global hold-time will be overridden if a specific hold-time timeout is configured for an individual peer.

Use the **no** variant of this command to delete the mesh-group member-specific hold-time timeout.

**Syntax** `ip msdp mesh-group <group-name> member <ip-address> hold-time <15-75>`

`no ip msdp mesh-group <group-name> member <ip-address> hold-time`

| Parameter    | Description                                |
|--------------|--------------------------------------------|
| <group-name> | The name of a mesh-group.                  |
| <ip-address> | The IPv4 address of the mesh-group member. |
| <15-75>      | The hold-time timeout (in seconds).        |

**Default** MSDP mesh-group members use the global hold-time timeout (75 seconds by default).

**Mode** Global Configuration

**Example** To configure the hold-time timeout for a member of mesh-group 'group' at 192.168.1.5 to 45 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp mesh-group group 192.168.1.5 hold-time 45
```

To delete the specific hold-time timeout configured for the member at 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp mesh-group group 192.168.1.5 hold-time
```

ip msdp peer hold-time

ip msdp peer keep-alive

ip msdp sa-cache-timeout

**Command changes** Version 5.5.1-0.1: command added

# ip msdp mesh-group member keep-alive

**Overview** Use this command to configure the MSDP keep-alive timeout for an MSDP mesh-group member.

The keep-alive timeout defines the period between keep-alive messages being sent to each peer. It is important that the keep-alive timeout is less than the hold-time timeout configured on each peer device. The global keep-alive will be overridden if a specific keep-alive timeout is configured for an individual peer.

Use the **no** variant of this command to delete the mesh-group member-specific keep-alive timeout.

**Syntax** `ip msdp mesh-group <group-name> member <ip-address> keep-alive <10-60>`

`no ip msdp mesh-group <group-name> member <ip-address> keep-alive`

| Parameter    | Description                                |
|--------------|--------------------------------------------|
| <group-name> | The name of a mesh-group.                  |
| <ip-address> | The IPv4 address of the mesh-group member. |
| <10-60>      | The keep-alive timeout (in seconds).       |

**Default** MSDP mesh-group members use the global keep-alive timeout (60 seconds by default).

**Mode** Global Configuration

**Example** To configure the keep-alive timeout for a member of mesh-group 'group' at 192.168.1.5 to 45 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp mesh-group group 192.168.1.5 keep-alive 45
```

To delete the specific keep-alive timeout configured for the member at 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp mesh-group group 192.168.1.5 keep-alive
```

**changes**

# ip msdp peer

**Overview** Use this command to configure a new MSDP peer.  
Use the **no** variant of this command to remove an MSDP peer.

**Syntax** `ip msdp peer <ip-address> local-address <local-address>`  
`no ip msdp peer <ip-address> [local-address <local-address>]`

| Parameter       | Description                                     |
|-----------------|-------------------------------------------------|
| <ip-address>    | The IPv4 address of the peer.                   |
| <local-address> | The local IPv4 address to listen and send from. |

**Default** No MSDP peers are configured.

**Mode** Global Configuration

**Example** To configure an MSDP peer at 192.168.1.3 with a local address of 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp peer 192.168.1.3 local-address
192.168.1.5
```

# ip msdp peer keep-alive

**Overview** Use this command to configure the MSDP keep-alive timeout for an MSDP peer.

The keep-alive timeout defines the period between keep-alive messages being sent to each peer. It is important that the keep-alive timeout is less than the hold-time timeout configured on each peer device. The global keep-alive will be overridden if a specific keep-alive timeout is configured for an individual peer.

Use the **no** variant of this command to delete the peer-specific keep-alive timeout.

**Syntax** `ip msdp peer <ip-address> keep-alive <10-60>`  
`no ip msdp peer <ip-address> keep-alive`

| Parameter    | Description                          |
|--------------|--------------------------------------|
| <ip-address> | The IPv4 address of the peer.        |
| <10-60>      | The keep-alive timeout (in seconds). |

**Default** MSDP peers use the global keep-alive timeout (60 seconds by default).

**Mode** Global Configuration

**Example** To configure the keep-alive timeout for the peer at 192.168.1.5 to 45 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp peer 192.168.1.5 keep-alive 45
```

To delete the specific keep-alive timeout configured for the peer at 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 keep-alive
```

**Command changes** Version 5.5.1-0.1: command added

# ip msdp peer rp-filter

**Overview** Use this command to configure filters for incoming and outgoing SA messages for a peer based on the RP address. You can configure filters for a peer to permit or deny SA messages based on the RP addresses. The filters use an access list where the source must match the SA RP address; the destination address is unused.

Use the **no** variant of this command to remove the filters.

**Syntax**

```
ip msdp peer <ip-address> rp-filter in
{<100-199>|<2000-2699>|<access-list>}

ip msdp peer <ip-address> rp-filter out
{<100-199>|<2000-2699>|<access-list>}

no ip msdp peer <ip-address> rp-filter [in|out]
```

| Parameter     | Description                               |
|---------------|-------------------------------------------|
| <ip-address>  | The IPv4 address of the peer.             |
| in            | The incoming filter.                      |
| out           | The outgoing filter.                      |
| <100-199>     | IP extended access list.                  |
| <2000-2699>   | IP extended access list (expanded range). |
| <access-list> | Access list name.                         |

**Default** No RP filters are configured.

**Mode** Global Configuration

**Example** To configure an incoming RP filter for 192.168.1.5 using IP extended access list 100, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 100 permit ip 172.16.48.133/32
1.1.1.1/32
awplus(config)# ip msdp peer 192.168.1.5 rp-filter in 100
```

To configure an outgoing RP filter for 192.168.1.5 using an access list named 'list1', use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp peer 192.168.1.5 rp-filter out list1
```

To remove an incoming RP filter for 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 rp-filter in
```

To remove all RP filters for 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 rp-filter
```

**Command  
changes**

Version 5.5.1-0.1: command added

# ip msdp peer sg-filter

**Overview** Use this command to configure filters for a peer to permit or deny SA messages based on the source and group addresses. The filters use an access list where the source must match the SA source address, and the destination must match the SA group address.

Use the **no** variant of this command to remove the filters.

**Syntax**

```
ip msdp peer <ip-address> sg-filter in
{<100-199>|<2000-2699>|<access-list>}

ip msdp peer <ip-address> sg-filter out
{<100-199>|<2000-2699>|<access-list>}

no ip msdp peer <ip-address> sg-filter [in|out]
```

| Parameter     | Description                               |
|---------------|-------------------------------------------|
| <ip-address>  | The IPv4 address of the peer.             |
| in            | The incoming filter.                      |
| out           | The outgoing filter.                      |
| <100-199>     | IP extended access list.                  |
| <2000-2699>   | IP extended access list (expanded range). |
| <access-list> | Access list name.                         |

**Default** No SG filters are configured.

**Mode** Global Configuration

**Example** To configure an incoming SG filter for 192.168.1.5 using IP extended access list 100, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 100 permit ip 172.16.48.133/32
1.1.1.1/32
awplus(config)# ip msdp peer 192.168.1.5 sg-filter in 100
```

To configure an outgoing SG filter for 192.168.1.5 using an access list named 'list1', use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp peer 192.168.1.5 sg-filter out list1
```

To remove an incoming SG filter for 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 sg-filter in
```

To remove all SG filters for 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 sg-filter
```

# ip msdp sa-cache-timeout

**Overview** Use this command to configure the MSDP Source-Active cache expiry timeout. The MSDP Source-Active cache timeout determines how long entries can exist in the cache before they expire.

Use the **no** variant of this command to reset the timeout to the default (75 seconds).

**Syntax** `ip msdp sa-cache-timeout <75-300>`  
`no ip msdp sa-cache-timeout`

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| <75-300>  | How long cache entries exist before they expire (in seconds). |

**Default** 75 seconds

**Mode** Global Configuration

**Example** To configure the MSDP Source-Active cache timeout to 255 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp sa-cache-timeout 255
```

To reset the MSDP Source-Active cache timeout to the default of 75 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp sa-cache-timeout
```

**Command changes** Version 5.5.1-0.1: command added

# msdp default peer

**Overview** Use this command to configure an MSDP peer as a default peer. SA messages from the default peer will be accepted without Peer Reverse Path Forwarding (Peer-RPF) checks for the peer address against the advertised RP. It is possible to configure multiple default peers, however only one of the active peers that are configured as default will be recognized as the default.

Use the **no** variant of this command to remove an MSDP peer as a default peer.

**Syntax** `ip msdp peer <ip-address> default-peer`  
`no ip msdp peer <ip-address> default-peer`

| Parameter                       | Description                   |
|---------------------------------|-------------------------------|
| <code>&lt;ip-address&gt;</code> | The IPv4 address of the peer. |

**Default** No default peer is configured.

**Mode** Global Configuration

**Example** To configure existing MSDP peer 192.168.1.5 as the default peer, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp peer 192.168.1.5 default-peer
```

To remove MSDP peer 192.168.1.5 as the default peer, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 default-peer
```

**Command changes** Version 5.5.1-0.1: command added

# show debugging msdp

**Overview** Use this command to display which MSDP debugging options are currently enabled. Debugging is either on or off for each option.

**Syntax** show debugging msdp

**Mode** Privileged Exec

**Example** To display which MSDP debugging options are enabled, use the command:

```
awplus# show debugging msdp
```

**Output** Figure 41-1: Example output from **show debugging msdp**

```
awplus# show debugging msdp
MSDP debugging status:
 MSDP state debugging is on
 MSDP incoming packet debugging is on
 MSDP outgoing packet debugging is off
 MSDP peer hold timer debugging is off
 MSDP peer connect timer debugging is off
 MSDP peer keep-alive timer debugging is off
 MSDP source-active state timer debugging is on
 MSDP source-active advertisement timer debugging is off
```

Table 41-1: Parameters in the output from **show debugging msdp**

| Parameter                  | Description                                                                                                                |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------|
| MSDP state                 | If enabled, shows when a peer has a change of state.                                                                       |
| MSDP incoming packet       | If enabled, shows when MSDP packets are received by the device.                                                            |
| MSDP outgoing packet       | If enabled, shows when MSDP packets are transmitted by the device.                                                         |
| MSDP peer hold timer       | If enabled, shows activity related to the peer hold timer, for example, when the timer starts, expires, or is reset.       |
| MSDP peer connect timer    | If enabled, shows activity related to the peer hold timer, for example, when the timer starts or expires.                  |
| MSDP peer keep-alive timer | If enabled, shows activity related to the peer keep-alive timer, for example, when the timer starts, expires, or is reset. |

Table 41-1: Parameters in the output from **show debugging msdp** (cont.)

| Parameter                              | Description                                                                                                                            |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| MSDP source-active state timer         | If enabled, shows activity related to the source-active state timer, for example, when the timer starts, expires, or is reset.         |
| MSDP source-active advertisement timer | If enabled, shows activity related to the source-active advertisement timer, for example, when the timer starts, expires, or is reset. |

# show ip msdp mesh-group

**Overview** Use this command to show information about the MSDP mesh-groups and the members within them.

**Syntax**

```
show ip msdp mesh-group [detail]
show ip msdp mesh-group <group-name> [detail]
show ip msdp mesh-group <group-name> member <ip-address>
[detail]
```

| Parameter    | Description                                      |
|--------------|--------------------------------------------------|
| detail       | Show detailed information about the mesh groups. |
| <group-name> | The name of a mesh-group.                        |
| <ip-address> | The IPv4 address of a member of the mesh-group.  |

**Mode** Privileged Exec

**Example** To show brief information about every mesh-group and the members within, use the command:

```
awplus# show ip msdp mesh-group
```

To show information about mesh-group 'group2' and all of its members, use the command:

```
awplus# show ip msdp mesh-group group2
```

To show information about member 172.16.48.133 inside mesh-group 'group2', use the commands:

```
awplus# show ip msdp mesh-group group2 member 172.16.48.133
```

To show detailed information about member 172.16.48.133 inside mesh-group 'group2', use the commands:

```
awplus# show ip msdp mesh-group group2 member 172.16.48.133
detail
```

**Output** Figure 41-2: Example output from **show ip msdp mesh-group**

```
awplus# show ip msdp mesh-group

MSDP Mesh Group information:

Mesh Group : group1

Local address : 172.168.2.5

Table 41-2: Parameters in the output from **show ip msdp mesh-group**

| Parameter                   | Description                                                                                                                |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Default peer                | Yes, if the peer is a default peer, and No if not.                                                                         |
| Mesh-group                  | If the peer is a member of a mesh-group then the name of the mesh-group will be displayed, otherwise "--".                 |
| Keep Alive receive          | The number of keep alive messages the peer has received.                                                                   |
| Keep Alive transmit         | The number of keep alive messages the peer has transmitted.                                                                |
| Keep Alive receive error    | The number of keep alive messages that have been received that contained errors.                                           |
| Source active receive       | The number of source active messages the peer has received.                                                                |
| Source active transmit      | The number of source active messages the peer has transmitted.                                                             |
| Source active receive error | The number of source active messages that have been received that contained errors.                                        |
| Unknown TLV receive         | The number of messages received by the peer that were not keep alive or source active messages.                            |
| Peer Hold                   | The seconds remaining until the peer hold timer expires, at which point the peer connection ends.                          |
| Keep Alive                  | The seconds remaining until the keep alive timer expires, at which point the peer will send out a keep alive message.      |
| Connect Retry               | The seconds remaining till the connect retry timer expires, at which point another attempt is made to connect to the peer. |

Table 41-2: Parameters in the output from **show ip msdp mesh-group** (cont.)

| Parameter     | Description                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------|
| SG filter out | The name of the filter based on the source and group address of outgoing source active messages. |
| SG filter in  | The name of the filter based on the source and group address of incoming source active messages. |
| RP filter out | The name of the filter based on the RP address of outgoing source active messages.               |
| RP filter in  | The name of the filter based on the RP address of incoming source active messages.               |
| Out permit    | The number of SA messages that have been permitted to send.                                      |
| Out deny      | The number of SA messages that have been denied from being sent.                                 |
| In permit     | The number of SA messages that have been permitted to be received.                               |
| In deny       | The number of SA messages that have been denied to be received.                                  |

# show ip msdp peer

**Overview** Use this command to display MSDP peers, their addresses, and their current status. Use the **detail** parameter to display additional information on timers, filters, and counters.

**Syntax** `show ip msdp peer [<ip-address>] [detail]`

| Parameter    | Description                                                      |
|--------------|------------------------------------------------------------------|
| <ip-address> | The IPv4 address of the peer.                                    |
| detail       | Display additional information on timers, filters, and counters. |

**Mode** Privileged Exec

**Example** To show the results for all MSDP peers, use the command:

```
awplus# show ip msdp peer
```

To show the results for MSDP peer 192.168.1.3, use the command:

```
awplus# show ip msdp peer 192.168.1.3
```

To show detailed results for MSDP peer 192.168.1.3, use the command:

```
awplus# show ip msdp peer 192.168.1.3 detail
```

**Output** Figure 41-6: Example output from **show ip msdp peer**

```
awplus#show ip msdp peer

MSDP Peer Information:

Default peer : None

Peer address : 192.168.1.3
Local address : 192.168.1.2
State : Established

Peer address : 192.168.1.5
Local address : 192.168.1.4
State : Connecting
```

Table 41-3: Parameters in the output from **show ip msdp peer**

| Parameter                | Description                                                                                                 |
|--------------------------|-------------------------------------------------------------------------------------------------------------|
| Default peer             | Yes, if the peer is a default peer, and No if not.                                                          |
| Mesh-group               | If the peer is a member of a mesh-group, then the name of the mesh-group will be displayed, otherwise "--". |
| Keep Alive receive       | The number of keep alive messages the peer has received.                                                    |
| Keep Alive transmit      | The number of keep alive messages the peer has transmitted.                                                 |
| Keep Alive receive error | The number of keep alive messages that have been received that contained errors.                            |
| Source active receive    | The number of source active messages the peer has received.                                                 |

Table 41-3: Parameters in the output from **show ip msdp peer** (cont.)

| Parameter                   | Description                                                                                                                |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Source active transmit      | The number of source active messages the peer has transmitted.                                                             |
| Source active receive error | The number of source active messages that have been received that contained errors.                                        |
| Unknown TLV receive         | The number of messages received by the peer that were not keep alive or source active messages.                            |
| Peer Hold                   | The seconds remaining until the peer hold timer expires, at which point the peer connection ends.                          |
| Keep Alive                  | The seconds remaining until the keep alive timer expires, at which point the peer will send out a keep alive message.      |
| Connect Retry               | The seconds remaining till the connect retry timer expires, at which point another attempt is made to connect to the peer. |
| SG filter out               | The name of the filter based on the source and group address of outgoing source active messages.                           |
| SG filter in                | The name of the filter based on the source and group address of incoming source active messages.                           |
| RP filter out               | The name of the filter based on the RP address of outgoing source active messages.                                         |
| RP filter in                | The name of the filter based on the RP address of incoming source active messages.                                         |
| Out permit                  | The number of SA messages that have been permitted to send.                                                                |
| Out deny                    | The number of SA messages that have been denied from being sent.                                                           |
| In permit                   | The number of SA messages that have been permitted to be received.                                                         |
| In deny                     | The number of SA messages that have been denied to be received.                                                            |

- [ip msdp peer sg-filter](#)

[msdp default peer](#)

[show ip msdp sa-cache](#)

**Command changes** Version 5.5.1-0.1: command added

# show ip msdp sa-cache

**Overview** Use this command to display information about the MSDP Source Address Cache (SA-cache) entries.

Entries that are Local (Yes) are learned from the local multicast route table. They will expire when they are removed from the local multicast route table, and the MSDP expiry is always set to 0. Local entries will be advertised to MSDP peers.

Entries that are Local (No) have been received via an MSDP SA-message from an MSDP peer. They will expire when the expiry timer reaches 0, unless they are refreshed from the peer. SA-cache entries that are not local are advertised to PIM.

**Syntax** `show ip msdp sa-cache`

**Mode** Privileged Exec

**Example** To show information about the MSDP SA-cache entries, use the command:

```
awplus# show ip msdp sa-cache
```

**Output** Figure 41-9: Example output from **show ip msdp sa-cache**

```
awplus# show ip msdp sa-cache

MSDP Source-Active cache:

Source-Active advertisement expiry (secs): 51

RP Address Source Address Group Address Local Expiry (secs)

172.16.48.133 10.36.20.1 232.0.0.8 Yes 0
172.16.48.133 10.36.20.1 239.254.1.1 Yes 0
172.16.48.133 10.36.20.1 239.254.1.2 Yes 0
172.16.48.133 10.36.20.1 239.254.1.3 Yes 0

# IPv4 Hardware Access Control List (ACL) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of IPv4 Hardware Access Control List (ACL) commands. It contains detailed command information and command examples about IPv4 hardware ACLs, which you can apply directly to interfaces using the [access-group](#) command.

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself.

Most ACL command titles include information in parentheses:

- When the command title ends with words in parentheses, these words indicate usage instead of keywords to enter into the CLI. For example, the title **access-list (numbered hardware ACL for ICMP)** indicates that the command is used to create an ACL with the syntax:

```
access-list <3000-3699> <action> icmp <source-ip> <dest-ip>
[icmp-type <number>] [vlan <1-4094>]
```

- When the command title is completely surrounded by parentheses, the title indicates the type of ACL filter instead of keywords to enter into the CLI. For example, the title **(named hardware ACL: ICMP entry)** represents a command with the syntax:

```
[<sequence-number>] <action> icmp <source-ip> <dest-ip>
[icmp-type <number>] [vlan <1-4094>]
```

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**Sub-modes** Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

Table 42-1: IPv4 Hardware Access List Commands and Prompts

| Command Name                                          | Command Mode                    | Prompt                          |
|-------------------------------------------------------|---------------------------------|---------------------------------|
| show interface access-group                           | Privileged Exec                 | awplus#                         |
| show access-list (IPv4 Hardware ACLs)                 | Privileged Exec                 | awplus#                         |
| show acl-group ip address                             | Privileged Exec                 | awplus#                         |
| show acl-group ip port                                | Privileged Exec                 | awplus#                         |
| show interface access-group                           | Privileged Exec                 | awplus#                         |
| access-list (numbered hardware ACL for IP packets)    | Global Configuration            | awplus (config) #               |

## access-group

**Overview** This command adds or removes a hardware-based access-list to or from a switch port interface or interfaces. The number of hardware numbered and named access-lists that can be added to a switch port interface is determined by the available memory in hardware-based packet classification tables.

This command works in Interface Configuration mode to apply hardware access-lists to selected switch port interfaces.

The **no** variant of this command removes the selected access-list from an interface.

**Syntax**

```
access-group
[<3000-3699>|<4000-4699>|<hardware-access-list-name>]

no access-group
[<3000-3699>|<4000-4699>|<hardware-access-list-name>]
```

| Parameter                   | Description                    |
|-----------------------------|--------------------------------|
| <3000-3699>                 | Hardware IP access-list.       |
| <4000-4699>                 | Hardware MAC access-list.      |
| <hardware-access-list-name> | The hardware access-list name. |

**Mode** Interface Configuration for a switch port interface or interfaces

**Default** Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

**Usage notes** First create an IP access-list that applies the appropriate permit/deny requirements with the [access-list \(numbered hardware ACL for IP packets\)](#) command, the [access-list \(numbered hardware ACL for MAC addresses\)](#) command or the [access-list hardware \(named hardware ACL\)](#) command. Then use this command to apply this hardware access- list to a specific port or port range. Note that this command will apply the access-list only to incoming data packets.

To apply ACLs to an LACP aggregated link, apply it to all the individual switch ports in the aggregated group. To apply ACLs to a static channel group, apply it to the static channel group itself. An ACL can even be applied to a static aggregated link that spans more than one switch instance ([Link Aggregation Commands](#)).

Note that you cannot apply software numbered ACLs to switch port interfaces with the access-group command. This command will only apply hardware ACLs.

**NOTE:** Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**Examples** To add the numbered hardware access-list 3005 to switch port interface port1.0.1, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# access-group 3005
```

To add the named hardware access-list "hw-acl" to switch port interface port1.0.2, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# access-group hw-acl
```

To apply an ACL to static channel group 2 containing switch port1.0.3 and port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3-port1.0.4
awplus(config-if)# static-channel-group 2
awplus(config)# interface sa2
awplus(config-if)# access-group 3000
```

**Related  
commands**

[access-list hardware \(named hardware ACL\)](#)  
[access-list \(numbered hardware ACL for IP packets\)](#)  
[access-list \(numbered hardware ACL for MAC addresses\)](#)  
[show interface access-group](#)

# access-list (numbered hardware ACL for ICMP)

**Overview** This command creates an access-list for use with hardware classification. The access-list will match on ICMP packets that have the specified source and destination IP addresses and, optionally, ICMP type. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

The optional **vlan** parameter can be used to match tagged (802.1q) packets.

The **no** variant of this command removes the previously specified access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** `access-list <3000-3699> <action> icmp <source-ip> <dest-ip>  
[icmp-type <number>] [vlan <1-4094>] [log]  
no access-list <3000-3699>`

The following actions are available for hardware ACLs:

| Values for the <action> parameter                     |                                                                                                                                                                                                                                                              |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                  | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                                | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                           | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br>port-number]          | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br>port-number]          | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                           |

| Values for the <action> parameter |                                                                                                                                                                                 |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| send-to-cpu                       | Send matching packets to the CPU.                                                                                                                                               |
| deny-and-not-cpu                  | Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU. |

| Parameter   | Description                                                                                                                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <3000-3699> | An ID number for this hardware IP access-list.                                                                                                                                                                                                     |
| <action>    | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                    |
| icmp        | Match against ICMP packets                                                                                                                                                                                                                         |
| <source-ip> | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                                            |
|             | any Match any source IP address.                                                                                                                                                                                                                   |
|             | host <ip-addr> Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                       |
|             | <ip-addr>/<prefix> Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                         |
|             | <ip-addr><br><reverse-mask> Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <dest-ip>   | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                                             |
|             | any Match any destination IP address.                                                                                                                                                                                                              |
|             | host <ip-addr> Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                  |
|             | <ip-addr>/<prefix> Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                    |

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |   |               |   |                                   |   |                         |   |                                   |   |                |    |                         |    |                             |    |                     |    |                    |    |                       |    |                      |    |                        |    |                       |

|                                    | <p><i>&lt;ip-addr&gt;</i><br/><i>&lt;reverse-mask&gt;</i></p> <p>Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |   |               |   |                                   |   |                         |   |                                   |   |                |    |                         |    |                             |    |                     |    |                    |    |                       |    |                      |    |                        |    |                       |

| vlan <i>&lt;1-4094&gt;</i>         | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |   |               |   |                                   |   |                         |   |                                   |   |                |    |                         |    |                             |    |                     |    |                    |    |                       |    |                      |    |                        |    |                       |
| log                                | Log packets that are denied by this ACL. You must also enable the logging, using the command <a href="#">access-list hardware-deny-log</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |   |               |   |                                   |   |                         |   |                                   |   |                |    |                         |    |                             |    |                     |    |                    |    |                       |    |                      |    |                        |    |                       |

**Mode** Global Configuration

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

ICMP ACLs will match any ICMP packet that has the specified source and destination IP addresses and ICMP type. The ICMP type is an optional parameter.

**Examples** To create an access-list that will permit ICMP packets with a source address of 192.168.1.0/24 with any destination address and an ICMP type of 5 enter the following commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit icmp 192.168.1.0/24 any
icmp-type 5
```

To destroy the access-list with an access-list identity of 3000 enter the following commands:

```
awplus# configure terminal
awplus(config)# no access-list 3000
```

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# access-list (numbered hardware ACL for IP packets)

**Overview** This command creates an access-list for use with hardware classification. The access-list will match on packets that have the specified source and destination IP addresses. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

The optional **vlan** parameter can be used to match tagged (802.1q) packets.

The **no** variant of this command removes the previously specified IP hardware access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** `access-list <3000-3699> <action> ip <source-ip> <dest-ip> [vlan <1-4094>] [log]`  
`no access-list <3000-3699>`

The following actions are available for hardware ACLs:

| Values for the <action> parameter                     |                                                                                                                                                                                                                                                              |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                  | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                                | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                           | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br>port-number]          | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br>port-number]          | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                           |

| Values for the <action> parameter |                                                                                                                                                                                 |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| send-to-cpu                       | Send matching packets to the CPU.                                                                                                                                               |
| deny-and-not-cpu                  | Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU. |

Table 42-2: IP and ICMP parameters in **access-list (hardware IP numbered)**

| Parameter                   | Description                                                                                                                                                                                                            |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <3000-3699>                 | An ID number for this hardware IP access-list.                                                                                                                                                                         |
| <action>                    | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                        |
| ip                          | Match against IP packets                                                                                                                                                                                               |
| <source-ip>                 | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                |
| any                         | Match any source IP address.                                                                                                                                                                                           |
| host <ip-addr>              | Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                          |
| <ip-addr>/<prefix>          | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                |
| <ip-addr><br><reverse-mask> | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <dest-ip>                   | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                 |
| any                         | Match any destination IP address.                                                                                                                                                                                      |
| host <ip-addr>              | Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                     |
| <ip-addr>/<prefix>          | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                           |

Table 42-2: IP and ICMP parameters in **access-list (hardware IP numbered)**

| Parameter                                                         | Description                                                                                                                                                                                                                 |
|-------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-addr&gt;</code><br><code>&lt;reverse-mask&gt;</code> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <code>vlan &lt;1-4094&gt;</code>                                  | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                            |
| <code>log</code>                                                  | Log packets that are denied by this ACL. You must also enable the logging, using the command <a href="#">access-list hardware-deny-log</a> .                                                                                |

**Mode** Global Configuration

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

**Examples** To create an access-list that will permit IP packets with a source address of 192.168.1.1 and any destination address, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit ip 192.168.1.1/32 any
```

To destroy the access-list with an access-list identity of 3000 enter the following commands:

```
awplus# configure terminal
awplus(config)# no access-list 3000
```

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# access-list (numbered hardware ACL for IP protocols)

**Overview** This command creates an access-list for use with hardware classification. The access-list will match on packets that have the specified source and destination IP addresses and IP protocol number. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

The optional **vlan** parameter can be used to match tagged (802.1q) packets.

The **no** variant of this command removes the previously specified IP hardware access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** `access-list <3000-3699> <action> proto <1-255> <source-ip> <dest-ip> [vlan <1-4094>] [log]`  
`no access-list <3000-3699>`

The following actions are available for hardware ACLs:

| Values for the <action> parameter                     |                                                                                                                                                                                                                                                              |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                  | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                                | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                           | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br>port-number]          | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br>port-number]          | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                           |

| Values for the <action> parameter |                                                                                                                                                                                 |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| send-to-cpu                       | Send matching packets to the CPU.                                                                                                                                               |
| deny-and-not-cpu                  | Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU. |

Table 42-3: Parameters in **access-list (hardware IP numbered)**

| Parameter     | Description                                                                                                                                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <3000-3699>   | An ID number for this hardware IP access-list.                                                                                                                                                                                                                                     |
| <action>      | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                                    |
| proto <1-255> | The IP protocol number to match against, as defined by IANA (Internet Assigned Numbers Authority <a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a> )<br>See below for a list of IP protocol numbers and their descriptions. |
| <source-ip>   | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                                                                            |
|               | any Match any source IP address.                                                                                                                                                                                                                                                   |
|               | host <ip-addr> Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                                       |
|               | <ip-addr>/<prefix> Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                                         |
|               | <ip-addr><br><reverse-mask> Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.                                 |
| <dest-ip>     | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                                                                             |
|               | any Match any destination IP address.                                                                                                                                                                                                                                              |
|               | host <ip-addr> Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                                  |

Table 42-3: Parameters in **access-list (hardware IP numbered)** (cont.)

| Parameter                                                         | Description                                                                                                                                                                                                                 |
|-------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-addr&gt;/&lt;prefix&gt;</code>                       | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                |
| <code>&lt;ip-addr&gt;</code><br><code>&lt;reverse-mask&gt;</code> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <code>vlan &lt;1-4094&gt;</code>                                  | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                            |
| <code>log</code>                                                  | Log packets that are denied by this ACL. You must also enable the logging, using the command <a href="#">access-list hardware-deny-log</a> .                                                                                |

Table 42-4: IP protocol number and description

| Protocol Number | Protocol Description [RFC]                             |

| 254             | Use for experimentation and testing / RFC3692      |
| 255             | Reserved / IANA                                    |

**Mode** Global Configuration

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

**Examples** To create an access-list that will deny all IGMP packets (IP protocol 2) from the 192.168.0.0 network, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 deny proto 2 192.168.0.0/16
any
```

To destroy the access-list with an access-list identity of 3000 enter the following commands:

```
awplus# configure terminal
awplus(config)# no access-list 3000
```

**Related  
commands**

[access-group](#)  
[access-list hardware-deny-log](#)  
[match access-group](#)  
[show running-config](#)  
[show access-list \(IPv4 Hardware ACLs\)](#)

**Command  
changes**

Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# access-list (numbered hardware ACL for MAC addresses)

**Overview** This command creates an access-list for use with hardware classification. The access-list will match on packets that have the specified source and destination MAC addresses. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

The **no** variant of this command removes the specified MAC hardware filter access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax**

```
access-list <4000-4699> <action> {<source-mac>|any}
{<dest-mac>|any} [vlan <1-4094>] [inner-vlan
<1-4094>]

no access-list <4000-4699>
```

The following actions are available for hardware ACLs:

| Values for the <action> parameter                     |                                                                                                                                                                                                                                                              |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                  | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                                | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                           | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br>port-number]          | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br>port-number]          | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                           |

| Values for the <action> parameter |                                                                                                                                                                                 |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| send-to-cpu                       | Send matching packets to the CPU.                                                                                                                                               |
| deny-and-not-cpu                  | Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU. |

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <4000-4699>            | An ID number for this hardware IP access-list.                                                                                                                                                                                                                                                                                             |
| <action>               | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                                                                                            |
| <source-mac>           | The source MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.      |
| any                    | Match against any source MAC address.                                                                                                                                                                                                                                                                                                      |
| <dest-mac>             | The destination MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match. |
| any                    | Match against any destination MAC address.                                                                                                                                                                                                                                                                                                 |
| vlan <1-4094>          | Match against the specified ID in the packet's VLAN tag.                                                                                                                                                                                                                                                                                   |
| inner-vlan<br><1-4094> | Match against the inner VLAN tag (VID). This parameter is used within double-tagged VLANs. It is sometimes referred to as the C-TAG (Customer VLAN TAG), where the vlan VID tag is referred to as the S-TAG (Service VLAN TAG).                                                                                                            |

**Mode** Global Configuration

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 4000-4699 match on packets that have the specified source and destination MAC addresses.

**Examples** To create an access-list that will permit packets with a source MAC address of 0000.00ab.1234 and any destination address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4000 permit 0000.00ab.1234
0000.0000.0000 any
```

To create an access-list that will permit packets if their source MAC address starts with 0000.00ab, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 permit 0000.00ab.1234
0000.0000.FFFF any
```

To create an access-list that will send a copy of packets to the mirror port if their source MAC address starts with 0000.00ab, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 copy-to-mirror 0000.00ab.1234
0000.0000.FFFF any
```

You also need to configure the mirror port with the [mirror interface](#) command.

To destroy the access-list with an access-list identity of 4000 enter the commands:

```
awplus# configure terminal
awplus(config)# no access-list 4000
```

[show access-list \(IPv4 Hardware ACLs\)](#)

**Command  
changes**

Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# access-list (numbered hardware ACL for TCP or UDP)

**Overview** This command creates an access-list for use with hardware classification. The access-list will match on TCP or UDP packets that have the specified source and destination IP addresses and optionally, port values. You can use the value **any** instead of source or destination IP address if an address does not matter.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

You can use the optional **vlan** parameter to match tagged (802.1q) packets.

The **no** variant of this command removes the specified IP hardware access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** `access-list <3000-3699> <action> {tcp|udp} <source-ip>  
[<source-ports>] <dest-ip> [<dest-ports>] [vlan <1-4094>] [log]  
no access-list <3000-3699>`

The following actions are available for hardware ACLs:

| Values for the <action> parameter                     |                                                                                                                                                                                                                                                              |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                  | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                                | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                           | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br>port-number]          | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br>port-number]          | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                           |

| Values for the <action> parameter |                                                                                                                                                                                 |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| send-to-cpu                       | Send matching packets to the CPU.                                                                                                                                               |
| deny-and-not-cpu                  | Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU. |

| Parameter      | Description                                                                                                                                                                                                                                        |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <3000-3699>    | An ID number for this hardware IP access-list.                                                                                                                                                                                                     |
| <action>       | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                    |
| tcp            | Match against TCP packets.                                                                                                                                                                                                                         |
| udp            | Match against UDP packets.                                                                                                                                                                                                                         |
| <source-ip>    | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                                            |
|                | any Match any source IP address.                                                                                                                                                                                                                   |
|                | host <ip-addr> Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                       |
|                | <ip-addr>/<prefix> Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                         |
|                | <ip-addr><br><reverse-mask> Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <source-ports> | Match source TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:                                                                                             |
|                | eq <0-65535> Match a single port number.                                                                                                                                                                                                           |
|                | lt <0-65535> Match all port numbers that are less than the specified port number.                                                                                                                                                                  |
|                | gt <0-65535> Match all port numbers that are greater than the specified port number.                                                                                                                                                               |
|                | ne <0-65535> Match all port numbers except the specified port number.                                                                                                                                                                              |

| Parameter     | Description                                                                                                                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | range <start-port> <end-port> Match a range of port numbers.                                                                                                                                                                                         |
| <dest-ip>     | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                                               |
|               | any Match any destination IP address.                                                                                                                                                                                                                |
|               | host <ip-addr> Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                    |
|               | <ip-addr>/<prefix> Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                      |
|               | <ip-addr> <reverse-mask> Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |
| <dest-ports>  | Match destination TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:                                                                                          |
|               | eq <0-65535> Match a single port number.                                                                                                                                                                                                             |
|               | lt <0-65535> Match all port numbers that are less than the specified port number.                                                                                                                                                                    |
|               | gt <0-65535> Match all port numbers that are greater than the specified port number.                                                                                                                                                                 |
|               | ne <0-65535> Match all port numbers except the specified port number.                                                                                                                                                                                |
|               | range <start-port> <end-port> Match a range of port numbers.                                                                                                                                                                                         |
| vlan <1-4094> | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                                                     |
| log           | Log packets that are denied by this ACL. You must also enable the logging, using the command <a href="#">access-list hardware-deny-log</a> .                                                                                                         |

**Mode** Global Configuration

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

**Examples** To create an access-list that will permit TCP packets with a destination address of 192.168.1.1, a destination port of 80, and any source address and source port, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit tcp any 192.168.1.1/32
eq 80
```

To create an access-list that will copy TCP packets to the mirror port, if they have a destination address of 192.168.1.1, a destination port of 80, and any source address and source port, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 copy-to-mirror tcp any
192.168.1.1/32 eq 80
```

You also need to configure the mirror port with the [mirror interface](#) command.

**Related commands**

- [access-group](#)
- [access-list hardware-deny-log](#)
- [match access-group](#)
- [show running-config](#)
- [show access-list \(IPv4 Hardware ACLs\)](#)

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# access-list hardware (named hardware ACL)

**Overview** This command creates a named hardware access-list and puts you into IPv4 Hardware ACL Configuration mode, where you can add filter entries to the ACL.

Once you have configured the ACL, you can use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map.

The **no** variant of this command removes the specified named hardware ACL.

**Syntax** `access-list hardware <name>`  
`no access-list hardware <name>`

| Parameter | Description                          |
|-----------|--------------------------------------|
| <name>    | Specify a name for the hardware ACL. |

**Mode** Global Configuration

**Default** Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

**Usage notes** Use this command to name a hardware ACL and enter the IPv4 Hardware ACL Configuration mode. If the named hardware ACL does not exist, it will be created after entry. If the named hardware ACL already exists, then this command puts you into IPv4 Hardware ACL Configuration mode for that existing ACL.

Entering this command moves you to the IPv4 Hardware ACL Configuration mode (config-ip-hw-acl prompt), so you can enter ACL filters with sequence numbers. From this prompt, configure the filters for the ACL. See the [ACL Feature Overview and Configuration Guide](#) for complete examples of configured sequenced numbered ACLs.

**NOTE:** Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**Examples** To create the hardware access-list named "ACL-1" and enter the IPv4 Hardware ACL Configuration mode to specify the ACL filter entry, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware ACL-1
awplus(config-ip-hw-acl)#
```

To remove the hardware access-list named "ACL-1", use the commands:

```
awplus# configure terminal
awplus(config)# no access-list hardware ACL-1
```

**Related commands**

- `access-group`
  - (named hardware ACL entry for ICMP)
  - (named hardware ACL entry for IP protocols)
  - (named hardware ACL entry for TCP or UDP)
  - (access-list standard named filter)
- `show interface access-group`
- `show access-list` (IPv4 Hardware ACLs)

# access-list hardware-deny-log

**Overview** Use this command to enable logging of packets that are denied by hardware IP ACLs. Hardware IP ACLs are ACLs with an ID number from 3000 to 3699. If you turn on logging, the switch will produce a log message when it drops denied packets.

**CAUTION:** *If you enable this logging, do not use an action of **copy-to-cpu** or **send-to-cpu** in any of the switch's ACLs. If you do, packets that match those ACLs will also be dropped.*

Use the **no** variant of this command to disable logging of packets that are denied by hardware IP ACLs.

**Syntax**

```
access-list hardware-deny-log [info|warn] [rate <1-1000>]
[burst <1-1000>] [timeout <1-3600>]
no access-list hardware-deny-log
```

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| info             | Give the log messages a severity level of 'info'. This is the default severity level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| warn             | Give the log messages a severity level of 'warn'. If you want the messages to go to the buffered, permanent, and external log as well as the terminal, specify this parameter.                                                                                                                                                                                                                                                                                                                                                                                 |
| rate <1-1000>    | This limits the number of log messages produced per hour. The switch will stop creating log messages if packets are denied at a higher rate than this specified rate. The default is 12 packets per hour. This means, for example, that if there are 60 denied packets in the first hour, then at most the first 12 of these packets will be logged. After that, logging will stop unless the rate drops below 12 an hour. (The actual number of packets logged depends on the number of flows the dropped packets come from; see the <b>burst</b> parameter). |
| burst <1-1000>   | This is the maximum initial number of packets to log for a given flow. A flow is a set of packets with the same source IP address, destination IP address, source port, and destination port. The default is 5. The burst number reduces by 1 each time a packet in the flow is logged. Then it increases by 1 again every time the rate drops below the limit set by the <b>rate</b> parameter, up to the burst number.                                                                                                                                       |
| timeout <1-3600> | This is the length of time it takes for a flow record to expire, in seconds. The switch considers that a flow has expired if it hasn't received any packets that match that flow for the timeout number of seconds. The default is 3600 seconds (1 hour). When a flow expires, its burst value is reset and logging may restart (depending on the current rate of denied packets).                                                                                                                                                                             |

**Default** Disabled

**Mode** Global Configuration

**Usage notes** To enable logging for a particular ACL, enter:

- this command (**access-list hardware-deny-log**)
- the command [terminal monitor](#), and
- a **log** parameter at the end of the desired ACL.

The switch will send the log messages to:

- The terminal monitor, by default, as long as you enter the command [terminal monitor](#), and
- If you change the severity of the messages to **warn**, to the buffered log, permanent log, and external log as well. The external log defines what logs will be sent to external syslog servers.

The log message format is:

```
DENY> IN=<interface-name> OUT=<blank>
MAC=<dest-mac-addr:src-mac-addr:eth-type> SRC=<source-ip-address>
DST=<dest-ip-address> LEN=<packet-length> TOS=<type-of-service>
PREC=<precedence> TTL=<time-to-live> ID=<packet-ID>
PROTO=<L4-protocol> SPT=<L4-source-port> DPT=<L4-dest-port>
LEN=<L4-packet-length> MARK=<internal-packet-marking>
```

An example of a permanent log message is:

```
2023 March 03 07:04:37 local5.warning awplus ulogd[931]: DENY>
IN=vlan100 OUT= MAC=e0:1a:ea:50:51:fc:00:00:11:11:22:22:08:00
SRC=192.168.1.100 DST=192.170.1.1 LEN=42 TOS=00 PREC=0x00 TTL=64
ID=0 PROTO=UDP SPT=63 DPT=63 LEN=22 MARK=0x20000000
```

**Example** To log packets denied by ACL 3000, which denies all Echo requests, use the commands:

```
awplus# terminal monitor
awplus# configure terminal
awplus(config)# access-list hardware-deny-log
awplus(config)# access-list 3000 deny icmp any any icmp-type 8
```

terminal monitor

**Command changes**    Version 5.5.3-0.1: command added

# acl-group ip address

- Overview** Use this command to create a new named IPv4 ACL group that contains one or more IPv4 host or subnets.
- This command creates a named IPv4 ACL group and enters the ACL Host Group config mode. IPv4 hosts or subnets can be added to or removed from this group. This host group can be used as a source or destination match for any hardware ACL to simplify large ACL configs with lots of IPv4 hosts.
- Use the **no** variant of this command to delete an IPv4 ACL group.

**Syntax** `acl-group ip address <group>`  
`no acl-group ip address <group>`

| Parameter | Description                     |
|-----------|---------------------------------|
| <group>   | The name of the IPv4 ACL group. |

**Default** No ACL groups exist by default.

**Mode** Global Configuration

**Example** To create an IPv4 ACL group named IPV4\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip address IPV4_GROUP1
awplus(config-ip-host-group)#
```

To delete an IPv4 ACL group named IPV4\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# no acl-group ip address IPV4_GROUP1
```

**Related commands** [ip \(ip-host-group\)](#)  
[show acl-group ip address](#)

**Command changes** Version 5.5.0-1.1: command added

# acl-group ip port

**Overview** Use this command to create a new named port ACL group that contains one or more port rules for an ACL.

This command creates a named port ACL group and enters the ACL Port Group config mode. Port matching rules can be added to or removed from this group. This host group can be used to match on source or destination ports when used with an ACL.

Use the **no** variant of this command to delete a port ACL group.

**Syntax** `acl-group ip port <group>`  
`no acl-group ip port <group>`

| Parameter | Description                     |
|-----------|---------------------------------|
| <group>   | The name of the port ACL group. |

**Default** No ACL groups exist by default.

**Mode** Global Configuration

**Example** To create a port ACL group named PORT\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)#
```

To delete a port ACL group named PORT\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# no acl-group ip port PORT_GROUP1
```

**Related commands** [\(acl-group ip port range\)](#)  
[show acl-group ip port](#)

**Command changes** Version 5.5.0-1.1: command added

## (acl-group ip port range)

**Overview** Use this command to add one or more protocol port rules on a port ACL group. These port matching rules are used to simplify large ACL configs where many ACLs block or permit on the same service ports.

Use the **no** variant of this command to remove a rule match on protocol ports.

**Syntax**

```
eq <0-65535>
lt <0-65535>
gt <0-65535>
ne <0-65535>
range <0-65535> <0-65535>
no eq <0-65535>
no lt <0-65535>
no gt <0-65535>
no ne <0-65535>
no range <0-65535> <0-65535>
```

| Parameter | Description                                            |
|-----------|--------------------------------------------------------|
| eq        | The protocol port matches if equal to this number.     |
| lt        | The protocol port matches if less than this number.    |
| gt        | The protocol port matches if greater than this number. |
| ne        | The protocol port matches if not equal to this number. |
| range     | The protocol port matches if it is in this range.      |
| <0-65535> | The port number.                                       |

**Default** The port ACL group will match on all ports by default.

**Mode** IP ACL Port Group Configuration

**Example** To add the rule match on protocol ports equal to 20 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# eq 20
```

To add the rule match on protocol ports between 20 and 50 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# range 20 50
```

To add the rule match on protocol ports greater than 20 except 30 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# gt 20
awplus(config-ip-port-group)# ne 30
```

To remove the rule match on protocol ports between 20 and 50 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# no range 20 50
```

changes**

Version 5.5.0-1.1: command added

# clear access-list counters

**Overview** Use this command to reset the hardware access-list counters to zero. The access-list counters show the number of packets that match your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments.

**Syntax** `clear access-list counters [<acl>]`

| Parameter | Description                                                                          |
|-----------|--------------------------------------------------------------------------------------|
| <acl>     | Clear the counters for only the specified ACL. You can enter the ACL name or number. |

**Mode** Privileged Exec

**Usage notes** To view the counter values, use the command [show access-list counters](#).

**Example** To clear the counters for the ACL named ACL-1, use the command:

```
awplus# clear access-list counters ACL-1
```

**Related commands** [show access-list counters](#)

**Command changes** Version 5.5.2-2.1: command added

## commit (IPv4)

**Overview** Use this command to commit the IPv4 ACL filter configuration entered at the console to the hardware immediately without exiting the IPv4 Hardware ACL Configuration mode.

This command forces the associated hardware and software IPv4 ACLs to synchronize.

**Syntax** `commit`

**Mode** IPv4 Hardware ACL Configuration

**Usage notes** Normally, when an IPv4 hardware ACL is edited, the new configuration state of the IPv4 ACL is not written to hardware until you exit IPv4 Hardware ACL Configuration mode. By entering this command you can ensure that the current state of a hardware access-list that is being edited is written to hardware immediately.

Scripts typically do not include the [exit](#) command to exit configuration modes, potentially leading to IPv4 ACL filters in hardware not being correctly updated. Using this **commit** command in a configuration script after specifying an IPv4 hardware ACL filter ensures that it is updated in the hardware immediately.

**Example** To update the hardware with the IPv4 ACL filter configuration, use the command:

```
awplus# configure terminal
awplus(config)# access-list hardware my-hw-list
awplus(config-ip-hw-acl)# commit
```

**Related commands** [access-list hardware \(named hardware ACL\)](#)

# ip (ip-host-group)

**Overview** Use this command to add an IPv4 host or subnet to an IPv4 ACL group. Adding IPv4 hosts and subnets to an ACL group allows you to simplify ACL config when the same IP addresses are required for many ACLs.

Use the **no** variant of this command to remove an IPv4 host or subnet from an IPv4 ACL group.

**Syntax** `ip {any|<match-ip>}`  
`no ip {any|<match-ip>}`

| Parameter  | Description                                                                                                                                                                                                                                                                       |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| any        | Match any IP address.                                                                                                                                                                                                                                                             |
| <match-ip> | The addresses to match against. You can specify a single host or a subnet. The following are the valid formats for specifying the addresses:                                                                                                                                      |
|            | <code>&lt;ip-addr&gt;</code> Match a single host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                               |
|            | <code>&lt;ip-addr&gt;/&lt;prefix&gt;</code> Match any IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                      |
|            | <code>&lt;ip-addr&gt;</code><br><code>&lt;reverse-mask&gt;</code> Match any IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24. |

**Default** No hosts or subnets are in an IPv4 ACL group by default.

**Mode** IP ACL Host Group Configuration

**Example** To add the subnet 192.168.1.0/24 to an IPv4 ACL group IPV4\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip address IPV4_GROUP1
awplus(config-ip-host-group)# ip 192.168.1.0/24
```

To remove the subnet 192.168.1.0/24 from an IPv4 ACL group IPV4\_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip address IPV4_GROUP1
awplus(config-ip-host-group)# no ip 192.168.1.0/24
```

**Related commands**

- [acl-group ip address](#)
- [show acl-group ip address](#)

**Command changes** Version 5.5.0-1.1: command added

## (named hardware ACL entry for ICMP)

**Overview** Use this command to add a new ICMP filter entry to the current hardware access-list. The filter will match on any ICMP packet that has the specified source and destination IP addresses and (optionally) ICMP type. You can specify the value **any** if source or destination address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes an ICMP filter entry from the current hardware access-list. You can specify the ICMP filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its ICMP filter profile without specifying its sequence number (e.g. **no permit icmp 192.168.1.0/24 any icmp-type 11**).

You can find the sequence number by running the [show access-list \(IPv4 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** [`<sequence-number>`] `<action>` icmp `<source-ip>` `<dest-ip>`  
[icmp-type `<number>`] [vlan `<1-4094>`] [log]  
  
no `<sequence-number>`  
  
no `<action>` icmp `<source-ip>` `<dest-ip>` [icmp-type `<number>`]  
[vlan `<1-4094>`] [log]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter |                                                                                                                                                                                                                                                              |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                 | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                               | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                          | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br><i>port-number</i> ] | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br><i>port-number</i> ] | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |

| Values for the <action> parameter                     |                                                                                                                                                                                 |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                              |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                                                               |
| deny-and-not-cpu                                      | Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU. |

| Parameter         | Description                                                                                                                                                                                                                                                          |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <sequence-number> | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number. |
| <action>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                      |
| icmp              | Match against ICMP packets                                                                                                                                                                                                                                           |
| <source-ip>       | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                                                              |
|                   | any Match any source IP address.                                                                                                                                                                                                                                     |
|                   | host <ip-addr> Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                         |
|                   | <ip-addr>/<prefix> Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                           |
|                   | <ip-addr><br><reverse-mask> Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.                   |
| <dest-ip>         | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                                                               |
|                   | any Match any destination IP address.                                                                                                                                                                                                                                |

| Parameter                          | Description                                                                                                                                                                                                                                                                          |

|                                    | 18<br>Address mask replies.                                                                                                                                                                                                                                                          |
| vlan <i>&lt;1-4094&gt;</i>         | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                                                                                     |
| log                                | Log packets that are denied by this ACL. You must also enable the logging, using the command <a href="#">access-list hardware-deny-log</a> .                                                                                                                                         |

**Mode** IPv4 Hardware ACL Configuration (accessed by running the command [access-list hardware](#) (named hardware ACL))

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command [access-list hardware \(named hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add an access-list filter entry with a sequence number of 100 to the access-list named “my-list” that will permit ICMP packets with a source address of 192.168.1.0/24, any destination address and an ICMP type of 5, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# 100 permit icmp 192.168.1.0/24 any
icmp-type 5
```

To remove an access-list filter entry with a sequence number of 100 from the access-list named “my-list”, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# no 100
```

**Related commands**

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

## (named hardware ACL entry for IP packets)

**Overview** Use this command to add an IP packet filter entry to the current hardware access-list. The filter will match on IP packets that have the specified IP and/or MAC addresses. You can use the value **any** instead of source or destination IP or MAC address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny ip 192.168.0.0/16 any**).

You can find the sequence number by running the [show access-list \(IPv4 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** [`<sequence-number>`] `<action>` ip `<source-ip>` `<dest-ip>`  
[`<source-mac>` `<dest-mac>`] [`vlan <1-4094>`] [`log`]  
  
`no <sequence-number>`  
  
`no <action>` ip `<source-ip>` `<dest-ip>` [`<source-mac>` `<dest-mac>`]  
[`vlan <1-4094>`] [`log`]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter |                                                                                                                                                                                                                                                              |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                 | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                               | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                          | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br><i>port-number</i> ] | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br><i>port-number</i> ] | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |

| Values for the <action> parameter                     |                                                                                                                                                                                 |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                              |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                                                               |
| deny-and-not-cpu                                      | Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU. |

| Parameter                   | Description                                                                                                                                                                                                                                                          |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <sequence-number>           | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number. |
| <action>                    | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                      |
| ip                          | Match against IP packets                                                                                                                                                                                                                                             |
| <source-ip>                 | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                                                              |
| any                         | Match any source IP address.                                                                                                                                                                                                                                         |
| dhcp snooping               | Match the source address learned from the DHCP Snooping binding database.                                                                                                                                                                                            |
| host <ip-addr>              | Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                                        |
| <ip-addr>/<prefix>          | Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                                              |
| <ip-addr><br><reverse-mask> | Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.                                               |
| <dest-ip>                   | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                                                               |
| any                         | Match any destination IP address.                                                                                                                                                                                                                                    |

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host <ip-addr>              | Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                                                                                                         |
| <ip-addr>/<prefix>          | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                                                                                                               |
| <ip-addr><br><reverse-mask> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.                                                                                                                |
| <source-mac>                | The source MAC address to match against. You can specify a single MAC address, a range (through a mask), the address learned from DHCP snooping, or any:                                                                                                                                                                                   |
| any                         | Match against any source MAC address.                                                                                                                                                                                                                                                                                                      |
| <source-mac>                | The source MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.      |
| dhcpsnooping                | Match the source address learned from the DHCP Snooping binding database.                                                                                                                                                                                                                                                                  |
| <dest-mac>                  | The destination MAC address to match against. You can specify a single MAC address, a range (through a mask), or any:                                                                                                                                                                                                                      |
| any                         | Match against any destination MAC address.                                                                                                                                                                                                                                                                                                 |
| <dest-mac>                  | The destination MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match. |

| Parameter     | Description                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| vlan <1-4094> | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                             |
| log           | Log packets that are denied by this ACL. You must also enable the logging, using the command <a href="#">access-list hardware-deny-log</a> . |

**Mode** IPv4 Hardware ACL Configuration (accessed by running the command [access-list hardware](#) (named hardware ACL))

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, first run the command [access-list hardware](#) (named hardware ACL) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the access-list named “my-list” that will permit any IP packet with a source address of 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit ip 192.168.1.1/32 any
```

To add a filter entry to the access-list named “my-list” that will permit any IP packet with a source address of 192.168.1.1 and a MAC source address of ffee.ddcc.bbbaa, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit ip 192.168.1.1/32 any mac
ffee.ddcc.bbbaa 0000.0000.0000 any
```

To add a filter entry to the access-list named “my-list” that will deny all IP packets on vlan 2, use the commands:

```
awplus# enable
awplus(config)# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# deny ip any any vlan 2
```

**Related  
commands**

[access-group](#)  
[access-list hardware \(named hardware ACL\)](#)  
[access-list hardware-deny-log](#)  
[match access-group](#)  
[show running-config](#)  
[show access-list \(IPv4 Hardware ACLs\)](#)

**Command  
changes**

Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# (named hardware ACL entry for IP protocols)

**Overview** Use this command to add an IP protocol type filter entry to the current hardware access-list. The filter will match on IP packets that have the specified IP protocol number, and the specified IP and/or MAC addresses. You can use the value **any** instead of source or destination IP or MAC address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny proto 2 192.168.0.0/16 any**).

You can find the sequence number by running the [show access-list \(IPv4 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** [*<sequence-number>*] *<action>* proto *<1-255>* *<source-ip>*  
*<dest-ip>* [*<source-mac>* *<dest-mac>*] [*vlan <1-4094>*] [*log*]  
  
no *<sequence-number>*  
  
no *<action>* proto *<1-255>* *<source-ip>* *<dest-ip>* [*<source-mac>*  
*<dest-mac>*] [*vlan <1-4094>*] [*log*]

The following actions are available for hardware ACLs:

| Values for the <i>&lt;action&gt;</i> parameter       |                                                                                                                                                                                                                                                              |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                 | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                               | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                          | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br><i>port-number</i> ] | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-mirror<br>[interface<br><i>port-number</i> ] | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.         |

| Values for the <action> parameter                     |                                                                                                                                                                                 |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                              |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                                                               |
| deny-and-not-cpu                                      | Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU. |

Table 42-5: Parameters in IP protocol ACL entries

| Parameter         | Description                                                                                                                                                                                                                                                                        |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <sequence-number> | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.               |
| <action>          | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                                    |
| proto <1-255>     | The IP protocol number to match against, as defined by IANA (Internet Assigned Numbers Authority <a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a> )<br>See below for a list of IP protocol numbers and their descriptions. |
| <source-ip>       | The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:                                                                                                            |
|                   | any Match any source IP address.                                                                                                                                                                                                                                                   |
|                   | dhcpsnooping Match the source address learned from the DHCP Snooping binding database.                                                                                                                                                                                             |
|                   | host <ip-addr> Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.                                                                                                                                                                       |
|                   | <ip-addr>/<prefix> Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                                         |
|                   | <ip-addr><br><reverse-mask> Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.                                 |

Table 42-5: Parameters in IP protocol ACL entries (cont.)

| Parameter                                                         | Description                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;dest-ip&gt;</code>                                      | The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:                                                                                                                                                                                        |
| <code>any</code>                                                  | Match any destination IP address.                                                                                                                                                                                                                                                                                                                                             |
| <code>host &lt;ip-addr&gt;</code>                                 | Match a single destination host with the IP address given by <code>&lt;ip-addr&gt;</code> in dotted decimal notation.                                                                                                                                                                                                                                                         |
| <code>&lt;ip-addr&gt;/&lt;prefix&gt;</code>                       | Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.                                                                                                                                                                                                                  |
| <code>&lt;ip-addr&gt;</code><br><code>&lt;reverse-mask&gt;</code> | Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.                                                                                                                                                   |
| <code>&lt;source-mac&gt;</code>                                   | The source MAC address to match against. You can specify a single MAC address, a range (through a mask), the address learned from DHCP snooping, or any:                                                                                                                                                                                                                      |
| <code>any</code>                                                  | Match against any source MAC address.                                                                                                                                                                                                                                                                                                                                         |
| <code>&lt;source-mac&gt;</code>                                   | The source MAC address to match against, followed by the mask. Enter the address in the format <code>&lt;HHHH.HHHH.HHHH&gt;</code> , where each <i>H</i> is a hexadecimal number. Enter the mask in the format <code>&lt;HHHH.HHHH.HHHH&gt;</code> , where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match. |
| <code>dhcpsnooping</code>                                         | Match the source address learned from the DHCP Snooping binding database.                                                                                                                                                                                                                                                                                                     |
| <code>&lt;dest-mac&gt;</code>                                     | The destination MAC address to match against. You can specify a single MAC address, a range (through a mask), or any:                                                                                                                                                                                                                                                         |
| <code>any</code>                                                  | Match against any destination MAC address.                                                                                                                                                                                                                                                                                                                                    |

Table 42-5: Parameters in IP protocol ACL entries (cont.)

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;dest-mac&gt;</code>    | The destination MAC address to match against, followed by the mask.<br>Enter the address in the format <code>&lt;HHHH.HHHH.HHHH&gt;</code> , where each <i>H</i> is a hexadecimal number.<br>Enter the mask in the format <code>&lt;HHHH.HHHH.HHHH&gt;</code> , where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match. |
| <code>vlan &lt;1-4094&gt;</code> | The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.                                                                                                                                                                                                                                                                                         |
| <code>log</code>                 | Log packets that are denied by this ACL. You must also enable the logging, using the command <a href="#">access-list hardware-deny-log</a> .                                                                                                                                                                                                                                             |

**Mode** IPv4 Hardware ACL Configuration (accessed by running the command [access-list hardware \(named hardware ACL\)](#))

**Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

**Usage notes** To use this command, run the command [access-list hardware \(named hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl) #
```

Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

**Examples** To add a filter entry to the access-list named “my-list” that will deny all IGMP packets (protocol 2) from the 192.168.0.0 subnet, and give it a sequence number of 50, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# 50 deny proto 2 192.168.0.0/16 any
```

**Related commands**

- [access-group](#)
- [access-list hardware \(named hardware ACL\)](#)
- [access-list hardware-deny-log](#)
- [match access-group](#)
- [show running-config](#)
- [show access-list \(IPv4 Hardware ACLs\)](#)

**Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

# (named hardware ACL entry for MAC addresses)

**Overview** Use this command to add a MAC address filter entry to the current hardware access-list. The access-list will match on packets that have the specified source and destination MAC addresses. You can use the value **any** instead of source or destination MAC address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no permit mac aaaa.bbbb.cccc 0000.0000.0000 any**).

You can find the sequence number by running the [show access-list \(IPv4 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

**CAUTION:** Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

**Syntax** [`<sequence-number>`] `<action>` mac {`<source-mac>`|any} {`<dest-mac>`|any} [vlan `<1-4094>`] [inner-vlan `<1-4094>`]  
  
no `<sequence-number>`  
  
no `<action>` mac {`<source-mac>`|any} {`<dest-mac>`|any} [vlan `<1-4094>`] [inner-vlan `<1-4094>`]

The following actions are available for hardware ACLs:

| Values for the <code>&lt;action&gt;</code> parameter |                                                                                                                                                                                                                                                              |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deny                                                 | Reject packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| permit                                               | Permit packets that match the source and destination filtering specified with this command.                                                                                                                                                                  |
| copy-to-cpu                                          | Send a copy of matching packets to the CPU.                                                                                                                                                                                                                  |
| copy-to-mirror<br>[interface<br><i>port-number</i> ] | Send a copy of matching packets to a mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |

| Values for the <action> parameter                     |                                                                                                                                                                                                                                                      |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| send-to-mirror<br>[interface<br>port-number]          | Send matching packets to the mirror port. Use the <b>mirror interface</b> command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number. |
| send-to-vlan-port<br>vlan <vid> port<br><port-number> | Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.                                                                                                                   |
| send-to-cpu                                           | Send matching packets to the CPU.                                                                                                                                                                                                                    |
| deny-and-not-cpu                                      | Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.                                                                      |

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                      |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <sequence-number>      | The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.                                                                             |
| <action>               | The action that the switch will take on matching packets. See the table above for valid values.                                                                                                                                                                                                                                                  |
| mac                    | Match against MAC address                                                                                                                                                                                                                                                                                                                        |
| <source-mac>           | The source MAC address to match against, followed by the mask.<br>Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number.<br>Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.      |
| any                    | Match against any source MAC address.                                                                                                                                                                                                                                                                                                            |
| <dest-mac>             | The destination MAC address to match against, followed by the mask.<br>Enter the address in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number.<br>Enter the mask in the format <HHHH.HHHH.HHHH>, where each <i>H</i> is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match. |
| any                    | Match against any destination MAC address.                                                                                                                                                                                                                                                                                                       |
| vlan <1-4094>          | Match against the specified ID in the packet's VLAN tag.                                                                                                                                                                                                                                                                                         |
| inner-vlan<br><1-4094> | Match against the inner VLAN tag (VID). This parameter is used within double-tagged VLANs. It is sometimes referred to as the C-TAG (Customer VLAN TAG), and the vlan VID tag is referred to as the S-TAG (Service VLAN TAG).                                                                                                                    |

- Mode** IPv4 Hardware ACL Configuration (accessed by running the command [access-list hardware \(named hardware ACL\)](#))
- Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.
- Usage notes** To use this command, first run the command [access-list hardware \(named hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:
- ```
awplus(config-ip-hw-acl)#
```
- Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.
- Then use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.
- Examples** To add a filter entry to the access-list named “my-list” that will permit packets with a source MAC address of 0000.00ab.1234 and any destination MAC address, use the commands:
- ```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit mac 0000.00ab.1234
0000.0000.0000 any
```
- To remove a filter entry that permit packets with a source MAC address of 0000.00ab.1234 and any destination MAC address, use the commands:
- ```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# no permit mac 0000.00ab.1234
0000.0000.0000 any
```
- Related commands** [access-group](#)
[access-list hardware \(named hardware ACL\)](#)
[match access-group](#)
[show running-config](#)
[show access-list \(IPv4 Hardware ACLs\)](#)
- Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches
- Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches
- Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

(named hardware ACL entry for TCP or UDP)

Overview Use this command to add a TCP or UDP filter entry to the current hardware access-list. The access-list will match on TCP or UDP packets that have the specified source and destination IP addresses and optionally, port values. You can use the value **any** instead of source or destination IP address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no permit udp 192.168.0.0/16 any**).

You can find the sequence number by running the [show access-list \(IPv4 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

Syntax [`<sequence-number>`] `<action>` {`tcp|udp`} `<source-ip>`
[`<source-ports>`] `<dest-ip>` [`<dest-ports>`] [`vlan <1-4094>`] [`log`]

`no <sequence-number>`

`no <action>` {`tcp|udp`} `<source-ip>` [`<source-ports>`] `<dest-ip>`
[`<dest-ports>`] [`vlan <1-4094>`] [`log`]

The following actions are available for hardware ACLs:

Values for the <code><action></code> parameter	
<code>deny</code>	Reject packets that match the source and destination filtering specified with this command.
<code>permit</code>	Permit packets that match the source and destination filtering specified with this command.
<code>copy-to-cpu</code>	Send a copy of matching packets to the CPU.
<code>copy-to-mirror</code> [<code>interface</code> <code>port-number</code>]	Send a copy of matching packets to a mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
<code>send-to-mirror</code> [<code>interface</code> <code>port-number</code>]	Send matching packets to the mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.

Values for the <action> parameter	
send-to-vlan-port vlan <vid> port <port-number>	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.
send-to-cpu	Send matching packets to the CPU.
deny-and-not-cpu	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Parameter	Description
<sequence-number>	The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.
<action>	The action that the switch will take on matching packets. See the table above for valid values.
tcp	Match against TCP packets.
udp	Match against UDP packets.
<source-ip>	The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:
	any Match any source IP address.
	host <ip-addr> Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.
	<ip-addr>/<prefix> Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> <reverse-mask> Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<source-ports>	Match source TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:
	eq <0-65535> Match a single port number.
	lt <0-65535> Match all port numbers that are less than the specified port number.

Parameter	Description
gt <0-65535>	Match all port numbers that are greater than the specified port number.
ne <0-65535>	Match all port numbers except the specified port number.
range <start-port> <end-port>	Match a range of port numbers.
<dest-ip>	The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:
any	Match any destination IP address.
host <ip-addr>	Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.
<ip-addr>/<prefix>	Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
<ip-addr> <reverse-mask>	Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<dest-ports>	Match destination TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:
eq <0-65535>	Match a single port number.
lt <0-65535>	Match all port numbers that are less than the specified port number.
gt <0-65535>	Match all port numbers that are greater than the specified port number.
ne <0-65535>	Match all port numbers except the specified port number.
range <start-port> <end-port>	Match a range of port numbers.
vlan <1-4094>	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.
log	Log packets that are denied by this ACL. You must also enable the logging, using the command access-list hardware-deny-log .

- Mode** IPv4 Hardware ACL Configuration (accessed by running the command [access-list hardware \(named hardware ACL\)](#))
- Default** On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.
- Usage notes** To use this command, first run the command [access-list hardware \(named hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:
- ```
awplus(config-ip-hw-acl)#
```
- Then use this command (and the other “named hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.
- Then use the [access-group](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.
- Example** To add a filter entry to access-list named “my-list” that will permit TCP packets with a destination address of 192.168.1.1, a destination port of 80, from any source, use the commands:
- ```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit tcp any 192.168.1.1/32 eq 80
```
- Related commands** [access-group](#)
[access-list hardware \(named hardware ACL\)](#)
[access-list hardware-deny-log](#)
[match access-group](#)
[show running-config](#)
[show access-list \(IPv4 Hardware ACLs\)](#)
- Command changes** Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches
- Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches
- Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches
- Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

show access-list (IPv4 Hardware ACLs)

Overview Use this command to display the specified access-list, or all access-lists if none have been specified. Note that only defined access-lists are displayed. An error message is displayed for an undefined access-list.

Syntax `show access-list`
`[<1-99>|<100-199>|<1300-1999>|<2000-2699>|<3000-3699>|`
`<4000-4499>|<access-list-name>]`

Parameter	Description
<1-99>	IP standard access-list.
<100-199>	IP extended access-list.
<1300-1999>	IP standard access-list (standard - expanded range).
<2000-2699>	IP extended access-list (extended - expanded range).
<3000-3699>	Hardware IP access-list.
<4000-4499>	Hardware MAC access-list.
<access-list-name>	IP named access-list.

Mode User Exec and Privileged Exec

Examples To show all access-lists configured on the switch:

```
awplus# show access-list
```

```
Standard IP access list 1
  deny 172.16.2.0, wildcard bits 0.0.0.255
Standard IP access list 20
  deny 192.168.10.0, wildcard bits 0.0.0.255
  deny 192.168.12.0, wildcard bits 0.0.0.255
Hardware IP access list 3001
  permit ip 192.168.20.0 255.255.255.0 any
Hardware IP access list 3020
  permit tcp any 192.0.2.0/24
```

To show the access-list with an ID of 20:

```
awplus# show access-list 20
```

```
Standard IP access-list 20
  deny 192.168.10.0, wildcard bits 0.0.0.255
  deny 192.168.12.0, wildcard bits 0.0.0.255
```

ACLs that are added dynamically during port authentication will be displayed with the label 'dynamic':

```
awplus# show access-list
```

```
Hardware IP access list 3000
  4 permit ip any any
Hardware IP access list 3001
  4 deny ip 192.168.0.0/24 any
Hardware IP access list dacl-port1.0.49-eccd.6dc9.c0d2 (dynamic)
  4 permit ip 192.168.1.0/24 192.168.2.0/24
  8 deny ip 192.168.1.0/24 any
```

The following error message is displayed if you try to show an undefined access-list.

```
awplus# show access-list 2
```

```
% Can't find access-list 2
```

**Related
commands**

[access-list extended \(named\)](#)

[access-list \(numbered hardware ACL for MAC addresses\)](#)

[access-list hardware \(named hardware ACL\)](#)

show access-list counters

Overview Use this command to show the number of packets that match one or all of your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments. This lets you check your ACL configuration.

Syntax `show access-list counters [<acl>]`

Parameter	Description
<acl>	Display the number of packets that match only the specified ACL. You can enter the ACL name or number.

Mode User Exec and Privileged Exec

Usage notes This command displays the counter values since the last time they were cleared. To clear the counter values, enter the command [clear access-list counters](#).

To accurately measure the number of packet hits per ACL, you need to read the counters for all ACLs frequently.

Example To show the number of packets that match all hardware ACLs, use the following command:

```
awplus# show access-list counters
```

Output Figure 42-1: Example output from **show access-list counters**

```
awplus#show access-list counters
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
ACL-2
Packet Hits: 0
ACL-3
Packet Hits: 1
```

Output Figure 42-2: Example output from **show access-list counters ACL-1**

```
awplus#show access-list counters ACL-1
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
```

Table 42-7: Parameters in the output from **show access-list counters**

Parameter	Description
Packet Hits	The number of packets that match the ACL. The count includes both dropped and allowed packets.

Related commands [clear access-list counters](#)
 [show interface access-group](#)

Command changes Version 5.5.2-2.1: reading the counters no longer clears them
 Version 5.5.1-2.1: command added

show acl-group ip address

Overview Use this command to show the hosts and subnets in a named IPv4 ACL group.

Syntax `show acl-group ip address <group>`

Parameter	Description
<code><group></code>	The name of the IPv4 ACL group.

Mode Privileged Exec

Example To show all hosts and subnets in an IPv4 ACL group IPV4_GROUP1, use the command:

```
awplus# show acl-group ip address IPV4_GROUP1
```

Output Figure 42-3: Example output from **show acl-group ip address IPV4_GROUP1**

```
awplus#show acl-group ip address IPV4_GROUP1
Host Group: IPV4_GROUP1

192.168.1.2/32
192.168.2.5/32
10.0.0.0/8
```

Related commands [acl-group ip address](#)
[ip \(ip-host-group\)](#)

Command changes Version 5.5.0-1.1: command added

show acl-group ip port

Overview Use this command to show the port rules in a named port ACL group.

Syntax `show acl-group ip port <group>`

Parameter	Description
<code><group></code>	The name of the port ACL group.

Mode Privileged Exec

Example To show all port rules in a port ACL group PORT_GROUP1, use the command:

```
awplus# show acl-group ip port PORT_GROUP1
```

Output Figure 42-4: Example output from **show acl-group ip port PORT_GROUP1**

```
awplus#show acl-group ip port PORT_GROUP1
Port Group: PORT_GROUP1

eq 11
gt 20
lt 503
ne 500
```

Related commands [\(acl-group ip port range\)](#)
[acl-group ip port](#)

Command changes Version 5.5.0-1.1: command added

show interface access-group

Overview Use this command to display the access groups attached to a port. If an access group is specified, then the output only includes the ports that the specified access group is attached to. If no access group is specified then this command displays all access groups that are attached to the ports that are specified with <port-list>.

Note that **access group** is the term given for an access-list when it is applied to an interface.

NOTE: This command will function on the switch in stand-alone mode, but is not supported when the switch forms part of a VCStack.

Syntax

```
show interface <port-list> access-group  
[<3000-3699>|<4000-4699>|<access-list-name>]
```

```
show interface <port-list> access-group  
[<3000-3699>|<4000-4699>]
```

Parameter	Description
<port-list>	Specify the ports to display information. A port-list can be either: - a switch port (e.g. port1.0.6) a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po2) - a continuous range of ports separated by a hyphen, e.g. port1.0.1-1.0.6 or port1.0.1-port1.0.6 or po1-po2 - a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.3-1.0.6. Do not mix switch ports, static channel groups, and LACP channel groups in the same list.
access group	Select the access group whose details you want to show.
<3000-3699>	Specifies the Hardware IP access-list.
<4000-4699>	Specifies the Hardware MAC access-list.
<access-list-name>	Specify the Hardware IPv4 access-list name.

Mode User Exec and Privileged Exec

Example To show all access-lists attached to port1.0.1, use the command:

```
awplus# show interface port1.0.1 access-group
```

Output Figure 42-5: Example output from the **show interface access-group** command

```
Interface port1.0.1  
  access-group 3000  
  access-group 3002  
  access-group 3001
```

IPv4 Software Access Control List (ACL) Commands

Introduction

Overview This chapter provides an alphabetical reference for the IPv4 Software Access Control List (ACL) commands, and contains detailed command information and command examples about IPv4 software ACLs as applied to Routing and Multicasting, which are not applied to interfaces.

For information about ACLs, see the [ACL Feature Overview and Configuration Guide](#).

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see the following references:

- the [Link Aggregation Feature Overview_and_Configuration_Guide](#).
- [Link Aggregation Commands](#)

NOTE: Text in parenthesis in command names indicates usage not keyword entry. For example, **access-list hardware (named)** indicates named IPv4 hardware ACLs entered as `access-list hardware <name>` where <name> is a placeholder not a keyword.

Parenthesis surrounding ACL filters indicates the type of ACL filter not the keyword entry in the CLI, such as **(access-list standard numbered filter)** represents command entry in the format shown in the syntax:

```
[<sequence-number>] {deny|permit} {<source-address>|host  
<host-address>|any}
```

NOTE: Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Sub-modes Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

Table 43-1: IPv4 Software Access List Commands and Prompts

Command Name	Command Mode	Prompt
clear ip prefix-list	Privileged Exec	awplus#
show ip access-list	Privileged Exec	awplus#
show ip prefix-list	Privileged Exec	awplus#

access-list extended (named)

Overview This command configures an extended named access-list that permits or denies packets from specific source and destination IP addresses. You can:

- use this command to enter a new or existing ACL name and enter the IPv4 Extended ACL Configuration mode. Once in that mode, you can create an ACL filter entry. This approach lets you give the entry a sequence number.
- or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified extended named access-list.

Syntax [to enter the sub-mode]

```
access-list extended <list-name>
no access-list extended <list-name>
```

Parameter	Description
<list-name>	A user-defined name for the access-list

Syntax [icmp]

```
access-list extended <list-name> {deny|permit} icmp <source>
<destination> [icmp-type <type-number>] [log]
no access-list extended <list-name> {deny|permit} icmp <source>
<destination> [icmp-type <type-number>] [log]
```

Table 43-2: Parameters in the access-list extended (named) command - icmp

Parameter	Description
<list-name>	A user-defined name for the access-list.
deny	The access-list rejects packets that match the type, source, and destination filtering specified with this command.
permit	The access-list permits packets that match the type, source, and destination filtering specified with this command.
icmp	The access-list matches only ICMP packets.
icmp-type	Matches only a specified type of ICMP messages. This is valid only when the filtering is set to match ICMP packets.

Table 43-2: Parameters in the access-list extended (named) command - icmp

Parameter	Description
<i><source></i>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:
<i>any</i>	Matches any source IP address.
<i>host <ip-addr></i>	Matches a single source host with the IP address given by <i><ip-addr></i> in dotted decimal notation.
<i><ip-addr>/ <prefix></i>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
<i><ip-addr> <reverse-mask></i>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.10.0.0.255 is the same as entering 192.168.1.1/24.
<i><destination></i>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:
<i>any</i>	Matches any destination IP address.
<i>host <ip-addr></i>	Matches a single destination host with the IP address given by <i><ip-addr></i> in dotted decimal notation.
<i><ip-addr>/ <prefix></i>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
<i><ip-addr> <reverse-mask></i>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.10.0.0.255 is the same as entering 192.168.1.1/24.

Table 43-2: Parameters in the access-list extended (named) command - icmp

Parameter	Description
<type-number>	The ICMP type, as defined in RFC792 and RFC950. Specify one of the following integers to create a filter for the ICMP message type:
0	Echo replies.
3	Destination unreachable messages.
4	Source quench messages.
5	Redirect (change route) messages.
8	Echo requests.
11	Time exceeded messages.
12	Parameter problem messages.
13	Timestamp requests.
14	Timestamp replies.
15	Information requests.
16	Information replies.
17	Address mask requests.
18	Address mask replies.
log	Logs the results.

Syntax [tcp|udp]

```
access-list extended <list-name> {deny|permit} {tcp|udp}
<source> [eq <sourceport>|lt <sourceport>|gt <sourceport>|ne
<sourceport>] <destination> [eq <destport>|lt <destport>|gt
<destport>|ne <destport>] [log]
```

```
no access-list extended <list-name> {deny|permit} {tcp|udp}
<source> [eq <sourceport>|lt <sourceport>|gt <sourceport>|ne
<sourceport>] <destination> [eq <destport> |lt <destport>|gt
<destport>|ne <destport>] [log]
```

Table 43-3: Parameters in the access-list extended (named) command - tcp|udp

Parameter	Description
<list-name>	A user-defined name for the access-list.
deny	The access-list rejects packets that match the type, source, and destination filtering specified with this command.
permit	The access-list permits packets that match the type, source, and destination filtering specified with this command.
tcp	The access-list matches only TCP packets.
udp	The access-list matches only UDP packets.

Table 43-3: Parameters in the access-list extended (named) command - tcp|udp

Parameter	Description
<code><source></code>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:
<code>any</code>	Matches any source IP address.
<code>host <ip-addr></code>	Matches a single source host with the IP address given by <code><ip-addr></code> in dotted decimal notation.
<code><ip-addr>/ <prefix></code>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
<code><ip-addr> <reverse-mask></code>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering <code>192.168.1.10.0.0.0.255</code> is the same as entering <code>192.168.1.1/24</code> .
<code><destination></code>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:
<code>any</code>	Matches any destination IP address.
<code>host <ip-addr></code>	Matches a single destination host with the IP address given by <code><ip-addr></code> in dotted decimal notation.
<code><ip-addr>/ <prefix></code>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
<code><ip-addr> <reverse-mask></code>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering <code>192.168.1.10.0.0.0.255</code> is the same as entering <code>192.168.1.1/24</code> .
<code><sourceport></code>	The source port number, specified as an integer between 0 and 65535.
<code><destport></code>	The destination port number, specified as an integer between 0 and 65535.
<code>eq</code>	Matches port numbers equal to the port number specified immediately after this parameter.
<code>lt</code>	Matches port numbers less than the port number specified immediately after this parameter.
<code>gt</code>	Matches port numbers greater than the port number specified immediately after this parameter.

Table 43-3: Parameters in the access-list extended (named) command - tcp|udp

Parameter	Description
ne	Matches port numbers not equal to the port number specified immediately after this parameter.
log	Log the results.

Syntax
[proto|any|ip]

```
access-list extended <list-name> {deny|permit} {proto
<ip-protocol>|any|ip} {<source>} {<destination>} [log]
no access-list extended <list-name>{deny|permit} {proto
<ip-protocol>|any|ip}{<source>}{<destination>} [log]
```

Table 43-4: Parameters in the access-list extended (named) command -
proto|ip|any

Parameter	Description
<list-name>	A user-defined name for the access-list.
deny	The access-list rejects packets that match the type, source, and destination filtering specified with this command.
permit	The access-list permits packets that match the type, source, and destination filtering specified with this command.
proto	Matches only a specified type of IP Protocol.
any	The access-list matches any type of IP packet.
ip	The access-list matches only IP packets.
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:
	any Matches any source IP address.
	host <ip-addr> Matches a single source host with the IP address given by <ip-addr> in dotted decimal notation.
	<ip-addr>/<prefix> An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	<ip-addr><reverse-mask> Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24.

Table 43-4: Parameters in the access-list extended (named) command -
proto|ip|any (cont.)

Parameter	Description
<code><destination></code>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:
<code>any</code>	Matches any destination IP address.
<code>host <ip-addr></code>	Matches a single destination host with the IP address given by <code><ip-addr></code> in dotted decimal notation.
<code><ip-addr>/ <prefix></code>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
<code><ip-addr> <reverse-mask></code>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering <code>192.168.1.1 0.0.0.255</code> is the same as entering <code>192.168.1.1/24</code> .
<code>log</code>	Logs the results.
<code><ip-protocol></code>	The IP protocol number, as defined by IANA (Internet Assigned Numbers Authority) www.iana.org/assignments/protocol-numbers See below for a list of IP protocol numbers and their descriptions.

Table 43-5: IP protocol number and description

Protocol Number	Protocol Description [RFC]
1	Internet Control Message [RFC792]
2	Internet Group Management [RFC1112]
3	Gateway-to-Gateway [RFC823]
4	IP in IP [RFC2003]
5	Stream [RFC1190] [RFC1819]
6	TCP (Transmission Control Protocol) [RFC793]
8	EGP (Exterior Gateway Protocol) [RFC888]
9	IGP (Interior Gateway Protocol) [IANA]
11	Network Voice Protocol [RFC741]
17	UDP (User Datagram Protocol) [RFC768]
20	Host monitoring [RFC869]
27	RDP (Reliable Data Protocol) [RFC908]
28	IRTP (Internet Reliable Transaction Protocol) [RFC938]

Table 43-5: IP protocol number and description (cont.)

Protocol Number	Protocol Description [RFC]
29	ISO-TP4 (ISO Transport Protocol Class 4) [RFC905]
30	Bulk Data Transfer Protocol [RFC969]
33	DCCP (Datagram Congestion Control Protocol) [RFC4340]
48	DSR (Dynamic Source Routing Protocol) [RFC4728]
50	ESP (Encap Security Payload) [RFC2406]
51	AH (Authentication Header) [RFC2402]
54	NARP (NBMA Address Resolution Protocol) [RFC1735]
58	ICMP for IPv6 [RFC1883]
59	No Next Header for IPv6 [RFC1883]
60	Destination Options for IPv6 [RFC1883]
88	EIGRP (Enhanced Interior Gateway Routing Protocol)
89	OSPFv2 [RFC1583]
97	Ethernet-within-IP Encapsulation / RFC3378
98	Encapsulation Header / RFC1241
108	IP Payload Compression Protocol / RFC2393
112	Virtual Router Redundancy Protocol / RFC3768
134	RSVP-E2E-IGNORE / RFC3175
135	Mobility Header / RFC3775
136	UDPLite / RFC3828
137	MPLS-in-IP / RFC4023
138	MANET Protocols / RFC-ietf-manet-iana-07.txt
139-252	Unassigned / IANA
253	Use for experimentation and testing / RFC3692
254	Use for experimentation and testing / RFC3692
255	Reserved / IANA

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage Use this command when configuring access-lists for filtering IP software packets. You can either create access-lists from within this command, or you can enter **access-list extended** followed by only the name. Entering only the name moves you to the IPv4 Extended ACL Configuration mode for the selected access-list.

From there you can configure your access-lists by using the commands ([access-list extended ICMP filter](#)), ([access-list extended IP filter](#)), and ([access-list extended IP protocol filter](#)).

Note that packets must match both the source and the destination details.

NOTE: Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples You can enter the extended named ACL in the Global Configuration mode together with the ACL filter entry on the same line, as shown below:

```
awplus# configure terminal
awplus(config)# access-list extended TK deny tcp 2.2.2.3/24 eq
14 3.3.3.4/24 eq 12 log
```

Alternatively, you can enter the extended named ACL in Global Configuration mode before specifying the ACL filter entry in the IPv4 Extended ACL Configuration mode, as shown below:

```
awplus# configure terminal
awplus(config)# access-list extended TK
awplus(config-ip-ext-acl)# deny tcp 2.2.2.3/24 eq 14 3.3.3.4/24
eq 12 log
```

Related commands

- ([access-list extended ICMP filter](#))

- ([access-list extended TCP UDP filter](#))
- [show interface access-group](#)
- [show ip access-list](#)
- [show running-config](#)

access-list (extended numbered)

- Overview** This command configures an extended numbered access-list that permits or denies packets from specific source and destination IP addresses. You can:
- use this command to enter a new or existing ACL number and enter the IPv4 Extended ACL Configuration mode. Once in that mode, you can create an ACL filter entry. This approach lets you give the entry a sequence number.
 - or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified extended named access-list.

Syntax [to enter the sub-mode]

```
access-list {<100-199>|<2000-2699>}  
no access-list {<100-199>|<2000-2699>}
```

Syntax [to create an ACL entry]

```
access-list {<100-199>|<2000-2699>} {deny|permit} ip <source>  
<destination>  
no access-list {<100-199>|<2000-2699>} {deny|permit} ip  
<source> <destination>
```

Parameter	Description
<100-199>	IP extended access-list.
<2000-2699>	IP extended access-list (expanded range).
deny	Access-list rejects packets that match the source and destination filtering specified with this command.
permit	Access-list permits packets that match the source and destination filtering specified with this command.
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:
any	Matches any source IP address.
host <ip-addr>	Matches a single source host with the IP address given by <ip-addr> in dotted decimal notation.
<ip-addr> <reverse-mask>	An IPv4 address, followed by a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24. This matches any source IP address within the specified subnet.
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:

Parameter	Description
any	Matches any destination IP address.
host <ip-addr>	Matches a single destination host with the IP address given by <ip-addr> in dotted decimal notation.
<ip-addr> <reverse-mask>	An IPv4 address, followed by a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24. This matches any destination IP address within the specified subnet.

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes Use this command when configuring access-list for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access-list** followed by only the number. Entering only the number moves you to the IPv4 Extended ACL Configuration mode for the selected access-list. From there you can configure your access-lists by using the commands ([access-list extended ICMP filter](#)), ([access-list extended IP filter](#)), and ([access-list extended IP protocol filter](#)).

Note that packets must match both the source and the destination details.

NOTE: Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples You can enter the extended ACL in the Global Configuration mode together with the ACL filter entry on the same line, as shown below:

```
awplus# configure terminal
awplus(config)# access-list 101 deny ip 172.16.10.0 0.0.0.255
any
```

Alternatively, you can enter the extended ACL in Global Configuration mode before specifying the ACL filter entry in the IPv4 Extended ACL Configuration mode, as shown below:

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)# deny ip 172.16.10.0 0.0.0.255 any
```

Related commands (access-list extended ICMP filter)
(access-list extended IP filter)
(access-list extended TCP UDP filter)
show interface access-group
show ip access-list
show running-config

(access-list extended ICMP filter)

Overview Use this ACL filter to add a new ICMP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an ICMP filter entry from the current extended access-list. You can specify the ICMP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its ICMP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

Syntax [icmp] [*<sequence-number>*] {deny|permit} icmp *<source>* *<destination>*
[icmp-type *<icmp-value>*] [log]

no {deny|permit} icmp *<source>* *<destination>*[icmp-type
<icmp-value>] [log]

no *<sequence-number>*

Parameter	Description
<i><sequence-number></i>	<i><1-65535></i> The sequence number for the filter entry of the selected access control list.
deny	Access-list rejects packets that match the source and destination filtering specified with this command.
permit	Access-list permits packets that match the source and destination filtering specified with this command.
icmp	ICMP packet type.
<i><source></i>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:
	<i><ip-addr>/ <prefix></i> An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	any Matches any source IP address.
<i><destination></i>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:
	<i><ip-addr>/ <prefix></i> An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
	any Matches any destination IP address.

Parameter	Description
icmp-type	The ICMP type.
<icmp-value>	The value of the ICMP type.
log	Log the results.

Mode IPv4 Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

NOTE: The access control list being configured is selected by running the [access-list \(extended numbered\)](#) command or the [access-list extended \(named\)](#) command, with the required access control list number, or name - but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples To add a new entry in access-list called 'my-list' that will reject ICMP packets from 10.0.0.1 to 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny icmp 10.0.0.1/32 192.168.1.1/32
```

Use the following commands to add a new filter at sequence number 5 position of the access-list called 'my-list'. The filter will accept the ICMP type 8 packets from 10.1.1.0/24 network, to 192.168.1.0 network:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit icmp 10.1.1.0/24
192.168.1.0/24 icmp-type 8
```

Related commands [access-group](#)
[show interface access-group](#)
[show running-config](#)
[show ip access-list](#)

(access-list extended IP filter)

Overview Use this ACL filter to add a new IP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an IP filter entry from the current extended access-list. You can specify the IP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its IP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

Syntax [ip] [*<sequence-number>*] {deny|permit} ip *<source>* *<destination>*
no {deny|permit} ip *<source>* *<destination>*
no *<sequence-number>*

Parameter	Description						
<i><sequence-number></i>	<i><1-65535></i> The sequence number for the filter entry of the selected access control list.						
deny	Access-list rejects packets that match the source and destination filtering specified with this command.						
permit	Access-list permits packets that match the source and destination filtering specified with this command.						
<i><source></i>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source: <table><tr><td>any</td><td>Matches any source IP address.</td></tr><tr><td>host <i><ip-addr></i></td><td>Matches a single source host with the IP address given by <i><ip-addr></i> in dotted decimal notation.</td></tr><tr><td><i><ip-addr></i> <i><reverse-mask></i></td><td>Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255.</td></tr></table>	any	Matches any source IP address.	host <i><ip-addr></i>	Matches a single source host with the IP address given by <i><ip-addr></i> in dotted decimal notation.	<i><ip-addr></i> <i><reverse-mask></i>	Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255.
any	Matches any source IP address.						
host <i><ip-addr></i>	Matches a single source host with the IP address given by <i><ip-addr></i> in dotted decimal notation.						
<i><ip-addr></i> <i><reverse-mask></i>	Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255.						

Parameter	Description
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:
any	Matches any destination IP address.
host <ip-addr>	Matches a single destination host with the IP address given by <ip-addr> in dotted decimal notation.
<ip-addr> <reverse-mask>	Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255.

Mode Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

NOTE: The access control list being configured is selected by running the [access-list \(extended numbered\)](#) command or the [access-list extended \(named\)](#) command, with the required access control list number, or name - but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example 1 [list-number] First use the following commands to enter the IPv4 Extended ACL Configuration mode and define a numbered extended access-list 101:

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)#
```

Then use the following commands to add a new entry to the numbered extended access-list 101 that will reject packets from 10.0.0.1 to 192.168.1.1:

```
awplus(config-ip-ext-acl)# deny ip host 10.0.0.1 host
192.168.1.1
awplus(config-ip-ext-acl)# 20 permit ip any any
```

Example 2 [list-name] First use the following commands to enter the IPv4 Extended ACL Configuration mode and define a named access-list called 'my-acl':

```
awplus# configure terminal
awplus(config)# access-list extended my-acl
awplus(config-ip-ext-acl)#
```

Then use the following commands to add a new entry to the named access-list 'my-acl' that will reject packets from 10.0.0.1 to 192.168.1.1:

```
awplus(config-ip-ext-acl)# deny ip host 10.0.0.1 host  
192.168.1.1
```

```
awplus(config-ip-ext-acl)# 20 permit ip any any
```

Example 3 Use the following commands to remove the access-list filter entry with sequence
[list-number] number 20 from extended numbered access-list 101.

```
awplus# configure terminal  
awplus(config)# access-list 101  
awplus(config-ip-ext-acl)# no 20
```

Example 4 Use the following commands to remove the access-list filter entry with sequence
[list-name] number 20 from extended named access-list my-acl:

```
awplus# configure terminal  
awplus(config)# access-list extended my-acl  
awplus(config-ip-ext-acl)# no 20
```

- [access-list \(extended numbered\)](#)
- [show interface access-group](#)
- [show ip access-list](#)
- [show running-config](#)

(access-list extended IP protocol filter)

Overview Use this ACL filter to add a new IP protocol type filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an IP protocol filter entry from the current extended access-list. You can specify the IP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its IP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

Syntax [proto] [*<sequence-number>*] {deny|permit} proto *<ip-protocol>* *<source>* *<destination>* [log]

no {deny|permit} proto *<ip-protocol>* *<source>* *<destination>* [log]

no *<sequence-number>*

Parameter	Description
<i><sequence-number></i>	<i><1-65535></i> The sequence number for the filter entry of the selected access control list.
deny	Access-list rejects packets that match the source and destination filtering specified with this command.
permit	Access-list permits packets that match the source and destination filtering specified with this command.
proto <i><ip-protocol></i>	<i><1-255></i> Specify IP protocol number, as defined by IANA (Internet Assigned Numbers Authority) www.iana.org/assignments/protocol-numbers See below for a list of IP protocol numbers and their descriptions.
<i><source></i>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:
	<i><ip-addr>/<prefix></i> An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	any Matches any source IP address.

Parameter	Description
<code><destination></code>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:
<code><ip-addr>/ <prefix></code>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
<code>any</code>	Matches any destination IP address.
<code>log</code>	Log the results.

Mode IPv4 Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

NOTE: The access control list being configured is selected by running the *access-list (extended numbered)* command or the *access-list extended (named)* command, with the required access control list number, or name - but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example 1 [creating a list] Use the following commands to add a new access-list filter entry to the access-list named 'my-list' that will reject IP packets from source address 10.10.1.1/32 to destination address 192.168.1.1/32:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny ip 10.10.1.1/32 192.168.1.1/32
```

Example 2 Use the following commands to add a new access-list filter entry at sequence
[adding to a list] position 5 in the access-list named 'my-list' that will accept packets from source
address 10.10.1.1/24 to destination address 192.68.1.1/24:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit ip 10.10.1.1/24
192.168.1.1/24
```

- [access-list \(extended numbered\)](#)
- [show interface access-group](#)
- [show ip access-list](#)
- [show running-config](#)

(access-list extended TCP UDP filter)

Overview Use this ACL filter to add a new TCP or UDP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes a TCP or UDP filter entry from the current extended access-list. You can specify the TCP or UDP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its TCP or UDP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

Syntax [tcp|udp] [*<sequence-number>*] {deny|permit} {tcp|udp} *<source>* {eq *<sourceport>* |lt *<sourceport>*|gt *<sourceport>*|ne *<sourceport>*} *<destination>* [eq *<destport>*|lt *<destport>*|gt *<destport>*|ne *<destport>*] [log]

no [*<sequence-number>*] {deny|permit} {tcp|udp} *<source>* {eq *<sourceport>* |lt *<sourceport>*|gt *<sourceport>*|ne *<sourceport>*} *<destination>* [eq *<destport>*|lt *<destport>*|gt *<destport>*|ne *<destport>*] [log]

no *<sequence-number>*

Parameter	Description				
<i><sequence-number></i>	<1-65535> The sequence number for the filter entry of the selected access control list.				
deny	Access-list rejects packets that match the source and destination filtering specified with this command.				
permit	Access-list permits packets that match the source and destination filtering specified with this command.				
tcp	The access-list matches only TCP packets.				
udp	The access-list matches only UDP packets.				
<i><source></i>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source: <table><tr><td><i><ip-addr>/<prefix></i></td><td>An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.</td></tr><tr><td>any</td><td>Matches any source IP address.</td></tr></table>	<i><ip-addr>/<prefix></i>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.	any	Matches any source IP address.
<i><ip-addr>/<prefix></i>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.				
any	Matches any source IP address.				
<i><sourceport></i>	The source port number, specified as an integer between 0 and 65535.				

Parameter	Description
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:
<ip-addr>/ <prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
any	Matches any destination IP address.
<destport>	The destination port number, specified as an integer between 0 and 65535.
eq	Matches port numbers equal to the port number specified immediately after this parameter.
lt	Matches port numbers less than the port number specified immediately after this parameter.
gt	Matches port numbers greater than the port number specified immediately after this parameter.
ne	Matches port numbers not equal to the port number specified immediately after this parameter.
log	Log the results.

Mode IPv4 Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

NOTE: The access control list being configured is selected by running the [access-list \(extended numbered\)](#) command or the [access-list extended \(named\)](#) command, with the required access control list number, or name - but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example 1 [creating a list] To add a new entry to the access-list named 'my-list' that will reject TCP packets from 10.0.0.1 on TCP port 10 to 192.168.1.1 on TCP port 20, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny tcp 10.0.0.1/32 eq 10
192.168.1.1/32 eq 20
```

Example 2 To insert a new entry with sequence number 5 into the access-list named 'my-list'
[adding to a list] that will accept UDP packets from 10.1.1.0/24 network to 192.168.1.0/24 network on UDP port 80, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit udp 10.1.1.0/24
192.168.1.0/24 eq 80
```

- [show ip access-list](#)
- [show running-config](#)

access-list standard (named)

- Overview** This command configures a standard named access-list that permits or denies packets from a specific source IP address. You can:
- use this command to enter a new or existing ACL name and enter the IPv4 Standard ACL Configuration mode. Once in that mode, you can create an ACL filter entry using the command ([access-list standard named filter](#)). This approach lets you give the entry a sequence number.
 - or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified standard named access-list.

Syntax [to enter the sub-mode]

```
access-list standard <standard-acl-name>
no access-list standard <standard-acl-name>
```

Syntax [to create an ACL entry]

```
access-list standard <standard-acl-name> {deny|permit}
{any|<ip-addr>/<prefix>}
no access-list standard <standard-acl-name> {deny|permit}
{any|<ip-addr>/<prefix>}
```

Parameter	Description
<standard-acl-name>	Specify a name for the standard access-list.
deny	The access-list rejects packets that match the source filtering specified with this command.
permit	The access-list permits packets that match the source filtering specified with this command.
any	Match any source IP address.
<ip-addr>/<prefix>	Match the source address of the packets. Specify an IPv4 address in dotted decimal format, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes Use this command when configuring a standard named access-list for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access-list standard** followed by only the name. Entering only the name moves you to the IPv4 Standard ACL Configuration mode for the selected access-list. From

there you can configure your access-lists by using the command [\(access-list standard named filter\)](#).

NOTE: Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples To define a standard access-list named 'my-list' and deny any packets from any source, use the commands:

```
awplus# configure terminal
awplus(config)# access-list standard my-list deny any
```

Alternatively, to define a standard access-list named 'my-list' and enter the IPv4 Standard ACL Configuration mode, and then create ACL entry 5 to deny any packets from any source, use the commands:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# 5 deny any
```

Related commands [\(access-list standard named filter\)](#)

[show ip access-list](#)
[show running-config](#)

access-list (standard numbered)

Overview This command configures a standard numbered access-list that permits or denies packets from a specific source IP address. You can:

- use this command to enter a new or existing ACL number and enter the IPv4 Standard ACL Configuration mode. Once in that mode, you can create an ACL filter entry using the command ([access-list standard numbered filter](#)). This approach lets you give the entry a sequence number.
- or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified standard numbered access-list.

Syntax [to enter the sub-mode]

```
access-list {<1-99>|<1300-1999>}  
no access-list {<1-99>|<1300-1999>}
```

Syntax [to create an ACL entry]

```
access-list {<1-99>|<1300-1999>} {deny|permit} <source>  
no access-list {<1-99>|<1300-1999>} {deny|permit} <source>
```

Parameter	Description								
<1-99>	IP standard access-list.								
<1300-1999>	IP standard access-list (expanded range).								
deny	Access-list rejects packets from the specified source.								
permit	Access-list accepts packets from the specified source.								
<source>	The source address of the packets. The following are the valid formats for specifying the source: <table><tr><td><ip-addr> <reverse-mask></td><td>A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24).</td></tr><tr><td><ip-addr></td><td>A single source address to match. The source address is specified in dotted decimal format.</td></tr><tr><td>host <ip-addr></td><td>A single source address to match. The source address is specified in dotted decimal format.</td></tr><tr><td>any</td><td>Any source address.</td></tr></table>	<ip-addr> <reverse-mask>	A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24).	<ip-addr>	A single source address to match. The source address is specified in dotted decimal format.	host <ip-addr>	A single source address to match. The source address is specified in dotted decimal format.	any	Any source address.
<ip-addr> <reverse-mask>	A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24).								
<ip-addr>	A single source address to match. The source address is specified in dotted decimal format.								
host <ip-addr>	A single source address to match. The source address is specified in dotted decimal format.								
any	Any source address.								

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes Use this command when configuring a standard numbered access-list for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access-list** followed by only the number. Entering only the number moves you to the IPv4 Standard ACL Configuration mode for the selected access-list. From there you can configure your access-lists by using the command ([access-list standard numbered filter](#)).

NOTE: Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples To create ACL number 67 that will deny packets from subnet 172.16.10.0, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 67 deny 172.16.10.0 0.0.0.255
```

Alternatively, to define ACL number 67 and enter the IPv4 Standard ACL Configuration mode, and then create ACL entry 5 to deny any packets from subnet 172.16.10.0, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 67
awplus(config-ip-std-acl)# 5 deny 172.16.10.0 0.0.0.255
```

Related commands ([access-list standard numbered filter](#))
[show interface access-group](#)
[show ip access-list](#)
[show running-config](#)

(access-list standard named filter)

Overview This ACL filter adds a source IP address filter entry to a current named standard access-list. If the sequence number is specified, the new filter entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a source IP address filter entry from the current named standard access-list. You can specify the source IP address filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its source IP address filter profile without specifying its sequence number (e.g. **no deny any**).

Note that you can find the sequence number by running the [show access-list \(IPv4 Software ACLs\)](#) command.

Syntax [*<sequence-number>*] {deny|permit} {any|*<ip-addr>/<prefix>*
[exact-match] }

no *<sequence-number>*

no {deny|permit} {any|*<ip-addr>/<prefix>* [exact-match] }

Parameter	Description
<i><sequence-number></i>	<1-65535> The sequence number for the filter entry of the selected access control list.
deny	Access-list rejects packets of the source filtering specified.
permit	Access-list allows packets of the source filtering specified
any	Match any source IP address.
<i><ip-addr>/<prefix></i>	Match the source address of the packets. Specify an IPv4 address in dotted decimal format, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
exact-match	Specify an exact IP prefix to match on.

Mode IPv4 Standard ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

NOTE: The access control list being configured is selected by running the [access-list standard \(named\)](#) command with the required access control list name, but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples Use the following commands to add a new filter entry to access-list 'my-list' that will reject IP address 10.1.1.1:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# deny 10.1.1.1/32
```

Use the following commands to insert a new filter entry into access-list 'my-list' at sequence position number 15 that will accept IP network 10.1.2.0:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# 15 permit 10.1.2.0/24
```

(access-list standard numbered filter)

Overview This ACL filter adds a source IP address filter entry to a current standard numbered access-list. If a sequence number is specified, the new filter entry is inserted at the specified location. Otherwise, the new filter entry is added at the end of the access-list.

The **no** variant of this command removes a source IP address filter entry from the current standard numbered access-list. You can specify the source IP address filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its source IP address filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

Syntax [*<sequence-number>*] {deny|permit} *<source>*
no {deny|permit} *<source>*
no *<sequence-number>*

Parameter	Description								
<i><sequence-number></i>	<i><1-65535></i> The sequence number for the filter entry of the selected access control list.								
deny	Access-list rejects packets of the type specified.								
permit	Access-list allows packets of the type specified								
<i><source></i>	The source address of the packets. The following are the valid formats for specifying the source: <table><tr><td><i><ip-addr></i> <i><reverse-mask></i></td><td>A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24).</td></tr><tr><td><i><ip-addr></i></td><td>A single source address to match. The source address is specified in dotted decimal format.</td></tr><tr><td>host <i><ip-addr></i></td><td>A single source address to match. The source address is specified in dotted decimal format.</td></tr><tr><td>any</td><td>Any source address.</td></tr></table>	<i><ip-addr></i> <i><reverse-mask></i>	A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24).	<i><ip-addr></i>	A single source address to match. The source address is specified in dotted decimal format.	host <i><ip-addr></i>	A single source address to match. The source address is specified in dotted decimal format.	any	Any source address.
<i><ip-addr></i> <i><reverse-mask></i>	A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24).								
<i><ip-addr></i>	A single source address to match. The source address is specified in dotted decimal format.								
host <i><ip-addr></i>	A single source address to match. The source address is specified in dotted decimal format.								
any	Any source address.								

Mode IPv4 Standard ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

NOTE: The access control list being configured is selected by running the [access-list \(standard numbered\)](#) command with the required access control list number but with no further parameters selected.

Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example To add a new entry accepting the IP network 10.1.1.0/24 at the sequence number 15 position, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 99
awplus(config-ip-std-acl)# 15 permit 10.1.2.0 0.0.0.255
```

Related commands

- [access-list \(standard numbered\)](#)
- [show interface access-group](#)
- [show ip access-list](#)
- [show running-config](#)

clear ip prefix-list

Overview Use this command to reset the hit count to zero in the prefix-list entries.

Syntax `clear ip prefix-list [<list-name>] [<ip-address>/<mask>]`

Parameter	Description
<list-name>	The name of the prefix-list.
<ip-address>/<mask>	The IP prefix and length.

Mode Privileged Exec

Example To clear a prefix-list named List1:

```
awplus# clear ip prefix-list List1
```

dos

Overview Use this command to configure Denial-of-Service (DoS) protection features for a port. Six different DoS attacks can be detected: IP Options, Land, Ping-of-Death, Smurf, Synflood and Teardrop.

When the attack is detected, three different actions are available:

- Shutdown the port for one minute
- Cause an SNMP trap.
- Send traffic to the mirror port

Syntax `dos {ipoptions|land|ping-of-death|smurf broadcast
<ip-address>|synflood|teardrop} action {shutdown|trap|mirror}`

Parameter	Description
dos	Denial-Of-Service.
ipoptions	IP Options attack.
land	Land attack.
ping-of-death	Large ping attack.
smurf	Ping to broadcast address.
broadcast	Broadcast.
<ip-address>	Local IP Broadcast Address.
synflood	SYN flood attack.
teardrop	IP fragmentation attack.
action	Action.
shutdown	Shutdown port.
trap	Trap to SNMP.
mirror	Send packets to mirror port.

Mode Interface Configuration for a switch port interface.

Default DoS attack detection is not configured by default on any switch port interface.

Usage notes See the below table for more information about the DoS attacks recognized by this command:

Type of DoS attack	Description
ipoptions	This type of attack occurs when an attacker sends packets containing bad IP options to a victim node. There are many different types of IP options attacks and this software does not try to distinguish between them. Rather, if this defense is activated, the number of ingress IP packets containing IP options is counted. If the number exceeds 20 packets per second, the switch considers this a possible IP options attack. This defense does not require the CPU to monitor packets, so does not put extra load on the switch's CPU.
land	This type of attack occurs when the Source IP and Destination IP address are the same. This can cause a target host to be confused. Since packets with the same source and destination addresses should never occur, these packets are dropped when this attack is enabled. This defense does not require the CPU to monitor packets, so does not put extra load on the switch's CPU.
ping-of-death	This type of attack results from a fragmented packet which, when reassembled, would exceed the maximum size of a valid IP datagram. To detect this attack, the final fragment of ICMP packets has to be sent to the CPU for inspection. This defense can therefore load the CPU. Note that the extra CPU load will not affect normal traffic switching between ports, but other protocols such as IGMP and STP may be affected. This defense is not recommended where a large number of fragmented packets are expected.
smurf	This type of attack is an ICMP ping packet to a broadcast address. Although routers should not forward packets to local broadcast addresses anymore (see RFC2644), the Smurf attack can still be explicitly discarded with this command. In order for the Smurf attack to work, the broadcast IP address is required. Any ICMP Ping packet with this destination address is considered an attack. This defense does not require the CPU to monitor packets, so does not put extra load on the switch's CPU.
synflood	In this type of attack, an attacker, seeking to overwhelm a victim with TCP connection requests, sends a large number of TCP SYN packets with bogus source addresses to the victim. The victim responds with SYN ACK packets, but since the original source addresses are bogus, the victim node does not receive any replies. If the attacker sends enough requests in a short enough period, the victim may freeze operations once the requests exceed the capacity of its connections queue. To defend against this form of attack, a switch port monitors the number of ingress TCP-SYN packets it receives. An attack is recorded if a port receives more 60 TCP-SYN packets per second.
teardrop	In this DoS attack, an attacker sends a packet in several fragments with a bogus offset value, used to reconstruct the packet, in one of the fragments to a victim. This results in the victim being unable to reassemble the packet, possibly causing it to freeze operations.

Examples To configure **smurf** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos smurf broadcast 192.168.1.0 action
shutdown
```

To configure **land** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos land action shutdown
```

To configure **ipoptions** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos ipoptions action shutdown
```

To configure **ping-of-death** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos ping-of-death action shutdown
```

To configure **synflood** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos synflood action shutdown
```

To configure **teardrop** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos teardrop action shutdown
```

Related commands [show dos interface](#)

ip prefix-list

Overview Use this command to create an entry for an IPv4 prefix list.

Use the **no** variant of this command to delete the IPv4 prefix-list entry.

Syntax

```
ip prefix-list <list-name> [seq <1-429496725>] {deny|permit}
{any|<ip-prefix>} [ge <0-32>] [le <0-32>]

ip prefix-list <list-name> description <text>

ip prefix-list sequence-number

no ip prefix-list <list-name> [seq <1-429496725>]

no ip prefix-list <list-name> [description <text>]

no ip prefix-list sequence-number
```

Parameter	Description
<list-name>	Specifies the name of a prefix list.
seq <1-429496725>	Sequence number of the prefix list entry.
deny	Specifies that the prefixes are excluded from the list.
permit	Specifies that the prefixes are included in the list.
<ip-prefix>	Specifies the IPv4 address and length of the network mask in dotted decimal in the format A.B.C.D/M.
any	Any prefix match. Same as 0.0.0.0/0 le 32 .
ge<0-32>	Specifies the minimum prefix length to be matched.
le<0-32>	Specifies the maximum prefix length to be matched.
<text>	Text description of the prefix list.
sequence-number	Specify sequence numbers included or excluded in prefix list.

Mode Global Configuration

Usage notes When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. When setting these parameters, set the **le** value to be less than 32, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

Example In the following sample configuration, the last **ip prefix-list** command in the below list matches all, and the first **ip prefix-list** command denies the IP network 76.2.2.0:

```
awplus(config)# router bgp 100
awplus(config-router)# network 172.1.1.0
awplus(config-router)# network 172.1.2.0
awplus(config-router)# neighbor 10.6.5.3 remote-as 300
awplus(config-router)# neighbor 10.6.5.3 prefix-list mylist out
awplus(config-router)# exit
awplus(config)# ip prefix-list mylist seq 5 deny 76.2.2.0/24
awplus(config)# ip prefix-list mylist seq 100 permit any
```

To deny the IP addresses between 10.0.0.0/14 (10.0.0.0 255.252.0.0) and 10.0.0.0/22 (10.0.0.0 255.255.252.0) within the 10.0.0.0/8 (10.0.0.0 255.0.0.0) addressing range, enter the following commands:

```
awplus# configure terminal
awplus(config)# ip prefix-list mylist seq 12345 deny 10.0.0.0/8
ge 14 le 22
```

maximum-access-list (deleted)

Overview This command has been removed from version 5.5.1-01 onwards. There is no alternative command.

show access-list (IPv4 Software ACLs)

Overview Use this command to display the specified access-list, or all access-lists if none have been specified. Note that only defined access-lists are displayed. An error message is displayed for an undefined access-list

Syntax `show access-list`
`[<1-99>|<100-199>|<1300-1999>|<2000-2699>|<3000-3699>|`
`<4000-4499>|<access-list-name>]`

Parameter	Description
<1-99>	IP standard access-list.
<100-199>	IP extended access-list.
<1300-1999>	IP standard access-list (standard - expanded range).
<2000-2699>	IP extended access-list (extended - expanded range).
<3000-3699>	Hardware IP access-list.
<4000-4499>	Hardware MAC access-list.
<access-list-name>	IP named access-list.

Mode User Exec and Privileged Exec

Examples To show all access-lists configured on the switch:

```
awplus# show access-list
```

```
Standard IP access list 1
  deny 172.16.2.0, wildcard bits 0.0.0.255
Standard IP access list 20
  deny 192.168.10.0, wildcard bits 0.0.0.255
  deny 192.168.12.0, wildcard bits 0.0.0.255
Hardware IP access list 3001
  permit ip 192.168.20.0 255.255.255.0 any
Hardware IP access list 3020
  permit tcp any 192.0.2.0/24
awplus#show access-list 20
```

To show the access-list with an ID of 20:

```
awplus# show access-list 20
```

```
Standard IP access-list 20
  deny 192.168.10.0, wildcard bits 0.0.0.255
  deny 192.168.12.0, wildcard bits 0.0.0.255
```

Note the following error message is displayed if you attempt to show an undefined access-list:

```
awplus# show access-list 2
```

```
% Can't find access-list 2
```

[access-list \(extended numbered\)](#)

show dos interface

Overview Use this command to display the Denial-of-Service (DoS) features configured on a switch port interface from the [dos](#) command. See the [dos](#) command for descriptions of DoS attack types.

Syntax `show dos interface {<port-list>}`

Parameter	Description
<code><port-list></code>	Specify the switch port or port list to display DoS configuration options set with the dos command.

Mode Privileged Exec

Output Figure 43-1: Example output from the **show dos interface** command prior to a DoS attack

```
awplus#configure terminal
Enter configuration commands, one per line. End with CTNTRL/Z.
awplus(config)#interface port1.0.1
awplus(config-if)#dos synflood action shutdown
awplus(config-if)#exit
awplus(config)#exit
awplus#show dos interface port1.0.1

DoS settings  for interface port1.0.1
-----
Port status      : Enabled
ipoptions        : Disabled
land             : Disabled
ping-of-death    : Disabled
smurf            : Disabled
synflood         : Enabled
  Action         : Shutdown port
  Attacks detected : 0
teardrop         : Disabled
awplus#
```

Figure 43-2: Example output from the **show dos interface** command after a **synflood** DoS attack

```
awplus#show dos interface port1.0.1

DoS settings for interface port1.0.1
-----
Port status           : Enabled
ipoptions             : Disabled
land                  : Disabled
ping-of-death         : Disabled
smurf                 : Disabled
synflood              : Enabled
    Action            : Shutdown port
    Attacks detected   : 1
teardrop              : Disabled
awplus#
```

Table 44: Parameters in the **show dos interface** command output:

Type of DoS attack	Description
Port status	Displays Enabled when the port is configured as being administratively up after issuing the no shutdown command. Displays Disabled when the port is configured as being administratively down with the shutdown command.
ipoptions	Displays Enabled when the ipoptions parameter is configured with the dos command, plus the action (Shutdown port , Mirror port , or Trap port) and the number of instances of any ipoptions DoS attacks that have occurred on the interface. Displays Disabled when the ipoptions parameter is not configured with the dos command.
land	Displays Enabled when the land parameter is configured with the dos command, plus the action (Shutdown port , Mirror port , or Trap port) and the number of instances of any land DoS attacks that have occurred on the interface. Displays Disabled when the land parameter is not configured with the dos command.
ping-of-death	Displays Enabled when the ping-of-death parameter is configured with the dos command, plus the action (Shutdown port , Mirror port , or Trap port) and the number of instances of any ping-of-death DoS attacks that have occurred on the interface. Displays Disabled when the ping-of-death parameter is not configured with the dos command.

Table 44: Parameters in the **show dos interface** command output: (cont.)

Type of DoS attack	Description
smurf	Displays Enabled when the smurf parameter is configured with the dos command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any smurf DoS attacks that have occurred on the interface. Displays Disabled when the smurf parameter is not configured with the dos command.
synflood	Displays Enabled when the synflood parameter is configured with the dos command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any synflood DoS attacks that have occurred on the interface. Displays Disabled when the synflood parameter is not configured with the dos command.
teardrop	Displays Enabled when the teardrop parameter is configured with the dos command, plus the action (Shutdown port, Mirror port, or Trap port) and the number of instances of any teardrop DoS attacks that have occurred on the interface. Displays Disabled when the teardrop parameter is not configured with the dos command.

Related commands **dos**

show ip access-list

Overview Use this command to display IP access-lists.

Syntax `show ip access-list`
`[<1-99>|<100-199>|<1300-1999>|<2000-2699>|<access-list-name>]`

Parameter	Description
<1-99>	IP standard access-list.
<100-199>	IP extended access-list.
<1300-1999>	IP standard access-list (expanded range).
<2000-2699>	IP extended access-list (expanded range).
<access-list-name>	IP named access-list.

Mode User Exec and Privileged Exec

Example `awplus# show ip access-list`

Output Figure 43-3: Example output from the **show ip access-list** command

```
Standard IP access-list 1
  permit 172.168.6.0, wildcard bits 0.0.0.255
  permit 192.168.6.0, wildcard bits 0.0.0.255
```

show ip prefix-list

Overview Use this command to display the IPv4 prefix-list entries.
Note that this command is valid for RIP and BGP routing protocols only.

Syntax `show ip prefix-list [<name>|detail|summary]`

Parameter	Description
<name>	Specify the name of a prefix list in this placeholder.
detail	Specify this parameter to show detailed output for all IPv4 prefix lists.
summary	Specify this parameter to show summary output for all IPv4 prefix lists.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip prefix-list
awplus# show ip prefix-list 10.10.0.98/8
awplus# show ip prefix-list detail
```

Related commands [ip prefix-list](#)

vty access-class (numbered)

Overview For IPv4, use this command to set a standard numbered software access list to be the management ACL. This is then applied to all available VTY lines for controlling remote access by Telnet and SSH. This command allows or denies packets containing the IP addresses included in the ACL to create a connection to your device.

ACLs that are attached using this command have an implicit deny-all filter as the final entry in the ACL. So a typical configuration would be to permit a specific address, or range of addresses, and rely on the deny-all filter to block all other access.

Use the **no** variant of this command to remove the access list.

Syntax `vty access-class {<1-99>|<1300-1999>}`
`no vty access-class [<1-99>|<1300-1999>]`

Parameter	Description
<1-99>	IPv4 standard access-list number
<1300-1999>	IPv4 standard access-list number (expanded range)

Mode Global Configuration

Examples To set access-list 4 to be the management ACL, use the following commands:

```
awplus# configure terminal
awplus(config)# vty access-class 4
```

To remove access-list 4 from the management ACL, use the following commands:

```
awplus# configure terminal
awplus(config)# no vty access-class 4
```

Output Figure 43-4: Example output from the **show running-config** command

```
awplus#show running-config|grep access-class
vty access-class 4
```

Related commands [show running-config](#)

IPv6 Hardware Access Control List (ACL) Commands

Introduction

Overview This chapter provides an alphabetical reference for the IPv6 Hardware Access Control List (ACL) commands, and contains detailed command information and command examples about IPv6 hardware ACLs, which are applied directly to interfaces using the [ipv6 traffic-filter](#) command.

For information about ACLs, see the [ACL Feature Overview and Configuration Guide](#).

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see the following references:

- [Link Aggregation Feature Overview_and_Configuration_Guide](#).
- [Link Aggregation Commands](#)

Most ACL command titles include usage information in parentheses. When the command title is completely surrounded by parentheses, the title indicates the type of ACL filter instead of keywords to enter into the CLI. For example, the title **(named IPv6 hardware ACL: IP protocol entry)** represents a command with the syntax:

```
[<sequence-number>] <action> proto <1-255> <source-addr>  
<dest-addr> [vlan <1-4094>]
```

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Sub-modes Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

Table 44-1: IPv6 Hardware Access List Commands and Prompts

Command Name	Command Mode	Prompt
<code>show acl-group ipv6 address</code>	Privileged Exec	<code>awplus#</code>
<code>show ipv6 access-list (IPv6 Hardware ACLs)</code>	Privileged Exec	<code>awplus#</code>
<code>access-list hardware-deny-log</code>	Global Configuration	<code>awplus(config)#</code>
<code>acl-group ipv6 address</code>	Global Configuration	<code>awplus(config)#</code>
<code>ipv6 access-list (named IPv6 hardware ACL)</code>	Global Configuration	<code>awplus(config)#</code>
<code>ipv6 traffic-filter</code>	Interface Configuration	<code>awplus(config-if)#</code>
<code>commit (IPv6)</code>	IPv6 Hardware ACL Configuration	<code>awplus(config-ipv6-hw-acl)#</code>
<code>(named IPv6 hardware ACL: IPv6 packet entry)</code>	IPv6 Hardware ACL Configuration	<code>awplus(config-ipv6-hw-acl)#</code>
<code>(named IPv6 hardware ACL: ICMP entry)</code>	IPv6 Hardware ACL Configuration	<code>awplus(config-ipv6-hw-acl)#</code>
<code>(named IPv6 hardware ACL: IP protocol entry)</code>	IPv6 Hardware ACL Configuration	<code>awplus(config-ipv6-hw-acl)#</code>
<code>(named IPv6 hardware ACL: TCP or UDP entry)</code>	IPv6 Hardware ACL Configuration	<code>awplus(config-ipv6-hw-acl)#</code>
<code>ipv6 (ipv6-host-group)</code>	IPv6 ACL Host Group Configuration	<code>awplus(config-ipv6-host-group)#</code>

access-list hardware-deny-log

Overview Use this command to enable logging of packets that are denied by hardware IP ACLs. Hardware IP ACLs are ACLs with an ID number from 3000 to 3699. If you turn on logging, the switch will produce a log message when it drops denied packets.

CAUTION: *If you enable this logging, do not use an action of **copy-to-cpu** or **send-to-cpu** in any of the switch's ACLs. If you do, packets that match those ACLs will also be dropped.*

Use the **no** variant of this command to disable logging of packets that are denied by hardware IP ACLs.

Syntax `access-list hardware-deny-log [info|warn] [rate <1-1000>]
[burst <1-1000>] [timeout <1-3600>]
no access-list hardware-deny-log`

Parameter	Description
info	Give the log messages a severity level of 'info'. This is the default severity level.
warn	Give the log messages a severity level of 'warn'. If you want the messages to go to the buffered, permanent, and external log as well as the terminal, specify this parameter.
rate <1-1000>	This limits the number of log messages produced per hour. The switch will stop creating log messages if packets are denied at a higher rate than this specified rate. The default is 12 packets per hour. This means, for example, that if there are 60 denied packets in the first hour, then at most the first 12 of these packets will be logged. After that, logging will stop unless the rate drops below 12 an hour. (The actual number of packets logged depends on the number of flows the dropped packets come from; see the burst parameter).
burst <1-1000>	This is the maximum initial number of packets to log for a given flow. A flow is a set of packets with the same source IP address, destination IP address, source port, and destination port. The default is 5. The burst number reduces by 1 each time a packet in the flow is logged. Then it increases by 1 again every time the rate drops below the limit set by the rate parameter, up to the burst number.
timeout <1-3600>	This is the length of time it takes for a flow record to expire, in seconds. The switch considers that a flow has expired if it hasn't received any packets that match that flow for the timeout number of seconds. The default is 3600 seconds (1 hour). When a flow expires, its burst value is reset and logging may restart (depending on the current rate of denied packets).

Default Disabled

Mode Global Configuration

Usage notes To enable logging for a particular ACL, enter:

- this command (**access-list hardware-deny-log**)
- the command [terminal monitor](#), and
- a **log** parameter at the end of the desired ACL.

The switch will send the log messages to:

- The terminal monitor, by default, as long as you enter the command [terminal monitor](#), and
- If you change the severity of the messages to **warn**, to the buffered log, permanent log, and external log as well. The external log defines what logs will be sent to external syslog servers.

The log message format is:

```
DENY> IN=<interface-name> OUT=<blank>
MAC=<dest-mac-addr:src-mac-addr:eth-type> SRC=<source-ip-address>
DST=<dest-ip-address> LEN=<packet-length> TOS=<type-of-service>
PREC=<precedence> TTL=<time-to-live> ID=<packet-ID>
PROTO=<L4-protocol> SPT=<L4-source-port> DPT=<L4-dest-port>
LEN=<L4-packet-length> MARK=<internal-packet-marking>
```

An example of a permanent log message is:

```
2023 March 03 07:04:37 local5.warning awplus ulogd[931]: DENY>
IN=vlan100 OUT= MAC=e0:1a:ea:50:51:fc:00:00:11:11:22:22:08:00
SRC=192.168.1.100 DST=192.170.1.1 LEN=42 TOS=00 PREC=0x00 TTL=64
ID=0 PROTO=UDP SPT=63 DPT=63 LEN=22 MARK=0x20000000
```

Example To log packets denied by ACL 3000, which denies all Echo requests, use the commands:

```
awplus# terminal monitor
awplus# configure terminal
awplus(config)# access-list hardware-deny-log
awplus(config)# access-list 3000 deny icmp any any icmp-type 8
```

Command changes Version 5.5.3-0.1: command added

acl-group ipv6 address

- Overview** Use this command to create a new named IPv6 ACL group that contains one or more IPv6 host or subnets.
- This command creates a named IPv6 ACL group and enters the ACL Host Group config mode. IPv6 hosts or subnets can be added to or removed from this group. This host group can be used as a source or destination match for any hardware ACL to simplify large ACL configs with lots of IPv6 hosts.
- Use the **no** variant of this command to delete an IPv6 ACL group.

- Syntax** `acl-group ipv6 address <group>`
`no acl-group ipv6 address <group>`

Parameter	Description
<code><group></code>	The name of the IPv6 ACL group.

- Default** No ACL groups exist by default.

- Mode** Global Configuration

- Example** To create an IPv6 ACL group named IPV6_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ipv6 address IPV6_GROUP1
awplus(config-ip-host-group)#
```

To delete an IPv6 ACL group named IPV6_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# no acl-group ipv6 address IPV6_GROUP1
```

- Related commands** [ipv6 \(ipv6-host-group\)](#)
[show acl-group ipv6 address](#)

- Command changes** Version 5.5.0-1.1: command added

clear access-list counters

Overview Use this command to reset the hardware access-list counters to zero. The access-list counters show the number of packets that match your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments.

Syntax `clear access-list counters [<acl>]`

Parameter	Description
<acl>	Clear the counters for only the specified ACL. You can enter the ACL name or number.

Mode Privileged Exec

Usage notes To view the counter values, use the command [show access-list counters](#).

Example To clear the counters for the ACL named ACL-1, use the command:

```
awplus# clear access-list counters ACL-1
```

Related commands [show access-list counters](#)

Command changes Version 5.5.2-2.1: command added

commit (IPv6)

Overview Use this command to commit the IPv6 ACL filter configuration entered at the console to the hardware immediately without exiting the IPv6 Hardware ACL Configuration mode.

This command forces the associated hardware and software IPv6 ACLs to synchronize.

Syntax `commit`

Mode IPv6 Hardware ACL Configuration

Usage notes Normally, when an IPv6 hardware ACL is edited, the new configuration state of the IPv6 ACL is not written to hardware until you exit IPv6 Hardware ACL Configuration mode. By entering this command you can ensure that the current state of a hardware access-list that is being edited is written to hardware immediately.

Scripts typically do not include the [exit](#) command to exit configuration modes, potentially leading to IPv6 ACL filters in hardware not being correctly updated. Using this **commit** command in a configuration script after specifying an IPv6 hardware ACL filter ensures that it is updated in the hardware.

Example To update the hardware with the IPv6 ACL filter configuration, use the command:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-ipv6-acl
awplus(config-ipv6-hw-acl)# commit
```

Related commands [ipv6 access-list \(named IPv6 hardware ACL\)](#)

ipv6 (ipv6-host-group)

Overview Use this command to add an IPv6 host or subnet to an IPv6 ACL group. Adding IPv6 hosts and subnets to an ACL group allows you to simplify ACL config when the same IP addresses are required for many ACLs.

Use the **no** variant of this command to remove an IPv6 host or subnet from an IPv6 ACL group.

Syntax `ipv6 {any|<match-ip>}`
`no ipv6 {any|<match-ip>}`

Parameter	Description						
any	Match any IP address.						
<match-ip>	The addresses to match against. You can specify a single host or a subnet. The following are the valid formats for specifying the addresses: <table><tr><td><ipv6-addr></td><td>Specifies a single host address. The IPv6 address uses the format X:X::X:X.</td></tr><tr><td><ipv6-addr>/<prefix></td><td>Specifies an address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64, or has the value 128.</td></tr><tr><td><ipv6-addr> <reverse-mask></td><td>An IPv6 host and a reverse mask in format X:X::X:X.</td></tr></table>	<ipv6-addr>	Specifies a single host address. The IPv6 address uses the format X:X::X:X.	<ipv6-addr>/<prefix>	Specifies an address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64, or has the value 128.	<ipv6-addr> <reverse-mask>	An IPv6 host and a reverse mask in format X:X::X:X.
<ipv6-addr>	Specifies a single host address. The IPv6 address uses the format X:X::X:X.						
<ipv6-addr>/<prefix>	Specifies an address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64, or has the value 128.						
<ipv6-addr> <reverse-mask>	An IPv6 host and a reverse mask in format X:X::X:X.						

Default No hosts or subnets are in an IPv6 ACL group by default.

Mode IPv6 ACL Host Group Configuration

Example To add the subnet 2001:DB8::/32 to an IPv6 ACL group IPV6_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ipv6 address IPV6_GROUP1
awplus(config-ipv6-host-group)# ipv6 2001:DB8::/32
```

To remove the subnet 2001:DB8::/32 from an IPv6 ACL group IPV6_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ipv6 address IPV6_GROUP1
awplus(config-ipv6-host-group)# no ipv6 2001:DB8::/32
```

Related commands [acl-group ipv6 address](#)
 [show acl-group ipv6 address](#)

Command changes Version 5.5.0-1.1: command added

ipv6 access-list (named IPv6 hardware ACL)

Overview Use this command to either create a new IPv6 hardware access-list, or to select an existing IPv6 hardware access-list in order to apply a filter entry to it.

Use the **no** variant of this command to delete an existing IPv6 hardware access-list.

NOTE: Before you can delete an access-list, you must first remove it from any interface it is assigned to.

Syntax `ipv6 access-list <ipv6-access-list-name>`
`no ipv6 access-list <ipv6-access-list-name>`

Parameter	Description
<code><ipv6-access-list-name></code>	Specify an IPv6 access-list name.

Mode Global Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage notes Use IPv6 hardware named access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 hardware named access-list when a match is encountered.

This command moves you to the (config-ipv6-hw-acl) prompt for the selected IPv6 hardware named access-list number. From there you can configure the filters for this selected IPv6 hardware named access-list.

Once you have configured the ACL, use the [ipv6 traffic-filter](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Examples To create an IPv6 access-list named "my-ipv6-acl", use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-ipv6-acl
awplus(config-ipv6-hw-acl)#
```

To delete the IPv6 access-list named "my-ipv6-acl", use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 access-list my-ipv6-acl
```

Related commands ([named IPv6 hardware ACL: ICMP entry](#))

(named IPv6 hardware ACL: IPv6 packet entry)

ipv6 traffic-filter

Overview This command adds an IPv6 hardware-based access-list to an interface. The number of access-lists that can be added is determined by the amount of available space in the hardware-based packet classification tables.

Use the **no** variant of this command to remove an IPv6 hardware-based access-list from an interface.

Syntax `ipv6 traffic-filter <ipv6-access-list-name>`
`no ipv6 traffic-filter <ipv6-access-list-name>`

Parameter	Description
<code><ipv6-access-list-name></code>	Hardware IPv6 access-list name.

Mode Interface Configuration (to apply an IPv6 hardware ACL to a specific switch port).

Usage notes This command adds an IPv6 hardware-based access-list to an interface. The number of access-lists that can be added is determined by the amount of available space in the hardware-based packet classification tables.

Examples To add access-list "acl1" as a traffic-filter to interface port1.0.1, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ipv6 traffic-filter acl1
```

To remove access-list "acl1" as a traffic-filter from interface port1.0.1, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no ipv6 traffic-filter acl1
```

(named IPv6 hardware ACL: ICMP entry)

Overview Use this command to add a new ICMP filter entry to the current IPv6 hardware access-list. The filter will match on any ICMP packet that has the specified IPv6 source and destination IP addresses and (optionally) ICMP type. You can specify the value **any** if source or destination address does not matter.

The **no** variant of this command removes a filter entry from the current IPv6 hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny icmp 2001:0db8::0/64 any**).

You can find the sequence number by running the [show ipv6 access-list \(IPv6 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: Specifying a “send” action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

Syntax [`<sequence-number>`] `<action>` icmp `<source-addr>` `<dest-addr>`
[icmp-type `<number>`] [vlan `<1-4094>`] [log]

`no <sequence-number>`

`no <action>` icmp `<source-addr>` `<dest-addr>` [icmp-type `<number>`]
[vlan `<1-4094>`] [log]

The following actions are available for hardware ACLs:

Values for the <code><action></code> parameter	
deny	Reject packets that match the source and destination filtering specified with this command.
permit	Permit packets that match the source and destination filtering specified with this command.
copy-to-cpu	Send a copy of matching packets to the CPU.
copy-to-mirror [interface <i>port-number</i>]	Send a copy of matching packets to a mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
send-to-mirror [interface <i>port-number</i>]	Send matching packets to the mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
send-to-vlan-port vlan <code><vid></code> port <code><port-number></code>	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.

Values for the <action> parameter	
send-to-cpu	Send matching packets to the CPU.
deny-and-not-cpu	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Parameter	Description
<sequence-number>	The sequence number for the filter entry of the selected access control list, in the range 1-65535.
<action>	The action that the switch will take on matching packets. See the table above for valid values.
icmp	Match against ICMP packets.
<source-addr>	The source addresses to match against. You can specify a single host, a range, or all source addresses. The following are the valid formats for specifying the source:
	any Match any source host.
	<ipv6-src-address/prefix-length> Match the specified source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
	<ipv6-src-address> <ipv6-src-wildcard> Match the specified IPv6 source address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.
	host <ipv6-source-host> Match a single source host address. The IPv6 address uses the format X:X::X:X.
<dest-addr>	The destination addresses to match against. You can specify a single host, a range, or all destination addresses. The following are the valid formats for specifying the destination:
	any Match any destination host.
	<ipv6-dest-address/prefix-length> Match the specified destination address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.

Parameter	Description																										
	<code><ipv6-dest-address></code> <code><ipv6-dest-wildcard></code> Match the specified destination address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.																										
	host <code><ipv6-dest-host></code> Match a single destination host address. The IPv6 address uses the format X:X::X:X.																										
icmp-type <code><number></code>	The type of ICMP message to match against, as defined in RFC792 and RFC950. Values include: <table> <tr><td>0</td><td>Echo replies.</td></tr> <tr><td>3</td><td>Destination unreachable messages.</td></tr> <tr><td>4</td><td>Source quench messages.</td></tr> <tr><td>5</td><td>Redirect (change route) messages.</td></tr> <tr><td>8</td><td>Echo requests.</td></tr> <tr><td>11</td><td>Time exceeded messages.</td></tr> <tr><td>12</td><td>Parameter problem messages.</td></tr> <tr><td>13</td><td>Timestamp requests.</td></tr> <tr><td>14</td><td>Timestamp replies.</td></tr> <tr><td>15</td><td>Information requests.</td></tr> <tr><td>16</td><td>Information replies.</td></tr> <tr><td>17</td><td>Address mask requests.</td></tr> <tr><td>18</td><td>Address mask replies.</td></tr> </table>	0	Echo replies.	3	Destination unreachable messages.	4	Source quench messages.	5	Redirect (change route) messages.	8	Echo requests.	11	Time exceeded messages.	12	Parameter problem messages.	13	Timestamp requests.	14	Timestamp replies.	15	Information requests.	16	Information replies.	17	Address mask requests.	18	Address mask replies.
0	Echo replies.																										
3	Destination unreachable messages.																										
4	Source quench messages.																										
5	Redirect (change route) messages.																										
8	Echo requests.																										
11	Time exceeded messages.																										
12	Parameter problem messages.																										
13	Timestamp requests.																										
14	Timestamp replies.																										
15	Information requests.																										
16	Information replies.																										
17	Address mask requests.																										
18	Address mask replies.																										
vlan <code><1-4094></code>	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.																										
log	Log packets that are denied by this ACL. You must also enable the logging, using the command access-list hardware-deny-log .																										

Mode IPv6 Hardware ACL Configuration (accessed by running the command [ipv6 access-list \(named IPv6 hardware ACL\)](#))

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes To use this command, first run the command [ipv6 access-list \(named IPv6 hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl) #
```

Then use this command (and the other “named IPv6 hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the [ipv6 traffic-filter](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Examples To add a filter entry to the ACL named “my-acl”, to block ICMP packets sent from network 2001:0db8::0/64 , use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny icmp 2001:0db8::0/64 any
```

To remove a filter entry from the ACL named “my-acl” that blocks all ICMP packets sent from network 2001:0db8::0/64 , use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny icmp 2001:0db8::0/64 any
```

To specify an ACL named “my-acl1” and add a filter entry that blocks all ICMP6 echo requests, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl1
awplus(config-ipv6-hw-acl)# deny icmp any any icmp-type 128
```

To specify an ACL named “my-acl2” and add a filter entry that blocks all ICMP6 echo requests on the default VLAN (vlan1), enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl2
awplus(config-ipv6-hw-acl)# deny icmp any any icmp-type 128
vlan 1
```

To remove a filter entry that blocks all ICMP6 echo requests from the ACL named “my-acl1”, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl1
awplus(config-ipv6-hw-acl)# no deny icmp any any icmp-type 128
```

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

(named IPv6 hardware ACL: IPv6 packet entry)

Overview Use this command to add an IPv6 packet filter entry to the current hardware access-list. The filter will match on IPv6 packets that have the specified source and destination IPv6 address and (optionally) prefix. You can use the value **any** instead of source or destination IPv6 address if an address does not matter.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny ipv6 2001:0db8::0/64 any**).

You can find the sequence number by running the [show ipv6 access-list \(IPv6 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

Syntax [`<sequence-number>`] `<action>` ipv6 `<source-addr>` `<dest-addr>`
[vlan `<1-4094>`] [log]

no `<sequence-number>`

no `<action>` ipv6 `<source-addr>` `<dest-addr>` [vlan `<1-4094>`]
[log]

The following actions are available for hardware ACLs:

Values for the <code><action></code> parameter	
deny	Reject packets that match the source and destination filtering specified with this command.
permit	Permit packets that match the source and destination filtering specified with this command.
copy-to-cpu	Send a copy of matching packets to the CPU.
copy-to-mirror [interface <i>port-number</i>]	Send a copy of matching packets to a mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
send-to-mirror [interface <i>port-number</i>]	Send matching packets to the mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.

Values for the <action> parameter	
send-to-vlan-port vlan <vid> port <port-number>	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.
send-to-cpu	Send matching packets to the CPU.
deny-and-not-cpu	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Parameter	Description
<sequence-number>	The sequence number for the filter entry of the selected access control list, in the range 1-65535.
<action>	The action that the switch will take on matching packets. See the table above for valid values.
ipv6	Match against IPv6 packets
<source-addr>	The source addresses to match against. You can specify a single host, a range, or all source addresses. The following are the valid formats for specifying the source:
any	Match any source host.
<ipv6-src-address/ prefix-length>	Match the specified source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
<ipv6-src-address> <ipv6-src-wildcard>	Match the specified IPv6 source address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.
host <ipv6-source-host>	Match a single source host address. The IPv6 address uses the format X:X::X:X.
<dest-addr>	The destination addresses to match against. You can specify a single host, a range, or all destination addresses. The following are the valid formats for specifying the destination:
any	Match any destination host.

Parameter	Description
<i><ipv6-dest-address/ prefix-length></i>	Match the specified destination address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
<i><ipv6-dest-address> <ipv6-dest-wildcard></i>	Match the specified destination address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.
host <i><ipv6-dest-host></i>	Match a single destination host address. The IPv6 address uses the format X:X::X:X.
vlan <i><1-4094></i>	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.
log	Log packets that are denied by this ACL. You must also enable the logging, using the command access-list hardware-deny-log .

Mode IPv6 Hardware ACL Configuration (accessed by running the command [ipv6 access-list \(named IPv6 hardware ACL\)](#))

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes To use this command, first run the command [ipv6 access-list \(named IPv6 hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl) #
```

Then use this command (and the other "named IPv6 hardware ACL: entry" commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the [ipv6 traffic-filter](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Examples To add a filter entry to the ACL named “my-acl” to block IPv6 traffic sent from network 2001:0db8::0/64, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny ipv6 2001:0db8::0/64 any
```

To remove a filter entry from the ACL named “my-acl” that blocks all IPv6 traffic sent from network 2001:0db8::0/64, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny ipv6 2001:0db8::0/64 any
```

(named IPv6 hardware ACL: IP protocol entry)

Overview Use this command to add an IP protocol type filter entry to the current IPv6 hardware access-list. The filter will match on IPv6 packets that have the specified IP protocol number, and the specified IPv6 addresses. You can use the value **any** instead of source or destination IPv6 address if an address does not matter.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny proto 2 2001:0db8::0/64 any**).

You can find the sequence number by running the [show ipv6 access-list \(IPv6 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

Syntax [`<sequence-number>`] `<action>` proto `<1-255>` `<source-addr>`
`<dest-addr>` [`vlan <1-4094>`] [`log`]

`no <sequence-number>`

`no <action>` proto `<1-255>` `<source-addr>` `<dest-addr>` [`vlan <1-4094>`] [`log`]

The following actions are available for hardware ACLs:

Values for the <code><action></code> parameter	
deny	Reject packets that match the source and destination filtering specified with this command.
permit	Permit packets that match the source and destination filtering specified with this command.
copy-to-cpu	Send a copy of matching packets to the CPU.
copy-to-mirror [interface port-number]	Send a copy of matching packets to a mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
send-to-mirror [interface port-number]	Send matching packets to the mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.

Values for the <action> parameter	
send-to-vlan-port vlan <vid> port <port-number>	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.
send-to-cpu	Send matching packets to the CPU.
deny-and-not-cpu	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Table 44-2: Parameters in IP protocol ACL entries

Parameter	Description
<sequence-number>	The sequence number for the filter entry of the selected access control list, in the range 1-65535.
<action>	The action that the switch will take on matching packets. See the table above for valid values.
proto <1-255>	The IP protocol number to match against, as defined by IANA (Internet Assigned Numbers Authority www.iana.org/assignments/protocol-numbers) See below for a list of IP protocol numbers and their descriptions.
<source-addr>	The source addresses to match against. You can specify a single host, a range, or all source addresses. The following are the valid formats for specifying the source:
	any Match any source host.
	<ipv6-src-address/ prefix-length> Match the specified source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
	<ipv6-src-address> <ipv6-src-wildcard> Match the specified IPv6 source address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.
	host <ipv6-source-host> Match a single source host address. The IPv6 address uses the format X:X::X:X.
<dest-addr>	The destination addresses to match against. You can specify a single host, a range, or all destination addresses. The following are the valid formats for specifying the destination:

Table 44-2: Parameters in IP protocol ACL entries (cont.)

Parameter	Description
any	Match any destination host.
<code><ipv6-dest-address/ prefix-length></code>	Match the specified destination address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
<code><ipv6-dest-address> <ipv6-dest-wildcard></code>	Match the specified destination address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.
host <code><ipv6-dest-host></code>	Match a single destination host address. The IPv6 address uses the format X:X::X:X.
vlan <code><1-4094></code>	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.
log	Log packets that are denied by this ACL. You must also enable the logging, using the command access-list hardware-deny-log .

Table 44-3: IP protocol number and description

Protocol Number	Protocol Description [RFC]

Mode IPv6 Hardware ACL Configuration (accessed by running the command `ipv6 access-list (named IPv6 hardware ACL)`)

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes To use this command, first run the command `ipv6 access-list (named IPv6 hardware ACL)` and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl) #
```

Then use this command (and the other “named IPv6 hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the [ipv6 traffic-filter](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Examples To add a filter entry to the ACL named “my-acl” to deny IGMP packets from 2001:0db8::0/64 , use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny proto 2 2001:0db8::0/64 any
```

To remove a filter entry that blocks IGMP packets from network 2001:0db8::0/64 from the ACL named “my-acl”, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny proto 2 2001:0db8::0/64 any
```

Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

(named IPv6 hardware ACL: TCP or UDP entry)

Overview Use this command to add a TCP or UDP filter entry to the current IPv6 hardware access-list. The access-list will match on TCP or UDP packets that have the specified source and destination IP addresses and optionally, port values. You can use the value **any** instead of source or destination IP address if an address does not matter.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny tcp 2001:0db8::0/64 any**).

You can find the sequence number by running the [show ipv6 access-list \(IPv6 Hardware ACLs\)](#) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.

Syntax [`<sequence-number>`] `<action>` {tcp|udp} `<source-addr>`
[`<source-ports>`] `<dest-addr>` [`<dest-ports>`] [vlan `<1-4094>`]
[log]

no `<sequence-number>`

no `<action>` {tcp|udp} `<source-addr>` [`<source-ports>`]
`<dest-addr>` [`<dest-ports>`] [vlan `<1-4094>`] [log]

The following actions are available for hardware ACLs:

Values for the <code><action></code> parameter	
deny	Reject packets that match the source and destination filtering specified with this command.
permit	Permit packets that match the source and destination filtering specified with this command.
copy-to-cpu	Send a copy of matching packets to the CPU.
copy-to-mirror [interface <i>port-number</i>]	Send a copy of matching packets to a mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
send-to-mirror [interface <i>port-number</i>]	Send matching packets to the mirror port. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.

Values for the <action> parameter	
send-to-vlan-port vlan <vid> port <port-number>	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.
send-to-cpu	Send matching packets to the CPU.
deny-and-not-cpu	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Parameter	Description								
<sequence-number>	The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.								
<action>	The action that the switch will take on matching packets. See the table above for valid values.								
tcp	Match against TCP packets.								
udp	Match against UDP packets.								
<source-addr>	The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source: <table> <tr> <td>any</td><td>Match any source IP address.</td></tr> <tr> <td>host <ip-addr></td><td>Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.</td></tr> <tr> <td><ip-addr>/ <prefix></td><td>Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.</td></tr> <tr> <td><ip-addr> <reverse-mask></td><td>Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.</td></tr> </table>	any	Match any source IP address.	host <ip-addr>	Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.	<ip-addr>/ <prefix>	Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.	<ip-addr> <reverse-mask>	Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
any	Match any source IP address.								
host <ip-addr>	Match a single source host with the IP address given by <ip-addr> in dotted decimal notation.								
<ip-addr>/ <prefix>	Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.								
<ip-addr> <reverse-mask>	Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.								
<source-ports>	Match source TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows: <table> <tr> <td>eq <0-65535></td><td>Match a single port number.</td></tr> <tr> <td>lt <0-65535></td><td>Match all port numbers that are less than the specified port number.</td></tr> </table>	eq <0-65535>	Match a single port number.	lt <0-65535>	Match all port numbers that are less than the specified port number.				
eq <0-65535>	Match a single port number.								
lt <0-65535>	Match all port numbers that are less than the specified port number.								

Parameter	Description
gt <0-65535>	Match all port numbers that are greater than the specified port number.
ne <0-65535>	Match all port numbers except the specified port number.
range <start-port> <end-port>	Match a range of port numbers.
<dest-addr>	The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:
any	Match any destination IP address.
host <ip-addr>	Match a single destination host with the IP address given by <ip-addr> in dotted decimal notation.
<ip-addr>/ <prefix>	Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
<ip-addr> <reverse-mask>	Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<dest-ports>	Match destination TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:
eq <0-65535>	Match a single port number.
lt <0-65535>	Match all port numbers that are less than the specified port number.
gt <0-65535>	Match all port numbers that are greater than the specified port number.
ne <0-65535>	Match all port numbers except the specified port number.
range <start-port> <end-port>	Match a range of port numbers.
vlan <1-4094>	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.
log	Log packets that are denied by this ACL. You must also enable the logging, using the command access-list hardware-deny-log .

Mode IPv6 Hardware ACL Configuration (accessed by running the command [ipv6 access-list \(named IPv6 hardware ACL\)](#))

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes To use this command, first run the command [ipv6 access-list \(named IPv6 hardware ACL\)](#) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl)#
```

Then use this command (and the other “named IPv6 hardware ACL: entry” commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the [ipv6 traffic-filter](#) or the [match access-group](#) command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Examples To add a filter entry that blocks all SSH traffic from network 2001:0db8::0/64 to the hardware IPv6 access-list named “my-acl”, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny tcp 2001:0db8::0/64 any eq 22
```

To add a filter entry that blocks all SSH traffic from network 2001:0db8::0/64 on the default VLAN (vlan1) to the hardware IPv6 access-list named “my-acl”, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny tcp 2001:0db8::0/64 any eq 22
vlan 1
```

To remove an ACL filter entry that blocks all SSH traffic from network 2001:0db8::0/64 from the hardware IPv6 access-list named “my-acl”, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny tcp 2001:0db8::0/64 any eq 22
```

platform hwfilter-size

Overview You can use this command to control the configuration of hardware Access Control Lists (ACLs), which determines the total available number and functionality of hardware ACLs.

For this command to take effect, you need to reboot the affected service.

You cannot attach an IPv6 ACL to a port if the ACL contains a specified source or destination IPv6 address or both and the **hw-filter size** setting is **ipv4-limited-ipv6**. If you do so, a diagnostic message will be generated.

Syntax `platform hwfilter-size {ipv4-limited-ipv6|ipv4-full-ipv6}`

Parameter	Description
hwfilter-size	Configure hardware ACLs command.
ipv4-full-ipv6	Configure hardware ACLs to filter IPv4 traffic, MAC addresses and IPv6 traffic, including filtering on source or destination IPv6 addresses, or both; however, this will reduce the total number of filters available in the hardware table.
ipv4-limited-ipv6	Configure hardware ACLs to filter IPv4 traffic, MAC addresses and IPv6 traffic. Source or destination IPv6 addresses or both are not filtered.

Default The default mode is **ipv4-limited-ipv6**.

Mode Global Configuration

Example To configure hardware ACLs to filter IPv4 and IPv6 traffic, use the following commands:

```
awplus# configure terminal
awplus(config)# platform hwfilter-size ipv4-full-ipv6
```

Related commands [show platform](#)
[ipv6 access-list \(named IPv6 hardware ACL\)](#)

show access-list counters

Overview Use this command to show the number of packets that match one or all of your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments. This lets you check your ACL configuration.

Syntax `show access-list counters [<acl>]`

Parameter	Description
<acl>	Display the number of packets that match only the specified ACL. You can enter the ACL name or number.

Mode User Exec and Privileged Exec

Usage notes This command displays the counter values since the last time they were cleared. To clear the counter values, enter the command [clear access-list counters](#).

To accurately measure the number of packet hits per ACL, you need to read the counters for all ACLs frequently.

Example To show the number of packets that match all hardware ACLs, use the following command:

```
awplus# show access-list counters
```

Output Figure 44-1: Example output from **show access-list counters**

```
awplus#show access-list counters
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
ACL-2
Packet Hits: 0
ACL-3
Packet Hits: 1
```

Output Figure 44-2: Example output from **show access-list counters ACL-1**

```
awplus#show access-list counters ACL-1
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
```

Table 44-4: Parameters in the output from **show access-list counters**

Parameter	Description
Packet Hits	The number of packets that match the ACL. The count includes both dropped and allowed packets.

Related commands [clear access-list counters](#)
 [show interface access-group](#)

Command changes Version 5.5.2-2.1: reading the counters no longer clears them
 Version 5.5.1-2.1: command added

show acl-group ipv6 address

Overview Use this command to show the hosts and subnets in a named IPv6 ACL group.

Syntax `show acl-group ipv6 address <group>`

Parameter	Description
<code><group></code>	The name of the IPv6 ACL group.

Mode Privileged Exec

Example To show all hosts and subnets in an IPv6 ACL group IPV6_GROUP1, use the command:

```
awplus# show acl-group ipv6 address IPV6_GROUP1
```

Output Figure 44-3: Example output from **show acl-group ipv6 address IPV6_GROUP1**

```
awplus#show acl-group ipv6 address IPV6_GROUP1
Host Group: IPV6_GROUP1

2001:DB8::/32
2001:DB9::1/128
```

Related commands [acl-group ipv6 address](#)
[ipv6 \(ipv6-host-group\)](#)

Command changes Version 5.5.0-1.1: command added

show ipv6 access-list (IPv6 Hardware ACLs)

Overview Use this command to display all configured hardware IPv6 access-lists or the IPv6 access-list specified by name. Omitting the optional name parameter will display all IPv6 ACLs.

Syntax `show ipv6 access-list [<name>]`

Parameter	Description
<name>	Hardware IPv6 access-list name.

Mode User Exec and Privileged Exec

Example To show all configured IPv6 access-lists use the command:

```
awplus# show ipv6 access-list
```

Output Figure 44-4: Example output from the **show ipv6 access-list** command

```
IPv6 access-list deny_ssh
deny tcp abcd::0/64 any eq 22
```

ACLs that are added dynamically during port authentication will be displayed with the label 'dynamic':

```
awplus# show ipv6 access-list
```

```
Named Standard IPv6 access list red
 10 deny any

Named Extended IPv6 access list blue
 10 deny ip any any

Hardware IPv6 access list dacl-port1.0.45-2477.03fe.ded4-ipv6 (dynamic)
 4 deny ipv6 any any
```

IPv6 Software Access Control List (ACL) Commands

Introduction

Overview This chapter provides an alphabetical reference for the IPv6 Software Access Control List (ACL) commands, and contains detailed command information and command examples about IPv6 software ACLs as applied to Routing and Multicasting, which are not applied to interfaces.

For information about ACLs, see the [ACL Feature Overview and Configuration Guide](#).

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see the following references:

- the [Link Aggregation Feature Overview_and_Configuration_Guide](#).
- [Link Aggregation Commands](#)

Note that text in parenthesis in command names indicates usage not keyword entry. For example, **ipv6-access-list (named)** indicates named IPv6 ACLs entered as:

```
ipv6-access-list<name>
```

where <name> is a placeholder not a keyword.

Note also that parenthesis surrounding ACL filters indicates the type of ACL filter not the keyword entry in the CLI. For example, **(ipv6 access-list standard IPv6 filter)** represents command entry in the format shown in the syntax:

```
[<sequence-number>] {deny|permit}  
{<source-ipv6-address/prefix-length>|any}
```

NOTE: Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Sub-modes Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

Table 45-1: IPv6 Software Access List Commands and Prompts

Command Name	Command Mode	Prompt
show ipv6 access-list (IPv6 Software ACLs)	Privileged Exec	awplus#
ipv6 access-list extended (named)	Global Configuration	awplus (config) #
ipv6 access-list standard (named)	Global Configuration	awplus (config) #
(ipv6 access-list extended IP protocol filter)	IPv6 Extended ACL Configuration	awplus (config-ipv6-ext-acl) #
(ipv6 access-list extended TCP UDP filter)	IPv6 Extended ACL Configuration	awplus (config-ipv6-ext-acl) #
(ipv6 access-list standard filter)	IPv6 Standard ACL Configuration	awplus (config-ipv6-std-acl) #

ipv6 access-list extended (named)

Overview Use this command when configuring an IPv6 extended access-list for filtering frames that permit or deny IP, ICMP, TCP, UDP packets or ICMP packets with a specific value based on the source or destination.

The **no** variant of this command removes a specified IPv6 extended access-list.

Syntax
[list-name] ipv6 access-list extended <list-name>
no ipv6 access-list extended <list-name>

Parameter	Description
<list-name>	A user-defined name for the IPv6 software extended access-list.

Syntax
[any|icmp|ip] ipv6 access-list extended <list-name> {deny|permit}
{any|icmp|ip} {<ipv6-source-address/prefix-length>|any}
{<ipv6-destination-address/prefix-length>|any} [<icmp-type
<icmp-type>] [log]

no ipv6 access-list extended <list-name> {deny|permit}
{any|icmp|ip} {<ipv6-source-address/prefix-length>|any}
{<ipv6-destination-address/prefix-length>|any} [<icmp-type
<icmp-type>] [log]

Syntax [tcp|udp] ipv6 access-list extended <list-name> {deny|permit} {tcp|udp}
{<ipv6-source-address/prefix-length>|any} {eq <sourceport>|lt
<sourceport>|gt <sourceport>|ne
<sourceport>}{<ipv6-destination-address/prefix-length>|any}
{eq <destport>|lt <destport>|gt <destport>|ne <destport>} [log]
no ipv6 access-list extended <list-name> {deny|permit}
{tcp|udp} {<ipv6-source-address/prefix-length>|any} {eq
<sourceport>|lt <sourceport>|gt <sourceport>|ne
<sourceport>}{<ipv6-destination-addr/prefix-length>|any} {eq
<destport>|lt<destport>|gt <destport>|ne <destport>} [log]

Parameter	Description
<list-name>	A user-defined name for the IPv6 software extended access-list.
deny	The IPv6 software extended access-list rejects packets that match the type, source, and destination filtering specified with this command.
permit	The IPv6 software extended access-list permits packets that match the type, source, and destination filtering specified with this command.

Parameter	Description
any	For ICMP IP The IPv6 software extended access-list matches any type of packet.
ip	For ICMP IP The IPv6 software extended access-list matches only IP packets.
icmp	For ICMP IP The IPv6 software extended access-list matches only ICMP packets.
tcp	For TCP/UDP The IPv6 software extended access-list matches only TCP packets.
udp	For TCP/UDP The IPv6 software extended access-list matches only UDP packets.
<ipv6-source-address/prefix-length>	Specifies a source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
<ipv6-destination-address/prefix-length>	Specifies a destination address and prefix length. The IPv6 address uses the format X:X::X/X/Prefix-Length. The prefix-length is usually set between 0 and 64.
any	Matches any IPv6 address.
<sourceport>	For TCP/UDP The source port number, specified as an integer between 0 and 65535.
<destport>	For TCP/UDP The destination port number, specified as an integer between 0 and 65535.
icmp-type	For ICMP IP Matches only a specified type of ICMP messages. This is valid only when the filtering is set to match ICMP packets.
eq	For TCP/UDP Matches port numbers equal to the port number specified immediately after this parameter.
lt	For TCP/UDP Matches port numbers less than the port number specified immediately after this parameter.
gt	For TCP/UDP Matches port numbers greater than the port number specified immediately after this parameter.
ne	For TCP/UDP Matches port numbers not equal to the port number specified immediately after this parameter.

Parameter	Description																										
<code><icmp-type></code>	For ICMP IP The ICMP type, as defined in RFC792 and RFC950. Specify one of the following integers to create a filter for the ICMP message type: <table border="1"> <tr><td>0</td><td>Echo replies.</td></tr> <tr><td>3</td><td>Destination unreachable messages.</td></tr> <tr><td>4</td><td>Source quench messages.</td></tr> <tr><td>5</td><td>Redirect (change route) messages.</td></tr> <tr><td>8</td><td>Echo requests.</td></tr> <tr><td>11</td><td>Time exceeded messages.</td></tr> <tr><td>12</td><td>Parameter problem messages.</td></tr> <tr><td>13</td><td>Timestamp requests.</td></tr> <tr><td>14</td><td>Timestamp replies.</td></tr> <tr><td>15</td><td>Information requests.</td></tr> <tr><td>16</td><td>Information replies.</td></tr> <tr><td>17</td><td>Address mask requests.</td></tr> <tr><td>18</td><td>Address mask replies.</td></tr> </table>	0	Echo replies.	3	Destination unreachable messages.	4	Source quench messages.	5	Redirect (change route) messages.	8	Echo requests.	11	Time exceeded messages.	12	Parameter problem messages.	13	Timestamp requests.	14	Timestamp replies.	15	Information requests.	16	Information replies.	17	Address mask requests.	18	Address mask replies.
0	Echo replies.																										
3	Destination unreachable messages.																										
4	Source quench messages.																										
5	Redirect (change route) messages.																										
8	Echo requests.																										
11	Time exceeded messages.																										
12	Parameter problem messages.																										
13	Timestamp requests.																										
14	Timestamp replies.																										
15	Information requests.																										
16	Information replies.																										
17	Address mask requests.																										
18	Address mask replies.																										
<code>log</code>	Logs the results.																										

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes Use IPv6 extended access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 extended access-list when a match is encountered.

For backwards compatibility you can either create IPv6 extended access-lists from within this command, or you can enter `ipv6 access-list extended` followed by only the IPv6 extended access-list name. This latter (and preferred) method moves you to the `(config-ipv6-ext-acl)` prompt for the selected IPv6 extended access-list number, and from here you can configure the filters for this selected access-list.

NOTE: Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example 1 [creating a list] To add a new filter to the access-list named `my-list` that will reject incoming ICMP packets from 2001:0db8::0/64 to 2001:0db8::f/64, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# icmp 2001:0db8::0/64
2001:0db8::f/64
```

Example 2 [adding to a list] To insert a new filter at sequence number 5 of the access-list named `my-list` that will accept ICMP type 8 packets from the 2001:0db8::0/64 network to the 2001:0db8::f/64 network, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 icmp 2001:0db8::0/64
2001:0db8::f/64
```

Example 3 [list with filter] To create the access-list named TK to deny TCP protocols, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended TK deny tcp any eq 14
any lt 12 log
```

Command changes

Version 5.5.1-0.1: Support for the **no** variant added

ipv6 access-list extended proto

Overview Use this command when configuring an IPv6 extended access-list for filtering frames that permit or deny packets with a specific value based on the IP protocol number specified.

The **no** variant of this command removes a specified IPv6 extended access-list with an IP protocol number.

Syntax

```
ipv6 access-list extended <list-name> {deny|permit} proto  
<ip-protocol> {<ipv6-source-address/prefix>|any}  
{<ipv6-destination-address/prefix>|any} [log]  
  
no ipv6 access-list extended <list-name> {deny|permit} proto  
<ip-protocol>{<ipv6-source-address/prefix>|any}  
{<ipv6-destination-address/prefix>|any} [log]
```

Parameter	Description
<list-name>	A user-defined name for the IPv6 software extended access- list.
deny	Specifies the packets to reject.
permit	Specifies the packets to accept.
proto	The IP Protocol type specified by its protocol number in the range 1 to 255.
<ipv6-source-address/prefix>	IPv6 source address, or local address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
any	Any source address or local address.
<ipv6-destination-address/prefix>	IPv6 destination address, or local address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
any	Any destination address or remote address.
log	Log the results.

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes Use IPv6 extended access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 extended access-list when a match is encountered.

The filter entry will match on any IP protocol type packet that has the specified source and destination IPv6 addresses and the specified IP protocol type. The parameter **any** may be specified if an address does not matter.

NOTE: Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples To create the IPv6 access-list named ACL-1 to deny IP protocol 9 packets from 2001:0db8:1::1/128 to 2001:0db8:f::1/128, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended ACL-1 deny proto 9
2001:0db8:1::1/128 2001:0db8:f::1/128
```

To remove the IPv6 access-list named ACL-1 to deny IP protocol 9 packets from 2001:0db8:1::1/128 to 2001:0db8:f::1/128, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 access-list extended ACL-1 deny proto
10 2001:0db8:1::1/128 2001:0db8:f::1/128
```

(ipv6 access-list extended IP protocol filter)

Overview Use this ACL filter to add a filter entry for an IPv6 source and destination address and prefix, with or without an IP protocol specified, to the current extended IPv6 access-list. If a sequence is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source and destination address and prefix, with or without an IP protocol filter entry, from the current extended IPv6 access-list. You can specify the ACL filter entry by entering either its sequence number, or its filter entry profile.

Syntax [ip|proto] [*<sequence-number>*] {deny|permit} {ip|any|proto *<ip-protocol>*} {*<ipv6-source-address/prefix>*|any} {*<ipv6-destination-address/prefix>*|any} [log]

no {deny|permit} {ip|any|proto *<ip-protocol>*} {*<ipv6-source-address/prefix>*|any} {*<ipv6-destination-address/prefix>*|any} [log]

no [*<sequence-number>*]

Parameter	Description
<i><sequence-number></i>	<1-65535> The sequence number for the filter entry of the selected access control list.
deny	Specifies the packets to reject.
permit	Specifies the packets to accept.
ip	IP packet.
any	Any packet.
proto <i><ip-protocol></i>	<1-255> Specify IP protocol number, as defined by IANA (Internet Assigned Numbers Authority www.iana.org/assignments/protocol-numbers) See below for a list of IP protocol numbers and their descriptions.
<i><ipv6-source-address/prefix></i>	IPv6 source address, or local address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
any	Any source address or local address.
<i><ipv6-destination-address/prefix></i>	IPv6 destination address, or local address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
any	Any destination address or remote address.
log	Log the results.

Mode IPv6 Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes The filter entry will match on any IP protocol type packet that has the specified source and destination IPv6 addresses and the specified IP protocol type. The parameter *any* may be specified if an address does not matter.

NOTE: Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples To add a new ACL filter entry to the extended IPv6 access-list named *my-list* with sequence number 5 rejecting the IPv6 packet from *2001:db8:1:1:1* to *2001:db8:f:1:1*, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny ip 2001:db8:1::1/128
2001:db8:f::1/128
```

To remove the ACL filter entry to the extended IPv6 access-list named *my-list* with sequence number 5, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# no 5
```

Related commands [ipv6 access-list extended \(named\)](#)
[show ipv6 access-list \(IPv6 Software ACLs\)](#)
[show running-config](#)

(ipv6 access-list extended TCP UDP filter)

Overview Use this ACL filter to add a filter entry for an IPv6 source and destination address and prefix, with a TCP (Transmission Control Protocol) or UDP (User Datagram Protocol) source and destination port specified, to the current extended IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source and destination address and prefix, with a TCP or UDP source and destination port specified, from the current extended IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

Syntax [tcp|udp] [*<sequence-number>*] {deny|permit} {tcp|udp} {<ipv6-source-address/prefix>|any} {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>} {<IPv6-destination-address/prefix>|any} {eq <destport>|lt <destport>|gt <destport>|ne <destport>} [log]

no {deny|permit} {tcp|udp} {<ipv6-source-address/prefix>|any} {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>}} {<IPv6-destination-address/prefix>|any} {eq <destport>|lt <destport>|gt <destport>|ne <destport>} [log]

no <sequence-number>

Parameter	Description
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.
deny	Specifies the packets to reject.
permit	Specifies the packets to accept.
tcp	TCP packet.
udp	UDP packet.
<ipv6-source-address/prefix>	IPv6 source address, or local address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
any	Any source address or local address.
eq	Equal to.
lt	Less than.
gt	Greater than.
ne	Not equal to.
<sourceport>	The source port number, specified as an integer between 0 and 65535.

Parameter	Description
<ipv6-destination-address/prefix>	IPv6 destination address, or local address. The IPv6 address uses the format X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<destport>	The destination port number, specified as an integer between 0 and 65535.
log	Log the results.

Mode IPv6 Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes The filter entry will match on any packet that has the specified source and destination IPv6 addresses and the specified TCP or UDP source and destination port. The parameter *any* may be specified if an address does not matter.

NOTE: Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples To add a new filter entry with sequence number 5 to the access-list named *my-list* to reject TCP packets from 2001:0db8::0/64 port 10 to 2001:0db8::f/64 port 20, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny tcp 2001:0db8::0/64 eq 10
2001:0db8::f/64 eq 20
```

To add a new filter entry with sequence number 5 to the extended IPv6 access-list named *my-list* to reject UDP packets from 2001:0db8::0/64 port 10 to 2001:0db8::f/64 port 20, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny udp 2001:0db8::0/64 eq 10
2001:0db8::f/64 eq 20
```

To remove the filter entry with sequence number 5 to the extended IPv6 access-list named *my-list*, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# no 5
```

Related commands [ipv6 access-list extended \(named\)](#)

[show running-config](#)

ipv6 access-list standard (named)

Overview This command configures an IPv6 standard access-list for filtering frames that permit or deny IPv6 packets from a specific source IPv6 address.

The **no** variant of this command removes a specified IPv6 standard access-list.

Syntax
[list-name] `ipv6 access-list standard <ipv6-acl-list-name>`
`no ipv6 access-list standard <ipv6-acl-list-name>`

Parameter	Description
<code><ipv6-acl-list-name></code>	A user-defined name for the IPv6 software standard access-list.

Syntax [deny|permit] `ipv6 access-list standard <ipv6-acl-list-name> [{deny|permit} {<ipv6-source-address/prefix-length>|any} [exact-match]]`
`no ipv6 access-list standard <ipv6-acl-list-name> [{deny|permit} {<ipv6-source-address/prefix-length>|any} [exact-match]]`

Parameter	Description
<code><ipv6-acl-list-name></code>	A user-defined name for the IPv6 software standard access-list.
<code>deny</code>	The IPv6 software standard access-list rejects packets that match the type, source, and destination filtering specified with this command.
<code>permit</code>	The IPv6 software standard access-list permits packets that match the type, source, and destination filtering specified with this command.
<code><ipv6-source-address/prefix-length></code>	Specifies a source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
<code>any</code>	Matches any source IPv6 address.
<code>exact-match</code>	Exact match of the prefixes.

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes Use IPv6 standard access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 standard access-list when a match is encountered.

For backwards compatibility you can either create IPv6 standard access-lists from within this command, or you can enter `ipv6 access-list standard` followed by only the IPv6 standard access-list name. This latter (and preferred) method moves you to the `(config-ipv6-std-acl)` prompt for the selected IPv6 standard access-list, and from here you can configure the filters for this selected IPv6 standard access-list.

NOTE: Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example To enter the IPv6 Standard ACL Configuration mode for the access-list named `my-list`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)#
```

Related commands [\(ipv6 access-list standard filter\)](#)
[show ipv6 access-list \(IPv6 Software ACLs\)](#)
[show running-config](#)

(ipv6 access-list standard filter)

Overview Use this ACL filter to add a filter entry for an IPv6 source address and prefix length to the current standard IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source address and prefix from the current standard IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

Syntax [icmp] [*<sequence-number>*] {deny|permit}
{*<ipv6-source-address/prefix-length>*|any}
no {deny|permit} {*<ipv6-source-address/prefix-length>*|any}
no *<sequence-number>*

Parameter	Description
<i><sequence-number></i>	<i><1-65535></i> The sequence number for the filter entry of the selected access control list.
deny	Specifies the packets to reject.
permit	Specifies the packets to accept.
<i><ipv6-source-address/prefix-length></i>	IPv6 source address and prefix-length in the form X:X::X:X/P.
any	Any IPv6 source host address.

Mode IPv6 Standard ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage The filter entry will match on any IPv6 packet that has the specified IPv6 source address and prefix length. The parameter *any* may be specified if an address does not matter.

NOTE: Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples To add an ACL filter entry with sequence number 5 that will deny any IPv6 packets to the standard IPv6 access-list named *my-list*, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# 5 deny any
```

To remove the ACL filter entry that will deny any IPv6 packets from the standard IPv6 access-list named `my-list`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# no deny any
```

Alternately, to remove the ACL filter entry with sequence number 5 to the standard IPv6 access-list named `my-list`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# no 5
```

**Related
commands**

[ipv6 access-list standard \(named\)](#)
[show ipv6 access-list \(IPv6 Software ACLs\)](#)
[show running-config](#)

ipv6 prefix-list

Overview Use this command to create an IPv6 prefix list or an entry in an existing prefix list.

Use the **no** variant of this command to delete a whole prefix list, a prefix list entry, or a description.

Syntax

```
ipv6 prefix-list <list-name> [seq <1-429496725>] {deny|permit}
{any|<ipv6-prefix>} [ge <0-128>] [le <0-128>]

ipv6 prefix-list <list-name> description <text>

no ipv6 prefix-list <list-name> [seq <1-429496725>]

no ipv6 prefix-list <list-name> [description <text>]
```

Parameter	Description
<list-name>	Specifies the name of a prefix list.
seq <1-429496725>	Sequence number of the prefix list entry.
deny	Specifies that the prefixes are excluded from the list.
permit	Specifies that the prefixes are included in the list.
<ipv6-prefix>	Specifies the IPv6 prefix and prefix length in hexadecimal in the format X:X::X:X/M.
any	Any prefix match. Same as ::0/0 le 128.
ge <0-128>	Specifies the minimum prefix length to be matched.
le <0-128>	Specifies the maximum prefix length to be matched.
description	Prefix list specific description.
<text>	Up to 80 characters of text description of the prefix list.

Mode Global Configuration

Usage notes When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. The parameters **ge** and **le** are only used if an ip-prefix is stated. When setting these parameters, set the **le** value to be less than 128, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

Example To check the first 32 bits of the prefix 2001:db8:: and that the subnet mask must be greater than or equal to 34 and less than or equal to 40, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 prefix-list mylist seq 12345 permit
2001:db8::/32 ge 34 le 40
```

Related commands

- match ipv6 address
- show ipv6 prefix-list
- show running-config ipv6 prefix-list

show ipv6 access-list (IPv6 Software ACLs)

Overview Use this command to display all configured IPv6 access-lists or the IPv6 access-list specified by name.

Syntax `show ipv6 access-list [<access-list-name>]`
`show ipv6 access-list standard [<access-list-name>]`
`show ipv6 access-list extended [<access-list-name>]`

Parameter	Description
<access-list-name>	Only display information about an IPv6 access-list with the specified name.
standard	Only display information about standard access-lists.
extended	Only display information about extended access-lists.

Mode User Exec and Privileged Exec

Example To show all configured IPv6 access-lists, use the following command:

```
awplus# show ipv6 access-list
```

Output Figure 45-1: Example output from **show ipv6 access-list**

```
IPv6 access-list deny_icmp
deny icmp any any vlan 1

IPv6 access-list deny_ssh
deny tcp abcd::0/64 any eq 22
```

Example To show the IPv6 access-list named **deny_icmp**, use the following command:

```
awplus# show ipv6 access-list deny_icmp
```

Output Figure 45-2: Example output from **show ipv6 access-list** for a named ACL

```
IPv6 access-list deny_icmp
deny icmp any any vlan 1
```

show ipv6 prefix-list

Overview Use this command to display the prefix-list entries.
Note that this command is valid for RIPng and BGP4+ routing protocols only.

Syntax `show ipv6 prefix-list [<name>|detail|summary]`

Parameter	Description
<name>	Specify the name of an individual IPv6 prefix list.
detail	Specify this parameter to show detailed output for all IPv6 prefix lists.
summary	Specify this parameter to show summary output for all IPv6 prefix lists.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 prefix-list
awplus# show ipv6 prefix-list 10.10.0.98/8
awplus# show ipv6 prefix-list detail
```

Related commands [ipv6 prefix-list](#)

vtv ipv6 access-class (named)

Overview For IPv6, use this command to set a standard named software access list to be the management ACL. This is then applied to all available VTY lines for controlling remote access by Telnet and SSH. This command allows or denies packets containing the IPv6 addresses included in the ACL to create a connection to your device.

ACLs that are attached using this command have an implicit 'deny-all' filter as the final entry in the ACL. A typical configuration is to permit a specific address, or range of addresses, and rely on the 'deny-all' filter to block all other access.

Use the **no** variant of this command to remove the access list.

Syntax `vtv ipv6 access-class <access-name>`
`no vtv ipv6 access-class [<access-name>]`

Parameter	Description
<code><access-name></code>	Specify an IPv6 standard software access-list name

Mode Global Configuration

Examples To set the named standard access-list named **access-ctrl** to be the IPv6 management ACL, use the following commands:

```
awplus# configure terminal
awplus(config)# vtv ipv6 access-class access-ctrl
```

To remove **access-ctrl** from the management ACL, use the following commands:

```
awplus# configure terminal
awplus(config)# no vtv ipv6 access-class access-ctrl
```

Output Figure 45-3: Example output from the **show running-config** command

```
awplus#show running-config|grep access-class
vtv ipv6 access-class access-ctrl
```

class

Overview Use this command to associate an existing class-map to a policy or policy-map (traffic classification), and to enter Policy Map Class Configuration mode to configure the class-map.

Use the **no** variant of this command to delete an existing class-map.

If your class-map does not exist, you can create it by using the [class-map](#) command.

Syntax `class {<name>|default}`
`no class <name>`

Parameter	Description
<name>	Name of the (already existing) class-map.
default	Specify the default class-map.

Mode Policy Map Configuration

Example The following example creates the policy-map `pmap1` (using the `policy-map` command), then associates this to an already existing class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)#
```

Related commands [class-map](#)
[policy-map](#)

class-map

Overview Use this command to create a class-map.
Use the **no** variant of this command to delete the named class-map.

Syntax `class-map <name>`
`no class-map <name>`

Parameter	Description
<name>	Name of the class-map to be created.

Mode Global Configuration

Example This example creates a class-map called `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)#
```

clear mls qos interface policer-counters

Overview Resets an interface's policer counters to zero. You can either clear a specific class-map, or you can clear all class-maps by not specifying a class map.

Syntax `clear mls qos interface <port> policer-counters [class-map <class-map>]`

Parameter	Description
<port>	The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4).
class-map	Select a class-map.
<class-map>	Class-map name.

Mode Privileged Exec

Example To reset the policy counters to zero for all class-maps for port1.0.4, use the command:

```
awplus# clear mls qos interface port1.0.4 policer-counters
```

Related commands [show mls qos interface policer-counters](#)

clear mls qos interface queue-counters

Overview Use this command to clear the QoS queue counters for an interface.

Syntax `clear mls qos interface <interface> queue-counters`

Parameter	Description
<interface>	The interface to clear the counters for. This can be a switchport, a static channel group, or a dynamic (LACP) channel group.

Mode Privileged Exec

Example To clear the egress queue counters on interface port1.0.1, use the command:

```
awplus# clear mls qos interface port1.0.1 queue-counters
```

To clear the egress queue counters on the static aggregator sa1, use the command:

```
awplus# clear mls qos interface sa1 queue-counters
```

Related commands [show mls qos interface queue-counters](#)

Command changes Version 5.5.2-2.1: command added

default-action

Overview Use this command to set the action for the default class-map belonging to a particular policy-map. The action for a non-default class-map depends on the action of any ACL that is applied to the policy-map.

You can think of the default action as the action that the switch will apply to any data that does not meet the criteria specified by the applied matching commands.

Use the **no** variant of this command to reset to the default action of 'permit'.

Syntax `default-action <action>`
`no default-action`

Parameter	Description
<code><action></code> <code>permit</code>	Permit packets
<code>deny</code>	Deny packets.
<code>send-to-cpu</code>	Send packets to the CPU.
<code>copy-to-cpu</code>	Copy packets to the CPU as well as forwarding them.
<code>copy-to-mirror</code> <code>[interface</code> <code>port-number]</code>	Copy packets to the mirror port as well as forwarding them. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.
<code>send-to-mirror</code> <code>[interface</code> <code>port-number]</code>	Send packets to the mirror port instead of forwarding them. Use the mirror interface command to configure the mirror port. If there are multiple mirror ports and you do not specify one, then the switch will use the mirror port with the lowest port number.

Default The default is **permit**.

Mode Policy Map Configuration

Examples To set the action for the default class-map to 'deny' for the policy map named 'map1', use the commands:

```
awplus# configure terminal
awplus(config)# mls qos enable
awplus(config)# policy-map map1
awplus(config-pmap)# default-action deny
```

To set the action for the default class-map to 'copy-to-mirror' for use with the [mirror interface](#) command, for the policy map named 'map1', use the commands:

```
awplus# configure terminal
awplus(config)# mls qos enable
awplus(config)# policy-map map1
awplus(config-pmap)# default-action copy-to-mirror
```

**Related
commands** [mirror interface](#)

description (QoS policy-map)

Overview Adds a textual description of the policy-map. This can be up to 80 characters long. Use the **no** variant of this command to remove the current description from the policy-map.

Syntax `description <line>`
`no description`

Parameter	Description
<code><line></code>	Up to 80 character long line description.

Mode Policy Map Configuration

Example To add the description, VOIP traffic, use the command:
`awplus(config-pmap)# description VOIP traffic`

egress-rate-limit

Overview Use this command to limit the amount of traffic that can be transmitted per second from this port.

Use the **no** variant of this command to disable the limiting of traffic egressing on the interface.

Syntax `egress-rate-limit <rate-limit>`
`no egress-rate-limit`

Parameter	Description
<code><rate-limit></code>	Bandwidth <1-10000000 units per second> (usable units: k, m, g). The minimum bandwidth depends on the type of card the port is on. The egress rate limit can be configured in multiples of 64kbps. If you configure a value that is not an exact multiple of 64kbps, then the value will be rounded up to the nearest higher exact multiple of 64kbps. The minimum is 64 Kb. The default unit is Kb (k), but Mb (m) or Gb (g) can also be specified. The command syntax is not case sensitive, so a value such as 20m or 20M will be interpreted as 20 megabits.

Mode Interface Configuration

Examples To enable egress rate limiting on a port, with a limit of approximately 500Mbps, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# egress-rate-limit 500m
```

To disable egress rate limiting on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no egress-rate-limit
```

Related commands [egress-rate-limit overhead](#)

egress-rate-limit overhead

Overview Use this command to allow for the size of packet preamble and inter-packet gap (the “overhead”) in egress queue rate limiting on switch ports.

Doing this keeps the rate limit at the same percentage of line rate for all packet sizes. Otherwise, the percentage of line rate changes with packet size, because of the size of the overhead relative to smaller packets. This means smaller packets take up a larger percentage of the line rate.

Use the **no** variant of this command to turn off the overhead allowance.

Syntax `egress-rate-limit overhead <bytes>`
`no egress-rate-limit overhead`

Parameter	Description
<code><bytes></code>	The number of bytes to allow for overhead. For standard ethernet packets, use a value of 20 bytes (8 bytes of preamble and a inter-packet gap of 12 bytes).

Default No overhead allowance

Mode Interface Configuration

Example To configure an overhead allowance of 20 bytes (8 bytes of preamble and a inter-packet gap of 12 bytes) on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# egress-rate-limit overhead 20
```

To return port1.0.1 to the default of no overhead allowance, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no egress-rate-limit overhead
```

Related commands [egress-rate-limit](#)

Command changes Version 5.4.9-2.1: command added

match access-group

Overview Use this command to apply an ACL to a class-map or VLAN.

Use the **no** variant of this command to remove the match.

Syntax `match access-group {<hw-IP-ACL>|<hw-MAC-ACL>|<hw-named-ACL>}`
`no match access-group`
`{<hw-IP-ACL>|<hw-MAC-ACL>|<hw-named-ACL>}`

Parameter	Description
<hw-IP-ACL>	Specify a hardware IP ACL number in the range <3000-3699>.
<hw-MAC-ACL>	Specify a hardware MAC ACL number in the range <4000-4699>.
<hw-named-ACL>	Specify a hardware named ACL (IP, IPv6 or MAC address entries).

Mode Class Map or VLAN Access-Map

Usage notes First create an access-list that applies the appropriate action to matching packets. Then use the **match access-group** command to apply this access-list as desired. Note that this command will apply the access-list matching only to *incoming* data packets.

Examples To configure a class-map named "cmap1", which matches traffic against access-list 3001, which allows IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 3001 permit ip any any
awplus(config)# class-map cmap1
awplus(config-cmap)# match access-group 3001
```

To configure a class-map named "cmap2", which matches traffic against access-list 4001, which allows MAC traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 permit any any
awplus(config)# class-map cmap2
awplus(config-cmap)# match access-group 4001
```

To configure a class-map named “cmap3”, which matches traffic against access-list “hw_acl”, which allows IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware hw_acl
awplus(config-ip-hw-acl)# permit ip any any
awplus(config)# class-map cmap3
awplus(config-cmap)# match access-group hw_acl
```

To apply ACL 3001 to VLAN 48, where the ACL drops IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 3001 deny ip any any
awplus(config)# vlan access-map deny_all
awplus(config-vlan-access-map)# match access-group 3001
awplus(config-vlan-access-map)# exit
awplus(config)# vlan filter deny_all vlan-list 48 input
```

**Related
commands**

[class-map](#)
[vlan access-map](#)

**Command
changes**

Version 5.4.6-2.1: support for VLAN access-maps added

match cos

Overview Use this command to define a COS to match against incoming packets.
Use the **no** variant of this command to remove CoS.

Syntax `match cos <0-7>`
`no match cos`

Parameter	Description
<0-7>	Specify the CoS value.

Mode Class Map Configuration

Examples To set the class-map's CoS to 4, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match cos 4
```

To remove CoS from a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match cos
```

match dscp

Overview Use this command to define the DSCP to match against incoming packets.
Use the **no** variant of this command to remove a previously defined DSCP.

Syntax `match dscp <0-63>`
`no match dscp`

Parameter	Description
<code><0-63></code>	Specify DSCP value (only one value can be specified).

Mode Class Map Configuration

Usage Use the **match dscp** command to define the match criterion after creating a class-map.

Examples To configure a class-map named `cmap1` with criterion that matches DSCP 56, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match dscp 56
```

To remove a previously defined DSCP from a class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match dscp
```

Related commands [class-map](#)

match eth-format protocol

Overview This command sets the Ethernet format and the protocol for a class-map to match on.

Select one Layer 2 format and one Layer 3 protocol when you issue this command.

Use the **no** variant of this command to remove the configured Ethernet format and protocol from a class-map.

Syntax `match eth-format <layer-two-format> protocol
<layer-three-protocol>`
`no match eth-format protocol`

The following eth-formats and protocols are available (note that not all options are available on all AlliedWare Plus switch models):

Parameter	Description
<i><layer-two-formats></i>	
802dot2-tagged	802.2 Tagged Packets (enter the parameter name).
802dot2-untagged	802.2 Untagged Packets (enter the parameter name).
ethii-tagged	EthII Tagged Packets (enter the parameter name).
ethii-untagged	EthII Untagged Packets (enter the parameter name).
ethii-any	EthII Tagged or Untagged Packets (enter the parameter name).
netwareraw-tagged	Netware Raw Tagged Packets (enter the parameter name).
netwareraw-untagged	Netware Raw Untagged Packets (enter the parameter name).
snap-tagged	SNAP Tagged Packets (enter the parameter name).
snap-untagged	SNAP Untagged Packets (enter the parameter name).
<i><layer-three-protocols></i>	
<word>	A Valid Protocol Number in hexadecimal.
any	Note that the parameter "any" is only valid when used with the netwarerawtagged and netwarerawuntagged protocol options.
sna-path-control	Protocol Number 04 (enter the parameter name or its number).
proway-lan	Protocol Number 0E (enter the parameter name or its number).
eia-rs Protocol	Number 4E (enter the parameter name or its number).
proway Protocol	Number 8E (enter the parameter name or its number).

Parameter	Description
ipx-802dot2	Protocol Number E0 (enter the parameter name or its number).
netbeui	Protocol Number F0 (enter the parameter name or its number).
iso-clns-is	Protocol Number FE (enter the parameter name or its number).
xdot75-internet	Protocol Number 0801 (enter the parameter name or its number).
nbs-internet	Protocol Number 0802 (enter the parameter name or its number).
ecma-internet	Protocol Number 0803 (enter the parameter name or its number).
chaosnet	Protocol Number 0804 (enter the parameter name or its number).
xdot25-level-3	Protocol Number 0805 (enter the parameter name or its number).
arp Protocol	Number 0806 (enter the parameter name or its number).
xns-compatible	Protocol Number 0807 (enter the parameter name or its number).
banyan-systems	Protocol Number 0BAD (enter the parameter name or its number).
bbn-simnet	Protocol Number 5208 (enter the parameter name or its number).
dec-mop-dump-ld	Protocol Number 6001 (enter the parameter name or its number).
dec-mop-rem-cdons	Protocol Number 6002 (enter the parameter name or its number).
dec-decnet	Protocol Number 6003 (enter the parameter name or its number).
dec-lat	Protocol Number 6004 (enter the parameter name or its number).
dec-diagnostic	Protocol Number 6005 (enter the parameter name or its number).
dec-customer	Protocol Number 6006 (enter the parameter name or its number).
dec-lavc	Protocol Number 6007 (enter the parameter name or its number).
rarp	Protocol Number 8035 (enter the parameter name or its number).
dec-lanbridge	Protocol Number 8038 (enter the parameter name or its number).

Parameter	Description
dec-encryption	Protocol Number 803D (enter the parameter name or its number).
appletalk	Protocol Number 809B (enter the parameter name or its number).
ibm-sna	Protocol Number 80D5 (enter the parameter name or its number).
appletalk-aarp	Protocol Number 80F3 (enter the parameter name or its number).
snmp	Protocol Number 814CV.
ethertalk-2	Protocol Number 809B (enter the parameter name or its number).
ethertalk-2-aarp	Protocol Number 80F3 (enter the parameter name or its number).
ipx-snap	Protocol Number 8137 (enter the parameter name or its number).
ipx-802dot3	Protocol Number FFFF (enter the parameter name or its number).
ip	Protocol Number 0800 (enter the parameter name or its number).
ipx	Protocol Number 8137 (enter the parameter name or its number).
ipv6	Protocol Number 86DD (enter the parameter name or its number).

Mode Class Map Configuration

Examples To set the eth-format to ethii-tagged and the protocol to 0800 (IP) for class-map cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match eth-format ethii-tagged protocol
0800
awplus(config-cmap)# match eth-format ethii-tagged protocol ip
```

To remove the eth-format and the protocol from the class-map cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match eth-format protocol
```

match inner-cos

Overview Sets the Inner CoS for a class-map to match on.
Use the **no** variant of this command to remove CoS.

Syntax `match inner-cos <0-7>`
`no match inner-cos`

Parameter	Description
<code><0-7></code>	Specify the Inner CoS value.

Mode Class Map Configuration

Examples To set the class-map's inner-cos to 4, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match inner-cos 4
```

To remove CoS from the class-map, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match inner-cos
```

match inner-vlan

Overview Use this command to define the inner VLAN ID as match criteria.
Use the **no** variant of this command to disable the VLAN ID used as match criteria.

Syntax `match inner-vlan <1-4094>`
`no match inner-vlan`

Parameter	Description
<code><1-4094></code>	The VLAN number.

Mode Class Map Configuration

Usage notes This command is used in double-tagged networks to match on a VLAN ID belonging to the client network. For more information on VLAN double-tagged networks, see the [VLAN_Feature Overview and Configuration Guide](#).

Examples To configure a class-map named `cmap1` to match traffic from inner VLAN 3, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match inner-vlan 3
```

To disable the configured VLAN ID as a match criteria for the class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match inner-vlan
```

match ip-precedence

Overview Use this command to identify IP precedence values as match criteria.

Use the **no** variant of this command to remove IP precedence values from a class-map.

Syntax `match ip-precedence <0-7>`
`no match ip-precedence`

Parameter	Description
<0-7>	The precedence value to be matched.

Mode Class Map Configuration

Example To configure a class-map named `cmap1` to match all IPv4 packets with a precedence value of 5, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match ip-precedence 5
```

match mac-type

Overview Use this command to set the MAC type for a class-map to match on.
Use **no** variant of this command to remove the MAC type match entry.

Syntax `match mac-type {l2broadcast|l2multicast|l2unicast}`
`no match mac-type`

Parameter	Description
l2broadcast	Layer 2 Broadcast traffic.
l2multicast	Layer 2 Multicast traffic.
l2unicast	Layer 2 Unicast traffic.

Mode Class Map Configuration

Examples To set the class-map's MAC type to Layer 2 multicast, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match mac-type l2multicast
```

To remove the class-map's MAC type entry, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match mac-type
```

match tcp-flags

Overview Sets one or more TCP flags (control bits) for a class-map to match on.

Use the **no** variant of this command to remove one or more TCP flags for a class-map to match on.

Syntax `match tcp-flags [ack] [fin] [psh] [rst] [syn] [urg]`
`no match tcp-flags [ack] [fin] [psh] [rst] [syn] [urg]`

Parameter	Description
ack	Acknowledge.
fin	Finish.
psh	Push.
rst	Reset.
syn	Synchronize.
urg	Urgent.

Mode Class Map Configuration

Examples To set the class-map's TCP flags to **ack** and **syn**, use the commands:

```
awplus# configure terminal
awplus(config)# class-map
awplus(config-cmap)# match tcp-flags ack syn
```

To remove the TCP flags **ack** and **rst**, use the commands:

```
awplus# configure terminal
awplus(config)# class-map
awplus(config-cmap)# no match tcp-flags ack rst
```

match vlan

Overview Use this command to define the VLAN ID as match criteria.
Use the **no** variant of this command to disable the VLAN ID used as match criteria.

Syntax `match vlan <1-4094>`
`no match vlan`

Parameter	Description
<code><1-4094></code>	The VLAN number.

Mode Class Map Configuration

Examples To configure a class-map named `cmap1` to include traffic from VLAN 3, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match vlan 3
```

To disable the configured VLAN ID as a match criteria for the class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match vlan
```

mls qos cos

Overview This command assigns a CoS (Class of Service) user-priority value to untagged frames entering a specified interface. By default, all untagged frames are assigned a CoS value of 0.

Use the **no** variant of this command to return the interface to the default CoS setting for untagged frames entering the interface.

Syntax `mls qos cos <0-7>`
`no mls qos cos`

Parameter	Description
<0-7>	The Class of Service, user-priority value.

Default By default, all untagged frames are assigned a CoS value of 0. Note that for tagged frames, the default behavior is not to alter the CoS value.

Mode Interface Configuration

Example To assign a CoS user priority value of 2 to all untagged packets entering port1.0.1 to port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# mls qos cos 2
```

mls qos enable

Overview Use this command to enable QoS.

Use the **no** variant of this command to globally disable QoS and remove all QoS configuration. The **no** variant of this command removes all class-maps, policy-maps, and policers that have been created. Running the **no mls qos** command will therefore remove all pre-existing QoS configurations on the switch.

Mode Global Configuration

Syntax `mls qos enable`
`no mls qos`

Example To enable QoS on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos enable
```

mls qos map cos-queue

Overview Use this command to set the default CoS to egress queue mapping. This is the default queue mapping for packets that do not get assigned an egress queue via any other QoS functionality.

Use the **no** variant of this command to reset the cos-queue map back to its default setting. The default mappings for this command are:

CoS Priority :	0	1	2	3	4	5	6	7

CoS QUEUE:	2	0	1	3	4	5	6	7

Syntax `mls qos map cos-queue <cos-priority> to <queue-number>`
`no mls qos map cos-queue`

Parameter	Description
<cos-priority>	CoS priority value. Can take a value between 0 and 7.
<queue-number>	Queue number. Can take a value between 0 and 7.

Mode Global Configuration

Examples To map CoS 2 to queue 0, use the command:

```
awplus# configure terminal
awplus(config)# mls qos map cos-queue 2 to 0
```

To set the cos-queue map back to its defaults, use the command:

```
awplus# configure terminal
awplus(config)# no mls qos map cos-queue
```

Related commands [show mls qos interface](#)

mls qos map premark-dscp

Overview This command configures the premark-dscp map. It is used when traffic is classified by a class-map that has [trust dscp](#) configured. Based on a lookup DSCP, the map determines new QoS settings for the traffic.

The **no** variant of this command resets the premark-dscp map to its defaults. If no DSCP is specified then all DSCP entries will be reset to their defaults.

Syntax `mls qos map premark-dscp <0-63> to
{[new-dscp <0-63>] [new-cos <0-7>]
[new-bandwidth-class {green|yellow|red}]}`
`no mls qos map premark-dscp [<0-63>]`

Parameter	Description
premark-dscp <0-63>	The DSCP value on ingress.
new-dscp <0-63>	The DSCP value that the packet will have on egress. If unspecified, this value will remain the DSCP ingress value.
new-cos <0-7>	The CoS value that the packet will have on egress. If unspecified, this value will retain its value on ingress.
new-bandwidth-class	Modify Egress Bandwidth-class. If unspecified, this value will be set to green.
green	Egress Bandwidth-class green (marked down Bandwidth-class).
yellow	Egress Bandwidth-class yellow (marked down Bandwidth-class).
red	Egress Bandwidth-class red (marked down Bandwidth-class).

Mode Global Configuration

Usage notes With the [trust dscp](#) command set, this command (**mls qos map premark-dscp**) enables you to remap the DSCP, CoS, output queue, or bandwidth class values.

However, note that you cannot simultaneously change the DSCP and CoS, because they use the same byte in the IP header.

Example To set the entry for DSCP 1 to use a new DSCP of 2, use the command:

```
awplus# configure terminal  
awplus(config)# mls qos map premark-dscp 1 to new-dscp 2
```

Example To set the entry for DSCP 1 to use a new CoS of 3, and a new bandwidth class of yellow, use the command:

```
awplus# configure terminal
awplus(config)# mls qos map premark-dscp 1 to new-cos 3
new-bandwidth-class yellow
```

Example To reset the entry for DSCP 1 use the command:

```
awplus# configure terminal
awplus(config)# no mls qos map premark-dscp 1
```

Related commands [show mls qos maps premark-dscp](#)
[trust dscp](#)

mls qos queue name

Overview Use this command to give a name and optional description to a specific egress queue.

Use the **no** variant of this command to remove the name and description from an egress queue.

Syntax `mls qos queue <0-7> name <name> [description <description>]`
`no mls qos queue <0-7> name`

Parameter	Description
<0-7>	The number of the egress queue to name.
<name>	The name you want to give the egress queue. The name can contain any printable ASCII character (ASCII 33-126), except for spaces.
<description>	The description you want to give the egress queue. The description can contain any printable ASCII character (ASCII 32-126), including spaces.

Default Queues have no name or description

Mode Global Configuration

Example To give queue 6 the name 'Video' and the description 'Real-time interactive, broadcast video', use the commands:

```
awplus# configure terminal
awplus(config)# mls qos queue 6 name Video description Real-time
interactive, broadcast video
```

To remove the name and description from queue 6, use the commands:

```
awplus# configure terminal
awplus(config)# no mls qos queue 6 name
```

Command changes Version 5.5.2-2.1: command added

no police

Overview Use this command to disable any policer previously configured on the class-map.

Syntax no police

Mode Policy Map Class Configuration

Usage notes This command disables any policer previously configured on the class-map.

Example To disable policing on a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# no police
```

Related commands [police single-rate action](#)
[police twin-rate action](#)

police single-rate action

Overview Configures a single-rate policer for a class-map.

Syntax `police single-rate <cir> <cbs> <ebs> action
{drop-red|remark-transmit}`

Parameter	Description
<cir>	Specify the Committed Information Rate (CIR) (1-100000000 kbps).
<cbs>	Specify the Committed Burst Size (CBS) (0-16777216 bytes).
<ebs>	Specify a Excess Burst Size (EBS) (0-16777216 bytes).
action	Specify the action if the rate is exceeded.
drop-red	Drop the red packets.
remark-transmit	Modify the packets using the remark map, then transmit. You can configure the remark map using the remark-map command.

Mode Policy Map Class Configuration

Usage notes You can use a policer to meter the traffic classified by the class-map and assign it to one of three bandwidth classes.

The bandwidth classes are green (conforming), yellow (partially-conforming), and red (non-conforming). A single-rate policer is based on three values. These are the average rate, minimum burst and maximum burst.

Color	Definition
green	The traffic rate is less than the average rate and minimum burst.
yellow	The traffic rate is between the minimum burst and the maximum burst.
red	The traffic rate exceeds the average rate and the maximum burst.

Using an action of drop-red means that any packets classed as red are discarded.

NOTE: This command will not take effect when applied to a class-map that attaches to a channel group whose ports span processor instances.

Note that the [remark-map](#) does not only apply to red traffic. If a remark-map is configured on the same class-map as the policer, then the remark-map will apply to green- colored and yellow-colored traffic irrespective of the value configured on the **action** parameter of the policer. So, even if **action** is configured to **drop-red**, the remark-map will be applied to green and yellow traffic. So, the **action** parameter only applies to red- colored traffic. If **action** is set to **drop-red**, then red

traffic is dropped; if **action** is set to **remark-transmit**, then the red traffic has the action of the remark map applied to it, and is then transmitted.

Example To configure a single rate meter measuring traffic of 100 Mbps that drops a sustained burst of traffic over this rate, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police single-rate 100000 1875000
1875000 action drop-red
```

Related commands

- [no police](#)
- [police twin-rate action](#)
- [remark-map](#)

police twin-rate action

Overview Configures a twin-rate policer for a class-map.

Syntax `police twin-rate <cir> <pir> <cbs> <pbs> action
{drop-red|remark-transmit}`

Parameter	Description
<cir>	Specify the Committed Information Rate (CIR) (1-100000000 kbps).
<pir>	Specify the Peak Information Rate (PIR) (1-100000000 kbps).
<cbs>	Specify the Committed Burst Size (CBS) (0-16777216 bytes).
<pbs>	Specify the Peak Burst Size (PBS) (0-16777216 bytes).
action	Specify the action if rate is exceeded.
drop-red	Drop the red packets.
remark-transmit	Modify the packets using the remark map, then transmit. You can configure the remark map using the remark-map command.

Mode Policy Map Class Configuration

Usage notes A policer can be used to meter the traffic classified by the class-map and as a result will be given one of three bandwidth classes. These are green (conforming), yellow (partially-conforming), and red (non-conforming).

A twin-rate policer is based on four values. These are the minimum rate (CIR), minimum burst size (CBS), maximum rate (PIR), and maximum burst size (PBS). The following table shows how these values define the bandwidth classes.

Bandwidth Class	Definition
green	The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that is less than that set for the CBS.
yellow	The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that is between those set for the CBS and the PBS.
red	The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that exceeds that set for the PBS.

Using an action of drop-red means that any packets classed as red will be discarded.

Using an action of remark-transmit means that the packet will be remarked with the values configured in the policed-dscp map. The index into this map is determined by the DSCP in the packet.

Note that the [remark-map](#) does not only apply to red traffic. If a remark-map is configured on the same class-map as the policer, then the remark-map will apply to green-colored and yellow-colored traffic irrespective of the value configured on the **action** parameter of the policer. So, even if **action** is configured to **drop-red**, the remark-map will be applied to green and yellow traffic. So, the **action** parameter only applies to red-colored traffic. If **action** is set to **drop-red**, then red traffic is dropped; if **action** is set to **remark-transmit**, then the red traffic has the action of the remark map applied to it, and is then transmitted.

Example To configure a twin rate meter measuring a minimum rate of 10 Mbps and a maximum rate of 20 Mbps, and drop red packets, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police twin-rate 10000 20000 1875000
3750000 action drop-red
```

To configure a twin rate meter measuring a minimum rate of 10 Mbps and a maximum rate of 20 Mbps that uses the remark map to remark any non-conforming traffic, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police twin-rate 10000 20000 1875000
3750000 action remark-transmit
```

Related commands [no police](#)
[police single-rate action](#)

policy-map

Overview Use this command to create a policy-map and to enter Policy Map Configuration mode to configure the specified policy-map.

Use the **no** variant of this command to delete an existing policy-map.

Syntax `policy-map <name>`
`no policy-map <name>`

Parameter	Description
<name>	Name of the policy-map.

Mode Global Configuration

Example To create a policy-map called pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)#
```

Related commands [class-map](#)

priority-queue

Overview This command configures strict priority-based scheduling on the specified egress queues. You must specify at least one queue.

Syntax `priority-queue [0] [1] [2] [3] [4] [5] [6] [7]`

Parameter	Description
<code>[0] [1] . . . [7]</code>	Specify the queues that will use strict priority scheduling. With strict priority scheduling, the switch will completely empty the highest numbered queue first, then start processing the next lowest numbered queue.

Mode Interface Configuration.

Usage notes By default, the queues on all ports are set for priority queuing. You can change the queue emptying sequence to weighted round robin, by using the [wrr-queue weight queues](#) command. You can then use the [priority-queue](#) command to reset the selected queues to priority queuing.

Note that the emptying sequence for priority queuing is always highest queue number to lowest queue number.

Example To apply priority-based scheduling to egress queues 1 and 2, use the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1
awplus(config-if)#priority-queue 1 2
```

Related commands [show mls qos interface](#)
[show mls qos interface queue-counters](#)
[wrr-queue weight queues](#)

remark-map

Overview Use this command to configure the remark map. If a re-mark map is applied to a class, and a policer is also applied to the same class, then:

- green and yellow traffic will all be acted upon by the remark-map, and
- red traffic will be either dropped or acted upon by the remark-map, depending on whether the policer **action** is set to **drop-red** or **remark-transmit**.

The **no** variant of this command resets the remark map to its defaults. Specifying the bandwidth class is optional. If no bandwidth class is specified, then all bandwidth classes are reset to their defaults.

Syntax `remark-map [bandwidth-class {green|yellow|red}] to {[new-dscp <0-63>] [new-bandwidth-class {green|yellow|red}]}`
`no remark-map [bandwidth-class {green|yellow|red}] to {[new-dscp <0-63>] [new-bandwidth-class {green|yellow|red}]}`

Parameter	Description
bandwidth-class	Specify the bandwidth class of packets to remark.
green	Remark green packets.
yellow	Remark yellow packets.
red	Remark red packets.
new-dscp	Specify the new DSCP value.
<0-63>	The DSCP value.
new-bandwidth-class	Specify the new bandwidth class.
green	Remark the packet green.
yellow	Remark the packet yellow.
red	Remark the packet red.

Mode Policy Map Class Configuration

Examples To remark the policed green traffic to a new DSCP of 2 and a new bandwidth class of yellow, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# remark-map bandwidth-class green to
new-dscp 2 new-bandwidth-class yellow
```

To remark the policed green traffic to a new DSCP of 2, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# remark-map bandwidth-class green to
new-dscp 2
```

To reset the DSCP for all bandwidth classes, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# no remark-map to new-dscp
```

Related commands [police single-rate action](#)
[police twin-rate action](#)

remark new-cos

- Overview** This command enables you to configure and remark either or both of:
- the CoS flag in the data packet
 - the input into the CoS to queue map, thus changing the destination egress queue.

Syntax `remark new-cos <0-7> [internal|external|both]`
`no remark new-cos [internal|external|both]`

Parameter	Description
<0-7>	The new value for the CoS flag and/or the input into the CoS to queue map.
external	Remarks the CoS flag in the packet.
internal	Remarks the new-CoS input into the CoS to queue map.
both	Remarks (with the same value) both the CoS flag in the packet and the input to the CoS to queue map.

Mode Policy Map Class Configuration

Usage notes The default CoS to Queue mappings are shown in the following table:

CoS Value	0	1	2	3	4	5	6	7
Egress Queue No	2	0	1	3	4	5	6	7

The relationship between this command and the CoS to queue map is shown in the following figure.

Figure 46-1: Remarking and the CoS to Q map

Table 46-1: CoS to egress queue remarking function

Input	Command	Output
CoS field = 1	Remark new-cos (not configured)	CoS value = 1 Packet sent to egress queue 0
CoS field = 1	Remark new-cos 2 external	CoS value = 2 Packet sent to egress queue 0
CoS set to 1	Remark new-cos 2 internal	CoS value = 1 Packet sent to egress queue 1
CoS set to 1	Remark new-cos 2 both	CoS value = 2 Packet sent to egress queue 1
Note: This table assumes that the CoS to Queue map is set to its default values.		

Example For policy-map “pmap3” and class-map “cmap1”, set the CoS value to 2 and also set the input to the CoS to queue map so that the traffic is assigned to egress queue 1:

```
awplus# configure terminal
awplus(config)# policy-map pmap3
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# remark new-cos 2 both
```

Related commands [mls qos map cos-queue](#)
[show mls qos maps cos-queue](#)

service-policy input

Overview Use this command to apply a policy-map to the input of an interface.

Use the **no** variant of this command to remove a policy-map and interface association.

Syntax `service-policy input <policy-map>`
`no service-policy input <policy-map>`

Parameter	Description
<code><policy-map></code>	Policy map name that will be applied to the input.

Mode Interface Configuration

Usage notes This command can be applied to switch ports or static channel groups, but not to dynamic (LACP) channel groups.

Example To apply a policy-map named `pmap1` to interface `port1.0.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
wplus(config-if)# service-policy input pmap1
```

set ip next-hop (PBR)

Overview Use this command to configure policy-based routing. When this command is set, all packets that match a selected class-map will be forwarded to the specified next hop.

The **no** variant of this command removes the next-hop address (in the context of its policy-map and class-map) from the configuration.

Syntax `set ip next-hop <ip-addr>`
`no set ip next-hop`

Parameter	Description
<ip-addr>	The IP address of the next hop destination.

Mode Policy Map Class Configuration

Usage notes **Combining conventional and policy-based routing**

In typical deployments of policy-based routing, some traffic types require conventional routing (i.e. via the routes in the IP routing table) while other traffic types require policy-based routing.

Where the traffic to be policy-routed is a subset of the traffic that is to be conventionally routed, then the configuration is reasonably simple. To configure this, make a policy-map that contains one or more class-maps that match the traffic to be policy routed. Then configure their next-hop with this command (**set ip next-hop**). The remaining traffic will be conventionally routed according to the rules set for the default class-map, providing that this is not subject to the **set ip next-hop**.

The situation becomes more complex if the traffic requiring conventional routing is a subset of the traffic to be policy-routed. To configure this, make a policy-map that contains one, or more, class-maps that match the requirement for conventional routing. Do not configure these class-maps with a **set ip next-hop** command. Then identify the remaining class-maps that require policy-based routing and apply the **set ip next-hop** command to them. Note that this remaining traffic could be just the default class-map, if all other traffic types were to be policy-routed.

Also note that the order in which the class-maps are configured in the policy-map is important, because traffic is matched against the class-maps in the order that they were assigned to the policy-map.

For more information about PBR, see the [Policy-Based Routing Feature Overview and Configuration Guide](#).

Example To forward packets to 192.168.1.1 if they match the class-map called cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# set ip next-hop 192.168.1.1
```

Related commands [class-map](#)

show class-map

Overview Use this command to display the QoS class-maps' criteria for classifying traffic.

Syntax `show class-map [<class-map-name>]`

Parameter	Description
<code><class-map-name></code>	Name of the class-map.

Mode User Exec and Privileged Exec

Example To display a QoS class-map's match criteria for classifying traffic, use the command:

```
awplus# show class-map cmap1
```

Output Figure 46-2: Example output from the **show class-map** command

```
awplus#show class-map

CLASS-MAP-NAME: myClass
Match Mac Type: 2 12mcast

CLASS-MAP-NAME: default
```

show mls qos

Overview Use this command to display whether QoS is enabled or disabled on the switch.

Syntax `show mls qos`

Mode User Exec and Privileged Exec

Example To display whether QoS is enabled or disabled, use the command:

```
awplus# show mls qos
```

Output Figure 46-3: Example output from the **show mls qos** command

```
awplus#show mls qos
Enable
```

Related commands [mls qos enable](#)

show mls qos interface

Overview Displays the current settings for the interface. This includes its default CoS and queue, scheduling used for each queue, and any policies/maps that are attached.

Syntax `show mls qos interface [<port>]`

Parameter	Description
<port>	Switch port.

Mode User Exec and Privileged Exec

Example To display current CoS and queue settings for interface port1.0.1, use the command:

```
awplus# show mls qos interface port1.0.1
```

Output Figure 46-4: Example output from the **show mls qos interface** command for port1.0.1

Table 46-2: Parameters in the output of the show mls qos interface command

Parameter	Description
Number of egress queues	The total number of egress queues available on this interface.
Egress Queue	Number of this egress queue.
Status	Queue can either be enabled or disabled.
Scheduler	The scheduling mode being used for servicing the transmission of packets on this port.

Table 46-2: Parameters in the output of the show mls qos interface command

Parameter	Description
Queue Limit	The percentage of the port's buffers that have been allocated to this queue.
Egress Rate Limit	The amount of traffic that can be transmitted via this queue per second. 0 Kb means there is currently no rate-limiting enabled.
Egress Traffic Shaping Overhead	The number of bytes specified to allow for the size of packet preamble and inter-packet gap (the "overhead") in egress queue rate limiting. Use the egress-rate-limit overhead command to change this.

**Command
changes**

Version 5.5.1-0.1: DSCP queue mapping removed from output

show mls qos interface policer-counters

Overview This command displays an interface's policer counters. This can either be for a specific class-map or for all class-maps attached to the interface. If no class-map is specified then all class-map policer counters attached to the interface are displayed.

Syntax `show mls qos interface <port> policer-counters [class-map <class-map>]`

Parameter	Description
<port>	Switch port.
class-map	Select a class-map.
<class-map>	Class-map name.

Mode User Exec and Privileged Exec

Usage Note that:

- The hardware does not record distinct counters for the number of Green or Yellow bytes, so the field marked Green/Yellow is the summation of bytes that have been marked Green or Yellow by the meter.
- The counters are based on metering performed on the specified class-map. Therefore, the 'Dropped Bytes' counter is the number of bytes dropped due to metering. This is different from packets dropped via a 'deny' action in the ACL. If a policer is configured to perform re-marking, bytes can be marked Red but are not dropped, and is shown with a value of 0 for the Dropped field and a non-0 value for the 'Red Bytes' field.

Example To show the counters for all class-maps attached to port1.0.1, use the command:

```
awplus# show mls qos interface port1.0.1 policer-counters
```

Output Figure 46-5: Example output from **show mls qos interface policer-counters** on a port

```
awplus#show mls qos interface port1.0.1 policer-counters
Interface:                port1.0.1
  Class-map:              default
    Green/Yellow Bytes:   0
    Red Bytes:            0
    Dropped Bytes:       0
    Non-dropped Bytes:   0
  Class-map:              cmap1
    Green/Yellow Bytes:  1290
    Red Bytes:           0
    Dropped Bytes:       0
    Non-dropped Bytes:  1290
```

show mls qos interface queue-counters

Overview This command displays an interface's egress queue counters. This can either be for a specific queue or for all queues on the interface. If no queue is specified all queue counters on the interface will be displayed.

The counters show the number of frames currently in the queue and the maximum number of frames allowed in the queue, for individual egress queues and the port's queue (which will be a sum of all egress queues).

Syntax `show mls qos interface <port> queue-counters [queue <0-7>]`

Parameter	Description
<port>	The switch port to display counters for.
queue <0-7>	The number of the queue to display counters for.

Mode User Exec and Privileged Exec

Example To show the counters for all queues on port1.0.1, use the command:

```
awplus# show mls qos interface port1.0.1 queue-counters
```

Output Figure 46-6: Example output from **show mls qos interface queue-counters**

```
Interface port1.0.1 Queue Counters:
```

Port queue length	1169
Egress Queue length:	
Queue 0	0
Queue 1	0
Queue 2	1169
Queue 3	0
Queue 4	0
Queue 5	0
Queue 6	0
Queue 7	0

```
Egress queue drop/transmit counters:
```

	Dropped Bytes	Dropped Pkts	Tx Bytes	Tx Pkts
Queue 0	0	0	0	0
Queue 1	0	0	0	0
Queue 2	0	0	0	0
Queue 3	0	0	0	0
Queue 4	0	0	576	9
Queue 5	0	0	0	0
Queue 6	0	0	10489664	63901
Queue 7	0	0	0	0

Table 46-3: Parameters in the output from **show mls qos interface queue-counters**

Parameter	Description
Interface	Port we are showing the counters for.
Port queue length	Number of frames in the port's queue. This will be the sum of all egress queues on the port.
Egress Queue length	Number of frames in a specific egress queue.
Egress queue drop/transmit counters	The number of bytes and packets dropped and transmitted on each egress queue.

Related commands [clear mls qos interface queue-counters](#)

show mls qos interface storm-status

Overview Show the current configuration and status of the QoS Storm Protection (QSP) on the given port.

Syntax `show mls qos interface <port> storm-status`

Parameter	Description
<port>	Switch port.

Mode User Exec and Privileged Exec

Example To see the QSP status on port1.0.1, use the command:

```
awplus# show mls qos interface port1.0.1 storm-status
```

Output Figure 46-7: Example output from **show mls qos interface storm-status**

```
Interface:      port1.0.1
Storm-Protection: Enabled
Port-status:    Enabled
Storm Action:   vlandisable
Storm Window:   5000 ms
Storm Downtime: 0 s
Timeout Remaining: 0 s
Last read data-rate: 0 kbps
Storm Rate:     1000 kbps
```

show mls qos maps premark-dscp

Overview This command displays the premark-dscp map. This map is used to replace the DSCP, CoS and/or bandwidth class of a packet matching the class-map, based on a lookup DSCP value.

Syntax `show mls qos maps premark-dscp [<0-63>]`

Parameter	Description
<0-63>	DSCP table entry.

Mode User Exec and Privileged Exec

Example To display the premark-dscp map for DSCP 1, use the command:

```
awplus# show mls qos maps premark-dscp 1
```

Output Figure 46-9: Example output from the **show mls qos maps premark-dscp** command

```
PREMARK-DSCP-MAP:

DSCP 1
Bandwidth Class
-----
New DSCP           2
New CoS            0
New Bandwidth Class green
```

IPv6 ACL              Inactive      0 /    0 ( 0%)
  Interface                      0
  VACL                          0
IPv6 Qos              Inactive      0 /    0 ( 0%)
Qos                   Inactive      0 /    0 ( 0%)

Rule Limit Reached (clear on read): 0
Total Rule Limit Reached from startup: 0

Space will be allocated to ACL and QOS as required.
```

Output parameters Depending on your switch, you will see some of the following parameters in the output from **show platform classifier statistics utilization brief**

Parameter	Description
IPv6 Multicast	Reserved hardware space for use by IPv6 multicast, when the ipv6 multicast-routing command is used.
System	Fixed system entries. For example, resiliency links make use of system ACLs.
MLD Snooping	Entries to send various packets that MLD Snooping is interested in to the CPU.
DHCP Snooping	Entries used to send DHCP and ARP packets to the CPU. User-added DHCP Snooping filters under ACLs are counted under the ACL or QoS categories.
Loop Detection	Entries uses to send the special loop detection frame to the CPU.
EPSR	Entries used to send EPSR control traffic to the CPU.
CFM	Entries used by Connectivity Fault Management.
G8032	Entries used to send G.8032 control traffic to the CPU.
Global ACLs	Entries for ACLs appear here if the ACLs are applied globally instead of per switchport.
ACL	Entries for ACL filters that have been applied directly to ports using the access-group command.
VACL	Entries for VLAN-based ACLs (ACLs that are applied to VLANs instead of ports).
DOS	Entries used for Denial of Service protection.
UFO	Entries used by Upward Forwarding Only (UFO).
QoS	Entries for ACL filters and other class-map configurations, such as policers, applied through policy maps using the service input command.
RA Guard	Entries used to block IPv6 router advertisements, configured with the ipv6 nd raguard command.
AMFAPPS	Entries used by AMF Application Proxy. These entries enable the SES Controller to block infected ports.
Pre-Ingress	Entries used for VLAN ID Translation (and also for subnet-based and MAC-based VLAN entries on SBx81XLEM cards).
Egress	Entries used for VLAN ID Translation.
UDB	User Defined Bytes (UDB), which are a limited resource of bytes that can be used to implement additional arbitrary matching on packet bytes on some switches. The software manages the use and allocation of these bytes automatically. The output of this table is intended for use by Allied Telesis Customer Support only.

Related commands [show platform](#)
[ipv6 access-list \(named IPv6 hardware ACL\)](#)

show policy-map

Overview Displays the policy-maps configured on the switch. The output also shows whether or not they are connected to a port (attached / detached) and shows their associated class-maps.

Syntax `show policy-map [<name>]`

Parameter	Description
<name>	The name of a specific policy-map.

Mode User Exec and Privileged Exec

Example To display a listing of the policy-maps configured on the switch, use the command:

```
awplus# show policy-map
```

Output Figure 46-11: Example output from the **show policy-map** command

```
POLICY-MAP-NAME: example
  Interfaces:
  Default class-map action: permit

  CLASS-MAP-NAME: default
    Policer counters enabled
```

Related commands [no police](#)
[service-policy input](#)

storm-action

Overview Sets the action to be taken when triggered by QoS Storm Protection (QSP). There are three available options:

- **portdisable** will disable the port in software.
- **vlandisable** will disable the port from the VLAN matched by the class-map in class-map. This option requires the match vlan class-map to be present in the class-map
- **linkdown** will physically bring the port down. .

The **no** variant of this command will negate the action set by the **storm-action** command.

Syntax `storm-action {portdisable|vlandisable|linkdown}`
`no storm-action`

Parameter	Description
portdisable	Disable the port in software.
vlandisable	Disable the VLAN.
linkdown	Shutdown the port physically.

Mode Policy Map Class Configuration

Examples To apply the storm protection of **vlandisable** to the policy-map named "pmap2" and the class-map named "cmap1", use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c# storm-action vlandisable
```

To negate the storm protection set on the policy-map named "pmap2" and the class-map named "cmap1", use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c# no storm-action
```

Related commands [storm-downtime](#)
[storm-protection](#)
[storm-rate](#)
[storm-window](#)

storm-downtime

Overview Sets the time to re-enable a port that has been disabled by QoS Storm Protection (QSP). The time is given in seconds, from a minimum of one second to maximum of 86400 seconds (i.e. one day).

The **no** variant of this command resets the time to the default value of 10 seconds.

Syntax `storm-downtime <1-86400>`
`no storm-downtime`

Parameter	Description
<1-86400>	Seconds.

Default 10 seconds

Mode Policy Map Class Configuration

Examples To re-enable the port in 1 minute, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# storm-downtime 60
```

To re-set the port to the default (10 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# no storm-downtime
```

Related commands [storm-action](#)
[storm-protection](#)
[storm-rate](#)
[storm-window](#)

storm-protection

Overview Use this command to enable policy-based Storm Protection (such as QSP - QoS Storm Protection). Storm protection is activated as soon as a port is enabled. However, it will only be functional after [storm-rate](#) and [storm-window](#) have been set.

The **no** variant of this command disables policy-based Storm Protection.

Syntax `storm-protection`
`no storm-protection`

Default By default, storm protection is disabled.

Mode Policy Map Class Configuration

Examples To enable QSP on cmap2 in pmap2, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-protection
```

To disable QSP on cmap2 in pmap2, use the following commands:

```
awplus# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# no storm-protection
```

Related commands [show mls qos interface storm-status](#)
[storm-action](#)
[storm-downtime](#)
[storm-rate](#)
[storm-window](#)

storm-rate

Overview Sets the data rate that triggers the storm-action. The rate is in kbps and the range is from 1kbps to 40Gbps.

Note that this setting is made in conjunction with the [storm-window](#) command.

Use the **no** variant of this command to negate the **storm-rate** command.

Syntax `storm-rate <1-40000000>`
`no storm-rate`

Parameter	Description
<code><1-40000000></code>	The range of the storm-rate.

Default No default

Mode Policy Map Class Configuration

Usage This setting is made in conjunction with the [storm-window](#) command.

Examples To limit the data rate to 100Mbps, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-rate 100000
```

To negate the limit set previously, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# no storm-rate
```

Related commands [storm-action](#)
[storm-downtime](#)
[storm-protection](#)
[storm-window](#)

storm-window

Overview Sets the window size of QoS Storm Protection (QSP). This sets the time to poll the data-rate every given milliseconds. Minimum window size is 100 ms and the maximum size is 60 sec.

Use the **no** variant of this command to negate the **storm-window** command.

Syntax `storm-window <100-60000>`
`no storm-window`

Parameter	Description
<code><100-60000></code>	The window size, measured in milliseconds.

Default No default

Mode Policy Map Class Configuration

Usage This command should be set in conjunction with the [storm-rate](#) command.

Examples To set the QSP window size to 5000 ms, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-window 5000
```

To negate the QSP window size set previously, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# no storm-window
```

Related commands [storm-action](#)
[storm-downtime](#)
[storm-protection](#)
[storm-rate](#)

strict-priority-queue egress-rate-limit queues

Overview Sets a limit on the amount of traffic that can be transmitted per second from these queues. The default unit is in Kb, but Mb or Gb can also be specified. The minimum is 651 Kb.

This limit applies to WRR queues too. Setting the limit with this command is the same as setting it with [wrr-queue egress-rate-limit queues](#).

Syntax `strict-priority-queue egress-rate-limit <bandwidth> queues [0] [1] [2] [3] [4] [5] [6] [7]`
`no strict-priority-queue egress-rate-limit <bandwidth> queues [0] [1] [2] [3] [4] [5] [6] [7]`

Parameter	Description
<bandwidth>	Bandwidth <1-100000000 kbits> (usable units: k, m, g).
[0] [2] . . . [7]	Selects one or more queues numbered 0 to 7.

Mode Interface Configuration

Example To limit the egress rate of queues 0, 1 and 2 on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# strict-priority-queue egress-rate-limit
500M queues 0 1 2
```

Related commands [show mls qos interface](#)
[wrr-queue egress-rate-limit queues](#)

trust dscp

Overview This command enables the premark-dscp map to replace the DSCP, bandwidth-class and/or CoS of classified traffic based on a lookup DSCP value.

With the **no** variant of this command, no premark-dscp mapping function will be applied for the selected class-map. QoS components of the packet existing either at ingress, or applied by the class-map, will pass unchanged.

Syntax `trust dscp`
`no trust`

Mode Policy-Map Configuration

Examples To enable the premark-dscp map lookup for policy-map pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# trust dscp
```

To disable the premark-dscp map lookup for policy-map pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# no trust
```

Related commands [mls qos map premark-dscp](#)

wrr-queue disable queues

Overview Use this command to disable an egress queue from transmitting traffic.
The **no** variant of this command enables an egress queue to transmit traffic.

Syntax `wrr-queue disable queues [0] [1] [2] [3] [4] [5] [6] [7]`
`no wrr-queue disable queues [0] [1] [2] [3] [4] [5] [6] [7]`

Parameter	Description
[0] [2] ... [7]	Selects one or more queues numbered 0 to 7.

Mode Interface Configuration

Examples To disable queue 1 on port1.0.1 from transmitting traffic, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# wrr-queue disable queues 1
```

To enable queue 1 on port1.0.1 to transmit traffic, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no wrr-queue disable queues 1
```

Related commands [show mls qos interface](#)

wrr-queue egress-rate-limit queues

Overview Sets a limit on the amount of traffic that can be transmitted per second from these queues. The default unit is in Kb, but Mb or Gb can also be specified. The minimum is 651 Kb.

This limit applies to strict priority queues too. Setting the limit with this command is the same as setting it with [strict-priority-queue egress-rate-limit queues](#).

Syntax `wrr-queue egress-rate-limit <bandwidth> queues
[0] [1] [2] [3] [4] [5] [6] [7]`
`no wrr-queue egress-rate-limit <bandwidth> queues
[0] [1] [2] [3] [4] [5] [6] [7]`

Parameter	Description
<bandwidth>	Bandwidth <1-100000000 kbits> (usable units: k, m, g).
[0] [2] . . . [7]	Selects one or more queues numbered 0 to 7.

Mode Interface Configuration

Example To limit the egress rate of queues 0, 1 and 2 on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# wrr-queue egress-rate-limit 500M queues 0 1
2
```

Related commands [show mls qos interface](#)
[strict-priority-queue egress-rate-limit queues](#)

wrr-queue weight queues

Overview This command configures weighted round-robin based scheduling on the specified egress queues on switch port interfaces only. The weights are specified as ratios relative to each other.

Use the **no wrr-queue** command to remove weighted round-robin based scheduling from the specified egress queue. The queue then reverts to its normal priority-based scheduling.

Syntax `wrr-queue weight <1-15> queues [0] [1] [2] [3] [4] [5] [6] [7]`
`no wrr-queue <queue-number>`

Parameter	Description
<1-15>	Weight (the higher the number the greater will be the queue servicing).
[0] [2] . . . [7]	Selects one or more queues numbered 0 to 7.
<queue-number>	Egress queue to revert to priority-based scheduling.

Mode Interface Configuration for switch port interfaces only (not for static aggregated interfaces).

Usage notes You cannot apply weighted round-robin based scheduling to static aggregated interfaces (for example, sa2).

NOTE: The commands **wrr-queue weight** and **no wrr-queue** interrupt traffic flow. The interruption lasts for less than a second and resolves automatically. When you enter either of these commands, the switch displays a message to warn you about the interruption and gives you an opportunity to abort.

Example To apply a WRR weight of 6 to queues 0 and 1 on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# wrr-queue weight 6 queues 0 1
```

To remove weighted round-robin scheduling from egress queue 2 on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no wrr-queue 2
```

Related commands [priority-queue](#)

Introduction

Overview 802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device. Devices wishing to access services behind a port must authenticate themselves before any Ethernet packets are allowed to pass through. The protocol is referred to as 802.1X because it was initially defined in the IEEE standard 802.1X, published in 2001 and revised in 2004 and again as the current 802.1X 2010 standard.

This chapter provides an alphabetical reference of commands used to configure 802.1X port access control. For more information, see the [AAA and Port Authentication_Feature Overview and Configuration Guide](#).

dot1x accounting

Overview This command overrides the **default** RADIUS accounting method for IEEE 802.1X-based authentication on an interface by allowing you to apply a user-defined named method list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method list.

Syntax `dot1x accounting {default|<list-name>}`
`no dot1x accounting`

Parameter	Description
default	Apply the default accounting method list
<list-name>	Apply the user-defined named list

Default The **default** method list is applied to an interface by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To apply the named list 'vlan10_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# dot1x accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no dot1x accounting
```

Related commands [aaa accounting dot1x](#)

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x authentication

Overview This command overrides the **default** 802.1X-based authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

Syntax `dot1x authentication {default|<list-name>}`
`no dot1x authentication`

Parameter	Description
<i>default</i>	Apply the default authentication method list
<i><list-name></i>	Apply the user-defined named list

Default The **default** method list is applied to an interface by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To apply the named list 'vlan10_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# dot1x authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no dot1x authentication
```

Related commands [aaa authentication dot1x](#)

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

debug dot1x

Overview Use this command to enable 802.1X IEEE Port-Based Network Access Control troubleshooting functions.

Use the **no** variant of this command to disable this function.

Syntax `debug dot1x [all|auth-web|event|nsm|packet|timer]`
`no debug all dot1x`
`no debug dot1x [all|auth-web|event|nsm|packet|timer]`

Parameter	Description
all	Used with the no variant of this command exclusively; turns off all debugging for 802.1X.
auth-web	Specifies debugging for 802.1X auth-web information.
events	Specifies debugging for 802.1X events.
nsm	Specifies debugging for NSM messages.
packet	Specifies debugging for 802.1X packets.
timer	Specifies debugging for 802.1X timers.

Mode Privileged Exec and Global Configuration

Usage notes This command turns on a mode where trace-level information is output during authentication conversations. Be aware that this is a very verbose output. It is mostly useful to capture this as part of escalating an issue to ATI support.

Examples Use this command without any parameters to turn on normal 802.1X debug information.

```
awplus# debug dot1x
awplus# show debugging dot1x
```

```
802.1X debugging status:
 802.1X events debugging is
 802.1X timer debugging is on
 802.1X packets debugging is on
 802.1X NSM debugging is on
```

Related commands [show debugging dot1x](#)
[undebug dot1x](#)

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x control-direction

- Overview** This command sets the direction of the filter for the unauthorized interface.
- If the optional **in** parameter is specified with this command then packets entering the specified port are discarded. The **in** parameter discards the ingress packets received from the supplicant.
- If the optional **both** parameter is specified with this command then packets entering (ingress) and leaving (egress) the specified port are discarded. The **both** parameter discards the packets received from the supplicant and sent to the supplicant.
- The **no** variant of this command sets the direction of the filter to **both**. The port will then discard both ingress and egress traffic.

Syntax dot1x control-direction {in|both}
no dot1x control-direction

Parameter	Description
in	Discard received packets from the supplicant (ingress packets).
both	Discard received packets from the supplicant (ingress packets) and transmitted packets to the supplicant (egress packets).

- Default** The authentication port direction is set to **both** by default.
- Mode** Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To set the port direction to the default (**both**) for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x control-direction
```

To set the port direction to **in** for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x control-direction in
```

To set the port direction to **in** for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x control-direction in
```

Related commands

- show auth interface

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x eap

Overview This command selects the transmit mode for the EAP packet. If the authentication feature is not enabled then EAP transmit mode is not enabled. The default setting discards EAP packets.

Syntax `dot1x eap {discard|forward|forward-untagged-vlan|forward-vlan}`

Parameter	Description
discard	Discard.
forward	Forward to all ports on the switch.
forward-untagged-vlan	Forward to ports with the same untagged VLAN.
forward-vlan	Forward to ports with the same VLAN.

Default The transmit mode is set to `discard` EAP packets by default.

Mode Global Configuration

Examples To set the transmit mode of EAP packet to **forward**, to forward EAP packets to all ports on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward
```

To set the transmit mode of EAP packet to **discard**, to discard EAP packets, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap discard
```

To set the transmit mode of EAP packet to **forward-untagged-vlan**, to forward EAP packets to ports with the same untagged VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward-untagged-vlan
```

To set the transmit mode of EAP packet to **forward-vlan**, to forward EAP packets to ports with the same VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward-vlan
```

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x eapol-version

Overview This command sets the EAPOL protocol version for EAP packets when 802.1X port authentication is applied.

Use the **no** variant of this command to set the EAPOL protocol version to 1.

The default EAPOL protocol version is version 1.

Syntax dot1x eapol-version {1|2}
no dot1x eapol-version

Parameter	Description
1 2	EAPOL protocol version 1 or 2.

Default The EAP version for 802.1X authentication is set to 1 by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To set the EAPOL protocol version to 2 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x eapol-version 2
```

To set the EAPOL protocol version to the default version (1) for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x eapol-version
```

To set the EAPOL protocol version to 2 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x eapol-version 2
```

Validation Commands auth profile (global)
show dot1x
show dot1x interface

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x initialize interface

Overview This command removes authorization for a specified connected interface. The connection will attempt to re-authorize when the specified port attempts to make use of the network connection.

NOTE: Reauthentication could be a long time after the use of this command because the reauthorization attempt is not triggered by this command. The attempt is triggered by the first packet from the interface trying to access the network resources.

Syntax `dot1x initialize interface <interface-list>`

Parameter	Description
<code><interface-list></code>	The interfaces or ports to configure. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list. The specified interfaces must exist.

Mode Privileged Exec

Examples To initialize 802.1X port authentication on the interface port1.0.2, use the command:

```
awplus# dot1x initialize interface port1.0.2
```

To unauthorize switch port1.0.2 and attempt reauthentication on switch port1.0.2, use the command:

```
awplus# dot1x initialize interface port1.0.2
```

To unauthorize all switch ports for a 18-port device and attempt reauthentication, use the command:

```
awplus# dot1x initialize interface port1.0.1-port1.0.18
```

Related commands [dot1x initialize supplicant](#)
[show dot1x](#)
[show dot1x interface](#)

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x initialize supplicant

Overview This command removes authorization for a connected supplicant with the specified MAC address or username. The connection will attempt to re-authorize when the specified supplicant attempts to make use of the network connection.

NOTE: *Reauthentication could be a long time after the use of this command because the reauthorization attempt is not triggered by this command. The attempt is triggered by the first packet from the supplicant trying to access the network resources.*

Syntax dot1x initialize supplicant {<macadd>|username}

Parameter	Description
dot1x	IEEE 802.1X Port-Based Access Control.
initialize	Initialize the port to attempt reauthentication.
supplicant	Specify the supplicant to initialize.
<macadd>	MAC (hardware address of the supplicant.
username	The name of the supplicant entry.

Mode Privileged Exec

Example To initialize the supplicant authentication, use the commands

```
awplus# configure terminal
awplus(config)# dot1x initialize supplicant 0090.99ab.a020
awplus(config)# dot1x initialize supplicant guest
```

Related commands [dot1x initialize interface](#)

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x keytransmit

Overview Use this command to enable key transmission on the interface specified previously in Interface mode.

This command enables key transmission over an Extensible Authentication Protocol (EAP) packet between the authenticator and supplicant.

The **no** variant of this command disables key transmission on the interface specified.

Syntax dot1x keytransmit
no dot1x keytransmit

Default Key transmission for port authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To enable the key transmit feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x keytransmit
```

To disable the key transmit feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x keytransmit
```

Related commands [show dot1x](#)
[show dot1x interface](#)

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x max-auth-fail

Overview Use this command to configure the maximum number of login attempts for a supplicant (client device) using the **auth-fail vlan** feature, when using 802.1X port authentication on an interface.

The **no** variant of this command resets the maximum login attempts for a supplicant (client device) using the auth-fail vlan feature, to the default configuration of 3 login attempts.

Syntax `dot1x max-auth-fail <0-10>`
`no dot1x max-auth-fail`

Parameter	Description
<0-10>	Specify the maximum number of login attempts for supplicants on an interface using 802.1X port authentication.

Default The default maximum number of login attempts for a supplicant on an interface using 802.1X port authentication is 3 login attempts.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes This command sets the maximum number of login attempts for supplicants on an interface. The supplicant is moved to the auth-fail VLAN from the Guest VLAN after the number of failed login attempts using 802.1X authentication is equal to the number set with this command.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- the auth-fail VLAN feature, and
- restrictions regarding combinations of authentication enhancements working together

Examples To configure the maximum number of login attempts for a supplicant on interface port1.0.2 to a single login attempt, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x max-auth-fail 1
```

To configure the maximum number of login attempts for a supplicant on interface port1.0.2 to the default number of 3 login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x max-auth-fail
```

To configure the maximum number of login attempts for a supplicant on authentication profile 'student' to a single login attempt, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-auth-fail 1
```

**Command
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x max-reauth-req

Overview Use this command to set the number of reauthentication attempts before an interface is unauthorized.

The **no** variant of this command resets the reauthentication delay to the default.

Syntax `dot1x max-reauth-req <1-10>`
`no dot1x max-reauth-req`

Parameter	Description
<1-10>	Specify the maximum number of reauthentication attempts for supplicants on an interface using 802.1X port authentication.

Default The default maximum reauthentication attempts for interfaces using 802.1X port authentication is two (2) reauthentication attempts, before an interface is unauthorized.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Use this command to set the maximum reauthentication attempts after failure.

Examples To configure the maximum number of reauthentication attempts for interface port1.0.2 to a single (1) reauthentication request, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x max-reauth-req 1
```

To configure the maximum number of reauthentication attempts for interface port1.0.2 to the default maximum number of two (2) reauthentication attempts, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x max-reauth-req
```

To configure the maximum number of reauthentication attempts for authentication profile 'student' to a single (1) reauthentication request, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-reauth-req 1
```

**Command
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x max-req

Overview Use this command to change the number of times the device resends an EAP Request packet if that packet is lost between the authenticating device and the supplicant. If the supplicant does not respond to an EAP Request after this number of retries, the supplicant fails the authentication process.

Use the **no** variant of this command to return to the default number of retries.

Syntax `dot1x max-req <1-10>`
`no dot1x max-req`

Parameter	Description
<1-10>	The number of retries. Note that this does not include the initial attempt, so the total number of attempts is one higher than the number you specify here.

Default The default value is 2.

Note: This means the authenticator sends the original attempt and 2 more attempts, which is 3 attempts in total.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes You can set this on a per-supplicant basis by using the **max-req** parameter in the commands:

- `auth supplicant-ip`
- `auth supplicant-mac`

Example To change the number of retries to 5 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x max-req 5
```

To return the number of retries to the default setting of 2 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x max-req
```

To set the number of retries to 1 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-req 1
```

changes**

Version 5.5.3-1.1: command added

dot1x port-control

Overview This command enables 802.1X port authentication on the interface specified, and sets the control of the authentication port.

The **no** variant of this command disables the port authentication on the interface specified.

Syntax `dot1x port-control {force-unauthorized|force-authorized|auto}`
`no dot1x port-control`

Parameter	Description
force-unauthorized	Force the port state to unauthorized. Specify this to force a port to always be in an unauthorized state.
force-authorized	Force the port state to authorized. Specify this to force a port to always be in an authorized state.
auto	Allow the port client to negotiate authentication. Specify this to enable authentication on the port.

Default 802.1X port control is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Use this command to force a port state.

When **port-control** is set to **auto**, the 802.1X authentication feature is executed on the interface, but only if the **aaa authentication dot1x** command has been issued.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

Examples To enable port authentication on the interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
```

To enable port authentication force authorized on the interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control force-authorized
```

To disable port authentication on the interface port1.0.2 use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x port-control
```

To enable port authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x port-control auto
```

changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x timeout tx-period

Overview This command sets the transmit timeout for the authentication request on the specified interface.

The **no** variant of this command resets the transmit timeout period to the default (30 seconds).

Syntax `dot1x timeout tx-period <1-65535>`
`no dot1x timeout tx-period`

Parameter	Description
<1-65535>	Seconds.

Default The default transmit period for port authentication is 30 seconds.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Use this command to set the interval between successive attempts to request an ID.

Examples To set the transmit timeout period to 5 seconds on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x timeout tx-period 5
```

To reset transmit timeout period to the default (30 seconds) on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x timeout tx-period
```

To set the transmit timeout period to 5 seconds on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x timeout tx-period 5
```

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show debugging dot1x

Overview Use this command to see what debugging is turned on for 802.1X.
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show debugging dot1x`

Mode User Exec and Privileged Exec

Example To enable 802.1X debugging and display the debugging option set, use the following commands:

```
awplus# debug dot1x
awplus# show debugging dot1x
```

```
802.1X debugging status:
 802.1X events debugging is on
 802.1X timer debugging is on
 802.1X packets debugging is on
 802.1X NSM debugging is on
```

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show dot1x diagnostics

Overview This command shows 802.1X authentication diagnostics for the specified interface (optional).

If no interface is specified then authentication diagnostics are shown for all interfaces.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show dot1x diagnostics [interface <interface-list>]`

Parameter	Description
interface	Specify a port to show.
<interface-list>	The interfaces or ports to configure. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list. The specified interfaces must exist.

Mode Privileged Exec

Example See the sample output below showing 802.1X authentication diagnostics for port1.0.2:

```
awplus# show dot1x diagnostics interface port1.0.2
```

Output Figure 47-1: Example output from the **show dot1x diagnostics** command

```

**Command
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show dot1x sessionstatistics

Overview This command shows authentication session statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Syntax `show dot1x sessionstatistics [interface <interface-list>]`

Parameter	Description
interface	Specify a port to show.
<interface-list>	The interfaces to display information about. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1,port1.0.3-port1.0.4). Do not mix interface types in a list.

Mode Privileged Exec

Example See sample output below showing 802.1X authentication session statistics for port1.0.2:

```
awplus# show dot1x sessionstatistics interface port1.0.2
```

```
Authentication session statistics for interface port1.0.2
  session user name: manager
    session authentication method: Remote server
    session time: 19440 secs
    session terminat cause: Not terminated yet
```

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show dot1x statistics interface

Overview Use this command to show the authentication statistics for the specified interface. For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

The output from this command is the same as the output from the [show auth statistics interface](#) command.

Syntax `show dot1x statistics interface <interface-list>`

Parameter	Description
<code><interface-list></code>	The interfaces to display information about. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.

Mode Privileged Exec

Example To display 802.1X authentication statistics for port1.0.2, use the command:

```
awplus# show dot1x statistics interface port1.0.2
```

Output Figure 47-2: Example output from **show dot1x statistics interface** for a port

```
awplus# show dot1x statistics interface port1.0.2
802.1X statistics for interface port1.0.2
  EAPOL Frames Rx: 5 - EAPOL Frames Tx: 16

  Invalid EAPOL Frames Rx: 0 - EAP Length Error Frames Rx: 0
  EAPOL Last Frame Version Rx: 1 - EAPOL Last Frame
Src:00d0.59ab.7037
```

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show dot1x supplicant

Overview This command shows the supplicant state of the authentication mode set for the switch.

This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare_Plus” Feature Overview and Configuration Guide](#).

Syntax show dot1x supplicant [<macadd>] [brief]

Parameter	Description
<macadd>	MAC (hardware) address of the Supplicant.
brief	Brief summary of the Supplicant state.

Mode Privileged Exec

Example See sample output below showing the 802.1X authenticated supplicant on the switch:

```
awplus# show dot1x supplicant
```

```
authenticationMethod: dot1x
totalSupplicantNum: 1
authorizedSupplicantNum: 1
macBasedAuthenticationSupplicantNum: 0
dot1xAuthenticationSupplicantNum: 1
webBasedAuthenticationSupplicantNum: 0
Supplicant name: manager
Supplicant address: 00d0.59ab.7037
  authenticationMethod: dot1x
    Two-Step Authentication:
      firstAuthentication: Pass - Method: mac
      secondAuthentication: Pass - Method: dot1x
portStatus: Authorized - currentId: 4
abort:F fail:F start:F timeout:F success:T
PAE: state: Authenticated - portMode: Auto
PAE: reAuthCount: 0 - rxRespId: 0
PAE: quietPeriod: 60 - maxReauthReq: 2 - txPeriod: 30
BE: state: Idle - reqCount: 0 - idFromServer: 3
BE: suppTimeout: 30 - serverTimeout: 30
CD: adminControlledDirections: in - operControlledDirections: in
CD: bridgeDetected: false
KR: rxKey: false
KT: keyAvailable: false - keyTxEnabled: false
RADIUS server group (auth): radius
RADIUS server (auth): 192.168.1.40
```

See sample output below showing the supplicant on the switch using the **brief** parameter:

```
awplus# show dot1x supplicant 00d0.59ab.7037 brief
```

```
Interface port1.0.2
 authenticationMethod: dot1x
 totalSupplicantNum: 1
 authorizedSupplicantNum: 1
   macBasedAuthenticationSupplicantNum: 0
   dot1xAuthenticationSupplicantNum: 1
   webBasedAuthenticationSupplicantNum: 0
```

Interface	VID	Mode	MAC Address	Status	IP Address	Username
port1.0.2	2	D	00d0.59ab.7037	Authenticated	192.168.2.201	manager

See sample output below showing the supplicant on the switch using the **brief** parameter:

```
awplus# show dot1x supplicant brief
```

For example, if two-step authentication is configured with 802.1X authentication as the first method and web authentication as the second method then the output is as follows:

```
Interface port1.0.2 authenticationMethod: dot1x/web
 Two-Step Authentication
   firstMethod: dot1x
   secondMethod: web
 totalSupplicantNum: 1
 authorizedSupplicantNum: 1
   macBasedAuthenticationSupplicantNum: 0
   dot1xAuthenticationSupplicantNum: 0
   webBasedAuthenticationSupplicantNum: 1
   otherAuthenticationSupplicantNum: 0
```

Interface	VID	Mode	MAC Address	Status	IP Address	Username
port1.0.2	5	W	0008.0d5e.c216	Authenticated	192.168.1.200	web

Related commands [show dot1x supplicant interface](#)

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show dot1x supplicant interface

Overview Use this command to show the supplicant state of the authentication mode set for the interface.

This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare_Plus” Feature Overview and Configuration Guide](#).

Syntax `show dot1x supplicant interface <interface-list> [brief]`

Parameter	Description
<code><interface-list></code>	The interfaces to display information about. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.
<code>brief</code>	Brief summary of the Supplicant state.

Mode Privileged Exec

Examples See sample output below showing the supplicant on the interface port1.0.2:

```
awplus# show dot1x supplicant interface port1.0.2
```

```
Interface port1.0.2
 authenticationMethod: dot1x

Authentication Commands

Introduction

Overview Port authentication commands enable you to specify three different types of device authentication: 802.1X authentication, web authentication, and MAC authentication.

- 802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device.
- Web authentication is applicable to devices that have a human user who opens the web browser and types in a user name and password when requested.
- MAC authentication is used to authenticate devices that have neither a human user nor implement 802.1X supplicant when making a network connection request.

This chapter provides an alphabetical reference for MAC and web authentication commands. For a list of 802.1X commands see the [802.1X Commands](#) chapter.

For more information on configuring and using port authentication, see the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

auth auth-fail vlan

Overview Use this command to enable the **auth-fail vlan** feature on the specified vlan interface. This feature assigns supplicants (client devices) to the specified VLAN if they fail port authentication.

Use the **no** variant of this command to disable the auth-fail vlan feature for a specified VLAN interface.

Syntax `auth auth-fail vlan <1-4094>`
`no auth auth-fail vlan`

Parameter	Description
<1-4094>	Assigns the VLAN ID to any supplicants that have failed port authentication.

Default The auth-fail vlan feature is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Use the auth-fail vlan feature when using web authentication instead of the Guest VLAN feature, when you need to separate networks where one supplicant (client device) requires authentication and another supplicant does not require authentication from the same interface.

This is because the DHCP lease time using the Web-Authentication feature is shorter, and the auth-fail vlan feature enables assignment to a different VLAN if a supplicant fails authentication.

To enable the auth-fail vlan feature with web authentication, you need to set the web authentication server virtual IP address by using the [auth-web-server ipaddress](#) command or the [auth-web-server dhcp ipaddress](#) command.

When using 802.1X port authentication, use a [dot1x max-auth-fail](#) command to set the maximum number of login attempts. Three login attempts are allowed by default for 802.1X port authentication before supplicants trying to authenticate are moved from the Guest VLAN to the auth-fail VLAN. See the [dot1x max-auth-fail](#) on page 2627 for command information.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- the auth-fail VLAN feature, which allows the Network Administrator to separate the supplicants who attempted authentication, but failed, from the supplicants who did not attempt authentication, and
- restrictions regarding combinations of authentication enhancements working together

Use appropriate ACLs (Access Control Lists) on interfaces for extra security if a supplicant allocated to the designated auth-fail vlan can access the same network

as a supplicant on the Guest VLAN. For more information about ACL concepts, and configuring ACLs see the [ACL Feature Overview and Configuration Guide](#). For more information about ACL commands see:

- [IPv4 Hardware Access Control List \(ACL\) Commands](#)
- [IPv4 Software Access Control List \(ACL\) Commands](#)
- [IPv6 Hardware Access Control List \(ACL\) Commands](#)
- [IPv6 Software Access Control List \(ACL\) Commands](#)

Examples To enable the auth-fail vlan feature for port1.0.2 and assign VLAN 100, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth auth-fail vlan 100
```

To disable the auth-fail vlan feature for port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth auth-fail vlan
```

Related commands [auth profile \(global\)](#)

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

auth critical

Overview Use this command to enable the critical port feature on the interface. When the critical port feature is enabled on an interface, and all the RADIUS servers are unavailable, then the interface becomes authorized.

The **no** variant of this command disables the critical port feature on the interface.

Syntax `auth critical`
`no auth critical`

Default The critical port of port authentication is disabled.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To enable the critical port feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth critical
```

To disable the critical port feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth critical
```

To enable the critical port feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth critical
```

Related commands [auth profile \(global\)](#)
[show auth-web-server](#)
[show dot1x](#)
[show dot1x interface](#)
[show running-config](#)

auth dhcp-framed-ip-lease

Overview Use this command to enable DHCP Framed IP Lease on an interface.

When the DHCP Framed IP Lease feature is enabled on an interface, supplicants authenticated using 802.1x or MAC authentication will be assigned a specific IP address, and other network settings, gathered from the RADIUS server during the authentication process.

Use the **no** variant of this command to disable DHCP Framed IP Lease.

Syntax `auth dhcp-framed-ip-lease`
`no auth dhcp-framed-ip-lease`

Default DHCP Framed IP Lease is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes You need to complete the following steps to configure the DHCP Framed IP Lease feature on your network.

On the RADIUS server:

- Configure the RADIUS server with the username and password for 802.1x or MAC authentication
- Configure the following 'framed' RADIUS attributes on the RADIUS server for the that user:
 - Framed-IP-Address (8): the IPv4 address for the supplicant
 - Framed-IP-Netmask (9): the netmask for the supplicant
 - Framed-Route (22): the default gateway IPv4 address for the supplicant
 - Session-Timeout (27): IP address lease time for the supplicant

NOTE: *The Frame-IP-Address (8) attribute must be configured for this feature to work. All other attributes are optional.*

On the DHCP server:

- Configure the RADIUS client
- Enable 802.1x or MAC authentication on the required interface/s
- Enable DHCP Framed IP Lease feature on the required interface/s
- Setup a DHCP pool with the network range for the IP address/es registered on the RADIUS server
- Enable DHCP server

For more information, see the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

Example To enable DHCP Framed IP Lease on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# auth dhcp-framed-ip-lease
```

To disable DHCP Framed IP Lease on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no auth dhcp-framed-ip-lease
```

Related commands [show dot1x supplicant](#)
[show ip dhcp pool](#)

Command changes Version 5.4.8-2.1: command added

auth dynamic-acl enable

Overview Use this command to enable Dynamic Access Control Lists (ACLs). This lets you configure port authentication to dynamically apply ACLs when a supplicant is authorized. These ACLs are automatically removed when the supplicant disconnects.

Use the **no** variant of this command to disable Dynamic ACLs.

Syntax `auth dynamic-acl enable`
`no auth dynamic-acl enable`

Default Disabled.

Mode Interface configuration for switch port or static aggregator.

Usage notes Dynamic ACLs are created and attached to a switchport in the following way:

- A RADIUS server holds the ACL rules for a supplicant, along with that supplicants user name and password.
- These ACL rules can be either:
 - a complete IPv4 or IPv6 hardware rule (stored as a RADIUS NAS-Filter-Rule attribute), or
 - name or number reference to an existing ACL rule (stored as a RADIUS Filter-Id attribute)
- When the first packet from a supplicant arrives on a switchport the authenticator starts the authentication process with the RADIUS server.
- The RADIUS server returns Access-Accept packet to the authenticator with the configured ACL rules.
- The authenticator creates and installs these ACLs dynamically on the switchport and authorizes the supplicant.
- These Dynamic ACLs are named IPv4 and IPv6 hardware access-lists. They are internally maintained and cannot be removed or modified from the CLI.
- All traffic on the switchport is filtered using these ACLs.
- When the supplicant is unauthorized, dynamically installed ACLs are removed and detached from the switchport.

For more information, see the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

Examples This example uses the local RADIUS server to define two ACL rules that are applied to MAC authenticated supplicants on port1.0.2.

Define the local RADIUS server as the RADIUS server to use:

```
awplus# configure terminal
awplus(config)# radius-server host 127.0.0.1 key
awplus-local-radius-server
```

Define the authentication method list:

```
awplus(config)# aaa authentication auth-mac default group
radius
```

Enable MAC authentication and dynamic ACLs on port1.0.2:

```
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac enable
awplus(config-if)# auth dynamic-acl enable
awplus(config-if)# exit
```

Configure the local RADIUS server with the required ACL rules:

```
awplus(config)# radius-server local
awplus(config-radsrv)# group dacl-rule
awplus(config-radsrv-group)# attribute repeated
NAS-Filter-Rule "ip:permit ip 192.168.1.0/24 192.168.2.0/24"
awplus(config-radsrv-group)# attribute repeated
NAS-Filter-Rule "ip:deny ip 192.168.1.0/24 any"
awplus(config-radsrv-group)# exit
```

Add a user with the Dynamic ACL rules and enable the local RADIUS server:

```
awplus(config-radsrv)# user xx-xx-xx-xx-xx-xx password
xx-xx-xx-xx-xx-x group dacl-rule
awplus(config-radsrv)# server enable
awplus(config-radsrv)# exit
```

These ACL rules will reject IP traffic from 192.168.1.x to any destination except 192.168.2.x for supplicants on port1.0.2.

**Command
changes**

Version 5.5.0-1.1: command added

auth dynamic-vlan-creation

Overview Use this command to enable and disable the Dynamic VLAN assignment feature.

The Dynamic VLAN assignment feature allows a supplicant (client device) to be placed into a specific VLAN based on information returned from the RADIUS server during authentication, on a given interface.

Use the **no** variant of this command to disable the Dynamic VLAN assignment feature.

Syntax `auth dynamic-vlan-creation [rule {deny|permit}] [type {multi|single}]`
`no auth dynamic-vlan-creation`

Parameter	Description
rule	VLAN assignment rule.
deny	Deny a differently assigned VLAN ID. This is the default rule.
permit	Permit a differently assigned VLAN ID.
type	Specifies whether multiple different VLANs can be assigned to supplicants (client devices) attached to the port, or whether only a single VLAN can be assigned to supplicants on the port.
multi	Multiple Dynamic VLAN.
single	Single Dynamic VLAN.

Default By default, the Dynamic VLAN assignment feature is disabled.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes If the Dynamic VLAN assignment feature is enabled, VLAN assignment is dynamic. If the Dynamic VLAN assignment feature is disabled then RADIUS attributes are ignored and configured VLANs are assigned to ports. Dynamic VLANs may be associated with authenticated MAC addresses if the **type** parameter is applied with the **rule** parameter.

The **rule** parameter deals with the case where there are multiple supplicants attached to a port, and the type parameter has been set to **single-vlan**. The parameter specifies how the switch should act if different VLAN IDs end up being assigned to different supplicants. The keyword value **deny** means that once a given VID has been assigned to the first supplicant, then if any subsequent supplicant is assigned a different VID, that supplicant is rejected. The keyword value **permit** means that once a given VID has been assigned to the first supplicant, then if any subsequent supplicant is assigned a different VID, that supplicant is accepted, but it is actually assigned the same VID as the first supplicant.

If you issue an **auth dynamic-vlan-creation** command without a **rule** parameter then a second supplicant with a different VLAN ID is rejected. It is not assigned to the first supplicant's VLAN. Issuing an **auth dynamic-vlan-creation** command without a **rule** parameter has the same effect as issuing an **auth dynamic-vlan-creation rule deny** command rejecting supplicants with differing VLANs.

The **type** parameter specifies whether multiple different VLANs can be assigned to supplicants attached to the port, or whether only a single VLAN can be assigned to supplicants on the port. The **type** parameter can select the port base VLAN or the MAC base VLAN from the RADIUS VLAN ID. This can be used when the host-mode is set to multi-supplicant. For **single**-host ports, the VLAN ID will be assigned to the port. It is not supported with the Guest VLAN feature. Display the ID assigned using a **show vlan** command. For **multi**-host ports, the VLAN ID will be assigned to the MAC address of the authenticated supplicant. The VLAN ID assigned for the MAC Base VLAN is displayed using the **show platform table vlan** command.

To configure Dynamic VLAN with Web Authentication, you need to set the Web Authentication Server virtual IP address by using the **auth-web-server ipaddress** command or the **auth-web-server dhcp ipaddress** command. You also need to create a hardware access-list that can be applied to the switch port interface.

You need to configure an IPv4 address for the VLAN interface on which Web Authentication is running.

Examples To enable the Dynamic VLAN assignment feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport access vlan 10
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# interface vlan10
awplus(config-if)# ip address 10.1.1.1/24
```

To enable the Dynamic VLAN assignment feature with Web Authentication on interface port1.0.2 when Web Authentication is needed, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ipaddress 1.2.3.4
awplus(config)# access-list hardware acl-web send-to-cpu ip any 1.2.3.4
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# access-group acl-web
awplus(config-if)# interface vlan1
awplus(config-if)# ip address 10.1.1.1/24
```

To disable the Dynamic VLAN assignment feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth dynamic-vlan-creation
```

To enable the Dynamic VLAN assignment feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth dynamic-vlan-creation
```

**Command
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

auth guest-vlan

Overview Use this command to enable and configure the Guest VLAN feature on the interface specified by associating a Guest VLAN with an interface. This command does not start authentication. The supplicant's (client device's) traffic is associated with the native VLAN of the interface unless it is already associated with another VLAN. The **routing** option enables routing from the Guest VLAN to another VLAN, so the switch can lease DHCP addresses and accept access to a limited network.

The **no** variant of this command disables the guest VLAN feature on the interface specified.

Syntax `auth guest-vlan <1-4094> [routing]`
`no auth guest-vlan [routing]`

Parameter	Description
<1-4094>	VLAN ID (VID).
routing	Enables routing from the Guest VLAN to other VLANs.

Default The Guest VLAN authentication feature is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes The Guest VLAN feature may be used by supplicants (client devices) that have not attempted authentication, or have failed the authentication process. Note that if a port is in multi-supplicant mode with per-port dynamic VLAN configuration, after the first successful authentication, subsequent hosts cannot use the guest VLAN due to the change in VLAN ID. This may be avoided by using per-user dynamic VLAN assignment.

When using the Guest VLAN feature with the multi-host mode, a number of supplicants can communicate via a guest VLAN before authentication. A supplicant's traffic is associated with the native VLAN of the specified switch port. The supplicant must belong to a VLAN before traffic from the supplicant can be associated.

Note that you must enable 802.1X on the port and define a VLAN using the [vlan](#) command before you can configure it as a guest VLAN.

Roaming Authentication cannot be enabled if DHCP snooping is enabled ([service dhcp-snooping](#) command), and vice versa.

Note that Guest VLAN can use only untagged ports.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- Guest VLAN, and

- restrictions regarding combinations of authentication enhancements working together

Examples To define vlan100 and assign the guest VLAN feature to vlan100 on interface port1.0.2, and enable routing from the guest VLAN to other VLANs, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100
awplus(config-vlan)# exit
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth guest-vlan 100 routing
```

To disable the guest VLAN feature on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth guest-vlan
```

To define vlan100 and assign the guest VLAN feature to vlan100 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100
awplus(config-vlan)# exit
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan 100
```

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

auth guest-vlan forward

Overview Use this command to enable packet forwarding from the guest VLAN to a destination IP address or subnet. If this command is configured, the device can lease DHCP addresses and accept access to a limited part of your network. Also, when using NAP authentication, the supplicant can log on to a domain controller to gain certification.

Use the **no** variant of this command to disable packet forwarding from the Guest VLAN to a destination IP address or subnet.

Syntax

```
auth guest-vlan forward {<ip-address>|<ip-address/mask>}  
[dns|tcp <1-65535>|udp <1-65535>]  
  
no auth guest-vlan forward {<ip-address>|<ip-address/mask>}  
[dns|tcp <1-65535>|udp <1-65535>]
```

Parameter	Description
<ip-address> <ip-address/ mask>	The IP address or subnet to which the guest VLAN can forward packets, in dotted decimal notation
dns	Enable forwarding of DNS packets
tcp <1-65535>	Enable forwarding of packets for the specified TCP port number
udp <1-65535>	Enable forwarding of packets for the specified UDP port number

Default Forwarding is disabled by default.

Mode Interface Configuration mode for a specified switch port, or Authentication Profile mode

Usage Before using this command, you must configure the guest VLAN with the [auth guest-vlan](#) command.

Example To enable packet forwarding from the guest VLAN to the destination IP address on interface port1.0.2, use the commands:

```
awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# auth guest-vlan forward 10.0.0.1
```

To enable forwarding of DNS packets from the guest VLAN to the destination IP address on interface port1.0.2, use the commands:

```
awplus# configure terminal  
awplus(config)# interface  
awplus(config-if)# auth guest-vlan forward 10.0.0.1 dns
```

To disable forwarding of DNS packets from the guest VLAN to the destination IP address on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth guest-vlan forward 10.0.0.1 dns
```

To enable the TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan forward 10.0.0.1
tcp 137
```

**Command
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

auth guest-vlan hw-forwarding

Overview Use this command to enable hardware forwarding on the guest VLAN. By default, hardware forwarding is disabled and all traffic on the VLAN is forwarded by the CPU.

Use the **no** variant of this command to disable hardware forwarding on the guest VLAN.

Syntax `auth guest-vlan hw-forwarding`
`no auth guest-vlan hw-forwarding`

Default Disabled.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To enable guest VLAN hardware forwarding on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth guest-vlan hw-forwarding
```

To disable guest VLAN hardware forwarding on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth guest-vlan hw-forwarding
```

To enable guest VLAN hardware forwarding authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan hw-forwarding
```

Related commands [auth profile \(global\)](#)
[auth guest-vlan](#)
[auth guest-vlan forward](#)

Command changes Version 5.5.0-1.1: command added to x230, GS970M, IE210 series switches.
Version 5.5.1-0.1: command added to all other AlliedWare Plus switches.

auth host-mode

Overview Use this command to select the host mode on the specified interface.

Use the **no** variant of this command to set host mode to the default setting (single host).

Syntax

```
auth host-mode  
{host-plus-voice|single-host|multi-host|multi-supPLICANT}  
  
no auth host-mode
```

Parameter	Description
host-plus-voice	In this mode, only one voice device (IP phone) and one host device can join the network. You use the RADIUS attribute 'Cisco-AVPair device-traffic-class=voice' to identify the IP phone. For more information and a step-by-step configuration example, see the "Limit the number of supplicants when connecting via an IP phone" section of the AAA and Port Authentication Feature Overview and Configuration Guide .
single-host	In this mode, only one supplicant is allowed per port. This is the default mode.
multi-host	In this mode, once the first host on a port is authenticated, all other downstream hosts are allowed without being authenticated (piggy-back mode).
multi-supPLICANT	In this mode, multiple separate supplicants are individually authenticated on one port.

Default The default host mode for port authentication is for a single host.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes **Single-host mode**

With this mode, only one supplicant may be authenticated on the port. Once that host has been authenticated, no other supplicants may be authenticated until the first supplicant's session has closed. This means, of course, that none of the other hosts downstream of the port will be able to send or receive traffic on that port.

This option is recommended when you know that there should only be one host connected to a port. By limiting the port to a single authenticated host, you guard against the consequences of someone accidentally or maliciously connecting a downstream switch to the port.

Multi-host mode

With this mode, once the first host has been authenticated on the port, all other downstream hosts are allowed without being authenticated. This is sometimes known as piggy-back mode. It is useful when the downstream switch attached to

the authenticating port is an intelligent switch that can act as an authentication supplicant.

If you trust that malicious users cannot be connected to that switch but you do not know the identity of those users, then you can simply authenticate the switch and then allow its attached users to have network access. If the valid switch is disconnected and an invalid one is connected which is not configured with the correct authentication credentials, then the devices connected to the invalid switch will be blocked from accessing the network.

Examples To set the host mode to multi-supplicant on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth host-mode multi-supplicant
```

To set the host mode to the default (single host) on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth host-mode
```

To set the host mode to multi-supplicant on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth host-mode multi-supplicant
```

To set the host mode to the default (single host) on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth host-mode
```

Command changes Version 5.5.2-1.1: **host-plus-voice** parameter added

auth log

Overview Use this command to configure the types of authentication feature log messages that are output to the log file.

Use the **no** variant of this command to remove either specified types or all types of authentication feature log messages that are output to the log file.

Syntax

```
auth log {dot1x|auth-mac|auth-web}  
{success|failure|logoff|all}  
  
no auth log {dot1x|auth-mac|auth-web}  
{success|failure|logoff|all}
```

Parameter	Description
dot1x	Specify only 802.1X-Authentication log messages are output to the log file.
auth-mac	Specify only MAC-Authentication log messages are output to the log file.
auth-web	Specify only Web-Authentication log messages are output to the log file.
success	Specify only successful authentication log messages are output to the log file.
failure	Specify only authentication failure log messages are output to the log file.
logoff	Specify only authentication log-off messages are output to the log file. Note that link down, age out and expired ping polling messages will be included.
all	Specify all types of authentication log messages are output to the log file. Note that this is the default behavior for the authentication logging feature.

Default All types of authentication log messages are output to the log file by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To configure the logging of MAC authentication failures to the log file for supplicants (client devices) connected to interface port1.0.2, use the following commands:

```
awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# auth log auth-mac failure
```

To disable the logging of all types of authentication log messages to the log file for auth-mac supplicants (client devices) connected to interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth log auth-mac all
```

To configure the logging of web authentication failures to the log file for supplicants (client devices) connected to authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth log auth-web failure
```

To disable the logging of all types of authentication log messages to the log file for auth-mac supplicants (client devices) connected to authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth log auth-mac all
```

Related commands [auth profile \(global\)](#)
[show running-config](#)

auth max-suppliant

Overview Use this command to set the maximum number of supplicants (client devices) that can be authenticated on the selected port. Once this value is exceeded, further supplicants will not be authenticated.

The **no** variant of this command resets the maximum supplicant number to the default.

Syntax `auth max-suppliant <2-1024>`
`no auth max-suppliant`

Parameter	Description
<2-1024>	Limit number.

Default 1024

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To set the maximum number of supplicants to 10 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth max-suppliant 10
```

To reset the maximum number of supplicants to the default value on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth max-suppliant
```

To set the maximum number of supplicants to 10 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth max-suppliant 10
```

To reset the maximum number of supplicants to the default value on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth max-suppliant
```

- `show dot1x interface`
- `show running-config`

auth max-suppliant tagged-vlan

Overview Use this command to set the maximum number of supplicants (client devices) that can be authenticated on the selected port on tagged VLANs. Once this value is exceeded, further supplicants will not be authenticated on tagged VLANs on that port.

This command is useful for preventing unwanted supplicants from connecting to the network when a host (e.g. a PC) connects to an AlliedWare Plus NAS via an IP phone. For more information and a step-by-step configuration example, see the [“Limit the number of supplicants when connecting via an IP phone”](#) section of the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

Use the **no** variant of this command to reset the maximum number of supplicants on tagged VLANs to the default.

Syntax `auth max-suppliant tagged-vlan <0-1024>`
`no auth max-suppliant tagged-vlan <0-1024>`

Default 1024

Mode Interface Configuration for a switch port; or Authentication Profile mode.

Examples To set the maximum number of supplicants on tagged VLANs on interface port1.0.2 to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth max-suppliant tagged-vlan 1
```

To reset the maximum number of supplicants on tagged VLANs on interface port1.0.2 to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth max-suppliant tagged-vlan
```

To set the maximum number of supplicants on tagged VLANs on authentication profile 'accounts' to 1, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# auth max-suppliant tagged-vlan 1
```

To reset the maximum number of supplicants on tagged VLANs on authentication profile 'accounts' to the default value, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# no auth max-suppliant tagged-vlan
```

Related commands [auth max-supPLICant](#)

Command changes Version 5.5.2-1.1: command added

auth max-suppliant untagged-vlan

Overview Use this command to set the maximum number of supplicants (client devices) that can be authenticated on the selected port on untagged VLANs. Once this value is exceeded, further supplicants will not be authenticated on untagged VLANs on that port.

This command is useful for preventing unwanted supplicants from connecting to the network when a host (e.g. a PC) connects to an AlliedWare Plus NAS via an IP phone. For more information and a step-by-step configuration example, see the [“Limit the number of supplicants when connecting via an IP phone”](#) section of the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

Use the **no** variant of this command to reset the maximum number of supplicants on untagged VLANs to the default.

Syntax `auth max-suppliant untagged-vlan <0-1024>`
`no auth max-suppliant untagged-vlan <0-1024>`

Default 1024

Mode Interface Configuration for a switch port; or Authentication Profile mode.

Examples To set the maximum number of supplicants on untagged VLANs on interface port1.0.2 to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth max-suppliant untagged-vlan 1
```

To reset the maximum number of supplicants on untagged VLANs on interface port1.0.2 to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth max-suppliant untagged-vlan
```

To set the maximum number of supplicants on untagged VLANs on authentication profile 'accounts' to 1, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# auth max-suppliant untagged-vlan 1
```

To reset the maximum number of supplicants on untagged VLANs on authentication profile 'accounts' to the default value, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# no auth max-suppliant untagged-vlan
```

- Related commands** [auth max-supPLICant](#)

auth multi-vlan-session

Overview Use this command to enable packet forwarding on multiple VLANs for an authenticated supplicant attached to a trunked (tagged VLAN) port.

By default, AlliedWare Plus only allows packet forwarding on the VLAN that a device was authenticated on. This command enables packet forwarding to the attached device on any VLAN configured on the switchport. After the device authenticates it will have access to all VLANs configured on the switchport.

Use the **no** variant of this command to disable packet forwarding on multiple VLANs for an authenticated supplicant.

Syntax `auth multi-vlan-session`
`no auth multi-vlan-session`

Default By default, **multi-vlan-session** is disabled.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To allow a client attached to port1.0.2 to access all VLANs configured on the AlliedWare Plus device, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan all
awplus(config-if)# auth host-mode multi-supPLICANT
awplus(config-if)# auth multi-vlan-session
```

To disable **multi-vlan-session** on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth multi-vlan-session
```

Command changes Version 5.4.8-1.1: command added
Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

auth priority

Overview Use this command to enable authentication priority on an interface. This sets the tri-authentication order of priority for MAC, 802.1X, and web-based authentication. If tri-authentication is not configured on the interface then this command has no effect.

You specify the authentication methods in order of priority. The first method in the list has the highest priority, the second method has the second highest priority, and the third method has the lowest priority. Any methods not specified will have the lowest priority.

Use the **no** variant of this command to disable authentication priority.

Syntax `auth priority {[auth-mac] [dot1x] [auth-web]}`
`no auth priority`

Parameter	Description
auth-mac	Set MAC authentication priority.
dot1x	Set 802.1X authentication priority.
auth-web	Set web-based authentication priority.

Default Authentication priority is not set.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Before using this command you must correctly configure tri-authentication on the interface. Tri-authentication is when multiple authentication methods (MAC, 802.1X, and/or web-based) are configured on the same interface. With tri-authentication, a supplicant is authorized to use the network as soon as they are successfully authenticated by any of the configured authentication methods.

When authentication priority is not set, once a supplicant is authenticated any future attempts to authenticate are ignored. When, however, authentication priority is set, and a higher priority authentication attempt is made by the supplicant, a new authentication process starts. The supplicant will then be authorized, or unauthorized, based on the result of this new authentication attempt.

Example To configure 802.1X authentication to have a higher priority than MAC authentication on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth priority dot1x auth-mac
```

To disable authentication priority on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth priority
```

To configure 802.1X authentication to have a higher priority than MAC authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth priority dot1x auth-mac
```

Command changes Version 5.5.0-2.1: command added

auth profile (global)

Overview Use this command to enter port authentication profile mode and configure a port authentication profile.

If the specified profile does not exist a new authentication profile is created with the name provided.

Use the **no** variant of this command to delete the specified port authentication profile.

Syntax `auth profile <profile-name>`
`no auth profile <profile-name>`

Parameter	Description
<code><profile-name></code>	Name of the profile to create or configure.

Default No port authentication profiles are created by default.

Mode Global Configuration

Usage A port authentication profile is a configuration object that aggregates multiple port authentication commands. These profiles are attached or detached from an interface using the [auth profile \(interface\)](#) command.

Example To create a new authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)#
```

To delete an authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# no auth profile student
```

Related commands [auth profile \(interface\)](#)
[description \(auth-profile\)](#)

auth profile (interface)

Overview Use this command to attach a port authentication profile to the current interface.

Use the **no** variant of this command to detach a port authentication profile from the current interface.

Syntax `auth profile <profile-name>`
`no auth profile <profile-name>`

Parameter	Description
<code><profile-name></code>	The name of the profile to attach to the current interface.

Default No profile is attached by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage This command attaches an authentication profile, that was created using the [auth profile \(global\)](#) command, to a static channel, a dynamic (LACP) channel group, or a switch port.

You can only attach one profile to an interface at a time. Use the **no** variant of the command to detach a profile before attempting to attach another one.

Example To attach the authentication profile 'student' to port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth profile student
```

To detach the authentication profile 'student' from port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth profile student
```

Related commands [auth profile \(global\)](#)

auth reauthentication

Overview Use this command to enable re-authentication on the interface specified in the Interface mode, which may be a static channel group (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Use the **no** variant of this command to disable reauthentication on the interface.

Syntax `auth reauthentication`
`no auth reauthentication`

Default Reauthentication of port authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To enable reauthentication on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth reauthentication
```

To disable reauthentication on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth reauthentication
```

To enable reauthentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth reauthentication
```

Related commands [auth profile \(global\)](#)

[show dot1x interface](#)
[show running-config](#)

auth roaming disconnected

Overview This command allows a supplicant to move to another authenticating interface without reauthentication, even if the link is down for the interface that the supplicant is currently connected to.

You must enter the [auth roaming enable](#) command on both interfaces before using this command.

The **no** variant of this command disables roaming authentication on interfaces that are link-down, and forces a supplicant to be reauthenticated when moving between interfaces.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for further information about this feature.

Syntax `auth roaming disconnected`
`no auth roaming disconnected`

Default By default, the authentication status for a roaming supplicant is deleted when an interface goes down, so supplicants must reauthenticate.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Note that 802.1X port authentication, MAC-authentication, or Web-authentication must be configured before using this feature. The port that the supplicant is moving to must have the same authentication configuration as the port the supplicant is moving from.

Roaming Authentication cannot be enabled if DHCP snooping is enabled ([service dhcp-snooping](#) command), and vice versa.

Examples To allow supplicants to move from port1.0.2 without reauthentication even when the link is down, when using 802.1X authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth roaming enable
awplus(config-if)# auth roaming disconnected
```

To require supplicants to reauthenticate when moving from port1.0.2 if the link is down, when using 802.1X authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth roaming disconnected
```

To allow supplicants using authentication profile 'student' to move between ports without reauthentication even when the link is down, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth roaming disconnected
```

To require supplicants using authentication profile 'student' to reauthenticate when moving between ports if the link is down, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth roaming disconnected
```

**Related
commands**

auth roaming enable

Overview Use this command to allow a supplicant to move to another authenticating interface without reauthentication, providing the link is up for the interface that the supplicant is currently connected to.

The **no** variant of this command disables roaming authentication on an interface, and forces a supplicant to be reauthenticated when moving between interfaces.

See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for further information about this feature.

Syntax `auth roaming enable`
`no auth roaming enable`

Default Roaming authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Note that 802.1X port authentication, MAC authentication, or web-based authentication must be configured before using this feature. The port that the supplicant is moving to must have the same authentication configuration as the port the supplicant is moving from.

This command only enables roaming authentication for links that are up. If you want roaming authentication on links that are down, you must also use the command [auth roaming disconnected](#).

Roaming Authentication cannot be enabled if DHCP snooping is enabled ([service dhcp-snooping](#) command), and vice versa.

Examples To enable roaming authentication for port1.0.4, when using auth-mac authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# auth-mac enable
awplus(config-if)# auth roaming enable
```

To disable roaming authentication for port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no auth roaming enable
```

To enable roaming authentication for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth roaming enable
```

auth supplicant-ip

Overview Use this command to add a supplicant (client device) IP address on a given interface.

Use the **no** variant of this command to delete the supplicant IP address and reset other parameters to their default values. The IP address can be determined before authentication for auth-web clients only.

Syntax `auth supplicant-ip <ip-addr> [max-reauth-req <1-10>] [max-req <1-10>] [port-control {auto|force-authorized|force-unauthorized|skip-second-auth}] [quiet-period <1-65535>] [reauthentication] [reauth-period <1-4294967295>] [supp-timeout <1-65535>] [server-timeout <1-65535>]`
`no auth supplicant-ip <ip-addr> [reauthentication]`

Parameter	Description
<ip-addr>	IP address of the supplicant entry in A.B.C.D/P format.
max-reauth-req <1-10>	Number of reauthentication attempts before becoming unauthorized (default 2).
max-req <1-10>	Number of times the device resends an EAP Request packet if that packet is lost between the authenticating device and the specified supplicant (default 2, which is 3 transmission attempts in total). If the supplicant does not respond to an EAP Request after this number of retries, the supplicant fails the authentication process.
port-control	Port control options: auto : Allow port client to negotiate authentication force-authorized : Force port state to authorized force-unauthorized : Force port state to unauthorized skip-second-auth : Skip second authentication step.
quiet-period <1-65535>	Quiet period in the HELD state in seconds (default 60 seconds).
reauthentication	Enable reauthentication on a port.
reauth-period <1-4294967295>	Seconds between reauthorization attempts (default 3600 seconds).
supp-timeout <1-65535>	Supplicant response timeout in seconds (default 30 seconds).
server-timeout <1-65535>	Authentication server response timeout in seconds (default 30 seconds).

Default No supplicant IP address for port authentication exists by default until first created with the **auth supplicant-ip** command. The parameter defaults are shown in the table above.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To add the supplicant IP address 192.168.10.0/24 to force authorized port control for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth supplicant-ip 192.168.10.0/24
port-control force-authorized
```

To delete the supplicant IP address 192.168.10.0/24 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth supplicant-ip 192.168.10.0/24
```

To disable reauthentication for the supplicant(s) IP address 192.168.10.0/24 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth supplicant-ip 192.168.10.0/24
reauthentication
```

To add the supplicant IP address 192.168.10.0/24 to force authorized port control for auth profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth supplicant-ip
192.168.10.0/24 port-control force-authorized
```

Command changes Version 5.5.3-1.1: **max-req** parameter added

auth supplicant-mac

Overview This command adds a supplicant (client device) MAC address or MAC mask on a given interface with the parameters as specified in the table below.

Use the **no** variant of this command to delete the supplicant MAC address and reset other parameters to their default values.

Syntax

```
auth supplicant-mac <mac-addr> [mask <mac-addr-mask>]
[max-reauth-req <1-10>] [max-req <1-10>] [port-control
{auto|force-authorized|force-unauthorized|skip-second-auth}]
[quiet-period <1-65535>] [reauthentication] [reauth-period
<1-4294967295>] [supp-timeout <1-65535>] [server-timeout
<1-65535>]

no auth supplicant-mac <mac-addr> [reauthentication]
```

Parameter	Description
<mac-addr>	MAC (hardware) address of the supplicant entry in HHHH.HHHH.HHHH MAC address hexadecimal format.
mask <mac-addr-mask>	A mask applied to MAC addresses in order to select only those addresses containing a specific string. The mask comprises a string of three (period separated) bytes, where each byte comprises four hexadecimal characters that will generally be either 1 or 0. When the mask is applied to a specific MAC address, a match is only required for characters that correspond to a 1 in the mask. Characters that correspond to a 0 in the mask are effectively ignored. In the examples section below, the mask ffff.ff00.0000 is applied for the MAC address 0000.5E00.0000. The applied mask will then match only those MAC addresses that begin with 0000.5E (in this case the OUI component). The remaining portion of the addresses (in this case the NIC component) will be ignored.
max-reauth-req <1-10>	Number of reauthentication attempts before becoming unauthorized (default 2).
max-req <1-10>	Number of times the device resends an EAP Request packet if that packet is lost between the authenticating device and the specified supplicant (default 2, which is 3 transmission attempts in total). If the supplicant does not respond to an EAP Request after this number of retries, the supplicant fails the authentication process.
port-control	Port control options: auto : Allow port client to negotiate authentication force-authorized : Force port state to authorized force-unauthorized : Force port state to unauthorized skip-second-auth : Skip second authentication step.
quiet-period <1-65535>	Quiet period in the HELD state in seconds (default 60 seconds).

Parameter	Description
reauthentication	Enable reauthentication on a port.
reauth-period <1-4294967295>	Seconds between reauthorization attempts (default 3600 seconds).
supp-timeout <1-65535>	Supplicant response timeout in seconds (default 30 seconds).
server-timeout <1-65535>	Authentication server response timeout in seconds (default 30 seconds).

Default No supplicant MAC address for port authentication exists by default until first created with the **auth supplicant-mac** command. The defaults for parameters are shown in the table above.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To add the supplicant MAC address 0000.5E00.5343 to force authorized port control for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth supplicant-mac 0000.5E00.5343
port-control force-authorized
```

To apply the mask ffff.ff00.0000 in order to add any supplicant MAC addresses whose MAC address begins with 0000.5E, and then to force authorized port control for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth supplicant-mac 0000.5E00.0000 mask
ffff.ff00.0000 port-control force-authorized
```

To delete the supplicant MAC address 0000.5E00.5343 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth supplicant-mac 0000.5E00.5343
```

To disable reauthentication for the supplicant MAC address 0000.5E00.5343 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth supplicant-mac 0000.5E00.5343
reauthentication
```

To add the supplicant MAC address 0000.5E00.5343 to force authorized port control for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth supplicant-mac
0000.5E00.5343 port-control force-authorized
```

To delete the supplicant MAC address 0000.5E00.5343 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth supplicant-mac
0000.5E00.5343
```

**Command
changes**

Version 5.5.3-1.1: **max-req** parameter added

auth timeout connect-timeout

Overview Use this command to set the connect-timeout period for the interface.

Use the **no** variant of this command to reset the connect-timeout period to the default.

Syntax `auth timeout connect-timeout <1-65535>`
`no auth timeout connect-timeout`

Parameter	Description
<code><1-65535></code>	Specifies the connect-timeout period (in seconds).

Default The connect-timeout default is 30 seconds.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes This command is used for MAC and web authentication. If the connect-timeout has lapsed and the supplicant has the state **connecting**, then the supplicant is deleted. When [auth-web-server session-keep](#) or [auth two-step enable](#) is enabled, we recommend you configure a longer connect-timeout period.

Examples To set the connect-timeout period to 3600 seconds for port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout connect-timeout 3600
```

To reset the connect-timeout period to the default (30 seconds) for port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout connect-timeout
```

To set the connect-timeout period to 3600 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout connect-timeout 3600
```

Related commands [auth profile \(global\)](#)
[show dot1x](#)

auth timeout quiet-period

Overview Use this command to set a time period for which another authentication request is not accepted on a given interface, after an authentication request has failed.

Use the **no** variant of this command to reset the quiet period to the default.

Syntax `auth timeout quiet-period <1-65535>`
`no auth timeout quiet-period`

Parameter	Description
<1-65535>	Specifies the quiet period (in seconds).

Default The quiet period for port authentication is 60 seconds.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To set the quiet period to 10 seconds for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout quiet-period 10
```

To reset the quiet period to the default (60 seconds) for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout quiet-period
```

To set the quiet period to 10 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout quiet-period 10
```

Related commands [auth profile \(global\)](#)

auth timeout reauth-period

Overview Use this command to set the timer for reauthentication on a given interface. The re-authentication for the supplicant (client device) is executed at this timeout. The timeout is only applied if the **auth reauthentication** command is applied.

Use the **no** variant of this command to reset the **reauth-period** parameter to the default (3600 seconds).

Syntax `auth timeout reauth-period <1-4294967295>`
`no auth timeout reauth-period`

Parameter	Description
<1-4294967295>	The reauthentication timeout period (in seconds).

Default The default reauthentication period for port authentication is 3600 seconds, when reauthentication is enabled on the port.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To set the reauthentication period to 1 day for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout reauth-period 86400
```

To reset the reauthentication period to the default (3600 seconds) for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout reauth-period
```

To set the reauthentication period to 1 day for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout reauth-period 86400
```

To reset the reauthentication period to the default (3600 seconds) for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth timeout reauth-period
```

auth timeout server-timeout

Overview Use this command to set the timeout for the waiting response from the RADIUS server on a given interface.

Use the **no** variant of this command to reset the server-timeout to the default (30 seconds).

Syntax `auth timeout server-timeout <1-65535>`
`no auth timeout server-timeout`

Parameter	Description
<1-65535>	Server timeout period (in seconds).

Default The server timeout for port authentication is 30 seconds.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To set the server timeout to 120 seconds for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout server-timeout 120
```

To set the server timeout to the default (30 seconds) for interface port1.0.2 use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout server-timeout
```

To set the server timeout to 120 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout server-timeout 120
```

To set the server timeout to the default (30 seconds) for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth timeout server-timeout
```

Related commands [auth profile \(global\)](#)

`show running-config`

auth timeout supp-timeout

Overview This command sets the timeout of the waiting response from the supplicant (client device) on a given interface.

The **no** variant of this command resets the supplicant timeout to the default (30 seconds).

Syntax `auth timeout supp-timeout <1-65535>`
`no auth timeout supp-timeout`

Parameter	Description
<1-65535>	The supplicant timeout period (in seconds).

Default The supplicant timeout for port authentication is 30 seconds.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To set the supplicant timeout to 2 seconds for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout supp-timeout 2
```

To reset the supplicant timeout to the default (30 seconds) for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout supp-timeout
```

To set the supplicant timeout to 2 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout supp-timeout 2
```

auth vlan-restriction

Overview Use this command to restrict port authenticated supplicants on an interface to one per VLAN. This is useful, for example, if you have configured multiple supplicants on an interface but you want to restrict network access to a single IP phone and a single authorized workstation.

Use the **no** variant of this command to remove the single supplicant per VLAN restriction.

Syntax `auth vlan-restriction`
`no auth vlan-restriction`

Default Not configured

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes This is a port authentication command, so you should first configure 802.1X, MAC, or web authentication. In addition, configure multi-supplicants on the interface using the **auth host-mode multi-supplicant** command.

This command works with both dynamic VLANs and static voice VLAN configurations.

Examples To restrict supplicants to a one per VLAN on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth vlan-restriction
```

To remove the one per VLAN supplicant restriction on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth vlan-restriction
```

Command changes Version 5.5.1-2.1: command added

auth two-step enable

Overview Use this command to enable a two-step authentication feature on an interface. When this feature is enabled, the supplicant is authorized in a two-step process. If authentication succeeds, the supplicant becomes authenticated.

Use this command to apply the two-step authentication method based on 802.1X, MAC or web authentication.

Use the **no** variant of this command to disable the two-step authentication feature.

Syntax `auth two-step enable`
`no auth two-step enable`

Default Two step authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage The single step authentication methods (either user or device authentication) have a potential security risk:

- an unauthorized user can access the network with an authorized device, or
- an authorized user can access the network with an unauthorized device.

Two-step authentication solves this problem by authenticating both the user and the device. The supplicant will only become authenticated if both these steps are successful. If the first authentication step fails, then the second step is not started.

Examples To enable the two step authentication feature, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth two-step enable
```

To disable the two step authentication feature, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth two-step enable
```

To enable MAC authentication followed by 802.1X authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable MAC authentication followed by web authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable 802.1X authentication followed by web authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable the two step authentication feature for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth two-step enable
```

**Command
changes**

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

auth two-step order

Overview Use this command to configure the order for two-step authentication. Two-step authentication and the relevant authentication methods must be enabled on the interface.

Use the **no** variant of this command to reset the authentication order to the default.

Syntax

```
auth two-step order auth-mac {dot1x|auth-web}  
auth two-step order dot1x {auth-mac|auth-web}  
no auth two-step order
```

Parameter	Description
auth-mac	MAC authentication
dot1x	802.1X authentication
auth-web	Web authentication

Default Order is determined by the authentication methods configured on the interface (see **Usage notes**).

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes The default authentication order depends on the combination of the authentication methods configured on the interface:

- If auth-mac is configured then auth-mac will be the first method.
- If auth-mac is **not** configured then dot1x will become the first method.
- If only two methods are configured then the remaining method becomes the second method.
- If all three methods are configured then the second method is chosen based on the packet type received (dot1x for an EAPOL packet and auth-web for an HTTP packet).

Examples To set the two-step authentication order on port1.0.1 for 802.1X authentication and then MAC authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth two-step enable
awplus(config-if)# auth two-step order dot1x auth-mac
```

To reset the two-step authentication order back to the default, which would be MAC authentication then 802.1X authentication if configured as above, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no auth two-step order
```

Command changes Version 5.5.0-0.3: command added

auth-mac accounting

Overview Use this command to override the **default** RADIUS accounting method for MAC-based authentication on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

Syntax `auth-mac accounting {default|<list-name>}`
`no auth-mac accounting`

Parameter	Description
default	Apply the default accounting method list
<list-name>	Apply the user-defined named list

Default The **default** method list is applied to an interface by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To apply the named list 'vlan10_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-mac accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the accounting method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-mac accounting
```

Related commands [aaa accounting auth-mac](#)

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-mac authentication

Overview This command overrides the **default** MAC authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

Syntax `auth-mac authentication {default|<list-name>}`
`no auth-mac authentication`

Parameter	Description
default	Apply the default authentication method list
<list-name>	Apply a user-defined named list

Default The **default** method list is applied to an interface by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To apply the named list 'vlan10_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-mac authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-mac authentication
```

Related commands [aaa authentication auth-mac](#)

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-mac enable

Overview This command enables MAC authentication on the interface specified in the Interface command mode.

Use the **no** variant of this command to disable MAC authentication on an interface.

Syntax `auth-mac enable`
`no auth-mac enable`

Default MAC-Authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Enabling **spanning-tree edgeport** on ports after enabling MAC authentication avoids unnecessary re-authentication when the port state changes, which does not happen when spanning tree edgeport is enabled. Note that re-authentication is correct behavior without **spanning-tree edgeport** enabled.

Applying **switchport mode access** on ports is also good practice to set the ports to access mode with ingress filtering turned on, whenever ports for MAC authentication are in a VLAN.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

Examples To enable MAC authentication on interface port1.0.2 and enable spanning tree edgeport to avoid unnecessary re-authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac enable
awplus(config-if)# spanning-tree edgeport
awplus(config-if)# switchport mode access
```

To disable MAC authentication on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac enable
```

To enable MAC authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac enable
```

**Command
changes**

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-mac method

Overview This command sets the type of authentication method for MAC authentication that is used with RADIUS on the interface specified in the interface command mode.

The **no** variant of this command resets the authentication method used to the default method (PAP) as the RADIUS authentication method used by the MAC authentication.

Syntax `auth-mac method [eap-md5|pap]`
`no auth-mac method`

Parameter	Description
eap-md5	Enable EAP-MD5 as the authentication method.
pap	Enable PAP as the authentication method.

Default The MAC authentication method is PAP.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To set the MAC authentication method to PAP on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac method pap
```

To set the MAC authentication method to the default on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac method
```

To set the MAC authentication method to EAP-MD5 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac method eap-md5
```

changes**

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-mac password

Overview This command changes the password for MAC-based authentication.
Use the **no** variant of this command to return the password to its default.

Syntax `auth-mac [encrypted] password <password>`
`no auth-mac password`

Parameter	Description
<code>auth-mac</code>	MAC-based authentication
<code>encrypted</code>	Specify an encrypted password
<code>password</code>	Configure the password
<code><password></code>	The new password. Passwords can be up to 64 characters in length and can contain any printable characters except: • ? • " (double quotes) • space

Default By default, the password is the MAC address of the supplicant.

Mode Global Configuration

Usage notes Changing the password increases the security of MAC-based authentication, because the default password is easy for an attacker to discover. This is particularly important if:

- some MAC-based supplicants on the network are intelligent devices, such as computers, and/or
- you are using two-step authentication (see the “Ensuring Authentication Methods Require Different Usernames and Passwords” section of the [AAA and Port Authentication Feature_Overview_and_Configuration_Guide](#)).

Examples To change the password to verySecurePassword, use the commands:

```
awplus# configure terminal
awplus(config)# auth-mac password verySecurePassword
```

Related commands [auth two-step enable](#)
[show auth](#)

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-mac reauth-relearning

Overview This command sets the MAC address learning of the supplicant (client device) to re-learning for re-authentication on the interface specified in the interface command mode.

Use the **no** variant of this command to disable the auth-mac re-learning option.

Syntax `auth-mac reauth-relearning`
`no auth-mac reauth-relearning`

Default Re-learning for port authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To enable the re-authentication re-learning feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac reauth-relearning
```

To disable the re-authentication re-learning feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac reauth-relearning
```

To enable the re-authentication re-learning feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac reauth-relearning
```

Related commands [auth profile \(global\)](#)

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-mac static

Overview This command configures MAC authentication to use static entries in the FDB. Static entries persist in the FDB, even if there is no traffic flow from the supplicant.

When static FDB entries are configured, the [auth roaming disconnected](#) command is supported for MAC authentication. This command allows a supplicant to move to another authenticating interface without re-authentication.

Use the **no** variant of this command to revert to dynamic FDB entries.

Syntax `auth-mac static`
`no auth-mac static`

Default By default MAC authentication supplicants are added to the FDB dynamically.

Mode Global Configuration

Example To configure MAC authentication to use static FDB entries, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-mac static
```

To configure MAC authentication to use dynamic FDB entries, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-mac static
```

Related commands [auth roaming disconnected](#)

Command changes Version 5.4.7-2.4: Command added
Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-mac username

Overview Use this command to specify the format of the MAC address in the username and password field when a request for MAC-based authorization is sent to a RADIUS server.

Syntax `auth-mac username {ietf|unformatted} {lower-case|upper-case}`

Parameter	Description
ietf	The MAC address includes a hyphen between each 2 bytes. (Example: xx-xx-xx-xx-xx-xx)
unformatted	The MAC address does not include hyphens. (Example: xxxxxxxxxxxx)
lower-case	The MAC address uses lower-case characters (a-f)
upper-case	The MAC address uses upper-case characters (A-F)

Default `auth-mac username ietf lower-case`

Mode Global Configuration

Usage This command is provided to allow other vendors', AlliedWare, and AlliedWare Plus switches to share the same format on the RADIUS server.

Example To configure the format of the MAC address in the username and password field to be changed to IETF and upper-case, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-mac username ietf upper-case
```

Related commands [auth-mac username](#)

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-web accounting

Overview This command overrides the default RADIUS accounting method for web-based authentication on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the default method.

Syntax `auth-web accounting {default|<list-name>}`
`no auth-web accounting`

Parameter	Description
default	Apply the default accounting method list
<list-name>	Apply a named accounting method list

Default The **default** method list is applied to an interface by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To apply the named list 'vlan10_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-web accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the accounting method back to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-web accounting
```

Related commands [aaa accounting auth-web](#)

auth-web authentication

Overview Use this command to override the default web-based authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the default method.

Syntax `auth-web authentication {default|<list-name>}`
`no auth-web authentication`

Parameter	Description
default	Apply the default authentication method list
<list-name>	Apply the user-defined named list

Default The **default** method list is applied to an interface by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To apply the named list 'vlan10_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-web authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-web authentication
```

Related commands [aaa authentication auth-web](#)

auth-web enable

Overview Use this command to enable web-based authentication in Interface mode on the interface specified.

Use the **no** variant of this command to apply its default.

Syntax `auth-web enable`
`no auth-web enable`

Default Web authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Web-based authentication cannot be enabled if DHCP snooping is enabled by using the [service dhcp-snooping](#) command, and vice versa. You need to configure an IPv4 address for the VLAN interface on which web authentication is running.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

Examples To enable web authentication on static-channel-group 2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# static-channel-group 2
awplus(config-if)# exit
awplus(config)# interface sa2
awplus(config-if)# auth-web enable
```

To disable web authentication on static-channel-group 2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface sa2
awplus(config-if)# no auth-web enable
```

To enable web authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web enable
```

To disable web authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web enable
```

commands**

[auth profile \(global\)](#)

[show auth](#)

[show auth interface](#)

[show running-config](#)

auth-web forward

Overview Use this command to enable the web authentication packet forwarding feature on the interface specified. This command also enables ARP forwarding, and adds forwarded packets to the **tcp** or **udp** port number specified.

Use the **no** variant of this command to disable the specified packet forwarding feature on the interface.

Syntax `auth-web forward [<ip-address>|<ip-address/prefix-length>]
{dns|tcp <1-65535>|udp <1-65535>}`

or

`auth-web forward {arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}`

The **no** variants of this command are:

`no auth-web forward [<ip-address>|<ip-address/prefix-length>]
{dns|tcp <1-65535>|udp <1-65535>}`

or

`no auth-web forward {arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}`

Parameter	Description
<ip-address> <ip-address/ prefix-length>	The IP address or subnet on which the web authentication is to be enabled.
arp	Enable forwarding of ARP.
dhcp	Enable forwarding of DHCP (67/udp).
dns	Enable forwarding of DNS (53/udp).
tcp	Enable forwarding of TCP specified port number.
<1-65535>	TCP Port number.
udp	Enable forwarding of UDP specified port number.
<1-65535>	UDP Port number.

Default Packet forwarding for port authentication is enabled by default for "arp", "dhcp" and "dns".

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes For more information about the <ip-address> parameter, and an example, see the "auth-web forward" section in the [Alliedware Plus Technical Tips and Tricks](#).

Examples To enable the ARP forwarding feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web forward arp
```

To add TCP forwarding port 137 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web forward tcp 137
```

To add the DNS Server IP address 192.168.1.10 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth-web forward 192.168.1.10 dns
```

To disable the ARP forwarding feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web forward arp
```

To delete TCP forwarding port 137 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web forward tcp 137
```

To delete all TCP forwarding on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web forward tcp
```

To enable the ARP forwarding feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web forward arp
```

To add TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web forward tcp 137
```

To disable the ARP forwarding feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward arp
```

To delete TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward tcp 137
```

To delete all TCP forwarding on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward tcp
```

**Related
commands**

[auth profile \(global\)](#)
[show auth](#)
[show auth interface](#)

auth-web idle-timeout enable

Overview Use this command to enable the idle-timeout for client of web authentication on the interface.

The **no** variant of this command to disable the idle-timeout for client of web authentication on the interface.

Syntax `auth-web idle-timeout enable`
`no auth-web idle-timeout enable`

Default The idle-timeout is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To enable the idle-timeout on an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config)# auth-web enable
awplus(config-if)# auth-web idle-timeout enable
```

To disable the idle-timeout on an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web idle-timeout enable
```

Related commands [auth-web enable](#)
[auth-web idle-timeout timeout](#)

auth-web idle-timeout timeout

Overview Use this command to set the timeout value for web authentication client in seconds. The client will be unauthorized when it does not have any activity for a period that exceeds the timeout value.

The **no** variant of this command sets the timeout value to the default setting, 3600 seconds.

Syntax `auth-web idle-timeout timeout <420-86400>`
`no auth-web idle-timeout timeout`

Parameter	Description
<420-86400>	Time in seconds.

Default The timeout is 3600 seconds by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To set 30 minutes as the idle-timeout, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web idle-timeout timeout 1800
```

To return the idle-timeout to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web idle-timeout timeout
```

Related commands [auth-web enable](#)
[auth-web idle-timeout enable](#)

auth-web max-auth-fail

Overview Use this command to set the number of authentication failures allowed before rejecting further authentication requests. When the supplicant (client device) fails more than the specified number of times, then login requests are refused during the quiet period.

Use the **no** variant of this command to reset the maximum number of authentication failures to the default.

Syntax `auth-web max-auth-fail <0-10>`
`no auth-web max-auth-fail`

Parameter	Description
<code><0-10></code>	The maximum number of authentication failures allowed before login requests are refused.

Default The maximum number of authentication failures is set to 3.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To set the lock count to 5 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web max-auth-fail 5
```

To set the lock count to the default on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web max-auth-fail
```

To set the lock count to 5 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web max-auth-fail 5
```

To set the lock count to the default on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web max-auth-fail
```

**Related
commands**

- auth profile (global)
- auth timeout quiet-period
- show auth
- show auth interface
- show running-config

auth-web method

Overview Use this command to set the web authentication access method that is used with RADIUS on the interface specified.

Use the **no** variant of this command to set the authentication method to PAP for the interface specified when web authentication is also used with the RADIUS authentication method.

Syntax `auth-web method {eap-md5|pap}`
`no auth-web method`

Parameter	Description
eap-md5	Enable EAP-MD5 as the authentication method.
pap	Enable PAP as the authentication method.

Default The web authentication method is set to PAP by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To set the web authentication method to EAP-MD5 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web method eap-md5
```

To set the web authentication method to EAP-MD5 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web method eap-md5
```

Related commands [auth profile \(global\)](#)
[show auth](#)
[show auth interface](#)
[show running-config](#)

auth-web-server blocking-mode

Overview Use this command to enable blocking mode for the Web-Authentication server. The blocking mode displays an authentication success or failure screen immediately from the response result from a RADIUS server.

Use the **no** variant of this command to disable blocking mode for the Web-Authentication server.

Syntax `auth-web-server blocking-mode`
`no auth-web-server blocking-mode`

Default By default, blocking mode is disabled for the Web-Authentication server.

Mode Global Configuration

Example To enable blocking mode for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server blocking-mode
```

To disable blocking mode for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server blocking-mode
```

Related commands [auth-web-server redirect-delay-time](#)
[show auth-web-server](#)
[show running-config](#)

auth-web-server dhcp ipaddress

Overview Use this command to assign an IP address and enable the DHCP service on the Web-Authentication server for supplicants (client devices).

Use the **no** variant of this command to remove an IP address and disable the DHCP service on the Web-Authentication server for supplicants.

Syntax `auth-web-server dhcp ipaddress <ip-address/prefix-length>`
`no auth-web-server dhcp ipaddress`

Parameter	Description
<code><ip-address/prefix-length></code>	The IPv4 address and prefix length assigned for the DHCP service on the Web-Authentication server for supplicants.

Default No IP address for the Web-Authentication server is set by default.

Mode Global Configuration

Usage notes See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- using DHCP with web authentication, and
- restrictions regarding combinations of authentication enhancements working together

You cannot use the IPv4 address assigned to the device's interface as the Web-Authentication server address.

Note that this Web Authentication virtual DHCP server is a limited implementation of the DHCP protocol. Separation of IP addresses depends on allocating addresses incrementally and a short lease time. In a situation where a supplicant remains permanently connected but does not authenticate, there is a risk of re-allocation of the same IP address once the server has rolled through the entire address range.

Examples To assign the IP address 10.0.0.1 to the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp ipaddress 10.0.0.1/8
```

To remove an IP address on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp ipaddress
```

**Related
commands** `auth-web-server dhcp lease`
 `show auth-web-server`
 `show running-config`

auth-web-server dhcp lease

Overview Use this command to set the DHCP lease time for supplicants (client devices) using the DHCP service on the Web-Authentication server.

Use the **no** variant of this command to reset to the default DHCP lease time for supplicants using the DHCP service on the Web-Authentication server.

Syntax `auth-web-server dhcp lease <20-60>`
`no auth-web-server dhcp lease`

Parameter	Description
<20-60>	DHCP lease time for supplicants using the DHCP service on the Web-Authentication server in seconds.

Default The default DHCP lease time for supplicants using the DHCP service on the Web-Authentication server is set to 30 seconds.

Mode Global Configuration

Usage notes See the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for information about:

- using DHCP with web authentication, and
- restrictions regarding combinations of authentication enhancements working together

Examples To set the DHCP lease time to 1 minute for supplicants using the DHCP service on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp lease 60
```

To reset the DHCP lease time to the default setting (30 seconds) for supplicants using the DHCP service on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp lease
```

Validation Commands `show running-config`

Related commands `show auth-web-server`
`auth-web-server dhcp ipaddress`

auth-web-server dhcp-wpad-option

Overview This command sets the DHCP WPAD (Web Proxy Auto-Discovery) option for the Web-Authentication temporary DHCP service.

For more information and examples, see the “Web Auth Proxy” section in the [Alliedware Plus Technical Tips and Tricks](#).

Use the **no** variant of this command to disable the DHCP WPAD function.

Syntax `auth-web-server dhcp wpad-option <url>`
`no auth-web-server dhcp wpad-option`

Parameter	Description
<url>	URL to the server which gets a .pac file.

Default The Web-Authentication server DHCP WPAD option is not set.

Mode Global Configuration

Usage notes If the supplicant is configured to use WPAD, the supplicant’s web browser will use TCP port 80 as usual. Therefore, the packet can be intercepted by Web-Authentication as normal, and the Web-Authentication Login page can be sent. However, after authentication, the browser does not know where to get the WPAD file and so cannot access external web pages. The WPAD file is usually named proxy.pac file and tells the browser what web proxy to use.

Use this command to tell the supplicant where it can get this file from. The switch itself can be specified as the source for this file, and it can deliver it to the supplicant on request.

Example To specify that the proxy.pac file is found on the server at 192.168.1.100, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp wpad-option
http://192.168.1.100/proxy/proxy.pac
```

Related commands [show auth-web-server](#)

auth-web-server host-name

Overview This command assigns a hostname to the web authentication server.

Use the **no** variant of this command to remove the hostname from the web authentication server.

Syntax `auth-web-server host-name <hostname>`
`no auth-web-server host-name`

Parameter	Description
<code><hostname></code>	URL string of the hostname

Default The web authentication server has no hostname.

Mode Global Configuration

Usage notes When the web authentication server uses HTTPS protocol, the web browser will validate the certificate. If the certificate is invalid, the web page gives a warning message before displaying server content. However, the web page will not give warning message if the server has a hostname same as the one stored in the installed certificate.

Examples To set the auth.example.com as the hostname of the web authentication server, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server host-name auth.example.com
```

To remove hostname auth.example.com from the web authentication server, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server host-name
```

Related commands [aaa authentication auth-web](#)
[auth-web enable](#)

auth-web-server intercept-port

Overview This command specifies any additional TCP port numbers that the Web-Authentication server is to intercept.

Use the **no** variant of this command to stop intercepting the TCP port numbers.

Syntax `auth-web-server intercept-port {<1-65535>|any}`
`no auth-web-server intercept-port {<1-65535>|any}`

Parameter	Description
<1-65535>	TCP port number.
any	Intercept all TCP packets

Default No additional TCP port numbers are intercepted by default.

Mode Global Configuration

Usage notes If this command is not specified, AlliedWare Plus Web-Authentication intercepts the supplicant's initial TCP port 80 connection to a web page and sends it the Web-Authentication Login page. However, if the supplicant is configured to use a web proxy, then it will usually be using TCP port 8080 (or another user configured port number). In this case Web-Authentication cannot intercept the connection.

To overcome this limitation you can use this command to tell the switch which additional port it should intercept, and then send the Web-Authentication Login page to the supplicant.

When the web authentication switch is in a guest network, the switch does not know the proxy server's port number in the supplicant's proxy setting. To overcome this limitation, you can use the **any** option in this command to intercept all TCP packets.

When you use this command in conjunction with a proxy server configured in the web browser, you must add the proxy server's network as a 'No Proxy' network. You can specify 'No Proxy' networks in the proxy settings in your web browser. For more information, see the "Web Auth Proxy" section in the [Alliedware Plus Technical Tips and Tricks](#).

Example To additionally intercept port number 3128, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server intercept-port 3128
```

Related commands [show auth-web-server](#)

auth-web-server ip-conflict-prefer-newer-supPLICANT

Overview Use this command to alter the behavior of a Network Access Server (NAS) when it detects a supplicant with a duplicate IP address.

The default behavior is for the NAS to not authorize the newer supplicant. This command allows it to authorize the newer supplicant and unauthorize the original supplicant.

This command applies to Web-based authentication supplicants only.

Use the **no** variant of this command to set the behavior back to default.

Syntax `auth-web-server ip-conflict-prefer-newer-supPLICANT`
`no auth-web-server ip-conflict-prefer-newer-supPLICANT`

Default The default behavior is to not authorize the newer supplicant if the NAS detects a duplicate IP address.

Mode Global Configuration

Usage notes Allied Telesis recommends you investigate and resolve the root cause of the conflicting IP addresses.

Example To configure a NAS to authorize the newer supplicant, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server
ip-conflict-prefer-newer-supPLICANT
```

Related commands [auth-web enable](#)
[show auth](#)

Command changes Version 5.5.2-0.1: command added

auth-web-server ipaddress

Overview This command sets the IP address for the Web-Authentication server.

Use the **no** variant of this command to delete the IP address for the Web-Authentication server.

You cannot use the IPv4 address assigned to the device's interface as the Web-Authentication server address.

Syntax `auth-web-server ipaddress <ip-address>`
`no auth-web-server ipaddress`

Parameter	Description
<code><ip-address></code>	Web-Authentication server dotted decimal IP address in A.B.C.D format.

Default The Web-Authentication server address on the system is not set by default.

Mode Global Configuration

Examples To set the IP address 10.0.0.1 to the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ipaddress 10.0.0.1
```

To delete the IP address from the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ipaddress
```

Validation Commands `show auth`
`show auth-web-server`
`show running-config`

auth-web-server page language

Overview Use this command to set the presentation language of Web authentication pages. Titles and subtitles of Web authentication pages will be set accordingly. Note that presently only English or Japanese are offered.

Use the **no** variant of this command to set the presentation language of Web authentication pages to its default (English).

Syntax `auth-web-server page language {english|japanese}`
`no auth-web-server page language`

Parameter	Description
english	Web authentication pages are presented in English.
japanese	Web authentication pages are presented in Japanese.

Default Web authentication pages are presented in English by default.

Mode Global Configuration

Examples To set Japanese as the presentation language of Web authentication pages, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page language japanese
```

To set English as the presentation language of Web authentication pages, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page language english
```

To unset the presentation language of Web authentication pages and use English as the default presentation language, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page language
```

Related commands [auth-web-server page title](#)
[auth-web-server page sub-title](#)

auth-web-server login-url

Overview This command sets the web-authentication login page URL. This lets you replace the login page with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#) for details.

Use the **no** variant of this command to delete the URL.

Syntax `auth-web-server login-url <URL>`
`no auth-web-server login-url`

Parameter	Description
<URL>	Set login page URL

Default The built-in login page is set by default.

Mode Global Configuration

Examples To set `http://example.com/login.html` as the login page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server login-url
http://example.com/login.html
```

To unset the login page URL, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server login-url
```

Related commands [show running-config](#)

auth-web-server page logo

Overview This command sets the type of logo that will be displayed on the web authentication page.

Use the **no** variant of this command to set the logo type to **auto**.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

Syntax `auth-web-server page logo {auto|default|hidden}`
`no auth-web-server page logo`

Parameter	Description
auto	Display the custom logo if installed; otherwise display the default logo
default	Display the default logo
hidden	Hide the logo

Default Logo type is **auto** by default.

Mode Global Configuration

Examples To display the default logo with ignoring installed custom logo, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page logo default
```

To set back to the default logo type **auto**, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page logo
```

Validation Commands `show auth-web-server page`

auth-web-server page sub-title

Overview This command sets the custom sub-title on the web authentication page.

Use the **no** variant of this command to reset the sub-title to its default.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

Syntax `auth-web-server page sub-title {hidden|text <sub-title>}`
`no auth-web-server page sub-title`

Parameter	Description
hidden	Hide the sub-title
<sub-title>	Text string of the sub-title

Default “Allied-Telesis” is displayed by default.

Mode Global Configuration

Examples To set the custom sub-title, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page sub-title text Web
Authentication
```

To hide the sub-title, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page sub-title hidden
```

To change back to the default title, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page sub-title
```

**Validation
Commands** `show auth-web-server page`

auth-web-server page success-message

Overview This command sets the success message on the web-authentication page.

Use the **no** variant of this command to remove the success message.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

Syntax `auth-web-server page success-message text <success-message>`
`no auth-web-server page success-message`

Parameter	Description
<code><success-message></code>	Text string of the success message

Default No success message is set by default.

Mode Global Configuration

Examples To set the success message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page success-message text Your
success message
```

To unset the success message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page success-message
```

**Validation
Commands** [show auth-web-server page](#)

auth-web-server page title

Overview This command sets the custom title on the web authentication page.

Use the **no** variant of this command to remove the custom title.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

Syntax `auth-web-server page title {hidden|text <title>}`
`no auth-web-server page title`

Parameter	Description
hidden	Hide the title
<title>	Text string of the title

Default “Web Access Authentication Gateway” is displayed by default.

Mode Global Configuration

Examples To set the custom title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page title text Login
```

To hide the title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page title hidden
```

To unset the custom title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page title
```

Validation Commands [show auth-web-server page](#)

auth-web-server page welcome-message

Overview This command sets the welcome message on the web-authentication login page.

Use the **no** variant of this command to remove the welcome message.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See “Customising the Login Page” in the [AAA and Port Authentication Feature Overview and Configuration Guide](#).

Syntax `auth-web-server page welcome-message text <welcome-message>`
`no auth-web-server page welcome-message`

Parameter	Description
<code><welcome-message></code>	Text string of the welcome message

Default No welcome message is set by default.

Mode Global Configuration

Examples To set the welcome message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page welcome-message text Your
welcome message
```

To remove the welcome message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page welcome-message
```

Validation Commands [show auth-web-server page](#)

auth-web-server ping-poll enable

Overview This command enables the ping polling to the supplicant (client device) that is authenticated by Web-Authentication.

The **no** variant of this command disables the ping polling to the supplicant that is authenticated by Web-Authentication.

Syntax `auth-web-server ping-poll enable`
`no auth-web-server ping-poll enable`

Default The ping polling feature for Web-Authentication is disabled by default.

Mode Global Configuration

Examples To enable the ping polling feature for Web-Authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
```

To disable the ping polling feature for Web-Authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll enable
```

**Validation
Commands** `show auth`
`show auth-web-server`
`show running-config`

auth-web-server ping-poll failcount

Overview This command sets a fail count for the ping polling feature when used with Web-Authentication. The **failcount** parameter specifies the number of unanswered pings. A supplicant (client device) is logged off when the number of unanswered pings are greater than the failcount set with this command.

Use the **no** variant of this command to resets the fail count for the ping polling feature to the default (5 pings).

Syntax `auth-web-server ping-poll failcount <1-100>`
`no auth-web-server ping-poll failcount`

Parameter	Description
<1-100>	Count.

Default The default failcount for ping polling is 5 pings.

Mode Global Configuration

Examples To set the failcount of ping polling to 10 pings, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll failcount 10
```

To set the failcount of ping polling to default, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll failcount
```

Validation Commands `show auth`
`show auth-web-server`
`show running-config`

auth-web-server ping-poll interval

Overview This command is used to change the ping poll interval. The interval specifies the time period between pings when the supplicant (client device) is reachable.

Use the **no** variant of this command to reset to the default period for ping polling (30 seconds).

Syntax `auth-web-server ping-poll interval <1-65535>`
`no auth-web-server ping-poll interval`

Parameter	Description
<1-65535>	Seconds.

Default The interval for ping polling is 30 seconds by default.

Mode Global Configuration

Examples To set the interval of ping polling to 60 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll interval 60
```

To set the interval of ping polling to the default (30 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll interval
```

Validation Commands `show auth`
`show auth-web-server`
`show running-config`

auth-web-server ping-poll reauth-timer-refresh

Overview This command modifies the **reauth-timer-refresh** parameter for the Web-Authentication feature. The **reauth-timer-refresh** parameter specifies whether a re-authentication timer is reset and when the response from a supplicant (a client device) is received.

Use the **no** variant of this command to reset the **reauth-timer-refresh** parameter to the default setting (disabled).

Syntax `auth-web-server ping-poll reauth-timer-refresh`
`no auth-web-server ping-poll reauth-timer-refresh`

Default The `reauth-timer-refresh` parameter is disabled by default.

Mode Global Configuration

Examples To enable the `reauth-timer-refresh` timer, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll reauth-timer-refresh
```

To disable the `reauth-timer-refresh` timer, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll
reauth-timer-refresh
```

**Validation
Commands** `show auth`
`show auth-web-server`
`show running-config`

auth-web-server ping-poll timeout

Overview This command modifies the ping poll **timeout** parameter for the Web-Authentication feature. The **timeout** parameter specifies the time in seconds to wait for a response to a ping packet.

Use the **no** variant of this command to reset the timeout of ping polling to the default (1 second).

Syntax `auth-web-server ping-poll timeout <1-30>`
`no auth-web-server ping-poll timeout`

Parameter	Description
<1-30>	Seconds.

Default The default timeout for ping polling is 1 second.

Mode Global Configuration

Examples To set the timeout of ping polling to 2 seconds, use the command:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll timeout 2
```

To set the timeout of ping polling to the default (1 second), use the command:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll timeout
```

**Validation
Commands** `show auth`
`show auth-web-server`
`show running-config`

auth-web-server ping-poll type

Overview Use this command to set the type of polling used to check that a web authenticated supplicant is still connected. The polling can be done using either ICMP (ping), or ARP messages.

If there is a firewall between an authenticating server and a supplicant, it may block ICMP traffic. If this occurs try changing to ARP polling.

Polling only starts when ping-polling is enabled and the supplicant has been authorized.

Use the **no** variant of this command to set the default polling type of ICMP (ping).

Syntax `auth-web-server ping-poll type {arp|ping}`
`no auth-web-server ping-poll type`

Parameter	Description
auth-web-server	Web authentication server configuration commands
arp	Enable polling via ARP
ping	Enable polling via ICMP (ping)

Default ICMP

Mode Global Configuration

Examples To set the polling type to ARP, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
awplus(config)# auth-web-server ping-poll type arp
```

To set the polling type to ICMP, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
awplus(config)# auth-web-server ping-poll type ping
```

To set the polling type to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll type
```

Related commands [auth-web-server ping-poll enable](#)

Command changes Version 5.5.1-1.1: command added

auth-web-server port

Overview This command sets the HTTP port number for the Web-Authentication server. Use the **no** variant of this command to reset the HTTP port number to the default (80).

Syntax `auth-web-server port <port-number>`
`no auth-web-server port`

Parameter	Description
<code><port-number></code>	Set the local Web-Authentication server port within the TCP port number range 1 to 65535.

Default The Web-Authentication server HTTP port number is set to 80 by default.

Mode Global Configuration

Examples To set the HTTP port number 8080 for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server port 8080
```

To reset to the default HTTP port number 80 for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server port
```

Validation Commands `show auth`
`show auth-web-server`
`show running-config`

auth-web-server redirect-delay-time

Overview Use this command to set the delay time in seconds before redirecting the supplicant to a specified URL when the supplicant is authorized.

Use the variant **no** to reset the delay time set previously.

Syntax `auth-web-server redirect-delay-time <5-60>`
`no auth-web-server redirect-delay-time`

Parameter	Description
<code>redirect-delay-time</code>	Set the delay time before jumping to a specified URL after the supplicant is authorized.
<code><5-60></code>	The time in seconds.

Default The default redirect delay time is 5 seconds.

Mode Global Configuration

Examples To set the delay time to 60 seconds for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-delay-time 60
```

To reset the delay time, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-delay-time
```

Related commands [auth-web-server blocking-mode](#)
[auth-web-server redirect-url](#)
[show auth-web-server](#)
[show running-config](#)

auth-web-server redirect-url

Overview This command sets a URL for supplicant (client device) authentication. When a supplicant is authorized it will be automatically redirected to the specified URL. Note that if the http redirect feature is used then this command is ignored.

Use the **no** variant of this command to delete the URL string set previously.

Syntax `auth-web-server redirect-url <url>`
`no auth-web-server redirect-url`

Parameter	Description
<code><url></code>	URL (hostname or dotted IP notation).

Default The redirect URL for the Web-Authentication server feature is not set by default (null).

Mode Global Configuration

Examples To enable and set redirect a URL string `www.alliedtelesis.com` for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-url
http://www.alliedtelesis.com
```

To delete a redirect URL string, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-url
```

Related commands [auth-web-server redirect-delay-time](#)

[show auth-web-server](#)
[show running-config](#)

auth-web-server session-keep

Overview This command enables the session-keep feature to jump to the original URL after being authorized by Web-Authentication.

Use the **no** variant of this command to disable the session keep feature.

Syntax `auth-web-server session-keep`
`no auth-web-server session-keep`

Default The session-keep feature is disabled by default.

Mode Global Configuration

Usage notes This function doesn't ensure to keep session information in all cases. Authenticated supplicant may be redirected to unexpected page when session-keep is enabled. This issue occurred by supplicant sending HTTP packets automatically after authentication page is displayed and the URL is written.

Examples To enable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server session-keep
```

To disable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server session-keep
```

Validation Commands `show auth`
`show auth-web-server`
`show running-config`

auth-web-server ssl

Overview This command enables HTTPS functionality for the Web-Authentication server feature.

Use the **no** variant of this command to disable HTTPS functionality for the Web-Authentication server.

Syntax `auth-web-server ssl`
`no auth-web-server ssl`

Default HTTPS functionality for the Web-Authentication server feature is disabled by default.

Mode Global Configuration

Examples To enable HTTPS functionality for the Web-Authentication server feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ssl
```

To disable HTTPS functionality for the Web-Authentication server feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ssl
```

**Validation
Commands** `show auth`
`show auth-web-server`
`show running-config`

auth-web-server ssl intercept-port

Overview Use this command to register HTTPS intercept port numbers when the HTTPS server uses custom port number (not TCP port number 443).

Note that you need to use the **auth-web-server intercept-port** command to register HTTP intercept port numbers.

Use the **no** variant of this command to delete registered port number.

Syntax `auth-web-server ssl intercept-port <1-65535>`
`no auth-web-server ssl intercept-port <1-65535>`

Parameter	Description
<1-65535>	TCP port number in the range from 1 through 65535

Default 443/TCP is registered by default.

Mode Global Configuration

Examples To register HTTPS port number 3128, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ssl intercept-port 3128
```

To delete HTTPS port number 3128, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ssl intercept-port 3128
```

Validation Commands [show auth-web-server](#)

Related commands [auth-web-server intercept-port](#)

auth-web-server trustpoint

Overview Use this command to set the PKI trustpoint to use for secure web authentication communication to an AlliedWare Plus device.

Use the **no** variant of this command to revert to using the default trustpoint 'default-selfsigned'.

Syntax `auth-web-server trustpoint <trustpoint-name>`
`no auth-web-server trustpoint`

Parameter	Description
<code><trustpoint-name></code>	Name of trustpoint

Default By default, web authentication uses the 'default-selfsigned' trustpoint.

Mode Global Configuration

Usage notes Before using the **auth-web-server trustpoint** command you will need to establish a trustpoint. For example, you can create a local self-signed trustpoint using the procedure outlined below.

Create a self-signed trustpoint called 'web-trust' with keypair 'web_key':

```
awplus# configure terminal
awplus(config)# crypto pki trustpoint web-trust
awplus(ca-trustpoint)# enrollment selfsigned
awplus(ca-trustpoint)# rsakeypair web_key
awplus(ca-trustpoint)# exit
awplus(config)# exit
```

Create the root and server certificates for this trustpoint:

```
awplus# crypto pki authenticate web-trust
awplus# crypto pki enroll web-trust
```

For more information about the AlliedWare Plus implementation of Public Key Infrastructure (PKI), see the [Public Key Infrastructure \(PKI\) Feature Overview and Configuration Guide](#)

Example To configure web authentication to use the trustpoint 'web-trust', use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server trustpoint web-trust
```

To configure web authentication to use the default trustpoint 'default-selfsigned', use the commands:

```
awplus# configure terminal  
awplus(config)# no auth-web-server trustpoint
```

Version 5.5.1-2.1: command added

copy proxy-autoconfig-file

Overview Use this command to download the proxy auto configuration (PAC) file to your switch. The Web-Authentication supplicant can get the downloaded file from the system web server.

Syntax `copy <filename> proxy-autoconfig-file`

Parameter	Description
<filename>	The URL of the PAC file.

Mode Privileged Exec

Example To download the PAC file to this device, use the command:

```
awplus# copy tftp://server/proxy.pac proxy-autoconfig-file
```

Related commands [show proxy-autoconfig-file](#)
[erase proxy-autoconfig-file](#)

copy web-auth-https-file

Overview Use this command to download the SSL server certificate for web-based authentication. The file must be in PEM (Privacy Enhanced Mail) format, and contain the private key and the server certificate.

Syntax `copy <filename> web-auth-https-file`

Parameter	Description
<code><filename></code>	The URL of the server certificate file.

Mode Privileged Exec

Example To download the server certificate file `verisign_cert.pem` from the TFTP server directory `server`, use the command:

```
awplus# copy tftp://server/verisign_cert.pem  
web-auth-https-file
```

Related commands

- [auth-web-server ssl](#)
- [erase web-auth-https-file](#)
- [show auth-web-server](#)

description (auth-profile)

Overview Use this command to add a description to an authentication profile in Authentication Profile mode.

Use the **no** variant of this command to remove the current description.

Syntax `description <description>`

Parameter	Description
<code><description></code>	Text describing the selected authentication profile.

Default No description configured by default.

Mode Authentication Profile

Example To add a description to the authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# description student room setting
```

To remove a description from the authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no description
```

Related commands [auth profile \(global\)](#)

erase proxy-autoconfig-file

Overview Use this command to remove the proxy auto configuration file.

Syntax `erase proxy-autoconfig-file`

Mode Privileged Exec

Example To remove the proxy auto configuration file, use the command:

```
awplus# erase proxy-autoconfig-file
```

Related commands [show proxy-autoconfig-file](#)
[copy proxy-autoconfig-file](#)

erase web-auth-https-file

Overview Use this command to remove the SSL server certificate for web-based authentication.

Syntax `erase web-auth-https-file`

Mode Privileged Exec

Example To remove the SSL server certificate file for web-based authentication use the command:

```
awplus# erase web-auth-https-file
```

Related commands

- [auth-web-server ssl](#)
- [copy web-auth-https-file](#)
- [show auth-web-server](#)

platform l3-hashing-algorithm

Overview This command enables you to change the L3 VLAN hash-key-generating algorithm.

The **no** variant of this command returns the hash-key algorithm to the default of `crc32l`.

Syntax `platform l3-hashing-algorithm {crc16l|crc16u|crc32l|crc32u}`
`no platform l3-hashing-algorithm`

Parameter	Description
<code>crc16l</code>	The algorithm that will apply to the lower bits of CRC-16
<code>crc16u</code>	The algorithm that will apply to the upper bits of CRC-16
<code>crc32l</code>	The algorithm that will apply to the lower bits of CRC-32
<code>crc32u</code>	The algorithm that will apply to the upper bits of CRC-32

Default The hash-key algorithm is `crc32l` by default.

Mode Global configuration

Usage notes Occasionally, when using the Multiple Dynamic VLAN feature, a supplicant cannot be authenticated because a collision occurs within the VLAN L3 table. This can happen when more than four different IP addresses produce the same hash-key.

When this situation occurs, collisions can sometimes be avoided by changing the hashing algorithm from its default of `crc32l`. Several different algorithms may need to be tried to rectify the problem.

You must restart the switch for this command to take effect.

Note that this command is intended for technical support staff, or advanced end users.

Example To change the hash-key generating algorithm applying to the lower bits of CRC-16, use the command:

```
awplus# configure terminal
awplus(config)# platform l3-hashing-algorithm crc16l
```

Related commands [platform mac-vlan-hashing-algorithm](#)
[show platform](#)

platform mac-vlan-hashing-algorithm

Overview This command enables you to change the MAC VLAN hash-key-generating algorithm.

The **no** variant of this command returns the hash-key algorithm to the default of `crc32l`

Syntax `platform mac-vlan-hashing-algorithm`
`{crc16l|crc16u|crc32l|crc32u}`
`no platform mac-vlan-hashing-algorithm`

Parameter	Description
<code>crc16l</code>	The algorithm that will apply to the lower bits of CRC-16
<code>crc16u</code>	The algorithm that will apply to the upper bits of CRC-16
<code>crc32l</code>	The algorithm that will apply to the lower bits of CRC-32
<code>crc32u</code>	The algorithm that will apply to the upper bits of CRC-32

Default The hash-key algorithm is `crc32l` by default.

Mode Global configuration

Usage notes Occasionally, when using the Multiple Dynamic VLAN feature, a supplicant cannot be authenticated because a collision occurs within the VLAN MAC table. This can happen when more than four different MAC addresses produce the same hash-key.

When this situation occurs, collisions can sometimes be avoided by changing the hashing algorithm from its default of `crc32l`. Several different algorithms may need to be tried to rectify the problem.

You must restart the switch for this command to take effect.

Note that this command is intended for technical support staff, or advanced end users.

Example To change the hash-key generating algorithm applying to the lower bits of CRC-16, use the command:

```
awplus# configure terminal
awplus(config)# platform mac-vlan-hashing-algorithm crc16l
```

Related commands [show platform](#)

show auth

Overview This command shows the configuration state of authentication.

Syntax `show auth [all]`

Parameter	Description
all	Display all authentication information for each authenticated interface. This can be a static channel (or static aggregator), or a dynamic (or LACP) channel group, or a switch port.

Mode Privileged Exec

Example To display all authentication information, enter the command:

```
awplus# show auth all
```

Output Figure 48-1: Example output from the **show auth** command

```
awplus# show auth all

commands

show auth diagnostics

Overview This command shows authentication diagnostics, optionally for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

If no interface is specified then authentication diagnostics are shown for all interfaces.

Syntax `show auth diagnostics [interface <interface-list>]`

Parameter	Description
<code>interface</code>	Specify ports to show.
<code><interface-list></code>	The interfaces or ports to configure. An interface-list can be: • an interface (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.0.6</code>), a static channel group (e.g. <code>sa2</code>) or a dynamic (LACP) channel group (e.g. <code>po2</code>) • a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.0.1-1.0.4</code>, or <code>sa1-2</code>, or <code>po1-2</code> • a comma-separated list of the above; e.g. <code>port1.0.1, port1.0.4-1.0.6</code>. Do not mix interface types in a list The specified interfaces must exist.

Mode Privileged Exec

Example To display authentication diagnostics for port1.0.6, enter the command:

```
awplus# show auth diagnostics interface port1.0.6
```

Output Figure 48-2: Example output from the **show auth diagnostics** command

```
Authentication Diagnostics for interface port1.0.6
  Supplicant address: 00d0.59ab.7037
    authEnterConnecting: 2

show auth interface

Overview This command shows the status of port authentication on the specified interface.

Syntax `show auth interface <interface-list>`

Parameter	Description
<code><interface-list></code>	The interfaces to display information about. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.

Mode Privileged Exec

Example To display the web-based authentication status for port1.0.4, enter the command:

```
awplus# show auth interface port1.0.4
```

If port-based authentication is not configured, the output will be

```
% Port-Control not configured on port1.0.4
```

To display the port-based authentication status for port1.0.4, enter the command:

```
awplus# show auth interface port1.0.4
```

```
awplus# show auth interface port1.0.4
Authentication Info for interface port1.0.4

show auth sessionstatistics

Overview This command shows authentication session statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Syntax `show auth sessionstatistics [interface <interface-list>]`

Parameter	Description
interface	Specify ports to show.
<interface-list>	The interfaces or ports to configure. An interface-list can be: • an interface (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.0.6</code>), a static channel group (e.g. <code>sa2</code>) or a dynamic (LACP) channel group (e.g. <code>po2</code>) • a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.0.1-1.0.4</code>, or <code>sa1-2</code>, or <code>po1-2</code> • a comma-separated list of the above; e.g. <code>port1.0.1,port1.0.4-1.0.6</code>. Do not mix interface types in a list The specified interfaces must exist.

Mode Privileged Exec

Example To display authentication statistics for port1.0.6, enter the command:

```
awplus# show auth sessionstatistics interface port1.0.6
```

Output Figure 48-3: Example output from the **show auth sessionstatistics** command

```
Authentication session statistics for interface port1.0.6
  session user name: manager
  session authentication method: Remote server
  session time: 19440 secs

```

show auth statistics interface

Overview Use this command to show the authentication statistics for the specified interface.

Syntax `show auth statistics interface <interface-list>`

Parameter	Description
<code><interface-list></code>	The interfaces to display information about. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.

Mode Privileged Exec

Example To display authentication statistics for port1.0.2, enter the command:

```
awplus# show auth statistics interface port1.0.2
```

Output Figure 48-4: Example output from **show auth statistics interface** for a port

```

Related commands [show dot1x interface](#)

show auth supplicant

Overview Use this command to show the supplicant (client device) state when authentication is configured for the switch. Use the optional **brief** parameter to show a summary of the supplicant state.

Syntax show auth supplicant [<macadd>] [brief]

Parameter	Description
<macadd>	Mac (hardware) address of the supplicant. Entry format is HHHH.HHHH.HHHH (hexadecimal).
brief	Brief summary of the supplicant state.

Mode Privileged Exec

Examples To display a summary of authenticated supplicant information on the device, enter the command:

```
awplus# show auth supplicant brief
```

To display authenticated supplicant information on the device, enter the command:

```
awplus# show auth supplicant
```

To display authenticated supplicant information for the device with MAC address 0000.5E00.5301, enter the command:

```
awplus# show auth supplicant 0000.5E00.5301
```

Output Figure 48-5: Example output from **show auth supplicant brief**

show auth supplicant interface

Overview This command shows the supplicant (client device) state for the authentication mode set for the interface. Use the optional **brief** parameter to show a summary of the supplicant state.

Syntax `show auth-web supplicant interface <interface-list> [brief]`

Parameter	Description
<interface-list>	The interfaces or ports to configure. An interface-list can be: • an interface (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.0.6</code>), a static channel group (e.g. <code>sa2</code>) or a dynamic (LACP) channel group (e.g. <code>po2</code>) • a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.0.1-1.0.4</code>, or <code>sa1-2</code>, or <code>po1-2</code> • a comma-separated list of the above; e.g. <code>port1.0.1, port1.0.4-1.0.6</code>. Do not mix interface types in a list The specified interfaces must exist.
brief	Brief summary of the supplicant state.

Mode Privileged Exec

Examples To display the authenticated supplicant on the interface `port1.0.2`, enter the command:

```
awplus# show auth supplicant interface port1.0.2
```

To display brief summary output for the authenticated supplicant on the interface `port1.0.2`, enter the command:

```
awplus# show auth supplicant interface port1.0.2 brief
```

show auth two-step supplicant brief

Overview This command displays the supplicant state of the two-step authentication feature on the interface.

Syntax show auth two-step supplicant [interface <interface-list>]
brief

Parameter	Description
interface	The interface selected for display.
<interface-list>	The interfaces to display information about. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.

Mode Privileged Exec

Usage notes Do not mix interface types in a list. The specified interfaces must exist.

Example To display the supplicant state of the two-step authentication feature, enter the command:

```
awplus# show two-step supplicant interface port1.0.2 brief
```

Output Figure 48-8: Example output from **show auth two-step supplicant brief**

interface port1.0.2						
authenticationMethod: dot1x/mac						
Two-Step Authentication:						
firstMethod:mac						
secondMethod:dot1x

AAA Commands

Introduction

Overview AAA is the collective title for the three related functions of Authentication, Authorization and Accounting. These functions can be applied in a variety of methods with a variety of servers.

The purpose of the AAA commands is to map instances of the AAA functions to sets of servers. The Authentication function can be performed in multiple contexts, such as authentication of users logging in at a console, or 802.1X-Authentication of devices connecting to Ethernet ports.

For each of these contexts, you may want to use different sets of servers for examining the proffered authentication credentials and deciding if they are valid. AAA Authentication commands enable you to specify which servers will be used for different types of authentication.

This chapter provides an alphabetical reference for AAA commands for Authentication, Authorization and Accounting. For more information, see the [AAA and Port_Authentication Feature Overview and Configuration Guide](#).

aaa accounting auth-mac

Overview This command configures an accounting method list for MAC-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with MAC-based authentication enabled, or a named method list, which can be applied to an interface with the [auth-mac accounting](#) command.

Use the **no** variant of this command to disable either the default or a named accounting method list for MAC-based authentication. Once all method lists are disabled, AAA accounting for MAC-based authentication is disabled globally.

Syntax `aaa accounting auth-mac {default|<list-name>}
{start-stop|stop-only|none} group {<group-name>|radius}
no aaa accounting auth-mac {default|<list-name>}`

Parameter	Description
default	Configure the default accounting method list
<list-name>	Configure a named accounting method list
start-stop	Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session.
stop-only	Only sends a stop accounting message at the end of the session.
none	No accounting record sent.
group	Use a server group
<group-name>	Server group name.
radius	Use all RADIUS servers.

Default RADIUS accounting for MAC-based Authentication is disabled by default

Mode Global Configuration

Usage notes This command can be used to configure either the default accounting method list or a named accounting method list:

- **default:** the default accounting method list which is automatically applied to all interfaces with MAC-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [auth-mac accounting](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command

- **group** <group-name>: use the specified RADIUS server group configured with the [aaa group server](#) command

The accounting event to send to the RADIUS server is configured with the following options:

- **start-stop**: sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only**: sends a **stop** accounting message at the end of a session.
- **none**: disables accounting.

Examples To enable the default RADIUS accounting for MAC-based authentication, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-mac default start-stop
group radius
```

To disable RADIUS accounting for MAC-based Authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-mac default
```

To enable a named RADIUS accounting method list 'vlan10_acct' for MAC-based authentication, with the RADIUS server group 'rad_group_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-mac vlan10_acct start-stop
group rad_group_vlan10
```

To disable a named RADIUS accounting method list 'vlan10_acct' for MAC-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-mac vlan10_acct
```

aaa accounting auth-web

Overview This command configures an accounting method list for Web-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with Web-based authentication enabled, or a named method list, which can be applied to an interface with the [auth-web accounting](#) command.

Use the **no** variant of this command to disable either the default or a named accounting method list for Web-based authentication. Once all method lists are disabled, AAA accounting for Web-based authentication is disabled globally.

Syntax `aaa accounting auth-web {default|<list-name>}
{start-stop|stop-only|none} group {<group-name>|radius}
no aaa accounting auth-web {default|<list-name>}`

Parameter	Description
default	Configure the default accounting method list
<list-name>	Configure a named accounting method list
start-stop	Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session.
stop-only	Only sends a stop accounting message at the end of the session.
none	No accounting record sent.
group	Use a server group
<group-name>	Server group name.
radius	Use all RADIUS servers.

Default RADIUS accounting for Web-based authentication is disabled by default.

Mode Global Configuration

Usage notes This command can be used to configure either the default accounting method list or a named accounting method list:

- **default:** the default accounting method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<list-name>:** a user named list which can be applied to an interface using the [auth-web accounting](#) command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius:** use all RADIUS servers configured by [radius-server host](#) command

- **group** <group-name>: use the specified RADIUS server group configured with the [aaa group server](#) command

Configure the accounting event to be sent to the RADIUS server with the following options:

- **start-stop**: sends a start accounting message at the beginning of a session and a stop accounting message at the end of the session.
